# Chapter 25

## Enhanced Periodic Interrupt Timer (EPIT)

### 25.1 Overview

EPIT is a 32-bit set-and-forget timer that is capable of providing precise interrupts at regular intervals with minimal processor intervention. EPIT begins counting after it is enabled by software.

The following figure shows the EPIT block diagram.

**Figure 25-1. EPIT block diagram**

## 25.1.1 EPIT features

EPIT has the following key features:

- 32-bit down counter with clock source selection
- 12-bit prescaler for division of input clock frequency
- Counter value that can be programmed on the fly
- Can be programmed to be active during low-power and debug modes
- Interrupt generation when counter reaches the compare value

## 25.1.2 EPIT modes and operations

EPIT supports the following modes: set-and-forget and free running. See the following sections for more information.

- [Operating in set-and-forget mode](#)
- [Operating in free-running mode](#)

See [Operations](#) for a description of the operations that EPIT supports.

## 25.2 External signals

The following table describes EPIT's I/O signals.

**Table 25-1. EPIT External Signals**

Signal	Description	Pad	Mode	Direction
EPIT1_OUT	Output 1 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition.	EIM_D19	ALT6	O
		GPIO_0	ALF4	
		GPIO_7	ALT2	
EPIT2_OUT	Output 2 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition.	EIM_D20	ALT6	O
		GPIO_8	ALT2	

## 25.3 Clocks

The table found here describes the clock sources for EPIT.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 25-2. EPIT Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from among the following sources:

- **High-frequency reference clock (ipg\_clk\_highfreq)**

This clock is provided by the Clock Control Module (CCM). This clock remains on during low-power mode when the peripheral clock is turned off, allowing EPIT to use this clock in low-power mode. In normal mode, the CCM synchronizes this clock to ahb\_clk; in low-power mode, CCM switches to an unsynchronized version.

- **Low-frequency reference clock (ipg\_clk\_32k)**

This 32 kHz reference clock is provided by the CCM. This clock remains on in low-power mode when the peripheral clock is turned off, so EPIT can use this clock during low-power mode. In normal mode, the CCM synchronizes this clock to ahb\_clk; in low-power mode, CCM switches to an unsynchronized version. This clock is derived from the external 32kHz crystal.

- **Peripheral clock (ipg\_clk)**

This is the peripheral clock (PER Clock) which is provided (and optionally gated) by the CCM. This clock is typically used in normal operations. In low-power modes, if the EPIT is programmed to be disabled (via STOPEN or WAITEN), then the peripheral clock can be switched off.

The clock input source is determined by the CLKSRC field in the control register. The clock input to the prescaler can also be disabled by setting CLKSRC to 0b00. **This field value should only be changed after first disabling the EPIT by clearing the EN bit in the EPIT\_EPITCR.** For other programming requirements that apply while changing clock source, refer section [Change of Clock Source](#).

The PRESCALER field in the control register is used to select the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value between 1 and 4096. A change in the value of the PRESCALER field is immediately reflected on its output clock frequency. The following figure shows the timing for a change in the prescaler value.

Figure 25-2. Prescaler Value Change Diagram

## 25.4 Functional Description

This section provides a complete functional description of the block.

### 25.4.1 Operating modes

EPIT can operate in either set-and-forget or free-running mode. Use EPIT\_CR[RLD] to select the desired mode.

#### 25.4.1.1 Operating in set-and-forget mode

To select this mode of operation, set the RLD bit in the control register (EPIT\_CR).

In this mode, the counter obtains its data from the load register (EPIT\_LR); it cannot be written to directly from the block data bus. Whenever the counter reaches zero, the value in EPIT\_LR is loaded into the counter. This value is then decremented to zero.

To directly initialize the counter instead of waiting for the count to reach zero, set the EPIT counter overwrite enable bit (EPIT\_CR[IOVW]) and write to EPIT\_LR with the required initialization value.

#### 25.4.1.2 Operating in free-running mode

To select this mode of operation, clear the RLD bit.

In this mode, the counter rolls over from 0000 0000h to FFFF FFFFh without reloading from the modulus register. After rolling over, the counter continues counting down.

To directly initialize the counter, set the EPIT counter overwrite enable bit (EPIT\_EPITCL[IOVW]) and write to EPIT\_EPITLR with the required initialization value.

## 25.4.2 Operations

EPIT has a single 32-bit down counter, which starts counting when the block is enabled by software.

The start value of the counter is loaded from the EPIT load register, which can be written to at any time by the processor. The value in the compare register determines the time that the interrupt occurs.

When EPIT is disabled (EN = 0), both the main counter and the prescaler counter freeze their count at their current count values. When EPIT is re-enabled (EN = 1), the ENMOD bit, which is a RW bit, decides the counter value:

- If ENMOD is set, the main counter is loaded with the load value (If RLD = 1)/ FFFF FFFFh (If RLD = 0) and the prescaler counter is reset (000h).
- If ENMOD is cleared, both main counter and prescaler counter restart counting from their frozen values.

If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both the main counter and the prescaler counter start counting from their frozen values regardless of the ENMOD bit.

A hardware reset resets all EPIT registers to their respective reset values. There is a software reset which has the same effect on all registers except for the EN, ENMOD, STOPEN and WAITEN bits in the control register. The state of these bits are not affected by software reset. A software reset can be asserted even when the EPIT is disabled.

## 25.4.3 Compare Event

When the programmed value of EPIT\_EPITCMPR matches the value in EPIT\_EPITCNR a compare status flag is set, and an interrupt is generated if the OCIEN bit is set in the control register.

## Functional Description

The compare output pin is set, cleared, toggled, or not affected at all depending on the setting of the output mode (OM) bits in the control register. If an interrupt is required at rollover (when the counter value reaches 0x0000\_0000 and the new value is loaded) then the compare register value should be set equal to the load register value in set-and-forget mode, or equal to 0xFFFF\_FFFF in free-running mode.

The following figure shows the timing for a compare event and interrupt.

**Figure 25-3. Compare Event and Interrupt Timing Diagram**

EPIT will generate a compare event in the next count if the EPITx\_CNR from the previous count equals the new EPITx\_CMPR configured before re-enabling the EPIT in the next count. Even in case a new start counter value was updated in EPITx\_LR before re-enabling the EPIT for the next round. To avoid this, configure the EPITx\_CMPR to previous EPITx\_CNR+1. Or, in set and forget mode, configure EPITx\_LR with IOVW=1, before disabling EPIT. Also can do an extra disable/enable iteration to clear OCIF and update EPITx\_CNR.

### 25.4.3.1 Counter Value Overwrite

The EPIT counter value can be overwritten to acquire a desired value at any point of time. The procedure for this is to set the IOVW bit in the control register and then write the desired value into the load register.

This results in the load register acquiring that value and also the counter being overwritten with it. If the EPIT is running the counter resumes counting from the overwritten value.

### 25.4.3.2 Low-Power Mode Behavior

The EPIT timer's behavior in low-power modes depends on which clock source is being used.

If the selected clock source is available and the corresponding low-power enable bit is set, then the EPIT continues to function in the low-power mode. If the EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), then main counter and the prescaler counter freeze at the current count values when the EPIT enters low-power mode. When the EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit.

### 25.4.3.3 Debug Mode Behavior

In debug mode, the user has the option to run or halt the EPIT timers. If the DBGGEN bit is reset in the EPIT Control Register, the timer is halted.

When debug mode is exited, the timer operation reverts to what it was prior to entering debug mode.

## 25.5 Initialization/ Application Information

### 25.5.1 Change of Clock Source

The CLKSRC field in EPIT\_EPITCR determines the clock source. This field value should be changed only after disabling the EPIT (EN = 0).

Below is the software sequence which must be followed while changing clock source.

1. Disable the EPIT - set EN=0 in EPIT\_EPITCR.
2. Disable EPIT output - program OM=00 in the EPIT\_EPITCR.
3. Disable EPIT interrupts.
4. Program CLKSRC to desired clock source in EPIT\_EPITCR.
5. Clear the EPIT status register (EPIT\_EPITSR), that is, write "1" to clear (w1c).
6. Set ENMOD= 1 in the EPIT\_EPITCR, to bring the EPIT Counter to defined state (EPIT\_EPITLR value or 0xFFFF\_FFFF).
7. Enable EPIT - set (EN=1) in the EPIT\_EPITCR
8. Enable the EPIT interrupts.

## 25.6 EPIT Memory Map/Register Definition

The EPIT includes five user-accessible 32-bit registers. The following table summarizes these registers and their addresses.

Peripheral bus write access to the EPIT control register (EPITCR) and the EPIT load register (EPITLR) results in one cycle of wait state, while other valid peripheral bus accesses are with 0 wait state.

EPIT memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20D_0000	Control register (EPIT1_CR)	32	R/W	0000_0000h	<a href="#">25.6.1/1338</a>
20D_0004	Status register (EPIT1_SR)	32	R/W	0000_0000h	<a href="#">25.6.2/1341</a>
20D_0008	Load register (EPIT1_LR)	32	R/W	FFFF_FFFFh	<a href="#">25.6.3/1341</a>
20D_000C	Compare register (EPIT1_CMPCR)	32	R/W	0000_0000h	<a href="#">25.6.4/1342</a>
20D_0010	Counter register (EPIT1_CNR)	32	R	FFFF_FFFFh	<a href="#">25.6.5/1342</a>
20D_4000	Control register (EPIT2_CR)	32	R/W	0000_0000h	<a href="#">25.6.1/1338</a>
20D_4004	Status register (EPIT2_SR)	32	R/W	0000_0000h	<a href="#">25.6.2/1341</a>
20D_4008	Load register (EPIT2_LR)	32	R/W	FFFF_FFFFh	<a href="#">25.6.3/1341</a>
20D_400C	Compare register (EPIT2_CMPCR)	32	R/W	0000_0000h	<a href="#">25.6.4/1342</a>
20D_4010	Counter register (EPIT2_CNR)	32	R	FFFF_FFFFh	<a href="#">25.6.5/1342</a>

### 25.6.1 Control register (EPITx\_CR)

The EPIT control register (EPIT\_CR) is used to configure the operating settings of the EPIT. It contains the clock division prescaler value and also the interrupt enable bit. Additionally, it contains other control bits which are described below.

Peripheral Bus Write access to EPIT Control Register (EPIT\_CR) results in one cycle of the wait state, while other valid peripheral bus accesses are with 0 wait state.

Address: Base address + 0h offset

**EPITx\_CR field descriptions**

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 CLKSRC	Select clock source These bits determine which clock input is to be selected for running the counter. This field value should only be changed when the EPIT is disabled by clearing the EN bit in this register. For other programming requirements while changing clock source, refer to <a href="#">Change of Clock Source</a> .  00 Clock is off 01 Peripheral clock 10 High-frequency reference clock 11 Low-frequency reference clock
23–22 OM	EPIT output mode. This bit field determines the mode of EPIT output on the output pin.  00 EPIT output is disconnected from pad 01 Toggle output pin 10 Clear output pin 11 Set output pin
21 STOPEN	EPIT stop mode enable. This read/write control bit enables the operation of the EPIT during stop mode. This bit is reset by a hardware reset and unaffected by software reset.  0 EPIT is disabled in stop mode 1 EPIT is enabled in stop mode
20 Reserved	This read-only field is reserved and always has the value 0.
19 WAITEN	This read/write control bit enables the operation of the EPIT during wait mode. This bit is reset by a hardware reset. A software reset does not affect this bit.  0 EPIT is disabled in wait mode 1 EPIT is enabled in wait mode
18 DBGEN	This bit is used to keep the EPIT functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is reset by hardware reset. A software reset does not affect this bit.  0 Inactive in debug mode 1 Active in debug mode
17 IOVW	EPIT counter overwrite enable. This bit controls the counter data when the modulus register is written. When this bit is set, all writes to the load register overwrites the counter contents and the counter starts subsequently counting down from the programmed value.  0 Write to load register does not result in counter value being overwritten. 1 Write to load register results in immediate overwriting of counter value.

Table continues on the next page...

**EPITx\_CR field descriptions (continued)**

Field	Description
16 SWR	<p>Software reset. The EPIT is reset when this bit is set to 1. It is a self clearing bit. This bit is set when the block is in reset state and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values, except for the EN, ENMOD, STOPEN, WAITEN and DBGEN bits in this control register</p> <p>0 EPIT is out of reset 1 EPIT is undergoing reset</p>
15–4 PRESCALAR	<p>Counter clock prescaler value. This bit field determines the prescaler value by which the clock is divided before it goes to the counter</p> <p>0x000 Divide by 1 0x001 Divide by 2... 0xFFFF Divide by 4096</p>
3 RLD	<p>Counter reload control.</p> <p>This bit is cleared by hardware reset. It decides the counter functionality, whether to run in free-running mode or set-and-forget mode.</p> <p>0 When the counter reaches zero it rolls over to 0xFFFF_FFFF (free-running mode) 1 When the counter reaches zero it reloads from the modulus register (set-and-forget mode)</p>
2 OCIEN	<p>Output compare interrupt enable.</p> <p>This bit enables the generation of interrupt on occurrence of compare event.</p> <p>0 Compare interrupt disabled 1 Compare interrupt enabled</p>
1 ENMOD	<p>EPIT enable mode.</p> <p>When EPIT is disabled (EN=0), both main counter and prescaler counter freeze their count at current count values. ENMOD bit is a r/w bit that determines the counter value when the EPIT is enabled again by setting EN bit. If ENMOD bit is set, then main counter is loaded with the load value (If RLD=1)/ 0xFFFF_FFFF (If RLD=0) and prescaler counter is reset, when EPIT is enabled (EN=1). If ENMOD is programmed to 0 then both main counter and prescaler counter restart counting from their frozen values when EPIT is enabled (EN=1). If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT/DEBUG), then both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 Counter starts counting from the value it had when it was disabled. 1 Counter starts count from load value (RLD=1) or 0xFFFF_FFFF (If RLD=0)</p>
0 EN	<p>This bit enables the EPIT. EPIT counter and prescaler value when EPIT is enabled (EN = 1), is dependent upon ENMOD and RLD bit as described for ENMOD bit. It is recommended that all registers be properly programmed before setting this bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 EPIT is disabled 1 EPIT is enabled</p>

## 25.6.2 Status register (EPITx\_SR)

The EPIT status register (EPIT\_SR) has a single status bit for the output compare event. The bit is a write 1 to clear bit.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															OCIF
W																w1c
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPITx\_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 OCIF	Output compare interrupt flag. This bit is the interrupt flag that is set when the content of counter equals the content of the compare register (EPIT_CMPR). The bit is a write 1 to clear bit. <ul style="list-style-type: none"> <li>0 Compare event has not occurred</li> <li>1 Compare event occurred</li> </ul>

## 25.6.3 Load register (EPITx\_LR)

The EPIT load register (EPIT\_LR) contains the value that is to be loaded into the counter when EPIT counter reaches zero if the RLD bit in EPIT\_CR is set. If the IOVW bit in the EPIT\_CR is set then a write to this register overwrites the value of the EPIT counter register in addition to updating this registers value. This overwrite feature is active even if the RLD bit is not set.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	LOAD																																	
W																																		
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1		

**EPITx\_LR field descriptions**

Field	Description
LOAD	Load value. Value that is loaded into the counter at the start of each count cycle.

**25.6.4 Compare register (EPITx\_CMPR)**

The EPIT compare register (EPIT\_CMPR) holds the value that determines when a compare event is generated.

Address: Base address + Ch offset

**EPITx\_CMPR field descriptions**

Field	Description
COMPARE	Compare Value. When the counter value equals this bit field value a compare event is generated.

**25.6.5 Counter register (EPITx\_CNR)**

The EPIT counter register (EPIT\_CNR) contains the current count value and can be read at any time without disturbing the counter. This is a read-only register and any attempt to write into it generates a transfer error. But if the IOVW bit in EPIT\_CR is set, the value of this register can be overwritten with a write to EPIT\_LR. This change is reflected when this register is subsequently read.

Address: Base address + 10h offset

**EPITx\_CNR field descriptions**

Field	Description
COUNT	Counter value. This contains the current value of the counter.

# Chapter 26

## Enhanced Serial Audio Interface (ESAI)

### 26.1 Overview

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, Sony/Phillips Digital Interface (SPDIF) transceivers, and other DSPs.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. It is a superset of the 56300 Family ESSI peripheral and of the 56000 Family SAI peripheral.

All serial transfers in the module are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is similar in that it is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The following figure shows the ESAI block diagram.

Figure 26-1. ESAI Block Diagram

## 26.1.1 Features

- Independent (asynchronous mode) or shared (synchronous mode) transmit and receive sections with separate or shared internal/external clocks and frame syncs, operating in Master or Slave mode.
- Up to six transmitters and four receivers with TX2\_RX3, TX3\_RX2, TX4\_RX1, and TX5\_RX0 pins shared by transmitters 2 to 5 and receivers 0 to 3. TX0 AND TX1 pins are used by transmitters 0 and 1 only.
- Programmable data interface modes such as I2S, LSB aligned, MSB aligned
- Programmable word length (8, 12, 16, 20 or 24bits)
- Flexible selection between system clock or external oscillator as input clock source, programmable internal clock divider and frame sync generation
- AC97 support
- Time Slot Mask Registers for reduced ARM platform overhead (for both Transmit and Receive)
- 128-word Transmit FIFO shared by six transmitters
- 128-word Receive FIFO shared by four receivers

## 26.1.2 Modes of Operation

ESAI has three basic operating modes and many data/operation formats.

ESAI operating mode are selected by the ESAI control registers (ESAI\_TCCR, ESAI\_TCR, ESAI\_RCCR, ESAI\_RCR, and ESAI\_SAICR). The main operating modes are described in the following section.

### 26.1.2.1 Normal/Network/On-Demand Mode Selection

Selecting between the normal mode and network mode is accomplished by clearing or setting the TMOD0-TMOD1 bits in the ESAI\_TCR register for the transmitter section, as well as in the RMOD0-RMOD1 bits in the ESAI\_RCR register for the receiver section.

For normal mode, the ESAI functions with one data word of I/O per frame (per enabled transmitter or receiver). The normal mode is typically used to transfer data to or from a single device.

For the network mode, 2 to 32 time slots per frame may be selected. During each frame, 0 to 32 data words of I/O may be received or transmitted. In either case, the transfers are periodic. The frame sync signal indicates the first time slot in the frame. Network mode is typically used in time division multiplexed (TDM) networks of codecs, DSPs with multiple words per frame, or multi-channel devices.

Selecting the network mode and setting the frame rate divider to zero (DC=00000) selects the on-demand mode. This special case does not generate a periodic frame sync. A frame sync pulse is generated only when data is available to transmit. The on-demand mode requires that the transmit frame sync be internal (output) and the receive frame sync be external (input). Therefore, for simplex operation, the synchronous mode could be used; however, for full-duplex operation, the asynchronous mode must be used. Data transmission that is data driven is enabled by writing data into each TX. Although the ESAI is double buffered, only one word can be written to each TX, even if the transmit shift register is empty. The receive and transmit interrupts function as usual using TDE and RDF; however, transmit underruns are impossible for on-demand transmission and are disabled.

### **26.1.2.2 Synchronous/Asynchronous Operating Modes**

The transmit and receive sections of the ESAI may be synchronous or asynchronous, that is, the transmitter and receiver sections may use common clock and synchronization signals (synchronous operating mode), or they may have their own separate clock and sync signals (asynchronous operating mode).

The SYN bit in the ESAI\_SAICR register selects synchronous or asynchronous operation. Because the ESAI is designed to operate either synchronously or asynchronously, separate receive and transmit interrupts are provided.

When SYN is cleared, the ESAI transmitter and receiver clocks and frame sync sources are independent. If SYN is set, the ESAI transmitter and receiver clocks and frame sync come from the transmitter section (either external or internal sources).

Data clock and frame sync signals can be generated internally by the ARM Core or may be obtained from external sources. If internally generated, the ESAI clock generator is used to derive high frequency clock, bit clock and frame sync signals from the ARM Core internal system clock.

### **26.1.2.3 Frame Sync Selection**

The frame sync can be either a bit-long or word-long signal.

The transmitter frame format is defined by the TFSL bit in the ESAI\_TCR register. The receiver frame format is defined by the RFSL bit in the ESAI\_RCR register.

1. In the word-long frame sync format, the frame sync signal is asserted during the entire word data transfer period. This frame sync length is compatible with codecs, SPI serial peripherals, serial A/D and D/A converters, shift registers and telecommunication PCM serial I/O.
2. In the bit-long frame sync format, the frame sync signal is asserted for one bit clock immediately before the data transfer period. This frame sync length is compatible with Intel and National components, codecs and telecommunication PCM serial I/O.

The relative timing of the word length frame sync as referred to the data word is specified by the TFSR bit in the ESAI\_TCR register for the transmitter section and by the RFSR bit in the ESAI\_RCR register for the receive section. The word length frame sync may be generated (or expected) with the first bit of the data word, or with the last bit of the previous word. TFSR and RFSR are ignored when a bit length frame sync is selected.

Polarity of the frame sync signal may be defined as positive (asserted high) or negative (asserted low). The TFSP bit in the ESAI\_TCCR register specifies the polarity of the frame sync for the transmitter section. The RFSP bit in the ESAI\_RCCR register specifies the polarity of the frame sync for the receiver section.

The ESAI receiver looks for a receive frame sync leading edge (trailing edge if RFSP is set) only when the previous frame is completed. If the frame sync goes high before the frame is completed (or before the last bit of the frame is received in the case of a bit frame sync or a word length frame sync with RFSR set), the current frame sync is not recognized, and the receiver is internally disabled until the next frame sync. Frames do not have to be adjacent, that is, a new frame sync does not have to immediately follow the previous frame. Gaps of arbitrary periods can occur between frames. Enabled transmitters are tri-stated during these gaps.

When operating in the synchronous mode (SYN=1), all clocks including the frame sync are generated by the transmitter section.

#### 26.1.2.4 Shift Direction Selection

Some data formats, such as those used by codecs, specify MSB first while other data formats, such as the AES-EBU digital audio interface, specify LSB first.

The MSB/LSB first selection is made by programming RSHFD bit in the ESAI\_RCR register for the receiver section and by programming the TSHFD bit in the ESAI\_TCR register for the transmitter section.

## 26.2 External Signals

Three to twelve pins are required for operation, depending on the operating mode selected and the number of transmitters and receivers enabled.

The TX0 and TX1 pins are used by transmitters 0 and 1 only. The TX2\_RX3, TX3\_RX2, TX4\_RX1, and TX5\_RX0 pins are shared by transmitters 2 to 5 with receivers 0 to 3. The actual mode of operation is selected under software control. All transmitters operate fully synchronized under control of the same transmitter clock signals. All receivers operate fully synchronized under control of the same receiver clock signals.

The following table describes the external signals of ESAI:

**Table 26-1. ESAI External Signals**

Signal	Description	Pad	Mode	Direction
ESAI_RX_CLK	RX serial bit clock for the ESAI interface. The direction can be programmed.	ENET_MDIO	ALT2	IO
		GPIO_1	ALT0	
ESAI_RX_FS	RX frame sync signal for the ESAI interface.	ENET_REF_CLK	ALT2	IO
		GPIO_9	ALT0	
ESAI_RX_HF_CLK	RX high frequency clock for the ESAI interface.	ENET_RX_ER	ALT2	IO
		GPIO_3	ALT0	
ESAI_TX0	Used for transmitting data from the ESAI_TX0 serial transmit shift register.	GPIO_17	ALT0	IO
		NANDF_CS2	ALT2	
ESAI_TX1	Used for transmitting data from the ESAI_TX1 serial transmit shift register.	GPIO_18	ALT0	IO
		NANDF_CS3	ALT2	
ESAI_TX2_RX3	Used as TX2 for transmitting data from the ESAI_TX2 serial transmit shift register when programmed as a transmitter pin  Used as the RX3 signal for receiving serial data to the ESAI_RX3 serial receive shift register when programmed as a receiver pin	ENET_TXD1	ALT2	IO
		GPIO_5	ALT0	
ESAI_TX3_RX2	Used as TX3 for transmitting data from the ESAI_TX3 serial transmit shift register when programmed as a transmitter pin  Used as the RX2 signal for receiving serial data to the ESAI_RX2 serial receive shift register when programmed as a receiver pin	ENET_TX_EN	ALT2	IO
		GPIO_16	ALT0	

*Table continues on the next page...*

**Table 26-1. ESAI External Signals  
(continued)**

Signal	Description	Pad	Mode	Direction
ESAI_TX4_RX1	Used as TX4 for transmitting data from the ESAI_TX4 serial transmit shift register when programmed as a transmitter pin  Used as the RX1 signal for receiving serial data to the ESAI_RX1 serial receive shift register when programmed as a receiver pin	ENET_TXD0	ALT2	IO
		GPIO_7	ALT0	
ESAI_TX5_RX0	Used as TX5 for transmitting data from the ESAI_TX5 serial transmit shift register when programmed as a transmitter pin  Used as the RX0 signal for receiving serial data to the ESAI_RX0 serial receive shift register when programmed as a receiver pin	ENET_MDC	ALT2	IO
		GPIO_8	ALT0	
ESAI_TX_CLK	TX serial bit clock for the ESAI interface. The direction can be programmed.	ENET_CRS_DV	ALT2	IO
		GPIO_6	ALT0	
ESAI_TX_FS	Frame sync for both the transmitters and receivers in the synchronous mode (SYN=1) and for the transmitters only in asynchronous mode	ENET_RXD1	ALT2	IO
		GPIO_2	ALT0	
ESAI_TX_HF_CLK	TX high frequency clock for the ESAI interface.	ENET_RXD0	ALT2	IO
		GPIO_4	ALT0	

## 26.2.1 Serial Transmit 0 Data Pin

TX0 is used for transmitting data from the ESAI\_TX0 serial transmit shift register.

TX0 is an output when data is being transmitted from the ESAI\_TX0 shift register. In the on-demand mode with an internally generated bit clock, the TX0 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX0 may be programmed as a disconnected pin (PC11) when the ESAI TX0 function is not being used. (See [Table 26-48](#).)

## 26.2.2 Serial Transmit 1 Data Pin

TX1 is used for transmitting data from the ESAI\_TX1 serial transmit shift register.

TX1 is an output when data is being transmitted from the ESAI\_TX1 shift register. In the on-demand mode with an internally generated bit clock, the TX1 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX1 may be programmed as a disconnected pin (PC10) when the ESAI TX1 function is not being used. (See [Table 26-48](#).)

## 26.2.3 Serial Transmit 2/Receive 3 Data Pin

TX2\_RX3 is used as the TX2 for transmitting data from the ESAI\_TX2 serial transmit shift register when programmed as a transmitter pin, or as the RX3 signal for receiving serial data to the ESAI\_RX3 serial receive shift register when programmed as a receiver pin.

TX2\_RX3 is an input when data is being received by the ESAI\_RX3 shift register. TX2\_RX3 is an output when data is being transmitted from the ESAI\_TX2 shift register. In the on-demand mode with an internally generated bit clock, the TX2\_RX3 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX2\_RX3 may be programmed as a disconnected pin (PC9) when the ESAI TX2 and RX3 functions are not being used. (See [Table 26-48](#).)

## 26.2.4 Serial Transmit 3/Receive 2 Data Pin

TX3\_RX2 is used as the TX3 signal for transmitting data from the ESAI\_TX3 serial transmit shift register when programmed as a transmitter pin, or as the RX2 signal for receiving serial data to the ESAI\_RX2 serial receive shift register when programmed as a receiver pin.

TX3\_RX2 is an input when data is being received by the ESAI\_RX2 shift register. TX3\_RX2 is an output when data is being transmitted from the ESAI\_TX3 shift register. In the on-demand mode with an internally generated bit clock, the TX3\_RX2 pin

becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX3\_RX2 may be programmed as a disconnected pin (PC8) when the ESAI TX3 and RX2 functions are not being used. (See [Table 26-48](#).)

### 26.2.5 Serial Transmit 4/Receive 1 Data Pin

TX4\_RX1 is used as the TX4 signal for transmitting data from the ESAI\_TX4 serial transmit shift register when programmed as transmitter pin, or as the RX1 signal for receiving serial data to the RX1 serial receive shift register when programmed as a receiver pin.

TX4\_RX1 is an input when data is being received by the ESAI\_RX1 shift register. TX4\_RX1 is an output when data is being transmitted from the ESAI\_TX4 shift register. In the on-demand mode with an internally generated bit clock, the TX4\_RX1 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX4\_RX1 may be programmed as a disconnected pin (PC7) when the ESAI TX4 and RX1 functions are not being used. (See [Table 26-48](#).)

### 26.2.6 Serial Transmit 5/Receive 0 Data Pin

TX5\_RX0 is used as the TX5 signal for transmitting data from the ESAI\_TX5 serial transmit shift register when programmed as transmitter pin, or as the RX0 signal for receiving serial data to the ESAI\_RX0 serial shift register when programmed as a receiver pin.

TX5\_RX0 is an input when data is being received by the ESAI\_RX0 shift register. TX5\_RX0 is an output when data is being transmitted from the ESAI\_TX5 shift register. In the on-demand mode with an internally generated bit clock, the TX5\_RX0 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX5\_RX0 may be programmed as a disconnected pin (PC6) when the ESAI TX5 and RX0 functions are not being used. (See [Table 26-48](#).)

## 26.2.7 Receiver Serial Clock

SCKR is a bidirectional pin providing the receivers serial bit clock for the ESAI interface.

The direction of this pin is determined by the RCKD bit in the ESAI\_RCCR register. The SCKR operates as a clock input or output used by all the enabled receivers in the asynchronous mode (SYN = 0), or as serial flag 0 pin in the synchronous mode (SYN = 1).

When this pin is configured as serial flag pin, its direction is determined by the RCKD bit in the ESAI\_RCCR register. When configured as the output flag OF0, this pin reflects the value of the OF0 bit in the ESAI\_SAICR register, and the data in the OF0 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When this pin is configured as the input flag IF0, the data value at the pin is stored in the IF0 bit in the ESAI\_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

SCKR may be programmed as a disconnected pin (PC0) when the ESAI SCKR function is not being used. (See [Table 26-48](#).)

### NOTE

Although the external ESAI serial clocks can be independent of and asynchronous to the internal ipg\_clk\_esai ESAI system clock, the external ESAI serial clock frequency cannot exceed 1/4 of the ipg\_clk\_esai and each external ESAI serial clock phase must exceed the minimum of  $2 \times 1/\text{ipg\_clk\_esai}$ .

For SCKR pin mode definitions, see [Table 26-39](#).

The table below provides a list of asynchronous-mode receiver clock sources. For more information about EXTAL/ESAI clocking control bits (ERI, ERO), refer to [ESAI Control Register \(ESAI\\_ECR\)](#).

**Table 26-2. Receiver Clock Sources (Asynchronous Mode Only)**

RHCKD	RFSD	RCKD	ERI	ERO	Receiver Bit Clock Source	OUTPUTS		
0	0	0	N/A	N/A	SCKR	-	-	-
0	0	1	N/A	N/A	HCKR	-	-	SCKR
0	1	0	N/A	N/A	SCKR	-	FSR	-
0	1	1	N/A	N/A	HCKR	-	FSR	SCKR
1	0	0	0	0	SCKR	HCKR	-	-

*Table continues on the next page...*

**Table 26-2. Receiver Clock Sources (Asynchronous Mode Only)  
(continued)**

RHCKD	RFSD	RCKD	ERI	ERO	Receiver Bit Clock Source	OUTPUTS		
1	0	0	0	1	SCKR	HCKR	-	-
1	0	0	1	0	SCKR	HCKR	-	-
1	0	0	1	1	SCKR	HCKR	-	-

1	1	1	1	0	EXTAL	HCKR	FSR	SCKR
1	1	1	1	1	EXTAL	HCKR	FSR	SCKR

Fsys = ipg\_clk\_esai

EXTAL is the on-chip clock source other than ipg\_clk\_esai ESAI system clock, and it is from esai\_clk\_root in CCM.

## 26.2.8 Transmitter Serial Clock

SCKT is a bidirectional pin providing the transmitters serial bit clock for the ESAI interface.

The direction of this pin is determined by the TCKD bit in the ESAI\_TCCR register. The SCKT is a clock input or output used by all the enabled transmitters in the asynchronous mode (SYN = 0) or by all the enabled transmitters and receivers in the synchronous mode (SYN = 1).

The following table provides a list of asynchronous-mode transmitter clock sources.

**Table 26-3. Transmitter Clock Sources (Asynchronous Mode Only)**

THCKD	TFSD	TCKD	ETI	ETO	Transmitter Bit Clock Source	OUTPUTS		
0	0	0	N/A	N/A	SCKT	-	-	-
0	0	1	N/A	N/A	HCKT	-	-	SCKT

*Table continues on the next page...*

**Table 26-3. Transmitter Clock Sources (Asynchronous Mode Only)  
(continued)**

THCKD	TFSD	TCKD	ETI	ETO	Transmitter Bit Clock Source	OUTPUTS		
0	1	0	N/A	N/A	SCKT	-	FST	-
0	1	1	N/A	N/A	HCKT	-	FST	SCKT
1	0	0	0	0	SCKT	HCKT	-	-
1	0	0	0	1	SCKT	HCKT	-	-
1	0	0	1	0	SCKT	HCKT	-	-

1	1	0	0	0	SCKR	HCKT	FST	-
1	1	0	0	1	SCKR	HCKT	FST	-
1	1	0	1	0	SCKR	HCKT	FST	-
1	1	0	1	1	SCKR	HCKT	FST	-
1	1	1	0	0	Fsys	HCKT	FST	SCKT
1	1	1	0	1	Fsys	HCKT	FST	SCKT
1	1	1	1	0	EXTAL	HCKT	FST	SCKT
1	1	1	1	1	EXTAL	HCKT	FST	SCKT

Fsys = ipg\_clk\_esai  
EXTAL is the on-chip clock sources other than ipg\_clk\_easi ESAI system clock, and it is from esai\_clk\_root in CCM

SCKT may be programmed as a disconnected pin (PC3) when the ESAI SCKT function is not being used. (See [Table 26-48](#).)

For more information about EXTAL/ESAI clocking control bits (ETI, ETO), see [ESAI Control Register \(ESAI\\_ECR\)](#).

#### NOTE

Although the external ESAI serial clocks can be independent of and asynchronous to the internal ipg\_clk\_esai ESAI system clock, the external ESAI serial clock frequency cannot exceed 1/4 of the ipg\_clk\_esai and each external ESAI serial clock phase must exceed the minimum of  $2 \times 1/\text{ipg\_clk\_esai}$ .

## 26.2.9 Frame Sync for Receiver

FSR is a bidirectional pin providing the receivers frame sync signal for the ESAI interface. The direction of this pin is determined by the RFSD bit in ESAI\_RCR register.

In the asynchronous mode (SYN=0), the FSR pin operates as the frame sync input or output used by all the enabled receivers. In the synchronous mode (SYN=1), it operates as either the serial flag 1 pin (TEBE=0), or as the transmitter external buffer enable control (TEBE=1, RFSD=1). For FSR pin mode definitions, see [Table 26-40](#); for receiver clock signals, see [Table 26-2](#).

When this pin is configured as serial flag pin, its direction is determined by the RFSD bit in the ESAI\_RCCR register. When configured as the output flag OF1, this pin reflects the value of the OF1 bit in the ESAI\_SAICR register, and the data in the OF1 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When configured as the input flag IF1, the data value at the pin is stored in the IF1 bit in the ESAI\_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

FSR may be programmed as a disconnected pin (PC1) when the ESAI FSR function is not being used. (See [Table 26-48](#).)

## 26.2.10 Frame Sync for Transmitter

FST is a bidirectional pin providing the frame sync for both the transmitters and receivers in the synchronous mode (SYN=1) and for the transmitters only in asynchronous mode (SYN=0) (see [Table 26-3](#)). The direction of this pin is determined by the TFSD bit in the ESAI\_TCCR register. When configured as an output, this pin is the internally generated frame sync signal. When configured as an input, this pin receives an external frame sync signal for the transmitters (and the receivers in synchronous mode).

FST may be programmed as a disconnected pin (PC4) when the ESAI FST function is not being used. (See [Table 26-48](#).)

## 26.2.11 High Frequency Clock for Transmitter

HCKT is a bidirectional pin providing the transmitters high frequency clock for the ESAI interface.

The direction of this pin is determined by the THCKD bit in the ESAI\_TCCR register. In the asynchronous mode (SYN=0), the HCKT pin operates as the high frequency clock input or output used by all enabled transmitters. In the synchronous mode (SYN=1), it

operates as the high frequency clock input or output used by all enabled transmitters and receivers. When programmed as input this pin is used as an alternative high frequency clock source to the ESAI transmitter rather than the ARM Core main clock. When programmed as output it can serve as a high frequency sample clock (to external DACs for example) or as an additional system clock (see [Table 26-3](#)).

HCKT may be programmed as a disconnected pin (PC5) when the ESAI HCKT function is not being used. (See [Table 26-48](#).)

### 26.2.12 High Frequency Clock for Receiver

HCKR is a bidirectional pin providing the receivers high frequency clock for the ESAI interface.

The direction of this pin is determined by the RHCKD bit in the ESAI\_RCCR register. In the asynchronous mode (SYN=0), the HCKR pin operates as the high frequency clock input or output used by all the enabled receivers. In the synchronous mode (SYN=1), it operates as the serial flag 2 pin. For HCKR pin mode definitions, see [Table 26-41](#); for receiver clock signals, see [Table 26-2](#).

When this pin is configured as serial flag pin, its direction is determined by the RHCKD bit in the ESAI\_RCCR register. When configured as the output flag OF2, this pin reflects the value of the OF2 bit in the ESAI\_SAICR register, and the data in the OF2 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When configured as the input flag IF2, the data value at the pin is stored in the IF2 bit in the ESAI\_SISR register, synchronized by the frame sync in normal mode or the slot in network mode.

HCKR may be programmed as a disconnected pin (PC2) when the ESAI HCKR function is not being used. (See [Table 26-48](#).)

### 26.2.13 Serial I/O Flags

Three ESAI pins (FSR, SCKR and HCKR) are available as serial I/O flags when the ESAI is operating in the synchronous mode (SYN=1).

Their operation is controlled by RCKD, RFSD, TEBE bits in the ESAI\_RCR, ESAI\_RCCR and ESAI\_SAICR registers. The output data bits (OF2, OF1 and OF0) and the input data bits (IF2, IF1 and IF0) are double buffered to/from the HCKR, FSR and SCKR pins. Double buffering the flags keeps them in sync with the TX and RX data lines.

Each flag can be separately programmed. Flag 0 (SCKR pin) direction is selected by RCKD, RCKD=1 for output and RCKD=0 for input. Flag 1 (FSR pin) is enabled when the pin is not configured as external transmitter buffer enable (TEBE=0) and its direction is selected by RFSD, RFSD=1 for output and RFSD=0 for input. Flag 2 (HCKR pin) direction is selected by RHCKD, RHCKD=1 for output and RHCKD=0 for input.

When programmed as input flags, the SCKR, FSR and HCKR logic values, respectively, are latched at the same time as the first bit of the receive data word is sampled. Because the input was latched, the signal on the input flag pin (SCKR, FSR or HCKR) can change without affecting the input flag until the first bit of the next receive data word. When the received data words are transferred to the receive data registers, the input flag latched values are then transferred to the IF0, IF1 and IF2 bits in the SAISR register, where they may be read by software.

When programmed as output flags, the SCKR, FSR and HCKR logic values are driven by the contents of the OF0, OF1 and OF2 bits in the ESAI\_SAICR register respectively, and they are driven when the transmit data registers are transferred to the transmit shift registers. The value on SCKR, FSR and HCKR is stable from the time the first bit of the transmit data word is transmitted until the first bit of the next transmit data word is transmitted. Software may change the OF0-OF2 values thus controlling the SCKR, FSR and HCKR pin values for each transmitted word. The normal sequence for setting output flags when transmitting data is as follows: wait for TDE (transmitter empty) to be set; first write the flags, and then write the transmit data to the transmit registers. OF0, OF1, and OF2 are double buffered so that the flag states appear on the pins when the transmit data is transferred to the transmit shift register, that is, the flags are synchronous with the data.

## 26.3 Clocks

The table found here describes the clock sources for ESAI.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 26-4. ESAI Clocks**

Clock name	Clock Root	Description
extal_clk	esai_clk_root	ESAI system clock
ipg_clk_esai	ahb_clk_root	Bus clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
mem_clk	ahb_clk_root	Mem clock

## 26.4 Functional Description

This section provides a complete functional description of the block.

### 26.4.1 ESAI After Reset

Hardware or software reset clears the port control register bits and the port direction control register bits, which configure all ESAI I/O pins as disconnected and both ESAI FIFOs are also in reset state.

The ESAI is in personal reset state while all ESAI pins are programmed as disconnected, and it is active only if at least one of the ESAI I/O pins is programmed as an ESAI pin.

### 26.4.2 ESAI Interrupt Requests

The ESAI can generate eight different interrupt requests

(ordered from the highest to the lowest priority):

#### 1. ESAI Receive Data with Exception Status

Occurs when the receive exception interrupt is enabled (REIE=1 in the RCR register), at least one of the enabled receive data registers is full (RDF=1) and a receiver overrun error has occurred (ROE=1 in the SAISR register). ROE is cleared by first reading the SAISR and then reading all the enabled receive data registers.

#### 2. ESAI Receive Even Data

Occurs when the receive even slot data interrupt is enabled (REDIE=1), at least one of the enabled receive data registers is full (RDF=1), the data is from an even slot (REDF=1) and no exception has occurred (ROE=0 or REIE=0).

Reading all enabled receiver data registers clears RDF and REDF.

#### 3. ESAI Receive Data

Occurs when the receive interrupt is enabled (RIE=1), at least one of the enabled receive data registers is full (RDF=1), no exception has occurred (ROE=0 or REIE=0) and no even slot interrupt has occurred (REDF=0 or REDIE=0). Reading all enabled receiver data registers clears RDF.

#### 4. ESAI Receive Last Slot Interrupt

Occurs, if enabled (RLIE=1), after the last slot of the frame ended (in network mode only) regardless of the receive mask register setting. The receive last slot interrupt may be used for resetting the receive mask slot register, reconfiguring the DMA channels and reassigning data memory pointers. Using the receive last slot interrupt guarantees that the previous frame was serviced with the previous setting and the new frame is serviced with the new setting without synchronization problems. Note that the maximum receive last slot interrupt service time should not exceed N-1 ESAI bits service time (where N is the number of bits in a slot).

#### 5. **ESAI Transmit Data with Exception Status**

Occurs when the transmit exception interrupt is enabled (TEIE=1), at least one transmit data register of the enabled transmitters is empty (TDE=1) and a transmitter underrun error has occurred (TUE=1). TUE is cleared by first reading the SAISR and then writing to all the enabled transmit data registers, or to the TSR register.

#### 6. **ESAI Transmit Last Slot Interrupt**

Occurs, if enabled (TLIE=1), at the start of the last slot of the frame in network mode regardless of the transmit mask register setting. The transmit last slot interrupt may be used for resetting the transmit mask slot register, reconfiguring the DMA channels and reassigning data memory pointers. Using the transmit last slot interrupt guarantees that the previous frame was serviced with the previous setting and the new frame is serviced with the new setting without synchronization problems. Note that the maximum transmit last slot interrupt service time should not exceed N-1 ESAI bits service time (where N is the number of bits in a slot).

#### 7. **ESAI Transmit Even Data**

Occurs when the transmit even slot data interrupt is enabled (TEDIE=1), at least one of the enabled transmit data registers is empty (TDE=1), the slot is an even slot (TEDE=1) and no exception has occurred (TUE=0 or TEIE=0). Writing to all the TX registers of the enabled transmitters or to TSR clears this interrupt request.

#### 8. **ESAI Transmit Data**

Occurs when the transmit interrupt is enabled (TIE=1), at least one of the enabled transmit data registers is empty (TDE=1), no exception has occurred (TUE=0 or TEIE=0) and no even slot interrupt has occurred (TEDE=0 or TEDIE=0). Writing to all the TX registers of the enabled transmitters, or to the TSR clears this interrupt request.

## 26.4.3 ESAI DMA Requests from the FIFOs

The ESAI can generate two different DMA requests:

1. ESAI Transmit FIFO Empty - Asserts when the number of empty slots in the ESAI transmit FIFO exceeds the threshold programmed in the ESAI Transmit FIFO Configuration Register (TFCR). Automatically negates when the number of empty slots is less than the threshold programmed in the ESAI Transmit FIFO Configuration Register.
2. ESAI Receive FIFO Full - Asserts when the number of data words in the ESAI receive FIFO exceeds the threshold programmed in the ESAI Receive FIFO Configuration Register (RFCR). Automatically negates when the number of words is less than the threshold programmed in the ESAI Receive FIFO Configuration Register.

## 26.4.4 ESAI Transmit and Receive Shift Registers

### 26.4.4.1 ESAI Transmit Shift Registers

The transmit shift registers contain the data being transmitted (Figure 26-2 and Figure 26-3).

Data is shifted out to the serial transmit data pins by the selected (internal/external) bit clock when the associated frame sync I/O is asserted.

The number of bits shifted out before the shift registers are considered empty and may be written to again can be 8, 12, 16, 20, 24 or 32 bits (determined by the slot length control bits in the TCR register). Data is shifted out of these registers MSB first if TSHFD=0 and LSB first if TSHFD=1.

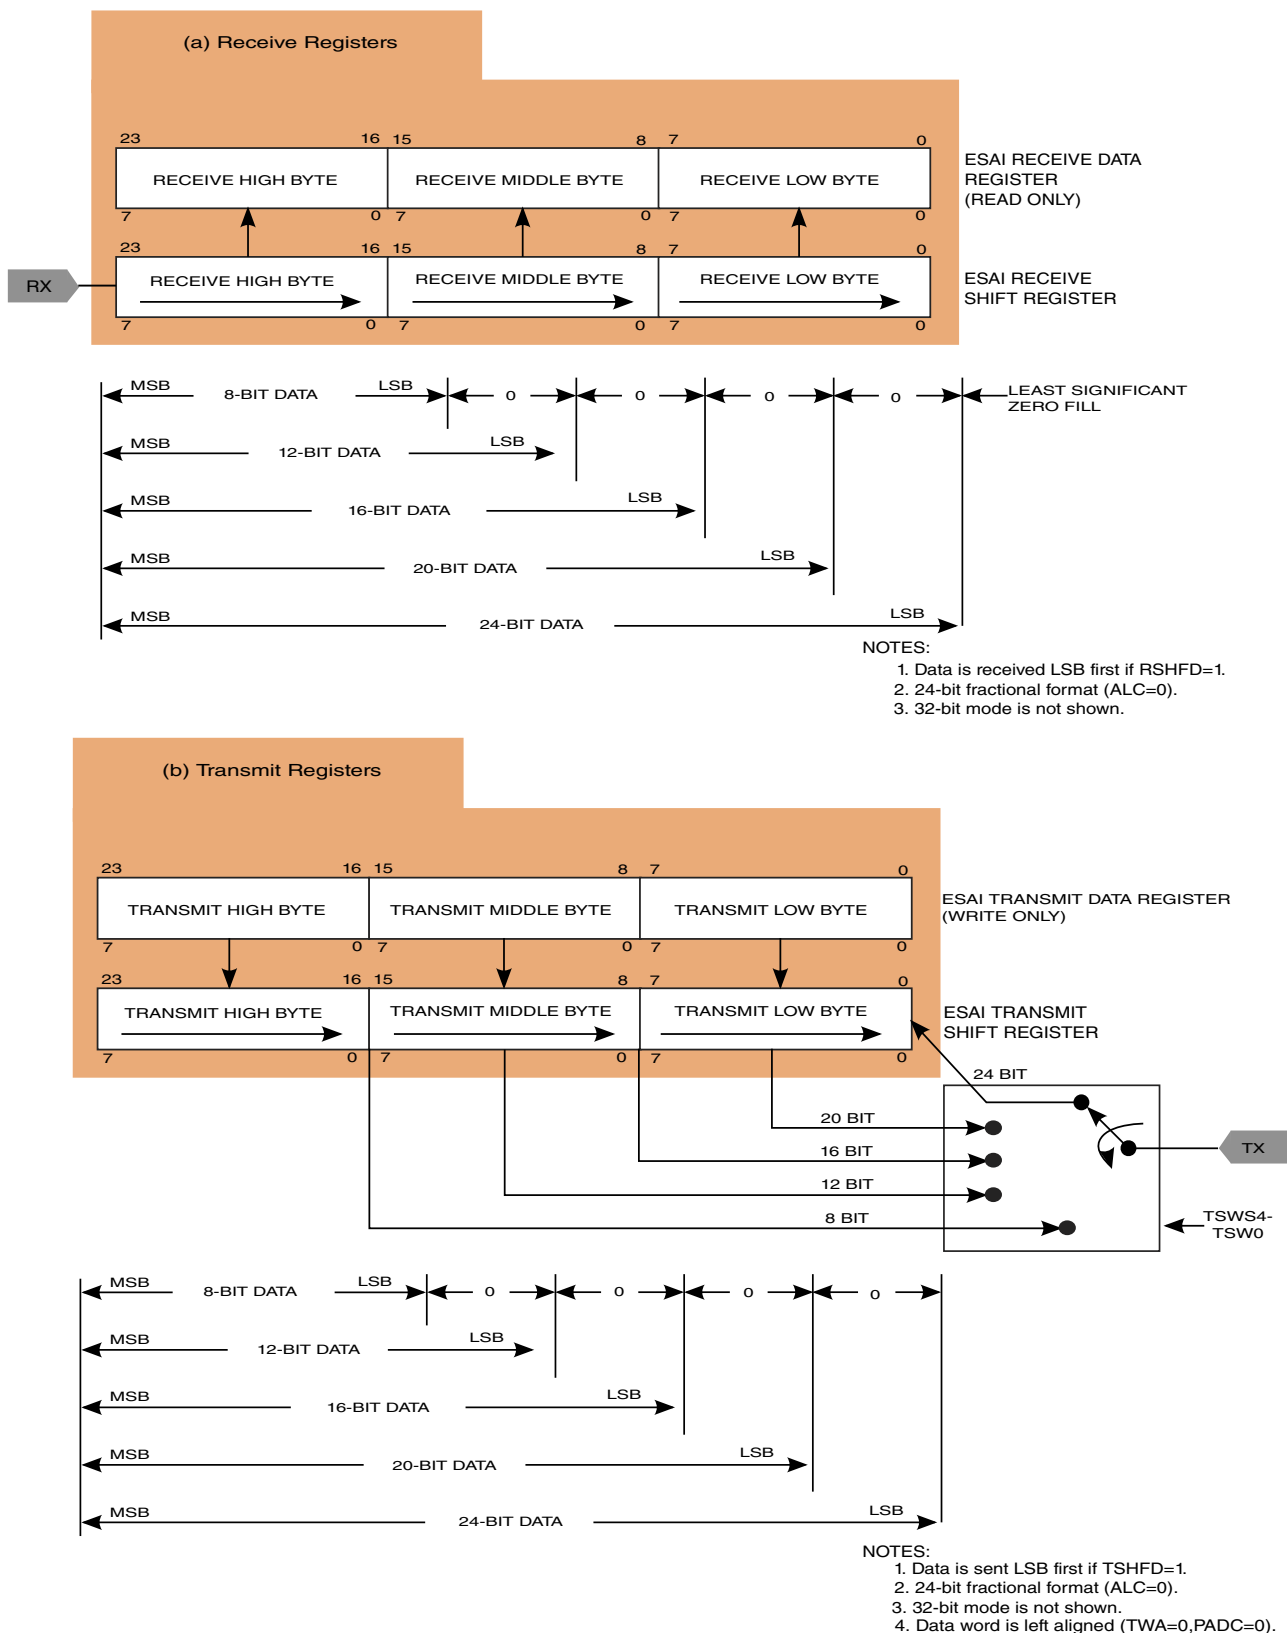

Figure 26-2. ESAI Data Path Programming Model ([R/T]SHFD=0)

# Functional Description

**Figure 26-3. ESAI Data Path Programming Model ([R/T]SHFD=1)**

### 26.4.4.2 ESAI Receive Shift Registers

The receive shift registers (Figure 26-2 and Figure 26-3) receive the incoming data from the serial receive data pins. Data is shifted in by the selected (internal/external) bit clock when the associated frame sync I/O is asserted. Data is assumed to be received MSB first if RSHFD=0 and LSB first if RSHFD=1. Data is transferred to the ESAI receive data registers after 8, 12, 16, 20, 24, or 32 serial clock cycles were counted, depending on the slot length control bits in the ESAI\_RCR register.

## 26.5 Initialization Information

### 26.5.1 ESAI Initialization

The correct way to initialize the ESAI is as follows:

1. Enable the ESAI logic clock by asserting bit 0 of ESAI Control Register (ESAI\_ECR[0]).
2. Hardware, software, ESAI individual reset. Note that asserting bit 1 of ESAI Control Register only reset the ESAI core logic, including configuration registers, but not the ESAI FIFOs.
3. Reset ESAI FIFOs by asserting bit 1 of ESAI\_TFCR and ESAI\_RFCR.
4. Program ESAI control and time slot registers. (The transmit/receive enable bits of TCR/RCR should not be set.)
5. Program ESAI FIFOs via TFCR and RFCR. (Enable Transmit/Receive FIFO, enable transmitters/receivers, transmit initialization and set Transmit FIFO/Receive FIFO watermark.)
6. Write initial words to ESAI Transmit Data Register (ESAI\_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI\_ETDR
7. Remove ESAI personal reset by configuring ESAI\_PCRC and ESAI\_PRRC.
8. Enabled Transmitters/Receivers in ESAI\_TCR/ESAI\_RCR.

During program execution, all ESAI pins may be defined disconnected, causing the ESAI to stop serial activity and enter the individual reset state.

All status bits of the interface are set to their reset state however, the control bits are not affected. This procedure allows the programmer to reset the ESAI separately from the other internal peripherals. During individual reset, internal DMA accesses to the data registers of the ESAI are not valid and data read is undefined.

The programmer must use an individual ESAI reset when changing the ESAI control registers (except for TEIE, REIE, TLIE, RLIE, TIE, RIE, TE0-TE5, RE0-RE3) to ensure proper operation of the interface.

### **NOTE**

If the ESAI receiver section is already operating with some of the receivers and enabling additional receivers on the fly, that is, without first putting the ESAI receiver in the personal reset state by setting their REx control bits, it will result in erroneous data being received as the first data word for the newly enabled receivers.

## **26.5.2 ESAI Initialization Examples**

### **26.5.2.1 Initializing the ESAI using Personal Reset**

1. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register(ESAI\_ECR[0]).
2. The ESAI should be in its personal reset state (ESAI\_PCRC = 0x000 and ESAI\_PRRC = 0x000). In the personal reset state, both the transmitter and receiver sections of the ESAI are simultaneously reset. The TPR bit in the ESAI\_TCR register may be used to reset just the transmitter section. The RPR bit in the ESAI\_RCR register may be used to reset just the receiver section.
3. Configure the control registers (ESAI\_TCCR, ESAI\_TCR, ESAI\_RCCR, ESAI\_RCR) and ESAI FIFOs configuration Registers (ESAI\_TFCR, ESAI\_RFCR) according to the operating mode, but do not enable transmitters (TE5-TE0 = 0x0) or receivers (RE3-RE0 = 0x0). It is possible to set the interrupt enable bits which are in use during the operation (no interrupt occurs).
4. Enable the ESAI by setting the ESAI\_PCRC and ESAI\_PRRC register bits according to pins which are in use during operation.
5. Write initial words to ESAI Transmit Data Register (ESAI\_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI\_ETDR. This step is needed even if DMA is used to service the transmitters.
6. Enable the transmitters and receivers.
7. From now on ESAI can be serviced either by polling, interrupts, or DMA.

Operation proceeds as follows:

- For internally generated clock and frame sync, these signals are active immediately after ESAI is enabled (step 4 above).

- Data is received only when one of the receive enable (REx) bits is set and after the occurrence of frame sync signal (either internally or externally generated).
- Data is transmitted only when the transmitter enable (TE<sub>x</sub>) bit is set and after the occurrence of frame sync signal (either internally or externally generated). The transmitter outputs remain tri-stated after TE<sub>x</sub> bit is set until the frame sync occurs.

### 26.5.2.2 Initializing the ESAI Transmitter Section

1. It is assumed that the ESAI is operational; that is, at least one pin is defined as an ESAI pin.
2. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register(ESAI\_ECR[0])
3. The transmitter section should be in its individual reset state (TPR = 1) and also reset the ESAI Transmit FIFO (ESAI\_TFCR[1] = 1).
4. Configure the control registers ESAI\_TCCR and ESAI\_TCR according to the operating mode, configure the Transmit FIFO Configuration Register (bring transmit FIFO out of reset, enable Transmit FIFO, enable transmitters, transmit initialization and set watermark). Make sure to clear the transmitter enable bits (TE0-TE5). TPR must remain set.
5. Take the transmitter section out of the individual reset state by clearing TPR.
6. Write initial words to ESAI Transmit Data Register (ESAI\_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI\_ETDR
7. Enable the transmitters by setting their TE bits.
8. Data is transmitted only when the transmitter enable (TE<sub>x</sub>) bit is set and after the occurrence of frame sync signal (either internally or externally generated). The transmitter outputs remain tri-stated after TE<sub>x</sub> bit is set until the frame sync occurs.
9. From now on the transmitters are operating and can be serviced either by polling, interrupts, or DMA.

### 26.5.2.3 Initializing the ESAI Receiver Section

1. It is assumed that the ESAI is operational; that is, at least one pin is defined as an ESAI pin.
2. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register (ESAI\_ECR[0])
3. The receiver section should be in its individual reset state (RPR = 1) and also reset the ESAI Receive FIFO (ESAI\_RFCR[1] = 1).
4. Configure the control registers ESAI\_RCCR and ESAI\_RCR according to the operating mode, configure the Receive FIFO Configuration Register (bring receive

FIFO out of reset, enable Receive FIFO, receivers, and set watermark). Making sure to clear the receiver enable bits (RE0-RE3). RPR must remain set.

5. Take the receiver section out of the individual reset state by clearing RPR.
6. Enable the receivers by setting their RE bits.
7. From now on the receivers are operating and can be serviced either by polling, interrupts, or DMA.

## 26.6 ESAI Memory Map/Register Definition

ESAI memory map

### ESAI\_ETDR field descriptions

Field	Description
ETDR	ESAI Transmit Data Register. Writing to this register stores the data written into the ESAI Transmit FIFO. Writing to this register when the Transmit FIFO is full causes the data written to be lost (the existing data within the FIFO is not overwritten). When multiple ESAI transmitters are enabled, the data for each transmitter must be interleaved from lowest transmitter to highest transmitter (for example, if transmitters 0, 2 and 3 are enabled then data must be written as follows: transmitter #0, transmitter #2, transmitter #3, transmitter #0, transmitter #2, transmitter #3, transmitter #0, etc). Data within the ESAI Transmit FIFO is passed to the ESAI transmit shifter registers as defined by the Transmit Word Alignment configuration bits.

### 26.6.2 ESAI Receive Data Register (ESAI\_ERDR)

Address: 202\_4000h base + 4h offset = 202\_4004h

### ESAI\_ERDR field descriptions

Field	Description
ERDR	ESAI Receive Data Register. Reading this register returns the data within the ESAI Receive FIFO. Reading this register when the Receive FIFO is empty returns the last valid data word. When multiple ESAI receivers are enabled, the data for each receiver is interleaved from lowest receiver to highest receiver (for example, if receivers 0, 2 and 3 are enabled then data is returned as follows: receiver #0, receiver #2, receiver #3, receiver #0, receiver #2, receiver #3, receiver #0, etc). Data is passed from the ESAI receive shift registers to the ESAI Receive FIFO as defined by the Receiver Word Alignment configuration bits either zero or sign-extended based on the Receive Extension control bit.

### 26.6.3 ESAI Control Register (ESAI\_ECR)

Address: 202\_4000h base + 8h offset = 202\_4008h

## ESAI\_ECR field descriptions

Field	Description
31–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 ETI	EXTAL Transmitter In. Mux EXTAL in place of the High Frequency Transmitter Clock input pin. HCKT can still be used to drive a divided down EXTAL or as GPIO.  0 HCKT pin has normal function. 1 EXTAL muxed into HCKT input.
18 ETO	EXTAL Transmitter Out. Drive the EXTAL input on the High Frequency Transmitter Clock pin.  0 HCKT pin has normal function. 1 EXTAL driven onto HCKT pin.
17 ERI	EXTAL Receiver In. Mux EXTAL in place of the High Frequency Receiver Clock input pin. HCKR can still be used to drive a divided down EXTAL or as GPIO.  0 HCKR pin has normal function. 1 EXTAL muxed into HCKR input.
16 ERO	EXTAL Receiver Out. Drive the EXTAL input on the High Frequency Receiver Clock pin.  0 HCKR pin has normal function. 1 EXTAL driven onto HCKR pin.
15–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 ERST	ESAI Reset. Reset the ESAI core logic (including configuration registers) but not the ESAI FIFOs.  0 ESAI not reset. 1 ESAI reset.
0 ESAIEN	ESAI Enable. Enables/disables the ESAI logic clock. Enable the ESAI before reading or writing other ESAI registers.  0 ESAI disabled. 1 ESAI enabled.

## 26.6.4 ESAI Status Register (ESAI\_ESR)

Address: 202\_4000h base + Ch offset = 202\_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ESAI\_ESR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 TINIT	Transmit Initialization. Indicates that the Transmit FIFO is writing the first word for each enabled transmitter into the Transmit Data Registers. This bit sets when the Transmit FIFO is enabled (provided Transmit Initialization is enabled) and clears after the Transmit Data Registers have been initialized. The Transmit Enable bits in the Transmit Control Register should not be set until this flag has cleared.  0 Transmitter has finished initializing the Transmit Data Registers (or Transmit FIFO is not enabled or Transmit Initialization is not enabled). 1 Transmitter has not finished initializing the Transmit Data Registers.
9 RFF	Receive FIFO Full. Indicates that the number of data words in the Receive FIFO has equaled or exceeded the Receive FIFO Watermark. This flag also drives the ESAI Receiver DMA request line. ESAI FIFO DMA requests see <a href="#">ESAI DMA Requests from the FIFOs</a> .  0 Number of words in Receive FIFO less than Receive FIFO watermark. 1 Number of words in Receive FIFO is equal to or greater than Receive FIFO watermark.
8 TFE	Transmit FIFO Empty. Indicates that the number of empty slots in the Transmit FIFO has met or exceeded the Transmit FIFO Watermark. This flag also drives the ESAI Transmitter DMA request line. ESAI FIFO DMA request see <a href="#">ESAI DMA Requests from the FIFOs</a> .  0 Number of empty slots in Transmit FIFO less than Transmit FIFO watermark. 1 Number of empty slots in Transmit FIFO is equal to or greater than Transmit FIFO watermark.
7 TLS	Transmit Last Slot. Reading this register when TLS is set will negate the Transmit Last Slot interrupt.  0 TLS is not the highest priority active interrupt. 1 TLS is the highest priority active interrupt.
6 TDE	Transmit Data Exception.  0 TDE is not the highest priority active interrupt. 1 TDE is the highest priority active interrupt.
5 TED	Transmit Even Data.  0 TED is not the highest priority active interrupt. 1 TED is the highest priority active interrupt.
4 TD	Transmit Data.  0 TD is not the highest priority active interrupt. 1 TD is the highest priority active interrupt.
3 RLS	Receive Last Slot. Reading this register when RLS is set will negate the Receive Last Slot interrupt.  0 RLS is not the highest priority active interrupt. 1 RLS is the highest priority active interrupt.
2 RDE	Receive Data Exception.  0 RDE is not the highest priority active interrupt. 1 RDE is the highest priority active interrupt.
1 RED	Receive Even Data.  0 RED is not the highest priority active interrupt. 1 RED is the highest priority active interrupt.

Table continues on the next page...

## ESAI\_ESR field descriptions (continued)

Field	Description
0 RD	Receive Data. 0 RD is not the highest priority active interrupt. 1 RD is the highest priority active interrupt.

## 26.6.5 Transmit FIFO Configuration Register (ESAI\_TFCR)

Address: 202\_4000h base + 10h offset = 202\_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0												TIEN	TWA[2:0]		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	TFWM[7:0]								TE5	TE4	TE3	TE2	TE1	TE0	TFR	TFE
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ESAI\_TFCR field descriptions

Field	Description
31–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 TIEN	Transmitter Initialization Enable. Enables the initialization of the Transmit Data Registers when the Transmitter FIFO is enabled. TIEN=1 is recommended.  0 Transmit Data Registers are not initialized from the FIFO once the Transmit FIFO is enabled. Software must manually initialize the Transmit Data Registers separately. 1 Transmit Data Registers are initialized from the FIFO once the Transmit FIFO is enabled.
18–16 TWA[2:0]	Transmit Word Alignment. Configures the alignment of the data written into the ESAI Transmit Data Register and then passed to the relevant 24 bit Transmit shift register.  000 MSB of data is bit 31. Data bits 7-0 are ignored when passed to transmit shift register. 001 MSB of data is bit 27. Data bits 3-0 are ignored when passed to transmit shift register. 010 MSB of data is bit 23. 011 MSB of data is bit 19. Bottom 4 bits of transmit shift register are zeroed. 100 MSB of data is bit 15. Bottom 8 bits of transmit shift register are zeroed. 101 MSB of data is bit 11. Bottom 12 bits of transmit shift register are zeroed. 110 MSB of data is bit 7. Bottom 16 bits of transmit shift register are zeroed. 111 MSB of data is bit 3. Bottom 20 bits of transmit shift register are zeroed.
15–8 TFWM[7:0]	Transmit FIFO Watermark. These bits configure the threshold at which the Transmit FIFO Empty flag will set. The TFE is set when the number of empty slots in the Transmit FIFO equal or exceed the selected threshold.
7 TE5	Transmitter #5 FIFO Enable. This bit enables transmitter #5 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.

Table continues on the next page...

**ESAI\_TFCR field descriptions (continued)**

Field	Description
	0 Transmitter #5 is not using the Transmit FIFO. 1 Transmitter #5 is using the Transmit FIFO.
6 TE4	Transmitter #4 FIFO Enable. This bit enables transmitter #4 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #4 is not using the Transmit FIFO. 1 Transmitter #4 is using the Transmit FIFO.
5 TE3	Transmitter #3 FIFO Enable. This bit enables transmitter #3 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #3 is not using the Transmit FIFO. 1 Transmitter #3 is using the Transmit FIFO.
4 TE2	Transmitter #2 FIFO Enable. This bit enables transmitter #2 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #2 is not using the Transmit FIFO. 1 Transmitter #2 is using the Transmit FIFO.
3 TE1	Transmitter #1 FIFO Enable. This bit enables transmitter #1 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #1 is not using the Transmit FIFO. 1 Transmitter #1 is using the Transmit FIFO.
2 TE0	Transmitter #0 FIFO Enable. This bit enables transmitter #0 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #0 is not using the Transmit FIFO. 1 Transmitter #0 is using the Transmit FIFO.
1 TFR	Transmit FIFO Reset. This bit resets the Transmit FIFO pointers.  0 Transmit FIFO not reset. 1 Transmit FIFO reset.
0 TFE	Transmit FIFO Enable. This bit enables the use of the Transmit FIFO.  0 Transmit FIFO disabled. 1 Transmit FIFO enabled.

## 26.6.6 Transmit FIFO Status Register (ESAI\_TFSR)

Address: 202\_4000h base + 14h offset = 202\_4014h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

### ESAI\_TFSR field descriptions

Field	Description
31–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–12 NTFO[2:0]	Next Transmitter FIFO Out. Indicates which Transmit Data Register receives the top word of the Transmit FIFO. This will usually equal the lowest enabled transmitter, unless the transmit FIFO is empty.  000 Transmitter #0 receives next word from the Transmit FIFO. 001 Transmitter #1 receives next word from the Transmit FIFO. 010 Transmitter #2 receives next word from the Transmit FIFO. 011 Transmitter #3 receives next word from the Transmit FIFO. 100 Transmitter #4 receives next word from the Transmit FIFO. 101 Transmitter #5 receives next word from the Transmit FIFO. 110 Reserved. 111 Reserved.
11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 NTFI[2:0]	Next Transmitter FIFO In. Indicates which transmitter receives the next word written to the FIFO.  000 Transmitter #0 receives next word written to the Transmit FIFO. 001 Transmitter #1 receives next word written to the Transmit FIFO. 010 Transmitter #2 receives next word written to the Transmit FIFO. 011 Transmitter #3 receives next word written to the Transmit FIFO. 100 Transmitter #4 receives next word written to the Transmit FIFO. 101 Transmitter #5 receives next word written to the Transmit FIFO. 110 Reserved. 111 Reserved.
TFCNT[7:0]	Transmit FIFO Counter. These bits indicate the number of data words stored in the Transmit FIFO.

## 26.6.7 Receive FIFO Configuration Register (ESAI\_RFCR)

Address: 202\_4000h base + 18h offset = 202\_4018h

### ESAI\_RFCR field descriptions

Field	Description
31–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 REXT	Receive Extension. Enables the receive data to be returned sign extended when the Receive Word Alignment is configured to return data where the MSB is not aligned with bit 31.  0 Receive data is zero extended. 1 Receive data is sign extended.
18–16 RWA[2:0]	Receive Word Alignment. Configures the alignment of the data passed from the relevant 24 bit Receive shift register and read out the ESAI Receive Data Register.  000 MSB of data is at bit 31. Data bits 7-0 are zeroed. 001 MSB of data is at bit 27. Data bits 3-0 are zeroed. 010 MSB of data is at bit 23. 011 MSB of data is at bit 19. Data bits 3-0 from receive shift register are ignored. 100 MSB of data is at bit 15. Data bits 7-0 from receive shift register are ignored. 101 MSB of data is at bit 11. Data bits 11-0 from receive shift register are ignored. 110 MSB of data is at bit 7. Data bits 15-0 from receive shift register are ignored. 111 MSB of data is at bit 3. Data bits 19-0 from receive shift register are ignored.
15–8 RFWM[7:0]	Receive FIFO Watermark. These bits configure the threshold at which the Receive FIFO Full flag will set. The RFF is set when the number of words in the Receive FIFO equal or exceed the selected threshold. It can be set to a non-zero value.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5 RE3	Receiver #3 FIFO Enable. This bit enables receiver #3 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled.  0 Receiver #3 is not using the Receive FIFO. 1 Receiver #3 is using the Receive FIFO.
4 RE2	Receiver #2 FIFO Enable. This bit enables receiver #2 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled.  0 Receiver #2 is not using the Receive FIFO. 1 Receiver #2 is using the Receive FIFO.

Table continues on the next page...

## ESAI\_RFCR field descriptions (continued)

Field	Description
3 RE1	Receiver #1 FIFO Enable. This bit enables receiver #1 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled.  0 Receiver #1 is not using the Receive FIFO. 1 Receiver #1 is using the Receive FIFO.
2 RE0	Receiver #0 FIFO Enable. This bit enables receiver #0 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled.  0 Receiver #0 is not using the Receive FIFO. 1 Receiver #0 is using the Receive FIFO.
1 RFR	Receive FIFO Reset. This bit resets the Receive FIFO pointers.  0 Receive FIFO not reset. 1 Receive FIFO reset.
0 RFE	Receive FIFO Enable. This bit enables the use of the Receive FIFO.  0 Receive FIFO disabled. 1 Receive FIFO enabled.

## 26.6.8 Receive FIFO Status Register (ESAI\_RFSR)

Address: 202\_4000h base + 1Ch offset = 202\_401Ch

## ESAI\_RFSR field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13–12 NRFI[1:0]	Next Receiver FIFO In. Indicates which Receiver Data Register the Receive FIFO will load next. This will usually equal the lowest enabled receiver, unless the receive FIFO is full.  00 Receiver #0 returns next word to the Receive FIFO. 01 Receiver #1 returns next word to the Receive FIFO. 10 Receiver #2 returns next word to the Receive FIFO. 11 Receiver #3 returns next word to the Receive FIFO.

*Table continues on the next page...*

**ESAI\_RFSR field descriptions (continued)**

Field	Description
11–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–8 NRFO[1:0]	Next Receiver FIFO Out. Indicates which receiver returns the top word of the Receive FIFO.  00 Receiver #0 returns next word from the Receive FIFO. 01 Receiver #1 returns next word from the Receive FIFO. 10 Receiver #2 returns next word from the Receive FIFO. 11 Receiver #3 returns next word from the Receive FIFO.
RFCNT[7:0]	Receive FIFO Counter. These bits indicate the number of data words stored in the Receive FIFO.

**26.6.9 Transmit Data Register n (ESAI\_TXn)**

ESAI\_TX5, ESAI\_TX4, ESAI\_TX3, ESAI\_TX2, ESAI\_TX1 and ESAI\_TX0 are 32-bit write-only registers. Data to be transmitted is written into these registers and is automatically transferred to the transmit shift registers (Figure 26-2 and Figure 26-3). The data written (8, 12, 16, 20, or 24 bits) should occupy the most significant portion of the TXn according to the ALC control bit setting. The unused bits (least significant portion and the 8 most significant bits when ALC=1) of the TXn are don't care bits. The Core is interrupted whenever the TXn becomes empty if the transmit data register empty interrupt has been enabled.

Address: 202\_4000h base + 80h offset + (4d × i), where i=0d to 5d

**ESAI\_TXn field descriptions**

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXn[23:0]	Stores the data to be transmitted and is automatically transferred to the transmit shift registers. See <a href="#">ESAI Transmit Shift Registers</a> .

## 26.6.10 ESAI Transmit Slot Register (ESAI\_TSR)

Address: 202\_4000h base + 98h offset = 202\_4098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ESAI\_TSR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TSR[23:0]	The write-only Transmit Slot Register (ESAI_TSR) is effectively a null data register that is used when the data is not to be transmitted in the available transmit time slot. The transmit data pins of all the enabled transmitters are in the high-impedance state for the respective time slot where TSR has been written. The Transmitter External Buffer Enable pin (FSR pin when SYN=1, TEBE=1, RFSD=1) disables the external buffers during the slot when the ESAI_TSR register has been written.

## 26.6.11 Receive Data Register n (ESAI\_RXn)

ESAI\_RX3, ESAI\_RX2, ESAI\_RX1, and ESAI\_RX0 are 32-bit read-only registers that accept data from the receive shift registers when they become full (Figure 26-2 and Figure 26-3). The data occupies the most significant portion of the receive data registers, according to the ALC control bit setting. The unused bits (least significant portion and 8 most significant bits when ALC=1) read as zeros. The Core is interrupted whenever RXn becomes full if the associated interrupt is enabled.

Address: 202\_4000h base + A0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### ESAI\_RXn field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RXn[23:0]	Accept data from the receive shift registers when they become full See <a href="#">ESAI Receive Shift Registers</a>

## 26.6.12 Serial Audio Interface Status Register (ESAI\_SAISR)

The Status Register (ESAI\_SAISR) is a read-only status register used by the ARM Core to read the status and serial input flags of the ESAI.

Address: 202\_4000h base + CCh offset = 202\_40CCh

**ESAI\_SAISR field descriptions**

Field	Description
31–18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 TODFE	ESAI_SAISR Transmit Odd-Data Register Empty. When set, TODFE indicates that the enabled transmitter data registers became empty at the beginning of an odd time slot. Odd time slots are all odd-numbered slots (1, 3, 5, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. This flag is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TODFE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TODFE is cleared when the Core writes to all the transmit data registers of the

*Table continues on the next page...*

## ESAI\_SAISR field descriptions (continued)

Field	Description
	enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TODFE is set. Hardware, software, ESAI individual reset clear TODFE.
16 TEDE	ESAI_SAISR Transmit Even-Data Register Empty. When set, TEDE indicates that the enabled transmitter data registers became empty at the beginning of an even time slot. Even time slots are all even-numbered slots (0, 2, 4, 6, etc.). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. The zero time slot is considered even. This flag is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TEDE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TEDE is cleared when the Core writes to all the transmit data registers of the enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TEDE is set. Hardware, software, ESAI individual reset clear TEDE.
15 TDE	ESAI_SAISR Transmit Data Register Empty. TDE is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TDE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TDE is cleared when the Core writes to all the transmit data registers of the enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TDE is set. Hardware, software, ESAI individual reset clear TDE.
14 TUE	ESAI_SAISR Transmit Underrun Error Flag. TUE is set when at least one of the enabled serial transmit shift registers is empty (no new data to be transmitted) and a transmit time slot occurs. When a transmit underrun error occurs, the previous data (which is still present in the TX registers that were not written) is retransmitted. If TEIE is set, an ESAI transmit data with exception (underrun error) interrupt request is issued when TUE is set. Hardware, software, ESAI individual reset clear TUE. TUE is also cleared by reading the ESAI_SAISR with TUE set, followed by writing to all the enabled transmit data registers or to ESAI_TSR.
13 TFS	ESAI_SAISR Transmit Frame Sync Flag. When set, TFS indicates that a transmit frame sync occurred in the current time slot. TFS is set at the start of the first time slot in the frame and cleared during all other time slots. Data written to a transmit data register during the time slot when TFS is set is transmitted (in network mode), if the transmitter is enabled, during the second time slot in the frame. TFS is useful in network mode to identify the start of a frame. TFS is cleared by hardware, software, ESAI individual reset. TFS is valid only if at least one transmitter is enabled, that is, one or more of TE0, TE1, TE2, TE3, TE4 and TE5 are set. (In normal mode, TFS always reads as a one when transmitting data because there is only one time slot per frame - the "frame sync" time slot)
12–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 RODF	ESAI_SAISR Receive Odd-Data Register Full. When set, RODF indicates that the received data in the receive data registers of the enabled receivers have arrived during an odd time slot when operating in the network mode. Odd time slots are all odd-numbered slots (1, 3, 5, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. RODF is set when the contents of the receive shift registers are transferred to the receive data registers. RODF is cleared when the Core reads all the enabled receive data registers or cleared by hardware, software, ESAI individual resets.
9 REDF	ESAI_SAISR Receive Even-Data Register Full. When set, REDF indicates that the received data in the receive data registers of the enabled receivers have arrived during an even time slot when operating in the network mode. Even time slots are all even-numbered slots (0, 2, 4, 6, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. The zero time slot is considered even. REDF is set when the contents of the receive shift registers are transferred to the receive data registers. REDF is cleared when the Core reads all the enabled receive data registers or

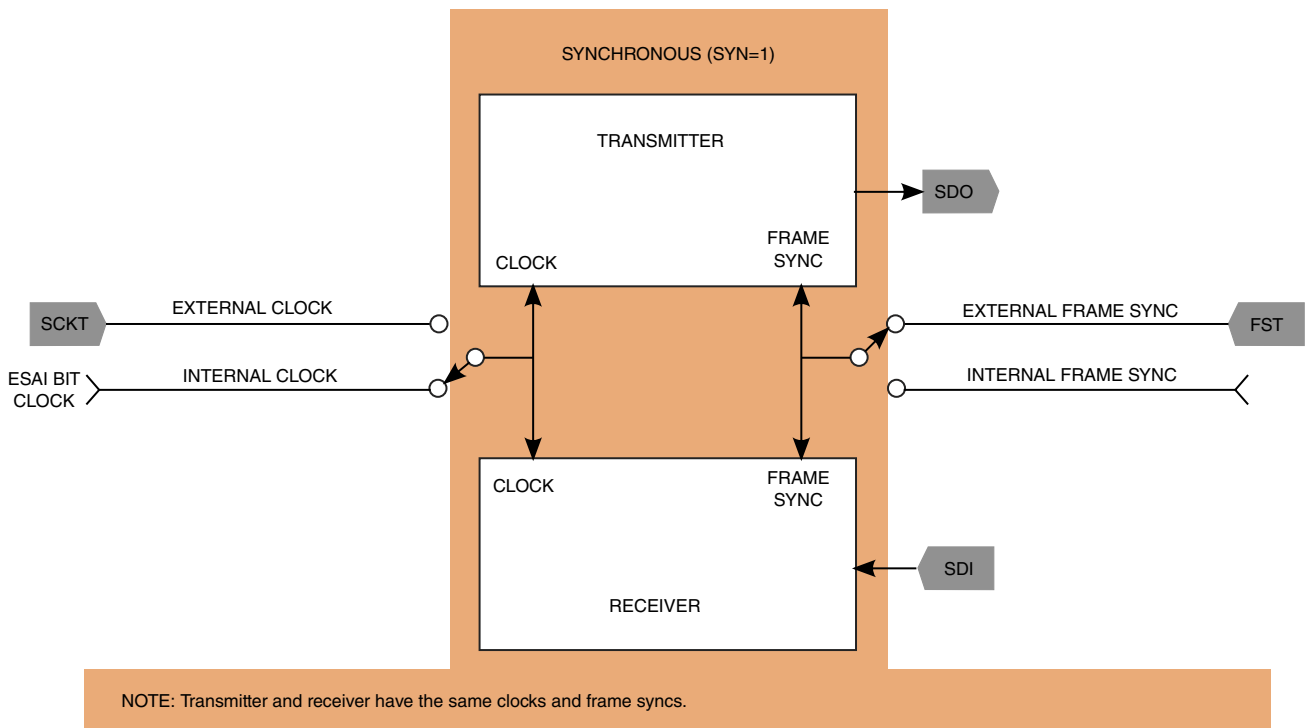

Table continues on the next page...

**ESAI\_SAISR field descriptions (continued)**

Field	Description
	cleared by hardware, software, ESAI individual resets. If REDIE is set, an ESAI receive even slot data interrupt request is issued when REDF is set.
8 RDF	ESAI_SAISR Receive Data Register Full. RDF is set when the contents of the receive shift register of an enabled receiver is transferred to the respective receive data register. RDF is cleared when the Core reads the receive data register of all enabled receivers or cleared by hardware, software, ESAI individual reset. If RIE is set, an ESAI receive data interrupt request is issued when RDF is set.
7 ROE	ESAI_SAISR Receive Overrun Error Flag. The ROE flag is set when the serial receive shift register of an enabled receiver is full and ready to transfer to its receiver data register (RXn) and the register is already full (RDF=1). If REIE is set, an ESAI receive data with exception (overrun error) interrupt request is issued when ROE is set. Hardware, software, ESAI individual reset clear ROE. ROE is also cleared by reading the SAISR with ROE set, followed by reading all the enabled receive data registers.
6 RFS	ESAI_SAISR Receive Frame Sync Flag. When set, RFS indicates that a receive frame sync occurred during reception of the words in the receiver data registers. This indicates that the data words are from the first slot in the frame. When RFS is clear and a word is received, it indicates (only in the network mode) that the frame sync did not occur during reception of that word. RFS is cleared by hardware, software, ESAI individual reset. RFS is valid only if at least one of the receivers is enabled (REx=1). (In normal mode, RFS always reads as a one when reading data because there is only one time slot per frame - the "frame sync" time slot)
5-3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 IF2	ESAI_SAISR Serial Input Flag 2. The IF2 bit is enabled only when the HCKR pin is defined as ESAI in the Port Control Register, SYN=1 and RHCKD=0, indicating that HCKR is an input flag and the synchronous mode is selected. Data present on the HCKR pin is latched during reception of the first received data bit after frame sync is detected. The IF2 bit is updated with this data when the receive shift registers are transferred into the receiver data registers. IF2 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF2.
1 IF1	ESAI_SAISR Serial Inout Flag 1. The IF1 bit is enabled only when the FSR pin is defined as ESAI in the Port Control Register, SYN =1, RFSD=0 and TEBE=0, indicating that FSR is an input flag and the synchronous mode is selected. Data present on the FSR pin is latched during reception of the first received data bit after frame sync is detected. The IF1 bit is updated with this data when the receiver shift registers are transferred into the receiver data registers. IF1 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF1.
0 IF0	ESAI_SAISR Serial Input Flag 0. The IF0 bit is enabled only when the SCKR pin is defined as ESAI in the Port Control Register, SYN=1 and RCKD=0, indicating that SCKR is an input flag and the synchronous mode is selected. Data present on the SCKR pin is latched during reception of the first received data bit after frame sync is detected. The IF0 bit is updated with this data when the receiver shift registers are transferred into the receiver data registers. IF0 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF0.

**26.6.13 Serial Audio Interface Control Register (ESAI\_SAICR)**

The read/write Common Control Register (ESAI\_SAICR) contains control bits for functions that affect both the receive and transmit sections of the ESAI.

**Figure 26-27. SAICR SYN Bit Operation**

### ESAI\_SAICR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 ALC	ESAI_SAICR Alignment Control. The ESAI is designed for 24-bit fractional data, thus shorter data words are left aligned to the MSB (bit 23). Some applications use 16-bit fractional data. In those cases, shorter data words may be left aligned to bit 15. The Alignment Control (ALC) bit supports these applications.  If ALC is set, transmitted and received words are left aligned to bit 15 in the transmit and receive shift registers. If ALC is cleared, transmitted and received word are left aligned to bit 23 in the transmit and receive shift registers.  While ALC is set, 20-bit and 24-bit words may not be used, and word length control should specify 8-, 12-, or 16-bit words; otherwise, results are unpredictable.
7 TEBE	ESAI_SAICR Transmit External Buffer Enable. The Transmitter External Buffer Enable (TEBE) bit controls the function of the FSR pin when in the synchronous mode. If the ESAI is configured for operation in the synchronous mode (SYN=1), and TEBE is set while FSR pin is configured as an output (RFSD=1), the FSR pin functions as the transmitter external buffer enable control to enable the use of an external buffers on the transmitter outputs. If TEBE is cleared, the FSR pin functions as the serial I/O flag 1. See <a href="#">Port C Control Register</a> for a summary of the effects of TEBE on the FSR pin.
6 SYN	ESAI_SAICR Synchronous Mode Selection. The Synchronous Mode Selection (SYN) bit controls whether the receiver and transmitter sections of the ESAI operate synchronously or asynchronously with respect to each other (see <a href="#">Port C Control Register</a> ). When SYN is cleared, the asynchronous mode is chosen and independent clock and frame sync signals are used for the transmit and receive sections. When SYN is set, the synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals.  When in the synchronous mode (SYN=1), the transmit and receive sections use the transmitter section clock generator as the source of the clock and frame sync for both sections. Also, the receiver clock pins SCKR, FSR and HCKR now operate as I/O flags. Refer to <a href="#">Table 26-39</a> , <a href="#">Table 26-40</a> , and <a href="#">Table 26-41</a> for the effects of SYN on the receiver clock pins.
5–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 OF2	ESAI_SAICR Serial Output Flag 2. The Serial Output Flag 2 (OF2) is a data bit used to hold data to be send to the OF2 pin. When the ESAI is in the synchronous clock mode (SYN=1), the HCKR pin is configured as the ESAI flag 2. If the receiver high frequency clock direction bit (RHCKD) is set, the HCKR pin is the output flag OF2, and data present in the OF2 bit is written to the OF2 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.
1 OF1	ESAI_SAICR Serial Output Flag 1. The Serial Output Flag 1 (OF1) is a data bit used to hold data to be send to the OF1 pin. When the ESAI is in the synchronous clock mode (SYN=1), the FSR pin is configured as the ESAI flag 1. If the receiver frame sync direction bit (RFSD) is set and the TEBE bit is cleared, the FSR pin is the output flag OF1, and data present in the OF1 bit is written to the OF1 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.

Table continues on the next page...

**ESAI\_SAICR field descriptions (continued)**

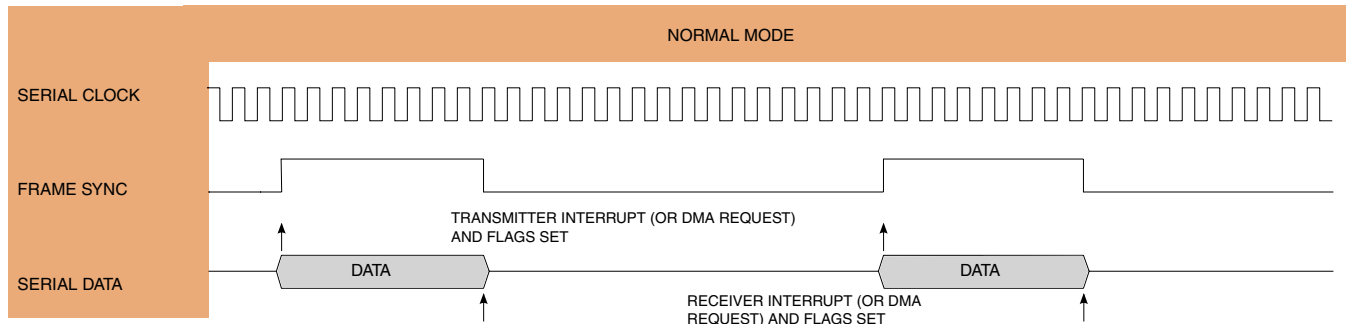

Field	Description
0 OF0	ESAI_SAICR Serial Output Flag 0. The Serial Output Flag 0 (OF0) is a data bit used to hold data to be send to the OF0 pin. When the ESAI is in the synchronous clock mode (SYN=1), the SCKR pin is configured as the ESAI flag 0. If the receiver serial clock direction bit (RCKD) is set, the SCKR pin is the output flag OF0, and data present in the OF0 bit is written to the OF0 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.

**26.6.14 Transmit Control Register (ESAI\_TCR)**

The read/write Transmit Control Register (ESAI\_TCR) controls the ESAI transmitter section. Interrupt enable bits for the transmitter section are provided in this control register. Operating modes are also selected in this register.

**Table 26-30. Transmit Network Mode Selection**

TMOD1	TMOD0	TDC4-TDC0	Transmitter Network Mode
0	0	0x0-0x1F	Normal Mode
0	1	0x0	On-Demand Mode

**ESAI\_TCR field descriptions**

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 TLIE	ESAI_TCR Transmit Last Slot Interrupt Enable. TLIE enables an interrupt at the beginning of last slot of a frame in network mode. When TLIE is set the Core is interrupted at the start of the last slot in a frame in network mode regardless of the transmit mask register setting. When TLIE is cleared the transmit last slot interrupt is disabled. TLIE is disabled when TDC[4:0]=0x00000 (on-demand mode). The use of the transmit last slot interrupt is described in <a href="#">ESAI Interrupt Requests</a> .
22 TIE	ESAI_TCR Transmit Interrupt Enable. The Core is interrupted when TIE and the TDE flag in the ESAI_SAISR status register are set. When TIE is cleared, this interrupt is disabled. Writing data to all the data registers of the enabled transmitters or to ESAI_TSR clears TDE, thus clearing the interrupt.  Transmit interrupts with exception have higher priority than normal transmit data interrupts, therefore if exception occurs (TUE is set) and TEIE is set, the ESAI requests an ESAI transmit data with exception interrupt from the interrupt controller.
21 TEDIE	ESAI_TCR Transmit Even Slot Data Interrupt Enable. The TEDIE control bit is used to enable the transmit even slot data interrupts. If TEDIE is set, the transmit even slot data interrupts are enabled. If TEDIE is cleared, the transmit even slot data interrupts are disabled. A transmit even slot data interrupt request is generated if TEDIE is set and the TEDE status flag in the ESAI_SAISR status register is set. Even time slots are all even-numbered time slots (0, 2, 4, etc.) when operating in network mode. The zero time slot in the frame is marked by the frame sync signal and is considered to be even. Writing data to all the data registers of the enabled transmitters or to ESAI_TSR clears the TEDE flag, thus servicing the interrupt.  Transmit interrupts with exception have higher priority than transmit even slot data interrupts, therefore if exception occurs (TUE is set) and TEIE is set, the ESAI requests an ESAI transmit data with exception interrupt from the interrupt controller.
20 TEIE	ESAI_TCR Transmit Exception Interrupt Enable. When TEIE is set, the Core is interrupted when both TDE and TUE in the ESAI_SAISR status register are set. When TEIE is cleared, this interrupt is disabled. Reading the ESAI_SAISR status register followed by writing to all the data registers of the enabled transmitters clears TUE, thus clearing the pending interrupt.
19 TPR	ESAI_TCR Transmit Section Personal Reset. The TPR control bit is used to put the transmitter section of the ESAI in the personal reset state. The receiver section is not affected. When TPR is cleared, the transmitter section may operate normally. When TPR is set, the transmitter section enters the personal reset state immediately. When in the personal reset state, the status bits are reset to the same state as after hardware reset. The control bits are not affected by the personal reset state. The transmitter data pins are tri-stated while in the personal reset state; if a stable logic level is desired, the transmitter data pins should be defined as GPIO outputs, or external pull-up or pull-down resistors should be used. The

Table continues on the next page...

**ESAI\_TCR field descriptions (continued)**

Field	Description
	transmitter clock outputs drive zeroes while in the personal reset state. Note that to leave the personal reset state by clearing TPR, the procedure described in <a href="#">ESAI Initialization Examples</a> should be followed.
18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 PADC	ESAI_TCR Transmit Zero Padding Control. When PADC is cleared, zero padding is disabled. When PADC is set, zero padding is enabled. PADC, in conjunction with the TWA control bit, determines the way that padding is done for operating modes where the word length is less than the slot length. See the TWA bit description in bit 7 for more details.  Because the data word is shorter than the slot length, the data word is extended until achieving the slot length, according to the following rule:  If the data word is left-aligned (TWA=0), and zero padding is disabled (PADC=0), the last data bit is repeated after the data word has been transmitted. If zero padding is enabled (PADC=1), zeroes are transmitted after the data word has been transmitted.  If the data word is right-aligned (TWA=1), and zero padding is disabled (PADC=0), the first data bit is repeated before the transmission of the data word. If zero padding is enabled (PADC=1), zeroes are transmitted before the transmission of the data word.
16 TFSR	ESAI_TCR Transmit Frame Sync Relative Timing. TFSR determines the relative timing of the transmit frame sync signal as referred to the serial data lines, for a word length frame sync only (TFSL=0). When TFSR is cleared the word length frame sync occurs together with the first bit of the data word of the first slot. When TFSR is set the word length frame sync starts one serial clock cycle earlier, that is, together with the last bit of the previous data word.
15 TFSL	ESAI_TCR Transmit Frame Sync Length. The TFSL bit selects the length of frame sync to be generated or recognized. If TFSL is cleared, a word-length frame sync is selected. If TFSL is set, a 1-bit clock period frame sync is selected. See Figure 1-21 for examples of frame length selection.
14–10 TSWS[14:10]	ESAI_TCR Tx Slot and Word Length Select (TSWS4-TSWS0). The TSWS4-TSWS0 bits are used to select the length of the slot and the length of the data words being transferred through the ESAI. The word length must be equal to or shorter than the slot length. The possible combinations are shown in <a href="#">Table 26-31</a> . See also the ESAI data path programming model in <a href="#">Figure 26-2</a> and <a href="#">Figure 26-3</a> .
9–8 TMOD[9:8]	ESAI_TCR Transmit Network Mode Control (TMOD1-TMOD0). The TMOD1 and TMOD0 bits are used to define the network mode of ESAI transmitters, as shown in <a href="#">Table 26-31</a> . In the normal mode, the frame rate divider determines the word transfer rate - one word is transferred per frame sync during the frame sync time slot, as shown in <a href="#">Figure 26-29</a> . In network mode, it is possible to transfer a word for every time slot, as shown in <a href="#">Figure 26-29</a> . For further details, refer to <a href="#">Modes of Operation</a>  In order to comply with AC-97 specifications, TSWS4-TSWS0 should be set to 00011 (20-bit slot, 20-bit word length), TFSL and TFSR should be cleared, and TDC4-TDC0 should be set to 0x0C (13 words in frame). If TMOD[1:0]=0b11 and the above recommendations are followed, the first slot and word will be 16 bits long, and the next 12 slots and words will be 20 bits long, as required by the AC97 protocol.
7 TWA	ESAI_TCR Transmit Word Alignment Control. The Transmitter Word Alignment Control (TWA) bit defines the alignment of the data word in relation to the slot. This is relevant for the cases where the word length is shorter than the slot length. If TWA is cleared, the data word is left-aligned in the slot frame during transmission. If TWA is set, the data word is right-aligned in the slot frame during transmission.  Because the data word is shorter than the slot length, the data word is extended until achieving the slot length, according to the following rule:  If the data word is left-aligned (TWA=0), and zero padding is disabled (PADC=0), the last data bit is repeated after the data word has been transmitted. If zero padding is enabled (PADC=1), zeroes are transmitted after the data word has been transmitted.  If the data word is right-aligned (TWA=1), and zero padding is disabled (PADC=0), the first data bit is repeated before the transmission of the data word. If zero padding is enabled (PADC=1), zeroes are transmitted before the transmission of the data word.

## ESAI\_TCR field descriptions (continued)

Field	Description
6 TSHFD	ESAI_TCR Transmit Shift Direction. The TSHFD bit causes the transmit shift registers to shift data out MSB first when TSHFD equals zero or LSB first when TSHFD equals one (see <a href="#">Figure 26-2</a> and <a href="#">Figure 26-3</a> ).
5 TE5	<p>ESAI_TCR ESAI Transmit 5 Enable. TE5 enables the transfer of data from ESAI_TX5 to the transmit shift register #5. When TE5 is set and a frame sync is detected, the transmit #5 portion of the ESAI is enabled for that frame. When TE5 is cleared, the transmitter #5 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX5 when TE5 is cleared but the data is not transferred to the transmit shift register #5.</p> <p>The SDO5/SDI0 pin is the data input pin for ESAI_RX0 if TE5 is cleared and RE0 in the ESAI_RCR register is set. If both RE0 and TE5 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE0 and TE5 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE5 and setting it again disables the transmitter #5 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO5/SDI0 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE5 can be left enabled.</p>
4 TE4	<p>ESAI_TCR ESAI Transmit 4 Enable. TE4 enables the transfer of data from ESAI_TX4 to the transmit shift register #4. When TE4 is set and a frame sync is detected, the transmit #4 portion of the ESAI is enabled for that frame. When TE4 is cleared, the transmitter #4 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX4 when TE4 is cleared but the data is not transferred to the transmit shift register #4.</p> <p>The SDO4/SDI1 pin is the data input pin for ESAI_RX1 if TE4 is cleared and RE1 in the RCR register is set. If both RE1 and TE4 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE1 and TE4 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE4 and setting it again disables the transmitter #4 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO4/SDI1 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE4 can be left enabled.</p>
3 TE3	<p>ESAI_TCR ESAI Transmit 3 Enable. TE3 enables the transfer of data from ESAI_TX3 to the transmit shift register #3. When TE3 is set and a frame sync is detected, the transmit #3 portion of the ESAI is enabled for that frame. When TE3 is cleared, the transmitter #3 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX3 when TE3 is cleared but the data is not transferred to the transmit shift register #3.</p> <p>The SDO3/SDI2 pin is the data input pin for ESAI_RX2 if TE3 is cleared and RE2 in the ESAI_RCR register is set. If both RE2 and TE3 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE2 and TE3 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE3 and setting it again disables the transmitter #3 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO3/SDI2 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE3 can be left enabled.</p>
2 TE2	ESAI_TCR ESAI Transmit 2 Enable. TE2 enables the transfer of data from ESAI_TX2 to the transmit shift register #2. When TE2 is set and a frame sync is detected, the transmit #2 portion of the ESAI is enabled for that frame. When TE2 is cleared, the transmitter #2 is disabled after completing transmission of data

Field	Description
	<p>currently in the ESAI transmit shift register. Data can be written to ESAI_TX2 when TE2 is cleared but the data is not transferred to the transmit shift register #2.</p> <p>The SDO2/SDI3 pin is the data input pin for ESAI_RX3 if TE2 is cleared and RE3 in the ESAI_RCR register is set. If both RE3 and TE2 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE3 and TE2 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE2 and setting it again disables the transmitter #2 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO2/SDI3 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE2 can be left enabled.</p>
<p>1 TE1</p>	<p>ESAI_TCR ESAI Transmit 1 Enable. TE1 enables the transfer of data from TX1 to the transmit shift register #1. When TE1 is set and a frame sync is detected, the transmit #1 portion of the ESAI is enabled for that frame. When TE1 is cleared, the transmitter #1 is disabled after completing transmission of data currently in the ESAI transmit shift register. The SDO1 output is tri-stated, and any data present in TX1 is not transmitted, that is, data can be written to TX1 with TE1 cleared, but data is not transferred to the transmit shift register #1.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE1 and setting it again disables the transmitter #1 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO1 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE1 can be left enabled.</p>
<p>0 TE0</p>	<p>ESAI_TCR ESAI Transmit 0 Enable. TE0 enables the transfer of data from ESAI_TX0 to the transmit shift register #0. When TE0 is set and a frame sync is detected, the transmit #0 portion of the ESAI is enabled for that frame. When TE0 is cleared, the transmitter #0 is disabled after completing transmission of data currently in the ESAI transmit shift register. The SDO0 output is tri-stated, and any data present in ESAI_TX0 is not transmitted, that is, data can be written to ESAI_TX0 with TE0 cleared, but data is not transferred to the transmit shift register #0.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE0 and setting it again disables the transmitter #0 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO0 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE0 can be left enabled.</p>

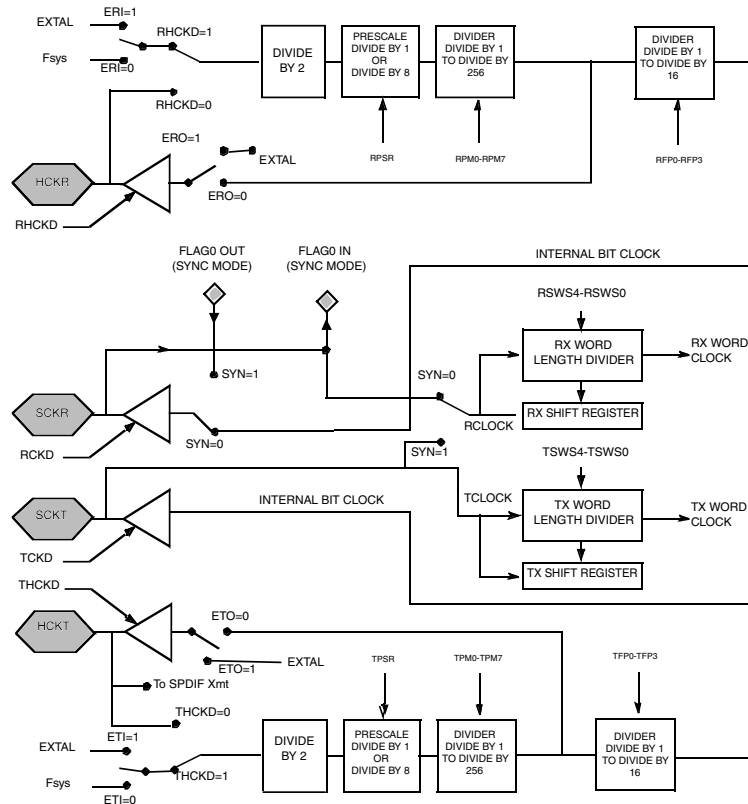

**26.6.15 Transmit Clock Control Register (ESAI\_TCCR)**

The read/write Transmitter Clock Control Register (ESAI\_TCCR) controls the ESAI transmitter clock generator bit and frame sync rates, the bit clock and high frequency clock sources and the directions of the HCKT, FST and SCKT signals. In the synchronous mode (SYN=1), the bit clock defined for the transmitter determines the receiver bit clock as well. ESAI\_TCCR also controls the number of words per frame for the serial data. Hardware and software reset clear all the bits of the ESAI\_TCCR register.

Care should be taken in asynchronous mode whenever the frame sync clock (FSR, FST) is not sourced directly from its associated bit clock (SCKR, SCKT). Proper phase relationships must be maintained between these clocks in order to guarantee proper operation of the ESAI.

### NOTE

ARM Core clock is ipg\_clk\_esai in block ESAI which is from CCM's ahb\_clk\_root.

**Figure 26-32. ESAI Clock Generator Functional Block Diagram**

### NOTE

1. ETI, ETO, ERI and ERO bit descriptions are covered in [ESAI Control Register \(ESAI\\_ECR\)](#).
2. Fsys is the ESAI system 133 MHz clock.
3. EXTAL is the on-chip clock sources other than ESAI system 133MHz clock.

**ESAI\_TCCR field descriptions**

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 THCKD	ESAI_TCCR Transmit High Frequency Clock Direction. THCKD controls the direction of the HCKT pin. When THCKD is cleared, HCKT is an input; when THCKD is set, HCKT is an output (see <a href="#">Table 26-3</a> ).
22 TFSD	ESAI_TCCR Transmit Frame Sync Signal Direction. TFSD controls the direction of the FST pin. When TFSD is cleared, FST is an input; when TFSD is set, FST is an output (see <a href="#">Table 26-3</a> ).
21 TCKD	ESAI_TCCR Transmit Clock Source Direction. The Transmitter Clock Source Direction (TCKD) bit selects the source of the clock signal used to clock the transmit shift registers in the asynchronous mode (SYN=0) and the transmit shift registers and the receive shift registers in the synchronous mode (SYN=1). When TCKD is set, the internal clock source becomes the bit clock for the transmit shift registers and word length divider and is the output on the SCKT pin. When TCKD is cleared, the clock source is external; the internal clock generator is disconnected from the SCKT pin, and an external clock source may drive this pin (see <a href="#">Table 26-3</a> ).
20 THCKP	ESAI_TCCR Transmit High Frequency Clock Polarity The Transmitter High Frequency Clock Polarity (THCKP) bit controls the polarity of the HCKT. 0 - Normal polarity 1 - Inverted polarity
19 TFSP	ESAI_TCCR Transmit Frame Sync Polarity. The Transmitter Frame Sync Polarity (TFSP) bit determines the polarity of the transmit frame sync signal. When TFSP is cleared, the frame sync signal polarity is positive, that is, the frame start is indicated by a high level on the frame sync pin. When TFSP is set, the frame sync signal polarity is negative, that is, the frame start is indicated by a low level on the frame sync pin.
18 TCKP	ESAI_TCCR Transmit Clock Polarity. The Transmitter Clock Polarity (TCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If TCKP is cleared the data and the frame sync are clocked out on the rising edge of the transmit bit clock and latched in on the falling edge of the transmit bit clock. If TCKP is set the falling edge of the transmit clock is used to clock the data out and frame sync and the rising edge of the transmit clock is used to latch the data and frame sync in.
17–14 TFP[3:0]	ESAI_TCCR Tx High Frequency Clock Divider. The TFP3-TFP0 bits control the divide ratio of the transmitter high frequency clock to the transmitter serial bit clock when the source of the high frequency clock and the bit clock is the internal ARM Core clock. When the HCKT input is being driven from an external high frequency clock, the TFP3-TFP0 bits specify an additional division ratio in the clock divider chain. <a href="#">Table 26-33</a> shows the specification for the divide ratio. <a href="#">Figure 26-32</a> shows the ESAI high frequency clock generator functional diagram.

Table continues on the next page...

**ESAI\_TCCR field descriptions (continued)**

Field	Description
13–9 TDC[4:0]	<p>ESAI_TCCR Tx Frame Rate Divider Control. The TDC4-TDC0 bits control the divide ratio for the programmable frame rate dividers used to generate the transmitter frame clocks.</p> <p>In network mode, this ratio may be interpreted as the number of words per frame minus one. The divide ratio may range from 2 to 32 (TDC[4:0]=0x00001 to 0x11111) for network mode. A divide ratio of one (TDC[4:0]=0x00000) in network mode is a special case (on-demand mode).</p> <p>In normal mode, this ratio determines the word transfer rate. The divide ratio may range from 1 to 32 (TDC[4:0]=0x00000 to 0x11111) for normal mode. In normal mode, a divide ratio of 1 (TDC[4:0]=0x00000) provides continuous periodic data word transfers. A bit-length frame sync (TFSL=1) must be used in this case.</p> <p>The ESAI frame sync generator functional diagram is shown in <a href="#">Figure 26-33</a></p>
8 TPSR	<p>ESAI_TCCR Transmit Prescaler Range. The TPSR bit controls a fixed divide-by-eight prescaler in series with the variable prescaler. This bit is used to extend the range of the prescaler for those cases where a slower bit clock is desired. When TPSR is set, the fixed prescaler is bypassed. When TPSR is cleared, the fixed divide-by-eight prescaler is operational (see <a href="#">Figure 26-32</a>). The maximum internally generated bit clock frequency is <math>F_{sys}/4</math>; the minimum internally generated bit clock frequency is <math>F_{sys}/(2 \times 8 \times 256 \times 16) = F_{sys}/65536</math>. (Do not use the combination TPSR=1, TPM7-TPM0=0x00, and TFP3-TFP0=0x0 which causes synchronization problems when using the internal ARM Core clock as source (TCKD=1 or THCKD=1))</p>
TPM[7:0]	<p>ESAI_TCCR Transmit Prescale Modulus Select. The TPM7-TPM0 bits specify the divide ratio of the prescale divider in the ESAI transmitter clock generator. A divide ratio from 1 to 256 (TPM[7:0]=0x00 to 0xFF) may be selected. The bit clock output is available at the transmit serial bit clock (SCKT) pin. The bit clock output is also available internally for use as the bit clock to shift the transmit and receive shift registers. The ESAI transmit clock generator functional diagram is shown in <a href="#">Figure 26-32</a>.</p>

**26.6.16 Receive Control Register (ESAI\_RCR)**

The read/write Receive Control Register (ESAI\_RCR) controls the ESAI receiver section. Interrupt enable bits for the receivers are provided in this control register. The receivers are enabled in this register (0,1,2 or 3 receivers can be enabled) if the input data pin is not used by a transmitter. Operating modes are also selected in this register.

### ESAI\_RCR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 RLIE	ESAI_RCR Receive Last Slot Interrupt Enable. RLIE enables an interrupt after the last slot of a frame ended in network mode only. When RLIE is set the Core is interrupted after the last slot in a frame ended regardless of the receive mask register setting. When RLIE is cleared the receive last slot interrupt is disabled. Hardware and software reset clear RLIE. RLIE is disabled when RDC[4:0]=00000 (on-demand mode). The use of the receive last slot interrupt is described in <a href="#">ESAI Interrupt Requests</a> .
22 RIE	ESAI_RCR Receive Interrupt Enable. The Core is interrupted when RIE and the RDF flag in the ESAI_SAISR status register are set. When RIE is cleared, this interrupt is disabled. Reading the receive data registers of the enabled receivers clears RDF, thus clearing the interrupt.  Receive interrupts with exception have higher priority than normal receive data interrupts, therefore if exception occurs (ROE is set) and REIE is set, the ESAI requests an ESAI receive data with exception interrupt from the interrupt controller.
21 REDIE	ESAI_RCR Receive Even Slot Data Interrupt Enable. The REDIE control bit is used to enable the receive even slot data interrupts. If REDIE is set, the receive even slot data interrupts are enabled. If REDIE is cleared, the receive even slot data interrupts are disabled. A receive even slot data interrupt request is generated if REDIE is set and the REDF status flag in the ESAI_SAISR status register is set. Even time slots are all even-numbered time slots (0, 2, 4, etc.) when operating in network mode. The zero time slot is marked by the frame sync signal and is considered to be even. Reading all the data registers of the enabled receivers clears the REDF flag, thus servicing the interrupt.  Receive interrupts with exception have higher priority than receive even slot data interrupts, therefore if exception occurs (ROE is set) and REIE is set, the ESAI requests an ESAI receive data with exception interrupt from the interrupt controller.
20 REIE	ESAI_RCR Receive Exception Interrupt Enable. When REIE is set, the Core is interrupted when both RDF and ROE in the ESAI_SAISR status register are set. When REIE is cleared, this interrupt is disabled. Reading the ESAI_SAISR status register followed by reading the enabled receivers data registers clears ROE, thus clearing the pending interrupt.
19 RPR	ESAI_RCR Receiver Section Personal Reset. The RPR control bit is used to put the receiver section of the ESAI in the personal reset state. The transmitter section is not affected. When RPR is cleared, the receiver section may operate normally. When RPR is set, the receiver section enters the personal reset state immediately. When in the personal reset state, the status bits are reset to the same state as after hardware reset. The control bits are not affected by the personal reset state. The receiver data pins are disconnected while in the personal reset state.

Table continues on the next page...

## ESAI\_RCR field descriptions (continued)

Field	Description
	<b>NOTE:</b> To leave the personal reset state by clearing RPR, the procedure described in <a href="#">ESAI Initialization Examples</a> should be followed.
18–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 RFSR	ESAI_RCR Receiver Frame Sync Relative Timing. RFSR determines the relative timing of the receive frame sync signal as referred to the serial data lines, for a word length frame sync only. When RFSR is cleared the word length frame sync occurs together with the first bit of the data word of the first slot. When RFSR is set the word length frame sync starts one serial clock cycle earlier, that is, together with the last bit of the previous data word.
15 RFSL	ESAI_RCR Receiver Frame Sync Length. The RFSL bit selects the length of the receive frame sync to be generated or recognized. If RFSL is cleared, a word-length frame sync is selected. If RFSL is set, a 1-bit clock period frame sync is selected. Refer to <a href="#">Figure 26-30</a> for examples of frame length selection.
14–10 RSWS[4:0]	ESAI_RCR Receiver Slot and Word Select. The RSWS4-RSWS0 bits are used to select the length of the slot and the length of the data words being received through the ESAI. The word length must be equal to or shorter than the slot length. The possible combinations are shown in <a href="#">Table 26-36</a> . See also the ESAI data path programming model in <a href="#">Figure 26-2</a> and <a href="#">Figure 26-3</a> .
9–8 RMOD[1:0]	ESAI_RCR Receiver Network Mode Control. The RMOD1 and RMOD0 bits are used to define the network mode of the ESAI receivers, as shown in <a href="#">Table 26-35</a> . In the normal mode, the frame rate divider determines the word transfer rate - one word is transferred per frame sync during the frame sync time slot, as shown in <a href="#">Figure 26-29</a> . In network mode, it is possible to transfer a word for every time slot, as shown in <a href="#">Figure 26-29</a> . For more details, see <a href="#">Modes of Operation</a> .  In order to comply with AC-97 specifications, RSWS4-RSWS0 should be set to 0x00011 (20-bit slot, 20-bit word); RFSL and RFSR should be cleared, and RDC4-RDC0 should be set to 0x0C (13 words in frame).
7 RWA	ESAI_RCR Receiver Word Alignment Control. The Receiver Word Alignment Control (RWA) bit defines the alignment of the data word in relation to the slot. This is relevant for the cases where the word length is shorter than the slot length. If RWA is cleared, the data word is assumed to be left-aligned in the slot frame. If RWA is set, the data word is assumed to be right-aligned in the slot frame.  If the data word is shorter than the slot length, the data bits which are not in the data word field are ignored.  For data word lengths of less than 24 bits, the data word is right-extended with zeroes before being stored in the receive data registers.
6 RSHFD	ESAI_RCR Receiver Shift Direction. The RSHFD bit causes the receiver shift registers to shift data in MSB first when RSHFD is cleared or LSB first when RSHFD is set (see <a href="#">Figure 26-2</a> and <a href="#">Figure 26-3</a> ).
5–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 RE3	ESAI_RCR ESAI Receiver 3 Enable. When RE3 is set and TE2 is cleared, the ESAI receiver 3 is enabled and samples data at the SDO2/SDI3 pin. ESAI_TX2 and ESAI_RX3 should not be enabled at the same time (RE3=1 and TE2=1). When RE3 is cleared, receiver 3 is disabled by inhibiting data transfer into ESAI_RX3. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX3 data register.  If RE3 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX3 will be invalid and must be discarded.
2 RE2	ESAI_RCR ESAI Receiver 2 Enable. When RE2 is set and TE3 is cleared, the ESAI receiver 2 is enabled and samples data at the SDO3/SDI2 pin. ESAI_TX3 and ESAI_RX2 should not be enabled at the same time (RE2=1 and TE3=1). When RE2 is cleared, receiver 2 is disabled by inhibiting data transfer into ESAI_RX2. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX2 data register.  If RE2 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX2 will be invalid and must be discarded.

Table continues on the next page...

**ESAI\_RCR field descriptions (continued)**

Field	Description
1 RE1	ESAI_RCR ESAI Receiver 1 Enable. When RE1 is set and TE4 is cleared, the ESAI receiver 1 is enabled and samples data at the SDO4/SDI1 pin. ESAI_TX4 and ESAI_RX1 should not be enabled at the same time (RE1=1 and TE4=1). When RE1 is cleared, receiver 1 is disabled by inhibiting data transfer into ESAI_RX1. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX1 data register.  If RE1 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX1 will be invalid and must be discarded.
0 RE0	ESAI_RCR ESAI Receiver 0 Enable. When RE0 is set and TE5 is cleared, the ESAI receiver 0 is enabled and samples data at the SDO5/SDI0 pin. ESAI_TX5 and ESAI_RX0 should not be enabled at the same time (RE0=1 and TE5=1). When RE0 is cleared, receiver 0 is disabled by inhibiting data transfer into ESAI_RX0. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX0 data register.  If RE0 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX0 will be invalid and must be discarded.

**26.6.17 Receive Clock Control Register (ESAI\_RCCR)**

The read/write Receiver Clock Control Register (ESAI\_RCCR) controls the ESAI receiver clock generator bit and frame sync rates, word length, and number of words per frame for the serial data. The ESAI\_RCCR control bits are described in the following paragraphs.

**NOTE**

ARM Core clock is ipg\_clk\_esai in block ESAI which is from CCM's ahb\_clk\_root.

**ESAI\_RCCR field descriptions**

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 RHCKD	<p>ESAI_RCCR Receiver High Frequency Clock Direction. The Receiver High Frequency Clock Direction (RHCKD) bit selects the source of the receiver high frequency clock when in the asynchronous mode (SYN=0) and the IF2/OF2 flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RHCKD is set, the internal clock generator becomes the source of the receiver high frequency clock and is the output on the HCKR pin. In the asynchronous mode, when RHCKD is cleared, the receiver high frequency clock source is external; the internal clock generator is disconnected from the HCKR pin, and an external clock source may drive this pin.</p> <p>When RHCKD is cleared, HCKR is an input; when RHCKD is set, HCKR is an output.</p> <p>In the synchronous mode when RHCKD is set, the HCKR pin becomes the OF2 output flag. If RHCKD is cleared, the HCKR pin becomes the IF2 input flag. Refer to <a href="#">Table 26-2</a> and <a href="#">Table 26-41</a>.</p>
22 RFSD	<p>ESAI_RCCR Receiver Frame Sync Signal Direction. The Receiver Frame Sync Signal Direction (RFSD) bit selects the source of the receiver frame sync signal when in the asynchronous mode (SYN=0) and the IF1/OF1/Transmitter Buffer Enable flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RFSD is set, the internal clock generator becomes the source of the receiver frame sync and is the output on the FSR pin. In the asynchronous mode, when RFSD is cleared, the receiver frame sync source is external; the internal clock generator is disconnected from the FSR pin, and an external clock source may drive this pin.</p> <p>In the synchronous mode when RFSD is set, the FSR pin becomes the OF1 output flag or the Transmitter Buffer Enable, according to the TEBE control bit. If RFSD is cleared, the FSR pin becomes the IF1 input flag. Refer to <a href="#">Table 26-2</a> and <a href="#">Table 26-40</a>.</p>
21 RCKD	<p>ESAI_RCCR Receiver Clock Source Direction. The Receiver Clock Source Direction (RCKD) bit selects the source of the clock signal used to clock the receive shift register in the asynchronous mode (SYN=0) and the IF0/OF0 flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RCKD is set, the internal clock source becomes the bit clock for the receive shift registers and word length divider and is the output on the SCKR pin. In the asynchronous mode when RCKD is cleared, the clock source is external; the internal clock generator is disconnected from the SCKR pin, and an external clock source may drive this pin.</p> <p>In the synchronous mode when RCKD is set, the SCKR pin becomes the OF0 output flag. If RCKD is cleared, the SCKR pin becomes the IF0 input flag. Refer to <a href="#">Table 26-2</a> and <a href="#">Table 26-39</a>.</p>
20 RHCKP	ESAI_RCCR Receiver High Frequency Clock Polarity. The Receiver High Frequency Clock Polarity (RHCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If RHCKP is cleared the data and the frame sync are clocked out on the rising edge of the receive high frequency bit clock and the frame sync is latched in on the falling edge of the receive bit clock. If RHCKP is set the falling edge of the receive clock is used to clock the data and frame sync out and the rising edge of the receive clock is used to latch the frame sync in.
19 RFSP	ESAI_RCCR Receiver Frame Sync Polarity. The Receiver Frame Sync Polarity (RFSP) determines the polarity of the receive frame sync signal. When RFSP is cleared the frame sync signal polarity is positive, that is, the frame start is indicated by a high level on the frame sync pin. When RFSP is set the frame sync signal polarity is negative, that is, the frame start is indicated by a low level on the frame sync pin.
18 RCKP	The Receiver Clock Polarity (RCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If RCKP is cleared the data and the frame sync are clocked out on the rising edge of the receive bit clock and the frame sync is latched in on the falling edge of the receive bit clock. If RCKP is set the falling edge of the receive clock is used to clock the data and frame sync out and the rising edge of the receive clock is used to latch the frame sync in.
17–14 RFP[3:0]	ESAI_RCCR Rx High Frequency Clock Divider. The RFP3-RFP0 bits control the divide ratio of the receiver high frequency clock to the receiver serial bit clock when the source of the receiver high frequency clock and the bit clock is the internal Arm Core clock. When the HCKR input is being driven

*Table continues on the next page...*

## ESAI\_RCCR field descriptions (continued)

Field	Description
	from an external high frequency clock, the RFP3-RFP0 bits specify an additional division ration in the clock divider chain. <a href="#">Table 26-38</a> provides the specification of the divide ratio. <a href="#">Figure 26-32</a> shows the ESAI high frequency generator functional diagram.
13–9 RDC[4:0]	<p>ESAI_RCCR Rx Frame Rate Divider Control. The RDC4-RDC0 bits control the divide ratio for the programmable frame rate dividers used to generate the receiver frame clocks.</p> <p>In network mode, this ratio may be interpreted as the number of words per frame minus one. The divide ratio may range from 2 to 32 (RDC[4:0]=0x00001 to 0x11111) for network mode. A divide ratio of one (RDC[4:0]=0x00000) in network mode is a special case (on-demand mode).</p> <p>In normal mode, this ratio determines the word transfer rate. The divide ratio may range from 1 to 32 (RDC[4:0]=0x00000 to 0x11111) for normal mode. In normal mode, a divide ratio of one (RDC[4:0]=0x00000) provides continuous periodic data word transfers. A bit-length frame sync (RFSL=1) must be used in this case.</p> <p>The ESAI frame sync generator functional diagram is shown in <a href="#">Figure 26-33</a>.</p>
8 RPSR	ESAI_RCCR Receiver Prescaler Range. The RPSR controls a fixed divide-by-eight prescaler in series with the variable prescaler. This bit is used to extend the range of the prescaler for those cases where a slower bit clock is desired. When RPSR is set, the fixed prescaler is bypassed. When RPSR is cleared, the fixed divide-by-eight prescaler is operational (see <a href="#">Figure 26-32</a> ). The maximum internally generated bit clock frequency is $F_{sys}/4$ , the minimum internally generated bit clock frequency is $F_{sys}/(2 \times 8 \times 256 \times 16) = F_{sys}/65536$ . (Do not use the combination RPSR=1 and RPM7-RPM0 =0x00, which causes synchronization problems when using the internal Core clock as source (RHCKD=1 or RCKD=1))
RPM[7:0]	ESAI_RCCR Receiver Prescale Modulus Select. The RPM7-RPM0 bits specify the divide ratio of the prescale divider in the ESAI receiver clock generator. A divide ratio from 1 to 256 (RPM[7:0]=0x00 to 0xFF) may be selected. The bit clock output is available at the receiver serial bit clock (SCKR) pin. The bit clock output is also available internally for use as the bit clock to shift the receive shift registers. The ESAI receive clock generator functional diagram is shown in <a href="#">Figure 26-32</a> .

### 26.6.18 Transmit Slot Mask Register A (ESAI\_TSMA)

The Transmit Slot Mask Register A together with Transmit Slot Mask Register B (ESAI\_TSMA and ESAI\_TSMB) are two read/write registers used by the transmitters in network mode to determine for each slot whether to transmit a data word and generate a transmitter empty condition (TDE=1), or to tri-state the transmitter data pins. Fields ESAI\_TSMA [TS[15:0]] and ESAI\_TSMB [TS[31:16]] are concatenated to form the 32-bit field TS[31:0]. Bit number *n* in TS[31:0] is the enable/disable control bit for transmission in slot number *n*.

Address: 202\_4000h base + E4h offset = 202\_40E4h

**26.6.21 Receive Slot Mask Register B (ESAI\_RSMB)**

The Receive Slot Mask Register B together with Receive Slot Mask Register A (ESAI\_RSMA and ESAI\_RSMB) are two read/write registers used by the receiver in network mode to determine for each slot whether to receive a data word and generate a receiver full condition (RDF=1), or to ignore the received data. Fields ESAI\_RSMA [RS[15:0]] and ESAI\_RSMB [RS31:16]] are concatenated to form the 32-bit field RS[31:0]. Bit number n in RS[31:0] is an enable/disable control bit for receiving data in slot number n.

Address: 202\_4000h base + F0h offset = 202\_40F0h

**ESAI\_RSMB field descriptions**

Field	Description
31-16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RS[31:16]	<p>When bit number N in the ESAI_RSMB register is cleared, the data from the enabled receivers input pins are shifted into their receive shift registers during slot number N. The data is not transferred from the receive shift registers to the receive data registers, and neither the RDF nor the ROE flag is set. This means that during a disabled slot, no receiver full interrupt is generated. The Core is interrupted only for enabled slots.</p> <p>When bit number N in the ESAI_RSMB is set, the receive sequence is as usual: data which is shifted into the enabled receivers shift registers is transferred to the receive data registers and the RDF flag is set.</p>

*Table continues on the next page...*

**ESAI\_RSMB field descriptions (continued)**

Field	Description
	Data written to the ESAI_RSMB affects the next received frame. The frame being received is not affected by this data and would comply to the last ESAI_RSMB setting. Data read from ESAI_RSMB returns the last written data.  After hardware or software reset, the ESAI_RSMB register is preset to 0x0000FFFF, which means that all 16 possible slots are enabled for data reception.

**26.6.22 Port C Direction Register (ESAI\_PRRC)**

There are two registers to control the ESAI personal reset status: Port C Direction Register (ESAI\_PRRC) and Port C Control Register (ESAI\_PCRC).

The read/write 32-bit Port C Direction Register (ESAI\_PRRC) in conjunction with the Port C Control Register (ESAI\_PCRC) controls the functionality of the ESAI personal reset state. [Table 26-48](#) provides the port pin configurations. Hardware and software reset clear all ESAI\_PRRC bits.

Address: 202\_4000h base + F8h offset = 202\_40F8h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

# Chapter 27

## Flexible Controller Area Network (FLEXCAN)

### 27.1 Overview

The Flexible Controller Area Network (FLEXCAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification.

The CAN protocol was primarily designed to be used as a vehicle serial data bus meeting the specific requirements of this field: real-time processing, reliable operation in the EMI environment of a vehicle, cost-effectiveness and required bandwidth. The FLEXCAN module is a full implementation of the CAN protocol specification, which supports both standard and extended message frames. 64 Message Buffers are supported.

#### 27.1.1 Block Diagram

A general block diagram is shown in the figure below, which describes the main sub-blocks implemented in the FLEXCAN module, including the associated memory for storing Mailboxes, Rx Global Mask Registers, Rx Individual Mask Registers, Rx FIFO and Rx FIFO ID Filters.

Support for 64 Mailboxes and 6-deep Rx FIFO is provided. The functions of the sub-modules are described in subsequent sections.

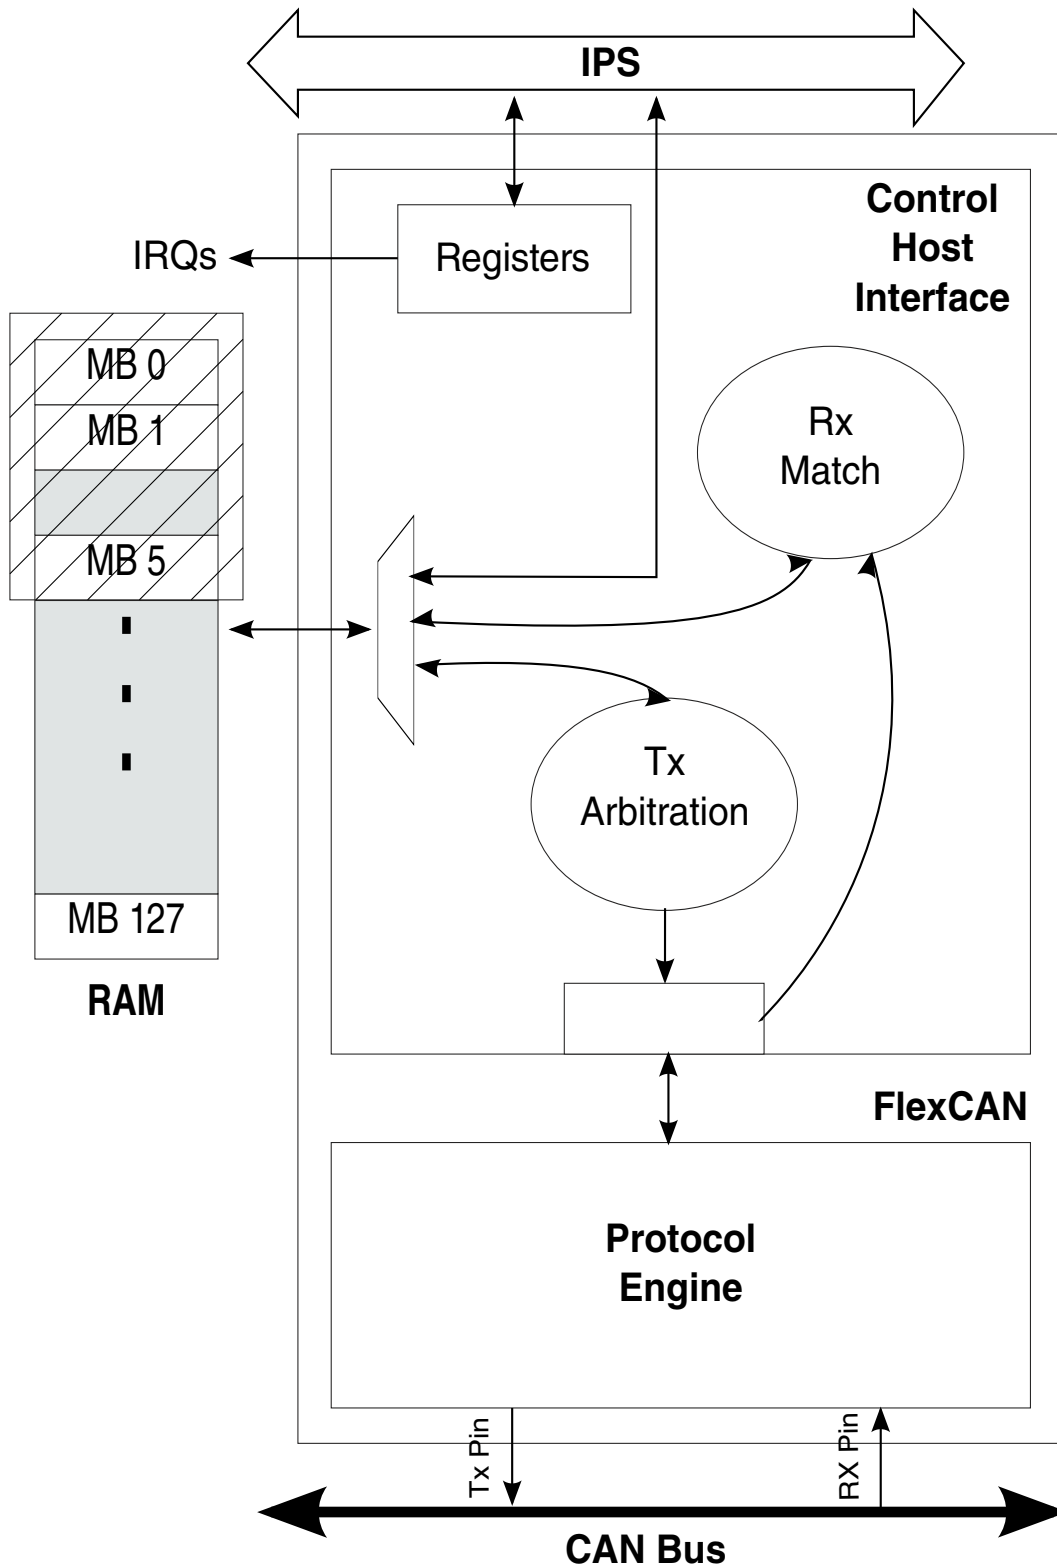

Figure 27-1. FLEXCAN Block Diagram

## 27.1.2 FLEXCAN Module Features

The FLEXCAN module includes these distinctive legacy features:

- Version 2.0B
  - Standard data and remote frames
  - Extended data and remote frames
  - Zero to eight bytes data length
  - Programmable bit rate up to 1 Mb/sec
  - Content-related addressing
- Flexible Mailboxes of eight bytes data length
- Each Mailbox is configurable as Rx or Tx, all supporting standard and extended messages
- Individual Rx Mask Registers per Mailbox
- Full featured Rx FIFO with storage capacity for 6 frames and internal pointer handling
- Transmission abort capability
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard or 512 partial (8 bits) IDs, with up to 32 individual masking capability
- 100% backwards compatibility with previous FLEXCAN version
- Unused structures space can be used as general purpose RAM space
- Listen only mode capability
- Programmable loop-back mode supporting self-test operation
- Programmable transmission priority scheme: lowest ID, lowest buffer number or highest priority
- Time Stamp based on 16-bit free-running timer
- Global network time, synchronized by a specific message
- Maskable interrupts independent of the transmission medium (an external transceiver is assumed)
- Short latency time due to an arbitration scheme for high-priority messages
- Low power modes, with programmable wake up on bus activity
- Configurable Glitch filter width to filter the noise on CAN bus when waking up
- Remote request frames may be handled automatically or by software.
- ID filter configuration in Normal Mode
- CAN bit time settings and configuration bits can only be written in Freeze Mode
- Tx mailbox status (Lowest priority buffer or empty buffer)
- SYNC bit status to inform that the module is synchronous with CAN bus
- CRC status for transmitted message
- Selectable priority between Mailboxes and Rx FIFO during matching process

### 27.1.3 Modes of Operation

The FLEXCAN module has four functional modes: Normal Mode (User and Supervisor), Freeze Mode, Listen-Only Mode and Loop-Back Mode. There are also two low power modes: Disable Mode and Stop Mode.

- Normal Mode (User or Supervisor):

In Normal Mode, the module operates receiving and/or transmitting message frames, errors are handled normally and all the CAN Protocol functions are enabled. User and Supervisor Modes differ in the access to some restricted control registers.

- Freeze Mode:

It is enabled when the FRZ bit in the MCR Register is asserted. If enabled, Freeze Mode is entered when the HALT bit in MCR is set or when Debug Mode is requested at MCU level and the FRZ\_ACK bit in the MCR Register is asserted by the FlexCAN. In this mode, no transmission or reception of frames is done and synchronicity to the CAN bus is lost. See [Freeze Mode](#) for more information.

- Listen-Only Mode:

The module enters this mode when the LOM bit in the Control Register is asserted. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.

- Loop-Back Mode:

The module enters this mode when the LPB bit in the Control Register is asserted. In this mode, FLEXCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is internally fed back to the receiver input. The FLEXCAN\_RX input pin is ignored and the FLEXCAN\_TX output goes to the recessive state (logic '1'). FLEXCAN behaves as it normally does when transmitting and treats its own transmitted message as a message received from a remote node. In this mode, FLEXCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field to ensure proper reception of its own message. Both transmit and receive interrupts are generated.

- Module Disable Mode:

This low power mode is entered when the MDIS bit in the MCR Register is asserted and the LPM\_ACK is asserted by the FlexCAN. When disabled, the module requests to disable the clocks to the CAN Protocol Engine and Controller Host Interface sub-modules. Exit from this mode is done by negating the MDIS bit in the MCR Register. See [Module Disable Mode](#) for more information.

- Stop Mode:

This low power mode is entered when Stop Mode is requested at ARM level and the LPM\_ACK bit in the MCR Register is asserted by the FlexCAN. When in Stop Mode, the module puts itself in an inactive state and then informs the ARM that the clocks can be shut down globally. Exit from this mode happens when the Stop Mode request is removed or when activity is detected on the CAN bus and the Self Wake Up mechanism is enabled. See [Stop Mode](#) for more information.

## 27.2 External Signals

The FLEXCAN module has two I/O signals.

## 27.3 Clocks

The table found here describes the clock sources for FLEXCAN.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 27-1. FLEXCAN Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_chi	ipg_clk_root	CHI clock
ipg_clk_pe	can_clk_root	Protocol Engine clock
ipg_clk_pe_nogate	can_clk_root	Protocol Engine clock (no gating)
ipg_clk_s	ipg_clk_root	Peripheral access clock
mem_ram_CLK	ipg_clk_root	RAM clock

## 27.4 Message Buffer Structure

Message Buffer Address: Base + 0x0080-0x047C

## Message Buffer Structure

The Message Buffer structure used by the FLEXCAN module is represented in the figure found here.

Both Extended and Standard Frames (29-bit Identifier and 11-bit Identifier, respectively) used in the CAN specification are represented.

**Table 27-2. Message Buffer Structure**

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x0					CODE					S R R	I D E	R T R	DLC				TIME STAMP															
0x4	PRIO		ID Standard								ID Extended																					
0x8	DATA BYTE 0				DATA BYTE 1				DATA BYTE 2				DATA BYTE 3																			
0xC	DATA BYTE 4				DATA BYTE 5				DATA BYTE 6				DATA BYTE 7																			

### CODE - Message Buffer Code

This 4-bit field can be accessed (read or write) by the CPU and by the FLEXCAN module itself, as part of the message buffer matching and arbitration process. The encoding is shown in the following tables. See [Functional Description](#) for additional information.

**Table 27-3. Message Buffer Code for Rx buffers**

CODE Description	Rx Code BEFORE receive New Frame	SRV <sup>1</sup>	Rx Code AFTER successful reception <sup>2</sup>	RRS <sup>3</sup>	Comment
0b0000: INACTIVE- MB is not active.	INACTIVE	-	-	-	MB does not participate in the matching process.
0b0100: EMPTY - MB is active and empty.	EMPTY	-	FULL	-	When a frame is received successfully (after move-in process. Refer to <a href="#">Move-in</a> for details), the CODE field is automatically updated to FULL.
0b0010: FULL - MB is full.	FULL	Yes	FULL	-	The act of reading the C/S word followed by unlocking the MB (SRV) does not make the code return to EMPTY. It remains FULL. If a new frame is moved to the MB after the MB was serviced, the code still remains FULL. Refer to <a href="#">Matching Process</a> for matching details related to FULL code.
		No	OVERRUN	-	If the MB is FULL and a new frame is moved to this MB before the CPU services it, the CODE field is automatically updated to OVERRUN. Refer to <a href="#">Matching Process</a> for details about overrun behavior.

Table continues on the next page...

**Table 27-3. Message Buffer Code for Rx buffers (continued)**

CODE Description	Rx Code BEFORE receive New Frame	SRV <sup>1</sup>	Rx Code AFTER successful reception <sup>2</sup>	RRS <sup>3</sup>	Comment
0b0110: OVERRUN - MB is being overwritten into a full buffer.	OVERRUN	Yes	FULL	-	If the CODE field indicates OVERRUN and CPU has serviced the MB, when a new frame is moved to the MB, the code returns to FULL.
		No	OVERRUN	-	If the CODE field already indicates OVERRUN, and another new frame must be moved, the MB will be overwritten again, and the code will remain OVERRUN. Refer to <a href="#">Matching Process</a> for details about overrun behavior.
0b1010: RANSWER <sup>4</sup> - A frame was configured to recognize a Remote Request Frame and transmit a Response Frame in return.	RANSWER	-	TANSWER(0b1110)	0	A Remote Answer was configured to recognize a remote request frame received, after that a MB is set to transmit a response frame. The code is automatically changed to TANSWER (0b1110). Refer to <a href="#">Matching Process</a> for details.  If CTRL2[RRS] is negated, transmit a response frame whenever a remote request frame with the same ID is received.
			-	1	This code is ignored during matching and arbitration process. Refer to <a href="#">Matching Process</a> for details.
CODE[0]=1b1: BUSY - FlexCAN is updating the contents of the MB. The CPU must not access the MB.	BUSY <sup>5</sup>	-	FULL	-	Indicates that the MB is being updated, it will be negated automatically and does not interfere on the next CODE.
			OVERRUN	-	

1. SRV: Serviced MB. MB was read and unlocked by reading TIMER or other MB.
2. A frame is considered successful reception after the frame to be moved to MB (move-in process). Refer to [Move-in](#) for details)
3. Remote Request Stored bit from CTRL2 register. Refer to [CTRL2](#) for details.
4. Code 4'b1010 is not considered as a Tx and a MB with this code should not to be aborted.
5. Note that for Tx MBs, the BUSY bit should be ignored upon read, except when AEN bit is set in the MCR register. If this bit is asserted, the corresponding MB does not participate in the matching process.

**Table 27-4. Message Buffer Code for Tx buffers**

CODE Description	Tx Code BEFORE tx frame	MB RT R	Tx Code AFTER successful transmission	Comment
0b1000: INACTIVE - MB is not active	INACTIVE	-	-	MB does not participate in the arbitration process.
0b1001: ABORT - MB is aborted	ABORT	-	-	MB does not participate in the arbitration process. .
0b1100: DATA -	DATA	0	INACTIVE	Transmit data frame unconditionally once. After transmission, the MB automatically returns to the INACTIVE state.

Table continues on the next page...

**Table 27-4. Message Buffer Code for Tx buffers (continued)**

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
MB is a Tx Data Frame (MB RTR must be 0)				
0b1100: REMOTE - MB is a Tx Remote Request Frame (MB RTR must be 1)	REMOTE	1	EMPTY	Transmit remote request frame unconditionally once. After transmission, the MB automatically becomes an Rx Empty MB with the same ID.
0b1110: TANSWER - MB is a Tx Response Frame from an incoming Remote Request Frame	TANSWER	-	RANSWER	This is an intermediate code that is automatically written to the MB by the CHI as a result of match to a remote request frame. The remote response frame will be transmitted unconditionally once and then the code will automatically return to RANSWER (0b1010). The CPU can also write this code with the same effect.  The remote response frame can be either a data frame or another remote request frame depending on the RTR bit value. Refer to <a href="#">Matching Process</a> and <a href="#">Arbitration process</a> for details.

**SRR - Substitute Remote Request**

Fixed recessive bit, used only in extended format. It must be set to '1' by the user for transmission (Tx Buffers) and will be stored with the value received on the CAN bus for Rx receiving buffers. It can be received as either recessive or dominant. If FLEXCAN receives this bit as dominant, then it is interpreted as arbitration loss.

1= Recessive value is compulsory for transmission in Extended Format frames

0= Dominant is not a valid value for transmission in Extended Format frames

**IDE - ID Extended Bit**

This bit identifies whether the frame format is standard or extended. It is also used as part of the reception filter.

1= Frame format is extended

0= Frame format is standard

**RTR - Remote Transmission Request**

This bit affects the behavior of Remote Frames and is part of the reception filter. Refer to the tables above and RRS bit in [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for additional details.

If FLEXCAN transmits this bit as '1' (recessive) and receives it as '0' (dominant), it is interpreted as arbitration loss. If this bit is transmitted as '0' (dominant), then if it is received as '1' (recessive), the FLEXCAN module treats it as bit error. If the value received matches the value transmitted, it is considered as a successful bit transmission.

1= Indicates the current MB has a Remote Frame to be transmitted if MB is Tx. If the MB is Rx then incoming Remote Request Frames may be stored.

0= Indicates the current MB has a Data Frame to be transmitted. In Rx MB it may be considered in matching processes.

#### DLC - Length of Data in Bytes

This 4-bit field is the length (in bytes) of the Rx or Tx data, which is located in offset 0x08 through 0x0F of the MB space (see the first table above). In reception, this field is written by the FLEXCAN module, copied from the DLC (Data Length Code) field of the received frame. In transmission, this field is written by the ARM and corresponds to the DLC field value of the frame to be transmitted. When RTR=1, the Frame to be transmitted is a Remote Frame and does not include the data field, regardless of the Length field. The DLC field indicates which DATA BYTES are valid as shown in the table below.

#### TIME STAMP - Free-Running Counter Time Stamp

This 16-bit field is a copy of the Free-Running Timer, captured for Tx and Rx frames at the time when the beginning of the Identifier field appears on the CAN bus.

#### PRIO - Local priority

This 3-bit field is only used when MCR[LPRIO\_EN] bit is asserted and it only makes sense for Tx mailboxes. These bits are not transmitted. They are appended to the regular ID to define the transmission priority. See [Arbitration process](#).

#### ID - Frame Identifier

In Standard Frame format, only the 11 most significant bits (28 to 18) are used for frame identification in both receive and transmit cases. The 18 least significant bits are ignored. In Extended Frame format, all bits are used for frame identification in both receive and transmit cases.

#### DATA BYTE 0-7 - Data Field

Up to eight bytes can be used for a data frame.

For Rx frames, the data is stored as it is received from the CAN bus. DATA BYTE (n) is valid only if *n* is less than DLC as shown in the table below.

For Tx frames, the CPU prepares the data field to be transmitted within the frame.

**Table 27-5. DATA BYTEs validity**

DLC	Valid DATA BYTEs
0	none
1	DATA BYTE 0
2	DATA BYTE 0-1
3	DATA BYTE 0-2
4	DATA BYTE 0-3
5	DATA BYTE 0-4
6	DATA BYTE 0-5
7	DATA BYTE 0-6
8	DATA BYTE 0-7

## 27.5 Rx FIFO Structure

When the MCR[RFEN] bit is set, the memory area from \$80 to \$DC (which is normally occupied by MBs 0 to 5) is used by the reception FIFO engine.

The region 0x80-0x8C contains the output of the FIFO which must be read by the CPU as a Message Buffer. This output contains the oldest message received and not read yet. The region 0x90-0xDC is reserved for internal use of the FIFO engine.

An additional memory area, that starts at 0xE0 and may extend up to 0x2DC (normally occupied by MBs 6 up to 37) depending on the CTRL2[RFFN] field setting, contains the ID Filter Table (configurable from 8 to 128 memory positions) that specifies filtering criteria for accepting frames into the FIFO. [Table 27-6](#) shows the Rx FIFO data structure.

Each ID Filter Table Element occupies an entire 32-bit word and can be compounded by one, two or four Identifier Acceptance Filters (IDAF) depending on the MCR[IDAM] field setting. [Table 27-7](#), [Table 27-8](#) and [Table 27-9](#) show the IDAF indexation. [Table 27-10](#) show the three different formats that the IDAF can assume, depending on the MCR[IDAM] field setting. Note that all elements of the table must have the same format. See [Rx FIFO](#) for more information.

Out of reset, the ID Filter Table flexible memory area defaults to 0xE0 and only extends to 0xFC, which corresponds to MBs 6 to 7 for RFFN=0.

**Table 27-6. Rx FIFO Structure**

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x80											S	I	R	DLC					TIME STAMP													
											R	D	T																			

*Table continues on the next page...*

**Table 27-9. Position of ID Filter Table Elements in format C**

Element	31								24	23										8	7							0				
0	IDAF0								IDAF1								IDAF2								IDAF3							
1	IDAF4								IDAF5								IDAF6								IDAF7							
2 through 125	Identifier Acceptance Filter 8 through 503																															
126	IDAF504								IDAF505								IDAF506								IDAF507							
127	IDAF508								IDAF509								IDAF510								IDAF511							

**Table 27-10. Identifier Acceptance Filter Format A,B and C**

Format	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	R T R	ID E	RXIDA (Standard = 29-19, Extended = 29-1)																													
B	R T R	ID E	RXIDB_0 (Standard = 29-19, Extended = 29-16)														R T R	ID E	RXIDB_1 (Standard = 13-3, Extended = 13-0)													
C	RXIDC_0 (Std/Ext = 31-24)								RXIDC_1 (Std/Ext = 23-16)								RXIDC_2 (Std/Ext = 15-8)								RXIDC_3 (Std/Ext = 7-0)							

**RTR - Remote Frame**

This bit specifies whether Remote Request Frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is a Remote Request Frame or not.

1= Remote Frames can be accepted and data frames are rejected

0= Remote Frames are rejected and data frames can be accepted

**IDE - Extended Frame**

Specifies if either Extended or Standard Format frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is of the Extended or Standard Format.

1= Extended frames can be accepted and standard frames are rejected

0= Extended frames are rejected and standard frames can be accepted

**RXIDA - Rx Frame Identifier (Format A)**

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), only the 11 most significant bits (29 to 19 ) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all bits are used.

#### RXIDB\_0, RXIDB\_1 - Rx Frame Identifier (Format B)

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), the 11 most significant bits (29 to 19 and 13 to 3 ) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all 14 bits of the field are compared with the 14 most significant bits of the Identifier of the incoming frame. The 15 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

#### RXIDC\_0, RXIDC\_1, RXIDC\_2, RXIDC\_3 - Rx Frame Identifier (Format C)

Specifies an ID to be used as acceptance criteria for the FIFO. In both Standard Format and Extended Format, all 8 bits of the field are compared to the 8 most significant bits of the Identifier of the incoming frame. The 3 least significant bits of the Identifier of an incoming Standard Format frame and the 21 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

## 27.6 Functional Description

This section provides a complete functional description of the block.

### 27.6.1 Functional Overview

The FLEXCAN module is a CAN protocol engine with a very flexible mailbox system for transmitting and receiving CAN frames.

The mailbox system consists of a set of 64 Message Buffers (MB) that store configuration and control data, time stamp, message ID and data (see [Message Buffer Structure](#)). The memory corresponding to the first 38 MBs can be configured to support a FIFO reception scheme with a powerful ID filtering mechanism, capable of checking incoming frames against a table of IDs (up to 128 extended IDs or 256 standard IDs or 512 8-bit ID slices), with individual mask register for up to 32 ID Filter Table elements. Simultaneous reception through FIFO and mailbox is supported. For mailbox reception, a *matching* algorithm makes it possible to store received frames only into MBs that have the same ID. A masking scheme makes it possible to match the ID programmed on the

MB with a range of Identifiers on received CAN frames. For transmission, an *arbitration* algorithm decides the prioritization of MBs to be transmitted based on the message ID (optionally augmented by 3 local priority bits) or the MB ordering.

Before proceeding with the functional description, an important concept must be explained. A Message Buffer is said to be "active" at a given time if it can participate in both the Matching and Arbitration processes. An Rx MB with a 0b0000 code is inactive (refer to [Table 27-3](#)). Similarly, a Tx MB with a 0b1000 or 0b1001 code is also inactive (refer to [Table 27-4](#)).

## 27.6.2 Transmit Process

In order to transmit a CAN frame, the CPU must prepare a Message Buffer for transmission by executing the procedure found here.

1. Check if the respective interruption bit is set and clear it.
2. If the MB is active (transmission pending), write the ABORT code (0b1001) to the CODE field of the Control and Status word to request an abortion of the transmission. Wait for the corresponding IFLAG to be asserted by polling the IFLAG register or by the interrupt request if enabled by the respective IMASK. Then read back the CODE field to check if the transmission was aborted or transmitted (see [Transmission Abort Mechanism](#)). If backwards compatibility is desired (MCR[AEN] bit negated), just write the INACTIVE code (0b1000) to the CODE field to inactivate the MB but then the pending frame may be transmitted without notification (see [Message Buffer Inactivation](#)).
3. Write the ID word.
4. Write the data bytes.
5. Write the DLC, Control and Code fields of the Control and Status word to activate the MB.

Once the MB is activated, it will participate into the arbitration process and eventually be transmitted according to its priority.

At the end of the successful transmission, the value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the MB's Time Stamp field, the CODE field in the Control and Status word is updated, the CRC Register is updated, a status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit. The new CODE field after transmission depends on the code that was used to activate the MB in step four (see [Table 27-3](#) and [Table 27-4](#) in [Message Buffer Structure](#))

When the Abort feature is enabled (MCR[AEN] bit is asserted), after the Interrupt Flag is asserted for a Mailbox configured as transmit buffer, the Mailbox is blocked, therefore the CPU is not able to update it until it negates the Interrupt Flag. It means that the CPU must clear the corresponding IFLAG before starting to prepare this MB for a new transmission or reception.

### 27.6.3 Arbitration process

The arbitration process scans the Mailboxes searching the Tx one that holds the message to be sent in the next opportunity. This Mailbox is called the *arbitration winner*.

The scan starts from the lowest Mailbox number and runs toward the higher ones.

The arbitration process is triggered in the following events:

- From the CRC field of the CAN frame. The start point depends on the CTRL2[TASD] field value. See [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for details.
- During the error delimiter field of the CAN frame
- During the Overload Delimiter field of a CAN frame.
- When the winner is inactivated and the CAN bus has still not reached the first bit of the Intermission field.
- When ARM write to the C/S word of a winner MB and the CAN bus has still not reached the first bit of the Intermission field.
- When CHI is in Idle state and ARM writes to the C/S word of any MB.
- When FlexCAN exits Bus Off state
- Upon leaving Freeze Mode or Low Power Mode

If the arbitration process does not manage to evaluate all Mailboxes before the CAN bus has reached the first bit of the Intermission field the temporary arbitration winner is invalidated and the FlexCAN will not compete for the CAN bus in the next opportunity.

The arbitration process selects the winner among the active Tx Mailboxes at the end of the scan according to both CTRL1[LBUF] and MCR[LPRIO\_EN] bits settings.

#### 27.6.3.1 Lowest Mailbox number first

If CTRL1[LBUF] bit is asserted the first (lowest number) active Tx Mailbox found is the arbitration winner. MCR[LPRIO\_EN] bit has no effect when CTRL1[LBUF] is asserted.

### 27.6.3.2 Highest Mailbox priority first

If CTRL1[LBUF] bit is negated then the arbitration process searches the active Tx Mailbox with the highest priority, and this Mailbox would have a higher probability to win the arbitration on CAN bus.

The sequence of bits considered for this arbitration is called the *arbitration value* of the Mailbox. The highest priority Tx Mailbox is the one that has the least arbitration value among all Tx Mailboxes.

If two or more Mailboxes have equivalent arbitration values the lowest Mailbox number is the arbitration winner.

The composition of the arbitration value depends on MCR[LPRIO\_EN] bit setting.

#### 27.6.3.2.1 Local Priority disabled

If MCR[LPRIO\_EN] bit is negated the arbitration value is built in the exact sequence of bits as they would be transmitted in a CAN frame (see [Table 27-11](#)) in such a way that the Local Priority is disabled.

**Table 27-11. Composition of the arbitration value when Local Priority is disabled**

Format	Mailbox Arbitration Value (32 bits)				
Standard (IDE = 0)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	Extended ID[28:18 ] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0 ] (18 bits)	RTR (1 bit)

#### 27.6.3.2.2 Local Priority enabled

If Local Priority is desired MCR[LPRIO\_EN] must be asserted.

In this case the Mailbox PRIO field is included at the very left of the arbitration value (see the table below).

**Table 27-12. Composition of the arbitration value when Local Priority is enabled**

Format	Mailbox Arbitration Value (35 bits)					
Standard (IDE = 0)	PRIO (3 bits)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	PRIO (3 bits)	Extended ID[28:18 ](11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0 ] (18 bits)	RTR (1 bit)

As the PRIO field is the most significant part of the arbitration value Mailboxes with low PRIO values have higher priority than Mailboxes with high PRIO values regardless the rest of their arbitration values.

Note that the PRIO field is not part of the frame on the CAN bus. Its purpose is only to affect the internal arbitration process.

Once the arbitration winner is found, its content is copied to a hidden auxiliary MB called Tx Serial Message Buffer (Tx SMB), which has the same structure as a normal MB but is not user accessible. This operation is called "move-out" and after it is done, write access to the corresponding MB is blocked (if the AEN bit in MCR is asserted). The write access is released in the following events:

- After the MB is transmitted
- FlexCAN enters in Freeze Mode or Bus Off
- FlexCAN loses the bus arbitration or there is an error during the transmission

At the first opportunity window on the CAN bus, the message on the Tx SMB is transmitted according to the CAN protocol rules. FlexCAN transmits up to eight data bytes, even if the DLC (Data Length Code) field value is greater than that.

Arbitration process can be triggered in the following situations:

- During Rx and Tx frames from CAN CRC field to end of frame. Arbitration start point depends on instantiation parameters NUMBER\_OF\_MB and T ASD. Additionally, T ASD value may be changed (see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)) to optimize the arbitration start point.
- During CAN Bus Off state from TX\_ERR\_CNT=124 to 128. Arbitration start point depends on instantiation parameters NUMBER\_OF\_MB and T ASD. Additionally, T ASD value may be changed (see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)) to optimize the arbitration start point.
- During C/S write by CPU in Bus Idle. First C/S write starts arbitration process and a second C/S write during this same arbitration restarts the process. If other C/S writes are performed, Tx arbitration process is pending. If there is no arbitration winner after arbitration process has finished, then TX arbitration machine begins a new arbitration process.
- Arbitration winner deactivation during a valid arbitration window.
- Upon Leave Freeze Mode. If there is a re-synchronization during WaitForBusIdle arbitration process is restarted.

Arbitration process stops in the following situation:

- All Mailboxes were scanned.
- A Tx active Mailbox is found in case of Lowest Buffer feature enabled.

## Functional Description

- Arbitration winner inactivation or abort during any arbitration process.
- There was not enough time to finish Tx arbitration process. For instance, a deactivation was performed near the end of frame). In this case arbitration process is pending.
- Error or Overload flag in the bus.
- Low Power or Freeze Mode request in Idle state

Arbitration is considered pending as described below:

- It was not possible to finish arbitration process in time.
- C/S write during arbitration if write is performed in a MB which number is lower than the Tx arbitration pointer.
- Any C/S write if there is no Tx Arbitration process in progress.
- Rx Match has just updated a Rx Code to Tx Code.
- Entering Bus off state.

C/S write during arbitration has the following effect:

- If C/S write is performed in the arbitration winner, a new process is restarted immediately.
- C/S write during arbitration if write is performed in a MB which number is higher than the Tx arbitration pointer.

### 27.6.4 Receive Process

To be able to receive CAN frames into a Mailbox, the CPU must prepare it for reception by executing the steps listed here.

1. If the Mailbox is active (either Tx or Rx) inactivate the Mailbox (see [Message Buffer Inactivation](#)), preferably with a *safe inactivation* (see [Transmission Abort Mechanism](#));
2. Write the ID word;
3. Write the EMPTY code (0b0100) to the CODE field of the Control and Status word to activate the Mailbox.

Once the Mailbox is activated in the third step, it will be able to receive frames that match the programmed filter. At the end of a successful reception, the Mailbox is updated by the *move-in process* (see [Move-in](#)) as follows:

1. The received Data field (8 bytes at most) is stored;
2. The received Identifier field is stored;
3. The value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the Mailbox Time Stamp field;

4. The received SRR, IDE, RTR and DLC fields are stored;
5. The CODE field in the Control and Status word is updated. (see [Table 27-3](#) and [Table 27-4](#) in Section [Message Buffer Structure](#))
6. A status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The recommended way for the CPU servicing (read) the frame received in a Mailbox is using the following procedure:

1. Read the Control and Status word of that Mailbox;
2. Check if the BUSY bit is deasserted, indicating that the Mailbox is locked. Repeat step 1) while it is asserted. See [Message Buffer Lock Mechanism](#);
3. Read the contents of the Mailbox. Once Mailbox is locked now, its contents won't be modified by FlexCAN Move-in processes. See [Move-in](#);
4. Acknowledge the proper flag at IFLAG registers;
5. Read the Free Running Timer. It is optional but recommended to unlock Mailbox as soon as possible and make it available for reception.

The CPU should synchronize to frame reception by the status flag bit for the specific Mailbox in one of the IFLAG Registers and not by the CODE field of that Mailbox. Polling the CODE field does not work because once a frame was received and the CPU services the Mailbox (by reading the C/S word followed by unlocking the Mailbox), the CODE field will not return to EMPTY. It will remain FULL. If the CPU tries to workaround this behavior by writing to the C/S word to force an EMPTY code after reading the Mailbox without a prior *safe inactivation*, a newly received message matching the filter of that Mailbox may be lost.

In summary: never do polling by reading directly the C/S word of the Mailboxes. Instead, read the IFLAG registers.

Note that the received frame's Identifier field is always stored in the matching Mailbox, thus the contents of the ID field in a Mailbox may change if the match was due to masking. Note also that FlexCAN does receive frames transmitted by itself if there exists a matching Rx Mailbox, provided the MCR[SRX\_DIS] bit is not asserted. If MCR[SRX\_DIS] bit is asserted, FlexCAN will not store messages transmitted by itself in any MB, even if it contains a matching MB, and no interrupt flag or interrupt signal will be generated due to the frame reception.

To be able to receive CAN messages through the Rx FIFO, the CPU must enable and configure the Rx FIFO during Freeze Mode (see [Rx FIFO](#)). Upon receiving the Frames Available in Rx FIFO interrupt (see [Interrupt Masks 1 Register \(FLEXCAN\\_IMASK1\)](#), bit IFLAG[BUF5I] - Frames available in Rx FIFO), the CPU should service the received frame using the following procedure:

1. Read the Control and Status word (optional - needed only if a mask was used for IDE and RTR bits);
2. Read the ID field (optional - needed only if a mask was used);
3. Read the Data field;
4. Read the RXFIR register (optional);
5. Clear the Frames Available in Rx FIFO interrupt by writing 1 to IFLAG[BUF5I] bit (mandatory - releases the MB and allows the CPU to read the next Rx FIFO entry)

### 27.6.5 Matching Process

The matching process scans the MB memory looking for Rx MBs programmed with the same ID as the one received from the CAN bus.

If the FIFO is enabled, the priority of scanning can be selected between Mailboxes and FIFO filters. In any case, the matching starts from the lowest number Message Buffer toward the higher ones. If no match is found within the first structure then the other is scanned subsequently. In the event that the FIFO is full, the matching algorithm will always look for a matching MB outside the FIFO region.

As the frame is being received, it is stored in a hidden auxiliary MB called Rx Serial Message Buffer (Rx SMB).

The matching process start point depends on the following conditions:

- if the received frame is a remote frame, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field equal to zero, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field different than zero, the start point is the DATA field of the frame;

If a matching ID is found in the FIFO table or in one of the Mailboxes, the contents of the SMB will be transferred to the FIFO or to the matched Mailbox by the move-in process. If any CAN protocol error is detected then no match results will be transferred to the FIFO or to the matched Mailbox at the end of reception.

The matching process scans all matching elements of both Rx FIFO (if enabled) and active Rx Mailboxes (CODE is EMPTY, FULL, OVERRUN or RANSWER) in search of a successful comparison with the matching elements of the Rx SMB that is receiving the frame on the CAN bus. The SMB has the same structure of a Mailbox. The reception structures (Rx FIFO or Mailboxes) associated with the matching elements that had a successful comparison are the *matched structures*. The *matching winner* is selected at the end of the scan among those matched structures and depends on conditions described ahead. Please, refer to the following table for details.

**Table 27-13. Matching architecture**

Structure	SMB[RTR]	CTRL2[RRS]	CTRL2[EACEN]	MB[IDE]	MB[RTR]	MB[ID] <sup>1</sup>	MB[CODE]
Mailbox	0	-	0	cmp <sup>2</sup>	no_cmp <sup>3</sup>	cmp_msk <sup>4</sup>	EMPTY or FULL or OVERRUN
Mailbox	0	-	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	0	-	cmp	no_cmp	cmp	RANSWER
Mailbox	1	1	0	cmp	no_cmp	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	1	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
FIFO <sup>5</sup>	-	-	-	cmp_msk	cmp_msk	cmp_msk	-

1. For Mailbox structure, If SMB[IDE] is asserted, the ID is 29 bits (ID Standard + ID Extended). In case of SMB[IDE] to be negated, the ID is only 11 bits (ID Standard). Please, refer to [Message Buffer Structure](#) for ID details. For FIFO structure, the ID depends on IDAM. Please, refer to [Rx FIFO Structure](#) for IDAM details.
2. cmp: Compares the SMB contents with the MB contents regardless the masks.
3. no\_cmp: The SMB contents are not compared with the MB contents.
4. cmp\_msk: Compares the SMB contents with MB contents taking into account the masks.
5. SMB[IDE] and SMB[RTR] are not taken into account when IDAM is type C.

A reception structure is *free-to-receive* when any of the following conditions is satisfied:

- the CODE field of the Mailbox is EMPTY;
- the CODE field of the Mailbox is either FULL or OVERRUN and it has already been serviced (the C/S word was read by the ARM and unlocked as described in [Message Buffer Lock Mechanism](#));
- the CODE field of the Mailbox is either FULL or OVERRUN and an inactivation is performed. (see [Message Buffer Inactivation](#))
- the Rx FIFO is not full.

The scan order for Mailboxes and Rx FIFO is from the matching element with lowest number to the higher ones.

The matching winner search for Mailboxes is affected by the MCR[IRMQ] bit. If it is negated the matching winner is the first matched Mailbox regardless if it is free-to-receive or not. If it is asserted, the matching winner is selected according to the priority below:

1. the first free-to-receive matched Mailbox;
2. the last non free-to-receive matched Mailbox.

It is possible to select the priority of scan between Mailboxes and Rx FIFO by the CTRL2[MRP] bit.

If the selected priority is Rx FIFO first:

- if the Rx FIFO is a matched structure and is free-to-receive then the Rx FIFO is the matching winner regardless of the scan for Mailboxes;
- otherwise (the Rx FIFO is not a matched structure or is not free-to-receive), then the matching winner is searched among Mailboxes as described above.

If the selected priority is Mailboxes first:

- if a free-to-receive matched Mailbox is found, it is the matching winner regardless the scan for Rx FIFO;
- if no matched Mailbox is found, then the matching winner is searched in the scan for the Rx FIFO;
- if both conditions above are not satisfied and a non free-to-receive matched Mailbox is found then the matching winner determination is conditioned by the MCR[IRMQ] bit:
  - if MCR[IRMQ] bit is negated the matching winner is the first matched Mailbox;
  - if MCR[IRMQ] bit is asserted the matching winner is the Rx FIFO if it is a free-to-receive matched structure, otherwise the matching winner is the last non free-to-receive matched Mailbox.

Please, refer to the table below for a summary of matching possibilities.

If a non-safe Mailbox inactivation (see [Message Buffer Inactivation](#)) occurs during matching process and the Mailbox inactivated is the temporary matching winner then the temporary matching winner is invalidated. The matching elements scan is not stopped nor restarted, it continues normally. The consequence is that the current matching process works as if the matching elements compared before the inactivation did not exist, therefore a message may be lost.

Suppose, for example, that the FIFO is disabled, IRMQ is enabled and there are two MBs with the same ID, and FlexCAN starts receiving messages with that ID. Let us say that these MBs are the second and the fifth in the array. When the first message arrives, the matching algorithm will find the first match in MB number 2. The code of this MB is EMPTY, so the message is stored there. When the second message arrives, the matching algorithm will find MB number 2 again, but it is not "free-to-receive", so it will keep looking and find MB number 5 and store the message there. If yet another message with the same ID arrives, the matching algorithm finds out that there are no matching MBs that are "free-to-receive", so it decides to overwrite the last matched MB, which is number 5. In doing so, it sets the CODE field of the MB to indicate OVERRUN.

**Table 27-14. Matching Possibilities and Resulting Reception Structures**

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception Structure	Description
No FIFO, only MB, match is always MB first						
0	0	X <sup>1</sup>	None <sup>2</sup>	- <sup>3</sup>	None	Frame lost by no match
0	0	X	Free <sup>4</sup>	-	FirstMB	
0	1	X	None	-	None	Frame lost by no match
0	1	X	Free	-	FirstMB	
0	1	X	NotFree	-	LastMB	Overrun
FIFO enabled, no match in FIFO is as if FIFO does not exist						
1	0	X	None	None <sup>5</sup>	None	Frame lost by no match
1	0	X	Free	None	FirstMB	
1	1	X	None	None	None	Frame lost by no match
1	1	X	Free	None	FirstMB	
1	1	X	NotFree	None	LastMB	Overrun
FIFO enabled, Queue disabled						
1	0	0	X	NotFull <sup>6</sup>	FIFO	
1	0	0	None	Full <sup>7</sup>	None	Frame lost by FIFO full (FIFO Overflow)
1	0	0	Free	Full	FirstMB	
1	0	0	NotFree	Full	FirstMB	
1	0	1	None	NotFull	FIFO	
1	0	1	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	0	1	Free	X	FirstMB	
1	0	1	NotFree	X	FirstMB	Overrun
FIFO enabled, Queue enabled						
1	1	0	X	NotFull	FIFO	
1	1	0	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	1	0	Free	Full	FirstMB	
1	1	0	NotFree	Full	LastMB	Overrun
1	1	1	None	NotFull	FIFO	
1	1	1	Free	X	FirstMB	
1	1	1	NotFree	NotFull	FIFO	
1	1	1	NotFree	Full	LastMB	Overrun

1. It is a don't care condition.
2. Matched in MB "None" means that the frame has not matched any MB (free-to-receive or non-free-to-receive).
3. It is a forbidden condition.
4. Matched in MB "Free" means that the frame matched at least one MB free-to-receive regardless it has matched MBs non-free-to-receive.
5. Matched in FIFO "None" means that the frame has not matched any filter in FIFO. It is as if the FIFO didn't exist (CTRL2[RFEN]=0).
6. Matched in FIFO "NotFull" means that the frame has matched a FIFO filter and has empty slots to receive it.
7. Matched in FIFO "Full" means that the frame has matched a FIFO filter but couldn't store it because it has no empty slots to receive it.

The ability to match the same ID in more than one MB can be exploited to implement a reception queue (in addition to the full featured FIFO) to allow more time for ARM to service the MBs. By programming more than one MB with the same ID, received messages will be queued into the MBs. ARM can examine the Time Stamp field of the MBs to determine the order in which the messages arrived.

Matching to a range of IDs is possible by using ID Acceptance Masks. FlexCAN supports individual masking per MB. Please refer to [Rx Mailboxes Global Mask Register \(FLEXCAN\\_RXMGMASK\)](#). During the matching algorithm, if a mask bit is asserted, then the corresponding ID bit is compared. If the mask bit is negated, the corresponding ID bit is "don't care". Please note that the Individual Mask Registers are implemented in RAM, so they are not initialized out of reset. Also, they can only be programmed while the module is in Freeze Mode, otherwise they are blocked by hardware.

FlexCAN also supports an alternate masking scheme with only four mask registers (RGXMASK, RX14MASK, RX15MASK and RXFGMASK) for backward compatibility. This alternate masking scheme is enabled when the IRMQ bit in the MCR Register is negated.

### 27.6.6 Move Process

There are two types of move process, namely move-in and move-out.

#### 27.6.6.1 Move-in

The move-in process is the copy of a message received by an Rx SMB to a Rx Mailbox or FIFO that has matched it. If the move destination is the Rx FIFO, attributes of the message are also copied to the RXFIR FIFO. Each Rx SMB has its own move-in process, but only one is performed at a given time as described ahead.

The move-in starts only when the message held by the Rx SMB has a corresponding matching winner (see [Matching Process](#)) and all of the following conditions are true:

- the CAN bus has reached or let past either:
  - the second bit of Intermission field next to the frame that carried the message that is in the Rx SMB;
  - the first bit of an overload frame next to the frame that carried the message that is in the Rx SMB;
- there is no ongoing matching process;

- the destination Mailbox is not locked by ARM;
- there is no ongoing move-in process from another Rx SMB. If more than one move-in processes are to be started at the same time both are performed and the newest substitutes the oldest.

The term *pending move-in* is used throughout the document and stands for a move-to-be that still does not satisfy all of the aforementioned conditions.

The move-in is cancelled and the Rx SMB is able to receive another message if any of the following conditions is satisfied:

- the destination Mailbox is inactivated after the CAN bus has reached the first bit of Intermission field next to the frame that carried the message and its matching process has finished;
- there is a previous pending move-in to the same destination Mailbox.
- the Rx SMB is receiving a frame transmitted by the FlexCAN itself and the self-reception is disabled;
- any CAN protocol error is detected.

Note that the pending move-in is not cancelled if the module enters in Freeze or Low Power Mode. It only stays on hold waiting for exiting Low Power Mode and to be unlocked. If an MB is unlocked during Freeze Mode, the move-in happens immediately.

The move-in process consists of the following steps:

1. if the message is destined to the Rx FIFO, push IDHIT into the RXFIR FIFO;
2. reads the words DATA0-3 and DATA4-7 from the Rx SMB;
3. writes it in the words DATA0-3 and DATA4-7 of the Rx Mailbox;
4. reads the words Control/Status and ID from the Rx SMB;
5. writes it in the words Control/Status and ID of the Rx Mailbox, updating the CODE field according to [Table 27-3](#).

The move-in process is not atomic, in such a way that it is immediately cancelled by the inactivation of the destination Mailbox (see [Message Buffer Inactivation](#)) and in this case the Mailbox may be left partially updated, thus incoherent. The exception is if the move-in destination is an Rx FIFO Message Buffer, then the process cannot be cancelled.

The BUSY Bit (least significant bit of the CODE field) of the destination Message Buffer is asserted while the move-in is being performed in such a way that ARM beware that the Message Buffer content is temporarily incoherent.

## 27.6.6.2 Move-out

The move-out process is the copy of the content from a Tx Mailbox to the Tx SMB when a message for transmission is available (see [Arbitration process](#)).

The move-out occurs in the following conditions:

- the first bit of Intermission field;
- during Bus off field when TX Error Counter is in the 124 to 128 range;
- during BusIdle field
- during Wait For Bus Idle field

The move-out process is not atomic. Only ARM has priority to access the memory concurrently out of BusIdle state. In BusIdle, the move-out has the lowest priority to the concurrent memory accesses.

## 27.6.7 Data Coherence

In order to maintain data coherency and FlexCAN proper operation, the ARM must obey the rules described in

Any form of ARM accessing an MB structure within FlexCAN other than those specified may cause FlexCAN to behave in an unpredictable way.

### 27.6.7.1 Transmission Abort Mechanism

The abort mechanism provides a safe way to request the abortion of a pending transmission. A feedback mechanism is provided to inform ARM if the transmission was aborted or if the frame could not be aborted and was transmitted instead.

In order to abort a transmission, ARM must write a specific abort code (0b1001) to the CODE field of the Control and Status word. The active MBs configured as transmission must be aborted first and then they may be updated. If the abort code is written to a Mailbox that is currently being transmitted, or to a Mailbox that was already loaded into the SMB for transmission, the write operation is blocked and the MB is kept active, but the abort request is captured and kept pending until one of the following conditions are satisfied:

- The module loses the bus arbitration
- There is an error during the transmission
- The module is put into Freeze Mode
- The module enters in BusOff state
- There is an overload frame

If none of conditions above are reached, the MB is transmitted correctly, the interrupt flag is set in the IFLAG register and an interrupt to the ARM is generated (if enabled). The abort request is automatically cleared when the interrupt flag is set. In the other hand, if one of the above conditions is reached, the frame is not transmitted, therefore the abort code is written into the CODE field, the interrupt flag is set in the IFLAG and an interrupt is (optionally) generated to ARM.

If ARM writes the ABORT code before the transmission begins internally, then the write operation is not blocked, therefore the MB is updated and the interrupt flag is set. In this way ARM just needs to read the abort code to make sure the active MB was *safely inactivated*. Although the AEN bit is asserted and ARM wrote the abort code, in this case the MB is inactivated and not aborted, because the transmission did not start yet. One Mailbox is only aborted when the abort request is captured and kept pending until one of the previous conditions are satisfied.

The abort procedure can be summarized as follows:

1. ARM checks the corresponding IFLAG and clears it, if asserted.
2. ARM writes 0b1001 into the CODE field of the C/S word.
3. ARM waits for the corresponding IFLAG indicating that the frame was either transmitted or aborted.
4. ARM reads the CODE field to check if the frame was either transmitted (CODE=0b1000) or aborted (CODE=0b1001).
5. It is necessary to clear the corresponding IFLAG in order to allow the MB to be reconfigured.

### 27.6.7.2 Message Buffer Inactivation

Inactivation is a mechanism provided to protect the Mailbox against updates by the FlexCAN internal processes, thus allowing ARM to rely on Mailbox data coherence after having updated it, even in Normal Mode.

If a Mailbox is inactivated it does not participate neither in the arbitration nor in the matching process until it is reactivated. See [Transmit Process](#) and [Receive Process](#) for more detailed instruction on how to inactivate and reactivate a Mailbox.

In order to inactivate a Mailbox ARM must update its CODE field to INACTIVE (either 0b0000 or 0b1000).

As the user is not able to synchronize the CODE field update with the FlexCAN internal processes an inactivation can lead to undesirable results:

## Functional Description

- a frame in the bus that matches the filtering of the inactivated Rx Mailbox may be lost without notice, even if there are other Mailboxes with the same filter;
- a frame containing the message within the inactivated Tx Mailbox may be transmitted without notice.

In order to eliminate such risk and perform a *safe inactivation* ARM must use the following mechanism along with the inactivation itself:

- for Tx Mailboxes, the Transmission Abort (see [Transmission Abort Mechanism](#));

The inactivation automatically unlocks the Mailbox (see [Message Buffer Lock Mechanism](#)).

Message Buffers that are part of the Rx FIFO cannot be inactivated. There is no write protection on FIFO region by FlexCAN. ARM must keep the data coherence into FIFO region when RFEN is asserted.

### 27.6.7.3 Message Buffer Lock Mechanism

Besides MB inactivation, FlexCAN has another data coherence mechanism for the receive process. When ARM reads the Control and Status word of an Rx MB with codes FULL or OVERRUN, FlexCAN assumes that ARM wants to read the whole MB in an atomic operation, and thus it sets an internal lock flag for that MB. The lock is released when ARM reads the Free Running Timer (global unlock operation), or when it reads the Control and Status word of another MB regardless of its code or when ARM writes into C/S word from locked MB. The MB locking is done to prevent a new frame to be written into the MB while ARM is reading it.

The locking mechanism only applies to Rx MBs that are not part of FIFO and have a code different than INACTIVE (0b0000) or EMPTY<sup>1</sup> (0b0100). Also, Tx MBs can not be locked.

Suppose, for example, that the FIFO is disabled and the second and the fifth MBs of the array are programmed with the same ID, and FlexCAN has already received and stored messages into these two MBs. Suppose now that the ARM decides to read MB number 5 and at the same time another message with the same ID is arriving. When ARM reads the Control and Status word of MB number 5, this MB is locked. The new message arrives and the matching algorithm finds out that there are no "free-to-receive" MBs, so it decides to override MB number 5. However, this MB is locked, so the new message can not be written there. It will remain in the SMB waiting for the MB to be unlocked, and only then will be written to the MB. If the MB is not unlocked in time and yet another

---

1. In previous FlexCAN versions, reading the C/S word locks the MB even if it is EMPTY. This behavior is maintained when the IRMQ bit is negated.

new message with the same ID arrives, then the new message overwrites the one on the SMB and there will be no indication of lost messages either in the CODE field of the MB or in the Error and Status Register.

While the message is being moved-in from the SMB to the MB, the BUSY bit on the CODE field is asserted. If ARM reads the Control and Status word and finds out that the BUSY bit is set, it should defer accessing the MB until the BUSY bit is negated.

If the BUSY bit is asserted or if the MB is empty, then reading the Control and Status word does not lock the MB.

Inactivation takes precedence over locking. If ARM inactivates a locked Rx Mailbox, then its lock status is negated and the Mailbox is marked as invalid for the current matching round. Any pending message on the SMB will not be transferred anymore to the Mailbox. An MB is unlocked when ARM reads the Free Running Timer Register (see [Free Running Timer Register \(FLEXCAN\\_TIMER\)](#)), or the C/S word of another MB.

Lock and unlock mechanisms have the same functionality in both Normal and Freeze modes.

An unlock during Normal or Freeze mode results in the move-in of the pending message. However, the move-in is postponed if an unlock occurs during any of the low power modes (see in [Modes of Operation](#) specific information on Module Disable or Stop modes) and it will take place only when the module resumes to Normal or Freeze modes.

### 27.6.8 Rx FIFO

The receive-only FIFO is enabled by asserting the RFEN bit in the MCR.

The reset value of this bit is zero to maintain software backward compatibility with previous versions of the module that did not have the FIFO feature. The FIFO is 6-message deep, therefore when the FIFO is enabled, the memory region occupied by the first 6 Message Buffers is reserved for use of the FIFO engine (see [Rx FIFO Structure](#)). ARM can read the received messages sequentially, in the order they were received, by repeatedly reading a Message Buffer structure at the output of the FIFO.

The IFLAG[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. An interrupt is generated if it is enabled by the corresponding mask bit. Upon receiving the interrupt, ARM can read the message (accessing the output of the FIFO as a Message Buffer) and the RXFIR register and then clear the interrupt. If there are more messages in the FIFO the act of clearing the interrupt updates the output of the FIFO with the next message and update the RXFIR with the attributes of that message, reissuing the interrupt to ARM. Otherwise, the flag remains negated. The output of the FIFO is only valid when the IFLAG[BUF5I] is asserted.

The IFLAG[BUF6I] (Rx FIFO Warning) is asserted when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. The flag remains asserted until ARM clears it.

The IFLAG[BUF7I] (Rx FIFO Overflow) is asserted when an incoming message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. The flag remains asserted until the ARM clears it.

Clearing one of those three flags does not affect the state of the other two.

An interrupt is generated if an IFLAG bit is asserted and the corresponding mask bit is asserted too.

A powerful filtering scheme is provided to accept only frames intended for the target application, thus reducing the interrupt servicing work load. The filtering criteria is specified by programming a table of up to 128 32-bit registers, according to CTRL2[RFFN] setting, that can be configured to one of the following formats (see also [Rx FIFO Structure](#)):

- Format A: 128 IDAFs (extended or standard IDs including IDE and RTR)
- Format B: 256 IDAFs (standard IDs or extended 14-bit ID slices including IDE and RTR)
- Format C: 512 IDAFs (standard or extended 8-bit ID slices)

Every frame available in the FIFO has a corresponding IDHIT (Identifier Acceptance Filter Hit Indicator) that can be read by accessing the RXFIR register. The RXFIR[IDHIT] field refers to the message at the output of the FIFO and is valid whilst the IFLAG[BUF5I] flag is asserted. The RXFIR register must be read only before clearing the flag, which guarantees that the information refers to the correct frame within the FIFO.

Up to thirty two elements of the ID Filter Table are individually affected by the Individual Mask Registers (RXIMR0 - RXIMR31), according to CTRL2[RFFN] setting (refer to [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)), allowing very powerful filtering criteria to be defined. If the MCR[IRMQ] bit is negated (or if the RXIMR are not available for the particular MCU), then the FIFO ID Filter Table is affected by RXFGMASK.

## 27.6.9 CAN Protocol Related Features

### 27.6.9.1 Remote Frames

Remote frame is a special kind of frame. The user can program a mailbox to be a Remote Request Frame by writing the mailbox as Transmit with the RTR bit set to '1'. After the remote request frame is transmitted successfully, the mailbox becomes a Receive Message Buffer, with the same ID as before.

When a remote request frame is received by FlexCAN, it can be treated in three ways, depending on Remote Request Storing (CTRL2[RRS]) and Rx FIFO Enable (MCR[RFEN]) bits:

- If RRS is negated the frame's ID is compared to the IDs of the Transmit Message Buffers with the CODE field 0b1010. If there is a matching ID, then this mailbox frame will be transmitted. Note that if the matching mailbox has the RTR bit set, then FlexCAN will transmit a remote frame as a response. The received remote request frame is not stored in a receive buffer. It is only used to trigger a transmission of a frame in response. The mask registers are not used in remote frame matching, and all ID bits (except RTR) of the incoming received frame should match. In the case that a remote request frame was received and matched a mailbox, this message buffer immediately enters the internal arbitration process, but is considered as normal Tx mailbox, with no higher priority. The data length of this frame is independent of the DLC field in the remote frame that initiated its transmission.
- If RRS is asserted the frame's ID is compared to the IDs of the receive mailboxes with the CODE field 0b0100, 0b0010 or 0b0110. If there is a matching ID, then this mailbox will store the remote frame in the same fashion of a data frame. No automatic remote response frame will be generated. The mask registers are used in the matching process.
- If RFEN is asserted FlexCAN will not generate an automatic response for remote request frames that match the FIFO filtering criteria. If the remote frame matches one of the target IDs, it will be stored in the FIFO and presented to the ARM. Note that for filtering formats A and B, it is possible to select whether remote frames are accepted or not. For format C, remote frames are always accepted (if they match the ID). Remote Request Frames are considered as normal frames, and generate a FIFO overflow when a successful reception occurs and the FIFO is already full.

### 27.6.9.2 Overload Frames

FLEXCAN does transmit overload frames due to detection of following conditions on CAN bus:

- Detection of a dominant bit in the first/second bit of Intermission

- Detection of a dominant bit at the 7th bit (last) of End of Frame field (Rx frames)
- Detection of a dominant bit at the 8th bit (last) of Error Frame Delimiter or Overload Frame Delimiter

### 27.6.9.3 Time Stamp

The value of the Free Running Timer is sampled at the beginning of the Identifier field on the CAN bus, and is stored at the end of "move-in" in the TIME STAMP field, providing network behavior with respect to time.

Note that the Free Running Timer can be reset upon a specific frame reception, enabling network time synchronization. Refer to TSYN description in [Control 1 Register \(FLEXCAN\\_CTRL1\)](#).

### 27.6.9.4 Protocol Timing

The FLEXCAN module supports a variety of means to setup bit timing parameters that are required by the CAN protocol. The Control Register has various fields used to control bit timing parameters: PRES DIV, PROPSEG, PSEG1, PSEG2 and RJW. See [Control 1 Register \(FLEXCAN\\_CTRL1\)](#).

The PRES DIV field controls a prescaler that generates the Serial Clock (Sclock), whose period defines the 'time quantum' used to compose the CAN waveform. A time quantum is the atomic unit of time handled by the CAN engine.

$$f_{Tq} = \frac{f_{CANCLK}}{(\text{Prescaler value})}$$

A bit time is subdivided into three segments<sup>2</sup> (reference [Table 27-15](#)):

---

2. For further explanation of the underlying concepts please refer to ISO/DIS 11519-1, Section 10.3. Reference also the Bosch CAN 2.0A/B protocol specification dated September 1991 for bit timing.

- SYNC\_SEG: This segment has a fixed length of one time quantum. Signal edges are expected to happen within this section
- Time Segment 1: This segment includes the Propagation Segment and the Phase Segment 1 of the CAN standard. It can be programmed by setting the PROPSEG and the PSEG1 fields of the CTRL Register so that their sum (plus 2) is in the range of 4 to 16 time quanta
- Time Segment 2: This segment represents the Phase Segment 2 of the CAN standard. It can be programmed by setting the PSEG2 field of the CTRL Register (plus 1) to be 2 to 8 time quanta long

$$\text{Bit Rate} = \frac{f_{Tq}}{\text{(number of Time Quanta)}}$$

**Figure 27-2. Segments within the Bit Time**

## Functional Description

Whenever CAN bit is used as a measure of duration (e.g. MCR[FRZ\_ACK] and MCR[LPM\_ACK] in [Module Configuration Register \(FLEXCAN\\_MCR\)](#)), the number of peripheral clocks in one CAN bit can be calculated as:

$$NCCP = \frac{f_{sys} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRES DIV + 1)}{f_{CANCLK}}$$

where:

NCCP is the number of peripheral clocks in one CAN bit;

$f_{CANCLK}$  is the Protocol Engine (PE) Clock in Hz;

$f_{SYS}$  is the frequency of operation of the system (CHI) clock, in Hz;

PSEG1 is the value in CTRL1[PSEG1] field;

PSEG2 is the value in CTRL1[PSEG2] field;

PROPSEG is the value in CTRL1[PROPSEG] field;

PRES DIV is the value in CTRL1[PRES DIV] field.

For example, 180 CAN bits = 180 x NCCP peripheral clock periods.

[Figure 27-2](#) gives an overview of the CAN compliant segment settings and the related parameter values.

**Table 27-15. Time Segment Syntax**

Syntax	Description
SYNC_SEG	System expects transitions to occur on the bus during this period.
Transmit Point	A node in transmit mode transfers a new value to the CAN bus at this point.
Sample Point	A node samples the bus at this point. If the three samples per bit option is selected, then this point marks the position of the third sample.

**Table 27-16. CAN Standard Compliant Bit Time Segment Settings**

Time Segment 1	Time Segment 2	Re-synchronization Jump Width
5 .. 10	2	1 .. 2

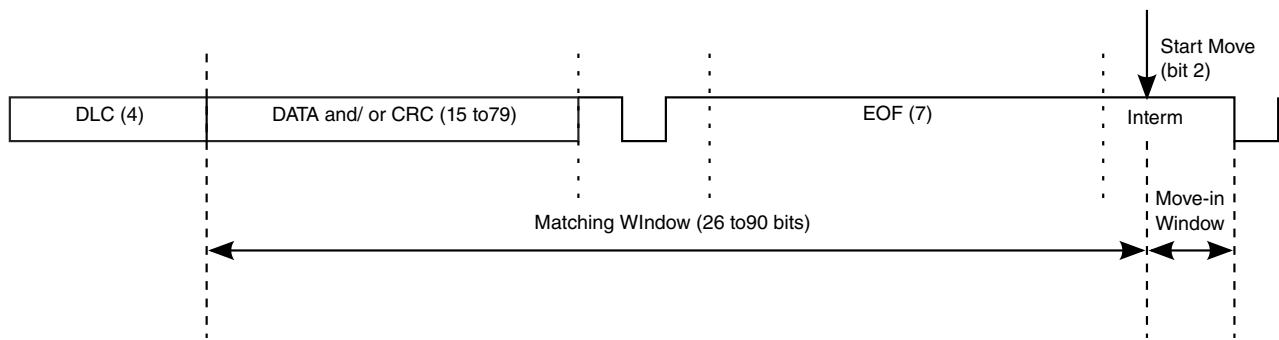

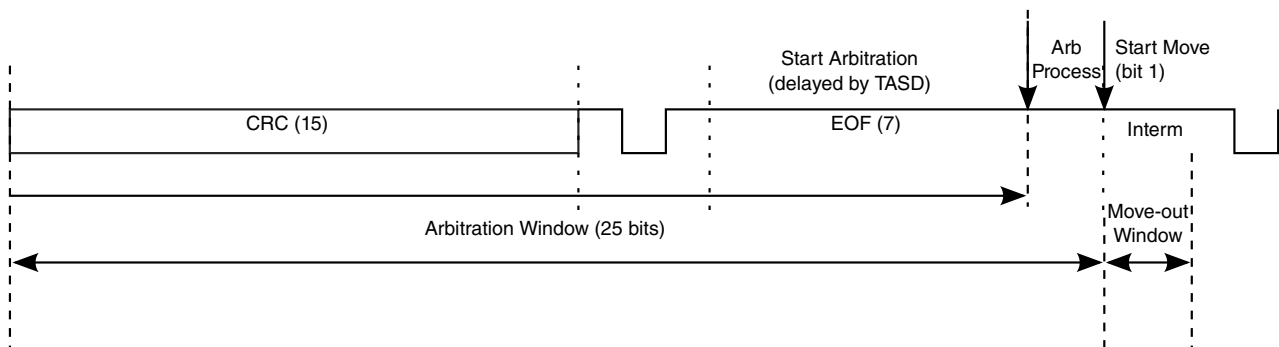

*Table continues on the next page...*

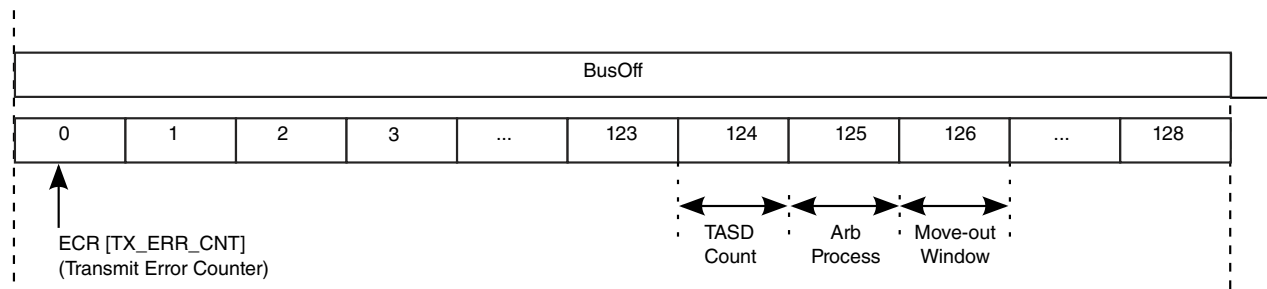

**Table 27-16. CAN Standard Compliant Bit Time Segment Settings (continued)**

Time Segment 1	Time Segment 2	Re-synchronization Jump Width
4 .. 11	3	1 .. 3
5 .. 12	4	1 .. 4
6 .. 13	5	1 .. 4
7 .. 14	6	1 .. 4
8 .. 15	7	1 .. 4
9 .. 16	8	1 .. 4

### 27.6.9.5 Arbitration and Matching Timing

During normal reception and transmission of frames, the matching, arbitration, move-in and move-out processes are executed during certain time windows inside the CAN frame, as shown in the following figures.

**Figure 27-3. Matching and Move-In Time Windows****Figure 27-4. Arbitration and Move-Out Time Windows**

**Figure 27-5. Arbitration at the end of Bus Off and Move-Out Time Windows**

When doing matching and arbitration, FlexCAN needs to scan the whole Message Buffer memory during the available time window. In order to have sufficient time to do that, the following requirements must be observed:

- A valid CAN bit timing must be programmed, as indicated in [Table 27-16](#)
- The peripheral clock frequency can not be smaller than the oscillator clock frequency, i.e. the PLL can not be programmed to divide down the oscillator clock
- There must be a minimum ratio between the peripheral clock frequency and the CAN bit rate, as specified in the following table.

**Table 27-17. Minimum Ratio Between Peripheral Clock Frequency and CAN Bit Rate**

Number of Message Buffers	RFEN	Minimum Number of Peripheral Clocks per CAN bit
16 and 32	0	16
64	0	25
16	1	16
32	1	17
64	1	30

A direct consequence of the first requirement is that the minimum number of time quanta per CAN bit must be 8, so the oscillator clock frequency should be at least 8 times the CAN bit rate. The minimum frequency ratio specified in [Table 27-17](#) can be achieved by choosing a high enough peripheral clock frequency when compared to the oscillator clock frequency, or by adjusting one or more of the bit timing parameters (PRES DIV, PROPSEG, PSEG1, PSEG2). As an example, taking the case of 64 MBs, if the oscillator and peripheral clock frequencies are equal and the CAN bit timing is programmed to have 8 time quanta per bit, then the prescaler factor (PRES DIV + 1) should be at least 2. For prescaler factor equal to one and CAN bit timing with 8 time quanta per bit, the ratio between peripheral and oscillator clock frequencies should be at least 2.

## 27.6.10 Modes of Operation Details

The FlexCAN module has four functional modes (Normal Mode, Freeze Mode, Listen-Only Mode and Loop-Back Mode) and two low power modes (Disable Mode and Stop Mode).

See in [Modes of Operation](#) an introductory description of all these modes of operation. The following sub-sections bring functional details on Freeze mode and the low power modes.

### 27.6.10.1 Freeze Mode

This mode is requested by ARM through the assertion of the HALT bit in the MCR Register or when the MCU is put into Debug Mode . In both cases it is also necessary that the FRZ bit is asserted in the MCR Register and the module is not in any of the low power modes (Disable, Stop). The acknowledgement is obtained through the assertion by the FlexCAN of FRZ\_ACK bit in the same register. The ARM must only consider the FlexCAN in Freeze Mode when both request and acknowledgement conditions are satisfied.

When Freeze Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Intermission, Passive Error, Bus Off or Idle state
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores the FLEXCAN\_RX input pin and drives the FLEXCAN\_TX pin as recessive
- Stops the prescaler, thus halting all CAN protocol activities
- Grants write access to the Error Counters Register, which is read-only in other modes
- Sets the NOT\_RDY and FRZ\_ACK bits in MCR

After requesting Freeze Mode, the user must wait for the FRZ\_ACK bit to be asserted in MCR before executing any other action, otherwise FlexCAN may operate in an unpredictable way. In Freeze mode, all memory mapped registers are accessible, except for CTRL1[CLK\_SRC] bit that can be read but cannot be written.

Exiting Freeze Mode is done in one of the following ways:

- ARM negates the FRZ bit in the MCR Register
- The ARM is removed from Debug Mode and the HALT bit is negated

The FRZ\_ACK bit is negated after protocol engine recognizes the negation of freeze request. Once out of Freeze Mode, FlexCAN tries to re-synchronize to the CAN bus by waiting for 11 consecutive recessive bits.

### **27.6.10.2 Module Disable Mode**

This low power mode is normally used to temporarily disable a complete FlexCAN block, with no power consumption. It is requested by the ARM through the assertion of the MDIS bit in the MCR Register and the acknowledgement is obtained through the assertion by the FlexCAN of the LPM\_ACK bit in the same register. The ARM must only consider the FlexCAN in Disable Mode when both request and acknowledgement conditions are satisfied.

If the module is disabled during Freeze Mode, it requests to disable the clocks to the PE and CHI sub-modules, sets the LPM\_ACK bit and negates the FRZ\_ACK bit. The ability to shut down the clocks depends on how FlexCAN is integrated into the MCU. If the module is disabled during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and then checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN\_RX input pin and drives its FLEXCAN\_TX pin as recessive
- May shut down the clocks to the PE and CHI sub-modules, depending on how FlexCAN is integrated into the MCU
- Sets the NOT\_RDY and LPM\_ACK bits in MCR

The Bus Interface Unit continues to operate, enabling the ARM to access memory mapped registers, except the Rx Mailboxes Global Mask Registers, the Rx Buffer 14 Mask Register, the Rx Buffer 15 Mask Register, the Rx FIFO Global Mask Register. The Rx FIFO Information Register, the Message Buffers, the Rx Individual Mask Registers, and the reserved words within RAM may not be accessed when the module is in Disable Mode depending on how FlexCAN RAM is integrated into the ARM. Exiting from this mode is done by negating the MDIS bit by ARM, which make FlexCAN requests to resume the clocks and negates the LPM\_ACK bit after CAN protocol engine recognizes the negation of disable mode requested by ARM.

### 27.6.10.3 Stop Mode

This is a system low power mode in which system clocks can be stopped for maximum power savings.. To enter stop mode, the CPU should manually assert a global Stop Mode request (see the CAN1\_STOP\_REQ and CAN2\_STOP\_REQ bit in the register IOMUXC\_GPR13) and check the acknowledgement asserted by the FlexCAN (see the CAN1\_STOP\_ARK and CAN2\_STOP\_ARK in the register IOMUXC\_GPR4) . The CPU must only consider the FlexCAN in Stop Mode when both request and acknowledgement conditions are satisfied.

If FlexCAN receives the global Stop Mode request during Freeze Mode, it sets the LPM\_ACK bit, negates the FRZ\_ACK bit and then sends the Stop Acknowledge signal to the CPU, in order to shut down the clocks globally. If Stop Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN\_RX input pin and drives its FLEXCAN\_TX pin as recessive
- Sets the NOT\_RDY and LPM\_ACK bits in MCR
- Sends a Stop Acknowledge signal to the CPU, so that it can shut down the clocks globally

Exiting Stop Mode is done in one of the following ways:

- ARM resuming the clocks and removing the Stop Mode request
- ARM resuming the clocks and Stop Mode request as a result of the Self Wake mechanism

In the Self Wake mechanism, if the SLF\_WAK bit in MCR Register was set at the time FlexCAN entered Stop Mode, then upon detection of a recessive to dominant transition on the CAN bus, FlexCAN sets the WAK\_INT bit in the ESR Register and, if enabled by the WAK\_MSK bit in MCR, generates a Wake Up interrupt to the ARM. Upon receiving the interrupt, the ARM should resume the clocks and remove the Stop Mode request manually. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up.

The sensitivity to CAN bus activity can be modified by applying a low-pass filter function to the FLEXCAN\_RX input line while in Stop Mode. See the WAK\_SRC bit in [Module Configuration Register \(FLEXCAN\\_MCR\)](#) . This feature can be used to protect FlexCAN from waking up due to short glitches on the CAN bus lines. Such glitches can result from electromagnetic interference within noisy environments.

## 27.6.11 Interrupts

The module can generate up to 70 interrupt sources (64 interrupts due to message buffers and 6 interrupts due to Ored interrupts from MBs, Bus Off, Error, Tx Warning, Rx Warning and Wake Up)).

The number of actual sources depends on the configured number of message buffers.

Each one of the message buffers can be an interrupt source, if its corresponding IMASK bit is set. There is no distinction between Tx and Rx interrupts for a particular buffer, under the assumption that the buffer is initialized for either transmission or reception. Each of the buffers has assigned a flag bit in the IFLAG Registers. The bit is set when the corresponding buffer completes a successful transmission/reception and is cleared when the ARM writes it to '1' (unless another interrupt is generated at the same time).

If the Rx FIFO is enabled (bit RFEN on MCR set), the interrupts corresponding to MBs 0 to 7 have a different behavior. Bit 7 of the IFLAG1 becomes the "FIFO Overflow" flag; bit 6 becomes the FIFO Warning flag, bit 5 becomes the "Frames Available in FIFO flag" and bits 4-0 are unused. See [Interrupt Flags 1 Register \(FLEXCAN\\_IFLAG1\)](#) for more information.

A combined interrupt for all MBs is also generated by an Or of all the interrupt sources from MBs. This interrupt gets generated when any of the Mailboxes or FIFO generates an interrupt. The ARM must read the IFLAG Registers to determine which MB or FIFO caused the interrupt.

The other 5 interrupt sources (Bus Off, Error, Tx Warning, Rx Warning and Wake Up generate interrupts like the MB ones, and can be read from both the Error and Status Register 1 and 2. The Bus Off, Error, Tx Warning and Rx Warning interrupt mask bits are located in the Control 1 Register and the Wake-Up interrupt mask bit is located in the MCR.

## 27.7 Initialization/Application Information

This section provide instructions for initializing the FLEXCAN module.

### 27.7.1 FLEXCAN Initialization Sequence

The FLEXCAN module may be reset in two ways:

- SOC level hard reset which resets all memory mapped registers asynchronously
- SOFT\_RST bit in MCR, which resets some of the memory mapped registers synchronously

Soft reset is synchronous and has to follow an internal request/acknowledge procedure across clock domains. Therefore, it may take some time to fully propagate its effects. The SOFT\_RST bit remains asserted while soft reset is pending, so software can poll this bit to know when the reset has completed. Also, soft reset can not be applied while clocks are shut down in any of the low power modes. The low power mode should be exited and the clocks resumed before applying soft reset.

After the module is enabled (MDIS bit negated), FLEXCAN automatically goes to Freeze Mode. In Freeze Mode, FLEXCAN is un-synchronized to the CAN bus, the HALT and FRZ bits in MCR Register are set, the internal state machines are disabled and the FRZ\_ACK and NOT\_RDY bits in the MCR Register are set. The FLEXCAN\_TX pin is in recessive state and FLEXCAN does not initiate any transmission or reception of CAN frames. Note that the Message Buffers and the Rx Individual Mask Registers are not affected by reset, so they are not automatically initialized.

For any configuration change/initialization it is required that FLEXCAN is put into Freeze Mode. The following is a generic initialization sequence applicable to the FLEXCAN module:

- Initialize the Module Configuration Register
  - Enable the individual filtering per MB and reception queue features by setting the IRMQ bit
  - Enable the warning interrupts by setting the WRN\_EN bit
  - If required, disable frame self reception by setting the SRX\_DIS bit
  - Enable the FIFO by setting the RFEN bit
  - Enable the abort mechanism by setting the AEN bit
  - Enable the local priority feature by setting the LPRIO\_EN bit
- Initialize the Control Register
  - Determine the bit timing parameters: PROPSEG, PSEG1, PSEG2, RJW
  - Determine the bit rate by programming the PRES DIV field
  - Determine the internal arbitration mode (LBUF bit)
- Initialize the Message Buffers
  - The Control and Status word of all Message Buffers must be initialized
  - If FIFO was enabled, the 8-entry ID table must be initialized
  - Other entries in each Message Buffer should be initialized as required
- Initialize the Rx Individual Mask Registers

## FLEXCAN Memory Map/Register Definition

- Set required interrupt mask bits in the IMASK Registers (for all MB interrupts), in CTRL Register (for Bus Off and Error interrupts) and in MCR Register for Wake-Up interrupt
- Negate the HALT bit in MCR

Starting with the last event, FLEXCAN attempts to synchronize to the CAN bus.

## 27.8 FLEXCAN Memory Map/Register Definition

The complete memory map for a FLEXCAN module with 64 MBs capability is shown in the following table. Each individual register is identified by its complete name and the corresponding mnemonic. The access type can be Supervisor (S) or Unrestricted (U). Most of the registers can be configured to have either Supervisor or Unrestricted access by programming the SUPV bit in the MCR Register. The MCR register allows only Supervisor access regardless the SUPV bit state.

The FLEXCAN module stores CAN messages for transmission and reception using a Mailboxes and Rx FIFO structure.

**FLEXCAN memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 27.8.1 Module Configuration Register (FLEXCANx\_MCR)

This register defines global system configurations, such as the module operation mode (e.g., low power) and maximum message buffer configuration.

Address: Base address + 0h offset

**FLEXCANx\_MCR field descriptions**

Field	Description
31 MDIS	This bit controls whether FLEXCAN is enabled or not. When disabled, FLEXCAN shuts down the clocks to the CAN Protocol Interface and Message Buffer Management sub-modules. This is the only bit in MCR not affected by soft reset. See <a href="#">Module Disable Mode</a> for more information.  1 Disable the FLEXCAN module 0 Enable the FLEXCAN module
30 FRZ	The FRZ bit specifies the FLEXCAN behavior when the HALT bit in the MCR Register is set or when Debug Mode is requested at ARM level. When FRZ is asserted, FLEXCAN is enabled to enter Freeze Mode. Negation of this bit field causes FLEXCAN to exit from Freeze Mode.  1 Enabled to enter Freeze Mode 0 Not enabled to enter Freeze Mode
29 RFEN	This bit controls whether the Rx FIFO feature is enabled or not. When RFEN is set, MBs 0 to 5 cannot be used for normal reception and transmission because the corresponding memory region (0x80-0xDC) is used by the FIFO engine as well as additional MBs (up to 32, depending on CTRL2[RFFN] setting) which are used as Rx FIFO ID Filter Table elements. RFEN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 27-17</a> (see <a href="#">Arbitration and Matching Timing</a> ). This bit can only be written in Freeze mode as it is blocked by hardware in other modes.  1 FIFO enabled 0 FIFO not enabled
28 HALT	Assertion of this bit puts the FLEXCAN module into Freeze Mode. The ARM should clear it after initializing the Message Buffers and Control Register. No reception or transmission is performed by FLEXCAN before this bit is cleared. Freeze Mode can not be entered while FLEXCAN is in any of the low power modes. See <a href="#">Freeze Mode</a> for more information  1 Enters Freeze Mode if the FRZ bit is asserted. 0 No Freeze Mode request.

Table continues on the next page...

## FLEXCANx\_MCR field descriptions (continued)

Field	Description
27 NOT_RDY	<p>This read-only bit indicates that FLEXCAN is either in Disable Mode, Stop Mode or Freeze Mode. It is negated once FLEXCAN has exited these modes.</p> <p>1 FLEXCAN module is either in Disable Mode, Stop Mode or Freeze Mode 0 FLEXCAN module is either in Normal Mode, Listen-Only Mode or Loop-Back Mode</p>
26 WAK_MSK	<p>This bit enables the Wake Up Interrupt generation.</p> <p>1 Wake Up Interrupt is enabled 0 Wake Up Interrupt is disabled</p>
25 SOFT_RST	<p>When this bit is asserted, FlexCAN resets its internal state machines and some of the memory mapped registers. The following registers are reset: MCR (except the MDIS bit), TIMER, ECR, ESR1, ESR2, IMASK1, IMASK2, IFLAG1, IFLAG2 and CRCR. Configuration registers that control the interface to the CAN bus are not affected by soft reset. The following registers are unaffected: CTRL1, CTRL2, RXIMR0_RXIMR63, RXGMASK, RX14MASK, RX15MASK, RXFGMASK, RXFIR and all Message Buffers</p> <p>The SOFT_RST bit can be asserted directly by the ARM when it writes to the MCR Register. It may take some time to fully propagate its effect. The SOFT_RST bit remains asserted while reset is pending, and is automatically negated when reset completes. Therefore, software can poll this bit to know when the soft reset has completed.</p> <p>Soft reset cannot be applied while clocks are shut down in any of the low power modes. The module should be first removed from low power mode, and then soft reset can be applied.</p> <p>1 Reset the registers 0 No reset request</p>
24 FRZ_ACK	<p>This read-only bit indicates that FLEXCAN is in Freeze Mode and its prescaler is stopped. The Freeze Mode request cannot be granted until current transmission or reception processes have finished. Therefore the software can poll the FRZ_ACK bit to know when FLEXCAN has actually entered Freeze Mode. If Freeze Mode request is negated, then this bit is negated once the FLEXCAN prescaler is running again. If Freeze Mode is requested while FLEXCAN is in any of the low power modes, then the FRZ_ACK bit will only be set when the low power mode is exited. See <a href="#">Freeze Mode</a> for more information</p> <p>1 FLEXCAN in Freeze Mode, prescaler stopped 0 FLEXCAN not in Freeze Mode, prescaler running</p>
23 SUPV	<p>This bit configures some of the FLEXCAN registers to be either in Supervisor or User Mode. Reset value of this bit is '1', so the affected registers start with Supervisor access allowance only. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FlexCAN is in Supervisor Mode. Affected registers allow only Supervisor access. Unrestricted access behaves as though the access was done to an unimplemented register location 0 FlexCAN is in User Mode. Affected registers allow both Supervisor and Unrestricted accesses</p>
22 SLF_WAK	<p>This bit enables the Self Wake Up feature when FLEXCAN is in Stop Mode. If this bit had been asserted by the time FLEXCAN entered Stop Mode, then FLEXCAN will look for a recessive to dominant transition on the bus during these modes. If a transition from recessive to dominant is detected during Stop Mode, then FLEXCAN generates, if enabled to do so, a Wake Up interrupt to the ARM so that it can resume the clocks globally and FlexCAN can request to resume the clocks. This bit can not be written while the module is in Stop Mode.</p> <p>1 FLEXCAN Self Wake Up feature is enabled 0 FLEXCAN Self Wake Up feature is disabled</p>
21 WRN_EN	<p>When asserted, this bit enables the generation of the TWRN_INT and RWRN_INT flags in the Error and Status Register. If WRN_EN is negated, the TWRN_INT and RWRN_INT flags will always be zero,</p>

Table continues on the next page...

## FLEXCANx\_MCR field descriptions (continued)

Field	Description
	<p>independent of the values of the error counters, and no warning interrupt will ever be generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 TWRN_INT and RWRN_INT bits are set when the respective error counter transition from <math>&lt;96</math> to <math>\geq 96</math>.  0 TWRN_INT and RWRN_INT bits are zero, independent of the values in the error counters.</p>
20 LPM_ACK	<p>This read-only bit indicates that FLEXCAN is either in Disable Mode or Stop Mode. Either of these low power modes can not be entered until all current transmission or reception processes have finished, so the ARM can poll the LPM_ACK bit to know when FLEXCAN has actually entered low power mode. See <a href="#">Module Disable Mode</a>, and <a href="#">Stop Mode</a> for more information</p> <p>1 FLEXCAN is either in Disable Mode, or Stop mode  0 FLEXCAN not in any of the low power modes</p>
19 WAK_SRC	<p>This bit defines whether the integrated low-pass filter is applied to protect the FLEXCAN_RX input from spurious wake up. See <a href="#">Stop Mode</a> for more information. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FLEXCAN uses the filtered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus  0 FLEXCAN uses the unfiltered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus.</p>
18 -	<p>This field is reserved.  Reserved</p>
17 SRX_DIS	<p>This bit defines whether FlexCAN is allowed to receive frames transmitted by itself. If this bit is asserted, frames transmitted by the module will not be stored in any MB, regardless if the MB is programmed with an ID that matches the transmitted frame, and no interrupt flag or interrupt signal will be generated due to the frame reception. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Self reception disabled  0 Self reception enabled</p>
16 IRMQ	<p>This bit indicates whether Rx matching process will be based either on individual masking and queue or on masking scheme with RXMGMASK, RX14MASK and RX15MASK, RXFGMASK. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Individual Rx masking and queue feature are enabled.  0 Individual Rx masking and queue feature are disabled. For backward compatibility, the reading of C/S word locks the MB even if it is EMPTY.</p>
15–14 -	<p>This field is reserved.  Reserved</p>
13 LPRIO_EN	<p>This bit is provided for backwards compatibility reasons. It controls whether the local priority feature is enabled or not. It is used to extend the ID used during the arbitration process. With this extended ID concept, the arbitration process is done based on the full 32-bit word, but the actual transmitted ID still has 11-bit for standard frames and 29-bit for extended frames. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Local Priority enabled  0 Local Priority disabled</p>
12 AEN	<p>This bit is supplied for backwards compatibility reasons. When asserted, it enables the Tx abort feature. This feature guarantees a safe procedure for aborting a pending transmission, so that no frame is sent in the CAN bus without notification. This bit can only be written in Freeze mode as it is blocked by hardware</p>

Table continues on the next page...

## FLEXCANx\_MCR field descriptions (continued)

Field	Description
	<p>in other modes. Write Abort code into Rx Mailboxes can cause unpredictable results when the MCR[AEN] is asserted.</p> <p>1 Abort enabled 0 Abort disabled</p>
11–10 -	This field is reserved. Reserved
9–8 IDAM	<p>This 2-bit field identifies the format of the elements of the Rx FIFO filter table, as shown below. Note that all elements of the table are configured at the same time by this field (they are all the same format). See <a href="#">Rx FIFO Structure</a>. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>00 Format A One full ID (standard or extended) per ID filter Table element. 01 Format B Two full standard IDs or two partial 14-bit extended IDs per ID filter Table element. 10 Format C Four partial 8-bit IDs (standard or extended) per ID filter Table element. 11 Format D All frames rejected.</p>
7 -	This field is reserved. Reserved
MAXMB	<p>This 7-bit field defines the number of the last Message Buffers that will take part in the matching and arbitration processes. The reset value (0x0F) is equivalent to 16 MB configuration. This field can only be written in Freeze Mode as it is blocked by hardware in other modes</p> <p>Number of the last MB = MAXMB.</p> <p><b>NOTE:</b> Additionally, the value of MAXMB must encompass the FIFO size defined by CTRL2[RFFN]</p> <p>MAXMB also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 27-17</a> (see <a href="#">Arbitration and Matching Timing</a>).</p>

## 27.8.2 Control 1 Register (FLEXCANx\_CTRL1)

This register is defined for specific FLEXCAN control features related to the CAN bus, such as bit-rate, programmable sampling point within an Rx bit, Loop Back Mode, Listen Only Mode, Bus Off recovery behavior and interrupt enabling (Bus-Off, Error, Warning). It also determines the Division Factor for the clock prescaler.

Address: Base address + 4h offset

### FLEXCANx\_CTRL1 field descriptions

Field	Description
31–24 PRESDIV	This 8-bit field defines the ratio between the PE clock frequency and the Serial Clock (Sclock) frequency. The Sclock period defines the time quantum of the CAN protocol. For the reset value, the Sclock frequency is equal to the PE clock frequency. The Maximum value of this register is 0xFF, that gives a minimum Sclock frequency equal to the PE clock frequency divided by 256. For more information refer to <a href="#">Protocol Timing</a> . This field can only be written in Freeze mode as it is blocked by hardware in other modes.  Sclock frequency = CPI clock frequency / (PRESDIV+1)
23–22 RJW	This 2-bit field defines the maximum number of time quanta <sup>1</sup> that a bit time can be changed by one re-synchronization. The valid programmable values are 0-3. This field can only be written in Freeze mode as it is blocked by hardware in other modes  Resync Jump Width = RJW + 1.

Table continues on the next page...

## FLEXCANx\_CTRL1 field descriptions (continued)

Field	Description
21–19 PSEG1	This 3-bit field defines the length of Phase Buffer Segment 1 in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 1 = (PSEG1 + 1) x Time-Quanta.
18–16 PSEG2	This 3-bit field defines the length of Phase Buffer Segment 2 in the bit time. The valid programmable values are 1-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 2 = (PSEG2 + 1) x Time-Quanta.
15 BOFF_MSK	This bit provides a mask for the Bus Off Interrupt. 1 Bus Off interrupt enabled 0 Bus Off interrupt disabled
14 ERR_MSK	This bit provides a mask for the Error Interrupt. 1 Error interrupt enabled 0 Error interrupt disabled
13 -	This field is reserved. Reserved
12 LPB	This bit configures FlexCAN to operate in Loop-Back Mode. In this mode, FlexCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is fed back internally to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FlexCAN behaves as it normally does when transmitting, and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field, generating an internal acknowledge bit to ensure proper reception of its own message. Both transmit and receive interrupts are generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Loop Back enabled 0 Loop Back disabled
11 TWRN_MSK	This bit provides a mask for the Tx Warning Interrupt associated with the TWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Tx Warning Interrupt enabled 0 Tx Warning Interrupt disabled
10 RWRN_MSK	This bit provides a mask for the Rx Warning Interrupt associated with the RWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Rx Warning Interrupt enabled 0 Rx Warning Interrupt disabled
9–8 -	This field is reserved. Reserved
7 SMP	This bit defines the sampling mode of CAN bits at the FLEXCAN_RX. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Three samples are used to determine the value of the received bit: the regular one (sample point) and 2 preceding samples, a majority rule is used 0 Just one sample is used to determine the bit value
6 BOFF_REC	This bit defines how FLEXCAN recovers from Bus Off state. If this bit is negated, automatic recovering from Bus Off state occurs according to the CAN Specification 2.0B. If the bit is asserted, automatic recovering from Bus Off is disabled and the module remains in Bus Off state until the bit is negated by the

*Table continues on the next page...*

**FLEXCANx\_CTRL1 field descriptions (continued)**

Field	Description
	<p>user. If the negation occurs before 128 sequences of 11 recessive bits are detected on the CAN bus, then Bus Off recovery happens as if the BOFF_REC bit had never been asserted. If the negation occurs after 128 sequences of 11 recessive bits occurred, then FLEXCAN will re-synchronize to the bus by waiting for 11 recessive bits before joining the bus. After negation, the BOFF_REC bit can be re-asserted again during Bus Off, but it will only be effective the next time the module enters Bus Off. If BOFF_REC was negated when the module entered Bus Off, asserting it during Bus Off will not be effective for the current Bus Off recovery.</p> <p>1 Automatic recovering from Bus Off state disabled 0 Automatic recovering from Bus Off state enabled, according to CAN Spec 2.0 part B</p>
5 TSYN	<p>This bit enables a mechanism that resets the free-running timer each time a message is received in Message Buffer 0. This feature provides means to synchronize multiple FLEXCAN stations with a special "SYNC" message (i.e., global network time). If the RFEN bit in MCR is set (FIFO enabled), the first available Mailbox, according to CTRL2[RFFN] setting, is used for timer synchronization instead of MB0. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Timer Sync feature enabled 0 Timer Sync feature disabled</p>
4 LBUF	<p>This bit defines the ordering mechanism for Message Buffer transmission. When asserted, the LPRIO_EN bit does not affect the priority arbitration. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Lowest number buffer is transmitted first 0 Buffer with highest priority is transmitted first</p>
3 LOM	<p>This bit configures FLEXCAN to operate in Listen Only Mode. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.</p> <p>Listen-Only Mode acknowledgement can be obtained by the state of ESR1[FLT_CONF] field which is Passive Error when Listen-Only Mode is entered. There can be some delay between the Listen-Only Mode request and acknowledge.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FLEXCAN module operates in Listen Only Mode 0 Listen Only Mode is deactivated</p>
PROP_SEG	<p>This 3-bit field defines the length of the Propagation Segment in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes</p> <p>Propagation Segment Time = (PROPSEG + 1) * Time-Quanta. Time-Quantum = one Sclock period.</p>

1. One time quantum is equal to the Sclock period.

### 27.8.3 Free Running Timer Register (FLEXCANx\_TIMER)

This register represents a 16-bit free running counter that can be read and written by the ARM. The timer starts from \$0000 after Reset, counts linearly to \$FFFF, and wraps around.

The timer is clocked by the FLEXCAN bit-clock (which defines the baud rate on the CAN bus). During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate. During Freeze Mode, disable, and stop mode, the timer is not incremented.

The timer value is captured at the beginning of the identifier field of any frame on the CAN bus. This captured value is written into the Time Stamp entry in a message buffer after a successful reception or transmission of a message.

If bit CTRL1[TSYN] is asserted the Timer is reset whenever a message is received in the first available Mailbox, according to CTRL2[RFFN] setting.

ARM can write to this register anytime. However, if the write occurs at the same time that the Timer is being reset by a reception in the first Mailbox, then the write value is discarded.

Reading this register affects the Mailbox Unlocking procedure. For additional details, refer to [Message Buffer Lock Mechanism](#).

Address: Base address + 8h offset

**27.8.4 Rx Mailboxes Global Mask Register (FLEXCANx\_RXMGMASK)**

RXMGMASK is provided for legacy support. Asserting the MCR[IRMQ] bit causes the RXMGMASK Register to have no effect on the module operation.

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

Table 27-48. Rx Mailboxes Global Mask usage

SMB[RTR] <sup>1</sup>	CTRL2[RRS]	CTRL2[EACEN]	Mailbox filter fields			
			MB[RTR]	MB[IDE]	MB[ID]	reserved
0	-	0	- Note <sup>2</sup>	- Note <sup>3</sup>	MG[28:0]	MG[31:29]

### FLEXCANx\_RXMGMASK field descriptions

Field	Description
MG31_MG0	<p>These bits mask the Mailbox filter bits as shown in the figure above. Note that the alignment with the ID word of the Mailbox is not perfect as the two most significant MG bits affect the fields RTR and IDE which are located in the Control and Status word of the Mailbox. <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a> shows in detail which MG bits mask each Mailbox filter field.</p> <p>1 The corresponding bit in the filter is checked against the one received  0 the corresponding bit in the filter is "don't care"</p>

## 27.8.5 Rx Buffer 14 Mask Register (FLEXCANx\_RX14MASK)

RX14MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX14MASK to have no effect on the module operation.

RX14MASK is used to mask the filter fields of Message Buffer 14.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
RX14M31_ RX14M0	<p>These bits mask Mailbox 14 filter bits in the same fashion as RXMGMASK masks other Mailboxes filters (see <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a>)</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

**27.8.6 Rx Buffer 15 Mask Register (FLEXCANx\_RX15MASK)**

RX15MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX15MASK Register to have no effect on the module operation.

RX15MASK is used to mask the filter fields of Message Buffer 15.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

Address: Base address + 18h offset

**FLEXCANx\_RX15MASK field descriptions**

Field	Description
RX15M31_ RX15M0	<p>These bits mask Mailbox 15 filter bits in the same fashion as RXMGMASK masks other Mailboxes filters (see <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a>).</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

**27.8.7 Error Counter Register (FLEXCANx\_ECR)**

This register has 2 8-bit fields reflecting the value of two FLEXCAN error counters: Transmit Error Counter (Tx\_Err\_Counter field) and Receive Error Counter (Rx\_Err\_Counter field). The rules for increasing and decreasing these counters are described in the CAN protocol and are completely implemented in the FLEXCAN module. Both counters are read only except in Freeze Mode, where they can be written by the ARM.

FLEXCAN responds to any bus state as described in the protocol, e.g. transmit 'Error Active' or 'Error Passive' flag, delay its transmission start time ('Error Passive') and avoid any influence on the bus when in 'Bus Off' state. The following are the basic rules for FLEXCAN bus state transitions.

- If the value of Tx\_Err\_Counter or Rx\_Err\_Counter increases to be greater than or equal to 128, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Error Passive' state.
- If the FLEXCAN state is 'Error Passive', and either Tx\_Err\_Counter or Rx\_Err\_Counter decrements to a value less than or equal to 127 while the other already satisfies this condition, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Error Active' state.
- If the value of Tx\_Err\_Counter increases to be greater than 255, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Bus Off' state, and an interrupt may be issued. The value of Tx\_Err\_Counter is then reset to zero.
- If FLEXCAN is in 'Bus Off' state, then Tx\_Err\_Counter is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, Tx\_Err\_Counter is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around while incrementing the Tx\_Err\_Counter. When Tx\_Err\_Counter reaches the value of 128, the FLT\_CONF field in the Error and Status Register is updated to be 'Error Active' and both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the Tx\_Err\_Counter value.
- If during system start-up, only one node is operating, then its Tx\_Err\_Counter increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACK\_ERR bit in the Error and Status Register). After the transition to 'Error Passive' state, the Tx\_Err\_Counter does not increment anymore by acknowledge errors. Therefore the device never goes to the 'Bus Off' state.
- If the Rx\_Err\_Counter increases to a value greater than 127, it is not incremented further, even if more errors are detected while being a receiver. At the next successful message reception, the counter is set to a value between 119 and 127 to resume to 'Error Active' state.

Tx_Err_Counter	Tx_Err_Counter

**27.8.8 Error and Status 1 Register (FLEXCANx\_ESR1)**

This register reflects various error conditions, some general status of the device and it is the source of four interrupts to the ARM.

The ARM read action clears bits 15-10, therefore the reported *error conditions*(bits 15-10) are those that occurred since the last time the ARM read this register. Bits 9-3 are status bits.

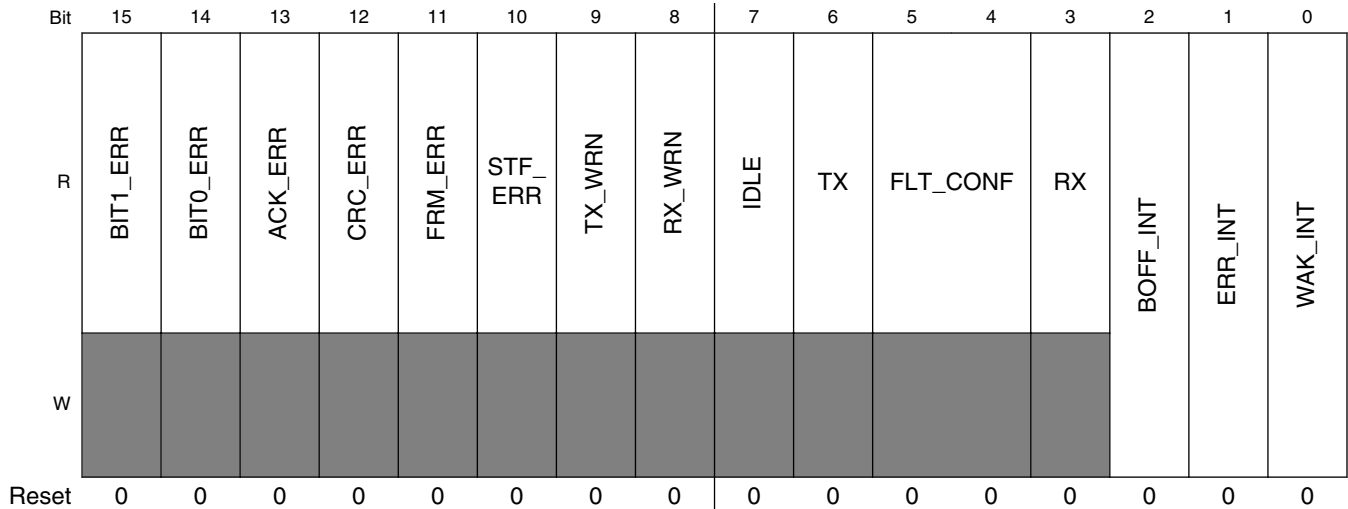

Some bits in this register are read-only and some are not.

**Table 27-53. FlexCAN State**

SYNCH	IDLE	TX	RX	FlexCAN state
0	0	0	0	Not synchronized to CAN bus
1	1	x	x	Idle
1	0	1	0	Transmitting
1	0	0	1	Receiving
other combinations				Reserved

Address: Base address + 20h offset

**FLEXCANx\_ESR1 field descriptions**

Field	Description
31–19 -	This field is reserved. Reserved
18 SYNCH	This read-only flag indicates whether the FlexCAN is synchronized to the CAN bus and able to participate in the communication process. It is set and cleared by the FlexCAN. Refer to <a href="#">Table 27-28</a>  1 FlexCAN is synchronized to the CAN bus 0 FlexCAN is not synchronized to the CAN bus
17 TWRN_INT	If the WRN_EN bit in MCR is asserted, the TWRN_INT bit is set when the TX_WRN flag transition from '0' to '1', meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control Register (TWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This flag is not generated during "Bus Off" state. This bit is not updated during Freeze mode.  1 The Tx error counter transition from < 96 to >= 96 0 No such occurrence
16 RWRN_INT	If the WRN_EN bit in MCR is asserted, the RWRN_INT bit is set when the RX_WRN flag transition from '0' to '1', meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control Register (RWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This bit is not updated during Freeze mode.  1 The Rx error counter transition from < 96 to >= 96 0 No such occurrence
15 BIT1_ERR	This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.  This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits.  1 At least one bit sent as recessive is received as dominant 0 No such occurrence

Table continues on the next page...

## FLEXCANx\_ESR1 field descriptions (continued)

Field	Description
14 BIT0_ERR	This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.  1 At least one bit sent as dominant is received as recessive 0 No such occurrence
13 ACK_ERR	This bit indicates that an Acknowledge Error has been detected by the transmitter node, i.e., a dominant bit has not been detected during the ACK SLOT.  1 An ACK error occurred since last read of this register 0 No such occurrence
12 CRC_ERR	This bit indicates that a CRC Error has been detected by the receiver node, i.e., the calculated CRC is different from the received.  1 A CRC error occurred since last read of this register. 0 No such occurrence
11 FRM_ERR	This bit indicates that a Form Error has been detected by the receiver node, i.e., a fixed-form bit field contains at least one illegal bit.  1 A Form Error occurred since last read of this register 0 No such occurrence
10 STF_ERR	This bit indicates that a Stuffing Error has been detected.  1 A Stuffing Error occurred since last read of this register. 0 No such occurrence.
9 TX_WRN	This bit indicates when repetitive errors are occurring during message transmission.  1 TX_Err_Counter $\geq$ 96 0 No such occurrence
8 RX_WRN	This bit indicates when repetitive errors are occurring during message reception.  1 Rx_Err_Counter $\geq$ 96 0 No such occurrence
7 IDLE	This bit indicates when CAN bus is in IDLE state.Refer to <a href="#">Table 27-28</a> .  1 CAN bus is now IDLE 0 No such occurrence
6 TX	This bit indicates if FLEXCAN is transmitting a message.Refer to <a href="#">Table 27-28</a> .  1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message
5-4 FLT_CONF	If the LOM bit in the Control Register is asserted, after some delay that depends on the CAN bit timing the FLT_CONF field will indicate "Error Passive". The very same delay affects the way how FLT_CONF reflects an update to ECR register by the ARM. It may be necessary up to one CAN bit time to get them coherent again.  Since the Control Register is not affected by soft reset, the FLT_CONF field will not be affected by soft reset if the LOM bit is asserted.  This 2-bit field indicates the Confinement State of the FLEXCAN module, as shown in below:  00 Error Active

Table continues on the next page...

## FLEXCANx\_ESR1 field descriptions (continued)

Field	Description
	01 Error Passive 1x Bus off
3 RX	This bit indicates if FlexCAN is receiving a message. Refer to <a href="#">Table 27-28</a> .  1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message
2 BOFF_INT	This bit is set when FLEXCAN enters 'Bus Off' state. If the corresponding mask bit in the Control Register (BOFF_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect.  1 FLEXCAN module entered 'Bus Off' state 0 No such occurrence
1 ERR_INT	This bit indicates that at least one of the Error Bits (bits 15-10) is set. If the corresponding mask bit in the Control Register (ERR_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect.  1 Indicates setting of any Error Bit in the Error and Status Register 0 No such occurrence
0 WAK_INT	When FLEXCAN is Stop Mode and a recessive to dominant transition is detected on the CAN bus and if the WAK_MSK bit in the MCR Register is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When SLF_WAK is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the SLF_WAK is set again. Writing '0' has no effect  1 Indicates a recessive to dominant transition received on the CAN bus when the FLEXCAN module is in Stop Mode 0 No such occurrence

## 27.8.9 Interrupt Masks 2 Register (FLEXCANx\_IMASK2)

This register allows any number of a range of 32 Message Buffer Interrupts to be enabled or disabled. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e. when the corresponding IFLAG2 bit is set).

Address: Base address + 24h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## FLEXCANx\_IMASK2 field descriptions

Field	Description
BUF63M_ BUF32M	Each bit enables or disables the respective FLEXCAN Message Buffer (MB32 to MB63) Interrupt.

**FLEXCANx\_IMASK2 field descriptions (continued)**

Field	Description
	Setting or clearing a bit in the IMASK2 Register can assert or negate an interrupt request, if the corresponding IFLAG2 bit is set.
1	The corresponding buffer Interrupt is enabled
0	The corresponding buffer Interrupt is disabled

**27.8.10 Interrupt Masks 1 Register (FLEXCANx\_IMASK1)**

This register allows to enable or disable any number of a range of 32 Message Buffer Interrupts. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e., when the corresponding IFLAG1 bit is set).

Address: Base address + 28h offset

**FLEXCANx\_IMASK1 field descriptions**

Field	Description
BUF31M_BUF0M	Each bit enables or disables the respective FLEXCAN Message Buffer (MB0 to MB31) Interrupt. Setting or clearing a bit in the IMASK1 Register can assert or negate an interrupt request, if the corresponding IFLAG1 bit is set
1	The corresponding buffer Interrupt is enabled
0	The corresponding buffer Interrupt is disabled

## 27.8.11 Interrupt Flags 2 Register (FLEXCANx\_IFLAG2)

This register defines the flags for 32 Message Buffer interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG2 bit. If the corresponding IMASK2 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect. Before updating MCR[MAXMB] field, ARM must treat the IFLAG2 bits which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 2Ch offset

### FLEXCANx\_IFLAG2 field descriptions

Field	Description
BUF63I_BUF32I	Each bit flags the respective FLEXCAN Message Buffer (MB32 to MB63) interrupt. <ul style="list-style-type: none"> <li>1 The corresponding buffer has successfully completed transmission or reception</li> <li>0 No such occurrence</li> </ul>

## 27.8.12 Interrupt Flags 1 Register (FLEXCANx\_IFLAG1)

This register defines the flags for 32 Message Buffer interrupts and FIFO interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG1 bit. If the corresponding IMASK1 bit is set, an interrupt will be generated. The Interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect.

When the RFEN bit in the MCR is set (Rx FIFO enabled), the function of the 8 least significant interrupt flags (BUF7I - BUF0I) is changed to support the FIFO operation. BUF7I, BUF6I and BUF5I indicate operating conditions of the FIFO, while BUF4I to BUF0I are not used. Before enabling the RFEN, ARM must service the IFLAGS asserted in the Rx FIFO region (see [Rx FIFO](#)). Otherwise, these IFLAGS will mistakenly show the related MBs now belonging to FIFO as having contents to be serviced. When the RFEN is negated, the FIFO flags must be cleared. The same care must be taken when a

## FLEXCAN Memory Map/Register Definition

RFFN value is selected extending Rx FIFO filters beyond MB7 (see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)). For example, when RFFN is 0x8, the MB0-23 range is occupied by Rx FIFO filters and related IFLAGS must be cleared.

Before updating MCR[MAXMB] field, ARM must service the IFLAG1 which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 30h offset

### FLEXCANx\_IFLAG1 field descriptions

Field	Description
31–8 BUF31I_BUF8I	Each bit flags the respective FLEXCAN Message Buffer (MB8 to MB31) interrupt.  1 The corresponding MB has successfully completed transmission or reception 0 No such occurrence
7 BUF7I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB7.  If the MCR[RFEN] bit is asserted, this flag indicates that a message was lost because Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.  1 MB7 completed transmission/reception or FIFO overflow 0 No such occurrence
6 BUF6I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB6.  If the MCR[RFEN] bit is asserted, this flag indicates when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared while the number of unread messages is greater than 4 it will not assert again until the number of unread messages within the Rx FIFO is decreased to equal or less than 4.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.  1 MB6 completed transmission/reception or FIFO almost full 0 No such occurrence
5 BUF5I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB5. If the Rx FIFO is enabled, this flag indicates that at least one frame is available to be read from the Rx FIFO.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.

*Table continues on the next page...*

**FLEXCANx\_IFLAG1 field descriptions (continued)**

Field	Description
	1 MB5 completed transmission/reception or frames available in the FIFO 0 No such occurrence
BUF4I_BUF0I	If the Rx FIFO is not enabled, these bits flag the interrupts for MB0 to MB4. If the Rx FIFO is enabled, these flags are not used and must be considered as reserved locations.  These flags are cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.  1 Corresponding MB completed transmission/reception 0 No such occurrence

**27.8.13 Control 2 Register (FLEXCANx\_CTRL2)**

This register contains control bits for CAN errors, FIFO features and mode selection.

**Table 27-59. Rx FIFO Filters**

RFFN[3:0]	Number of Rx FIFO filters	Message Buffers occupied by Rx FIFO and ID Filter Table	Remaining Available Mailboxes <sup>1</sup>	Rx FIFO ID Filter Table Elements Affected by Rx Individual Masks <sup>2</sup>	Rx FIFO ID Filter Table Elements Affected by Rx FIFO Global Mask <sup>2</sup>

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.

2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

Each group of eight filters occupies a memory space equivalent to two Message Buffers which means that the more filters are implemented the less Mailboxes will be available.

Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value corresponding to a number of filters not greater than the number of available memory words which can be calculated as follows:

$$(\text{SETUP\_MB} - 6) \times 4$$

where SETUP\_MB is MAXMB.

The number of remaining Mailboxes available will be:

$$\text{SETUP\_MB} - 8 - (\text{RFFN} \times 2)$$

If the Number of Rx FIFO Filters programmed through RFFN exceeds the SETUP\_MB value, the exceeding ones will not be functional. Unshaded regions in [Table 27-35](#) indicate the valid combinations of MAXMB, RFEN and RFFN, shaded regions are not functional.

Table continues on the next page...

**FLEXCANx\_CTRL2 field descriptions (continued)**

Field	Description
27–24 RFFN	<p>This 4-bit field defines the number of Rx FIFO filters according to <a href="#">Table 27-34</a>. The maximum selectable number of filters is determined by the ARM. This field can only be written in Freeze mode as it is blocked by hardware in other modes. RFFN defines a number of Message Buffers occupied by Rx FIFO and ID Filter (see <a href="#">Table 27-34</a>) that <b>may not exceed</b> the number of available Mailboxes present in module, defined by MCR[MAXMB]. Default RFFN value is 0x0, which leads to a total of 8 Rx FIFO filters, occupies the first 8 Message Buffers (MB 0-7) and makes available the next Message Buffers (MB 8-63) for Mailboxes. As a second example, when RFFN is set to 0xD, there will be 112 Rx FIFO filters, located in MB 0-33, and MB 34-63 are available for Mailboxes. Notice that, in this case, individual masks (RXIMR) will just cover Rx FIFO filters in 0-31 range, and filters 32-111 will use RXFGMASK. In case of reducing the number of last Message Buffers, MCR[MAXMB] (see <a href="#">Module Configuration Register (FLEXCAN_MCR)</a>) can be adjusted by the application to minimum of 33, in order to give room to the Rx FIFO and its ID Filter Table defined by RFFN. On the contrary, if the application sets MCR[MAXMB] to 16, for instance, the maximum RFFN is limited to 0x4. RFFN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 27-17</a> (see <a href="#">Arbitration and Matching Timing</a>).</p>
23–19 TASD	<p>This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. This field can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>This field is useful to optimize the transmit performance based on factors such as: peripheral/serial clock ratio, CAN bit timing and number of MBs. The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and CAN baud rate and inversely proportional to the peripheral clock frequency.</p> <p>The optimal arbitration timing is that in which the last MB is scanned right before the first bit of the Intermission field of a CAN frame. Therefore, if there are few MBs and the system/serial clock ratio is high and the CAN baud rate is low then the arbitration can be delayed and vice-versa.</p> <p>If TASD is 0 then the arbitration start is not delayed, thus ARM has less time to configure a Tx MB for the next arbitration, but more time is reserved for arbitration. In the other hand, if TASD is 24 then ARM can configure a Tx MB later and less time is reserved for arbitration.</p> <p>If too little time is reserved for arbitration the FlexCAN may be not able to find winner MBs in time to compete with other nodes for the CAN bus. If the arbitration ends too much time before the first bit of Intermission field then there is a chance that ARM reconfigure some Tx MBs and the winner MB is not the best to be transmitted.</p> <p>The reset value is different on various platforms, according to their peripheral clock frequency, number of MBs and target CAN baud rate.</p> <p>The optimal configuration for TASD can be calculated as:</p> $TASD = 25 - \left\{ \frac{f_{CANCLK} \times [MAXMB + 3 - (RFEN \times 8) - (RFEN \times RFFN \times 2)] \times 2}{f_{sys} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRES DIV + 1)} \right\}$ <p>where:</p> <p><math>f_{CANCLK}</math> is the Protocol Engine (PE) Clock in Hz; PE clock is derived from CAN_CLK_ROOT in CCM. See <a href="#">Clock Root Generator</a></p>

Table continues on the next page...

## FLEXCANx\_CTRL2 field descriptions (continued)

Field	Description
	<p><math>f_{SYS}</math> is the peripheral clock in Hz;</p> <p>MAXMB is the value in CTRL1[MAXMB] field;</p> <p>RFEN is the value in CTRL1[RFEN] bit;</p> <p>RFFN is the value in CTRL2[RFFN] field;</p> <p>PSEG1 is the value in CTRL1[PSEG1] field;</p> <p>PSEG2 is the value in CTRL1[PSEG2] field;</p> <p>PROPSEG is the value in CTRL1[PROPSEG] field;</p> <p>PRES DIV is the value in CTRL1[PRES DIV] field.</p> <p>Please refer to <a href="#">Arbitration process</a> and <a href="#">Protocol Timing</a> for more details.</p>
18 MRP	<p>If this bit is set the matching process starts from the Mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Matching starts from Mailboxes and continues on Rx FIFO 0 Matching starts from Rx FIFO and continues on Mailboxes</p>
17 RRS	<p>If this bit is asserted Remote Request Frame is submitted to a matching process and stored in the corresponding Message Buffer in the same fashion of a Data Frame. No automatic Remote Response Frame will be generated.</p> <p>If this bit is negated the Remote Request Frame is submitted to a matching process and an automatic Remote Response Frame is generated if a Message Buffer with CODE=0b1010 is found with the same ID.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Remote Request Frame is stored 0 Remote Response Frame is generated</p>
16 EACEN	<p>This bit controls the comparison of IDE and RTR bits within Rx Mailboxes filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Enables the comparison of both Rx Mailbox filter's IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply. 0 Rx Mailbox filter's IDE bit is always compared and RTR is never compared despite mask bits.</p>
-	<p>This field is reserved. Reserved</p>

### 27.8.14 Error and Status 2 Register (FLEXCANx\_ESR2)

This register reflects various interrupt flags and some general status.

Address: Base address + 38h offset

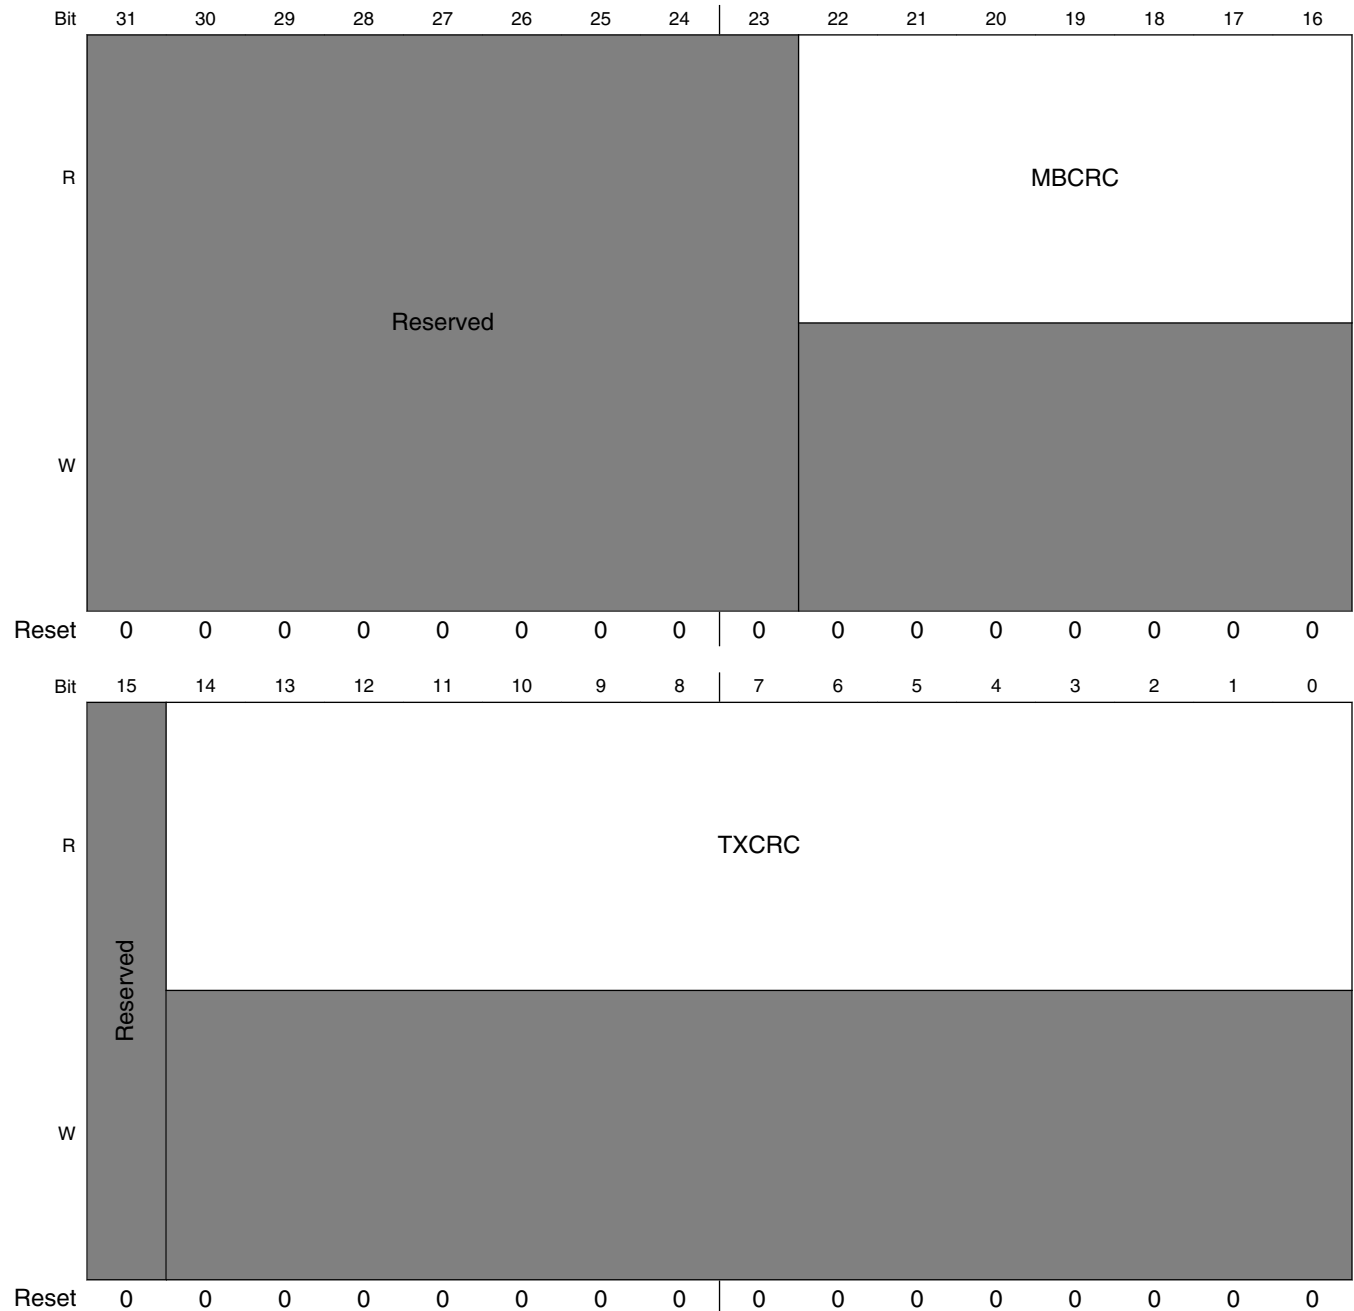

## FLEXCANx\_ESR2 field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 LPTM	If ESR2[VPS] is asserted, this 7-bit field indicates the lowest number inactive Mailbox (refer to IMB bit description). If there is no inactive Mailbox then the Mailbox indicated depends on CTRL1[LBUF] bit value. If CTRL1[LBUF] bit is negated then the Mailbox indicated is the one which has the greatest arbitration value (see <a href="#">Highest Mailbox priority first</a> ). If CTRL1[LBUF] bit is asserted then the Mailbox indicated is the highest number active Tx Mailbox. If a Tx Mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its Mailbox number.
15 -	This field is reserved. Reserved
14 VPS	This bit indicates whether IMB and LPTM contents are currently valid or not. VPS is asserted upon every complete Tx arbitration process unless the ARM writes to Control and Status word of a Mailbox that has already been scanned (i.e. it is behind Tx Arbitration Pointer) during the Tx arbitration process. If there is no inactive Mailbox and only one Tx Mailbox which is being transmitted then VPS is not asserted. VPS is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any Mailbox. ESR2[VPS] is not affected by any ARM write into Control Status (C/S) of a MB which is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of a MB that is been transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked.  1 Contents of IMB and LPTM are valid 0 Contents of IMB and LPTM are invalid
13 IMB	If ESR2[VPS] is asserted, this bit indicates whether there is any inactive Mailbox (CODE field is either 0b1000 or 0b0000).  This bit is asserted in the following cases: (1) During arbitration, if a LPTM is found and it is inactive. (2) If IMB is not asserted and a frame is transmitted successfully. (3) This bit is cleared in all start of arbitration (see <a href="#">Arbitration process</a> ).  LPTM mechanism have the following behavior: if a MB is successfully transmitted and ESR2[IMB]=0 (no inactive Mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM].  1 If ESR2[VPS] is asserted, there is at least one inactive Mailbox. LPTM content is the number of the first one. 0 If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive Mailbox.
-	This field is reserved. Reserved

### 27.8.15 CRC Register (FLEXCANx\_CRCR)

This register provides information about the CRC of transmitted messages

Address: Base address + 44h offset

## FLEXCANx\_CRCR field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 MBCRC	This field indicates the number of the Mailbox corresponding to the value in TXCRC field.
15 -	This field is reserved. Reserved
TXCRC	This field indicates the CRC value of the last message transmitted. This field is updated at the same time the Tx Interrupt Flag is asserted.

### 27.8.16 Rx FIFO Global Mask Register (FLEXCANx\_RXFGMASK)

If Rx FIFO is enabled RXFGMASK is used to mask the Rx FIFO ID Filter Table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze Mode as it is blocked by hardware in other modes.

**Table 27-64. Rx FIFO Global Mask usage**

Rx FIFO ID Filter Table Elements Format (MCR[IDAM])	Identifier Acceptance Filter fields					
	RTR	IDE	RXIDA	RXIDB	RXIDC	reserved
A	FGM[31]	FGM[30]	FGM[29:1]	-	-	FGM[0]
B	FGM[31] FGM[15]	FGM[30] FGM[14]	-	FGM[29:16] FGM[13:0] 1	-	-
C	-	-	-	-	FGM[31:24] FGM[23:16] FGM[15:8] FGM[7:0] 2	-

1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

## FLEXCAN Memory Map/Register Definition

Address: Base address + 48h offset

### FLEXCANx\_RXFGMASK field descriptions

Field	Description
FGM31_FGM0	<p>These bits mask the ID Filter Table elements bits in a perfect alignment. <a href="#">Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK)</a> shows in detail which FGM bits mask each IDAF field. Clear this register has the effect of disabling the ID Filter.</p> <p>1 The corresponding bit in the filter is checked                      0 The corresponding bit in the filter is "don't care"</p>

## 27.8.17 Rx FIFO Information Register (FLEXCANx\_RXFIR)

RXFIR provides information on Rx FIFO.

This register is the port through which ARM accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO as well as its output is updated whenever the output of the Rx FIFO is updated with the next message. Refer to [Rx FIFO](#) to find instructions on reading this register.

Address: Base address + 4Ch offset

### FLEXCANx\_RXFIR field descriptions

Field	Description
31–9 -	This field is reserved. Reserved
IDHIT	This 9-bit field indicates which Identifier Acceptance Filter (see <a href="#">Rx FIFO Structure</a> ) was hit by the received message that is in the output of the Rx FIFO. (refer to <a href="#">Rx FIFO</a> for details) If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only while the IFLAG[BUF5I] is asserted.

## 27.8.18 Rx Individual Mask Registers (FLEXCANx\_RXIMR0\_RXIMR63)

RXIMR are used as acceptance masks for ID filtering in Rx MBs and the Rx FIFO. If the Rx FIFO is not enabled, one mask register is provided for each available Mailbox, providing ID masking capability on a per Mailbox basis.

When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), up to 32 Rx Individual Mask Registers can apply to the Rx FIFO ID Filter Table elements on a one-to-one correspondence depending on CTRL2[RFFN] setting. Refer to [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for details.

RXIMR can only be written by the ARM while the module is in Freeze Mode, otherwise they are blocked by hardware.

The Individual Rx Mask Registers are not affected by reset and must be explicitly initialized prior to any reception.

Address: Base address + 880h offset

### FLEXCANx\_RXIMR0\_RXIMR63 field descriptions

Field	Description
MI31_MIO	<p>These bits mask both Mailbox filter and Rx FIFO ID Filter Table element in distinct ways.</p> <p>For Mailbox filter refer to <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a>.</p> <p>For Rx FIFO ID Filter Table element refer to <a href="#">Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK)</a>.</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

## 27.8.19 Glitch Filter Width Registers (FLEXCANx\_GFWR)

The Glitch Filter just takes effects when FLEXCAN enters the STOP mode.

Address: Base address + 9E0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	0																	GFWR																
W																		GFWR																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

**FLEXCANx\_GFWR field descriptions**

<b>Field</b>	<b>Description</b>
31–8 Reserved	This read-only field is reserved and always has the value 0.
GFWR	It determines the Glitch Filter Width. The width will be divided from Oscillator clock by GFWR values. By default, it is 5.33us when the oscillator is 24MHz.

# Chapter 28

## General Power Controller (GPC)

### 28.1 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- [DVFS - Dynamic Voltage & Frequency Scaling](#) load tracking for multi-core CPU
- [CPU Power Gating Control \(PGC\)](#)
- GPU/VPU accelerators power gating controller

Each sub-block has its own IP registers.

GPC determines wake-up irq for exiting STOP mode (with or without CPU power gating).

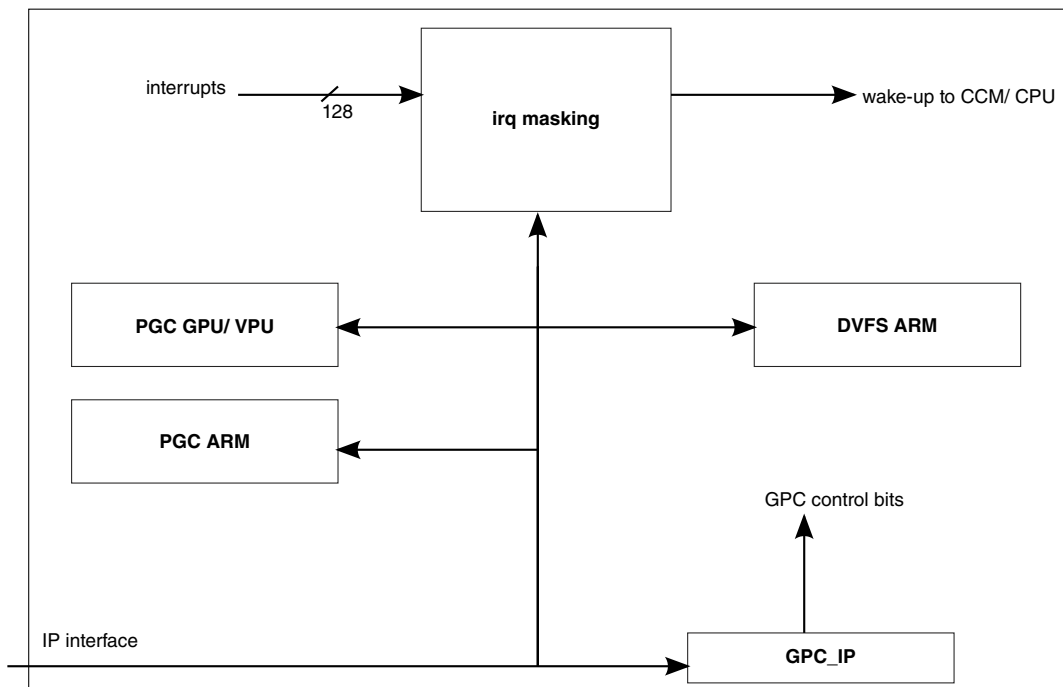

Figure 28-1. GPC Block Diagram

## 28.2 Clocks

The table found here describes the clock sources for GPC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 28-1. GPC Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
pgc_clk	ipg_clk_root	PGC peripheral clock
sys_clk	ipg_clk_root	Module clock

## 28.3 DVFS overview

The DVFS allows simple dynamic voltage frequency scaling.

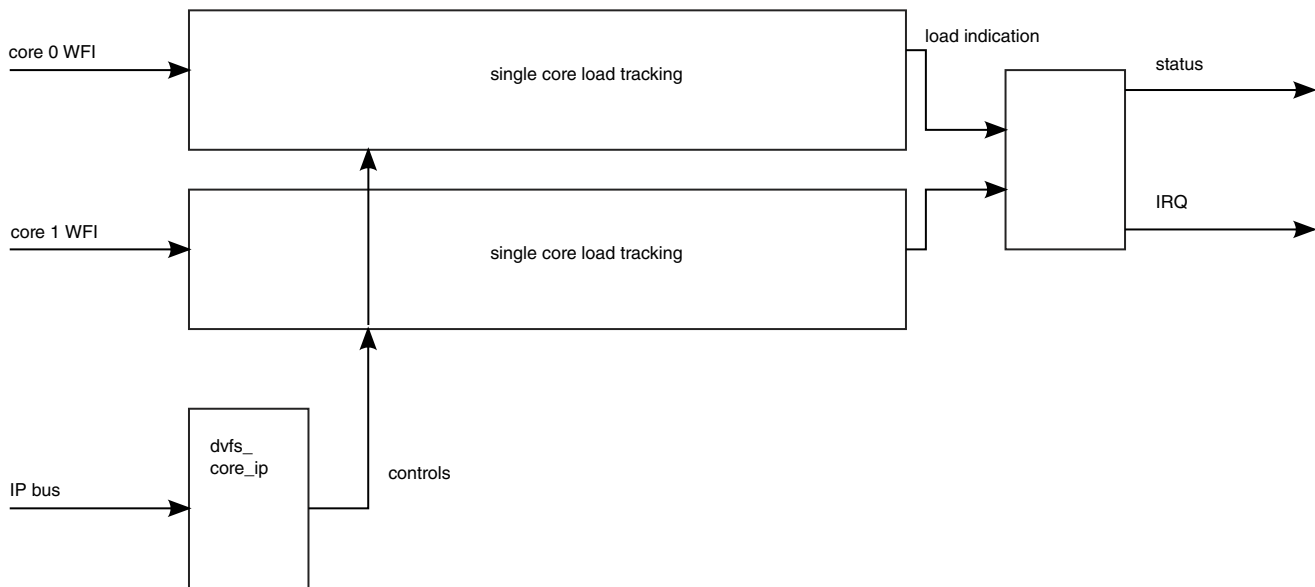

The frequency of the core clock domain and the voltage of the core power domain can be changed on the fly while all modules (including the MCU) continue their normal operation. The frequency of the core clock domain can be changed by temporally switching to an alternate PLL clock, or by changing the post dividers division factors.

The DVFS load tracking block allows hardware tracking on the core load and generate an interrupt when a frequency change is requested.

### NOTE

DVFS is a monitor that only provides an interrupt when CPU load exceeds the predefined value and does not send any request to make a change of voltage and frequency. This can be done by the user in the CPU interrupt routine or SDMA routine.

**Figure 28-2. DVFS\_core diagram**

### 28.3.1 Features

The DVFS load tracking block includes the following features:

- Configurable include/exclude of input signals:
  - per-core ARM standby signal (idle / non-idle)
  - 16 general purpose bits (common for all 4 tracking modules)
    - Configurable weight to each bit.
- Configurable generated clocks and averaging time slicing (respond time).
- Configurable panic mode respond logic (for frequency up).
- Programmable buffer for last 4, 8, 12, or 16 load tracking samples of core 0 (only).

## 28.4 DVFS output event/interrupt configuration

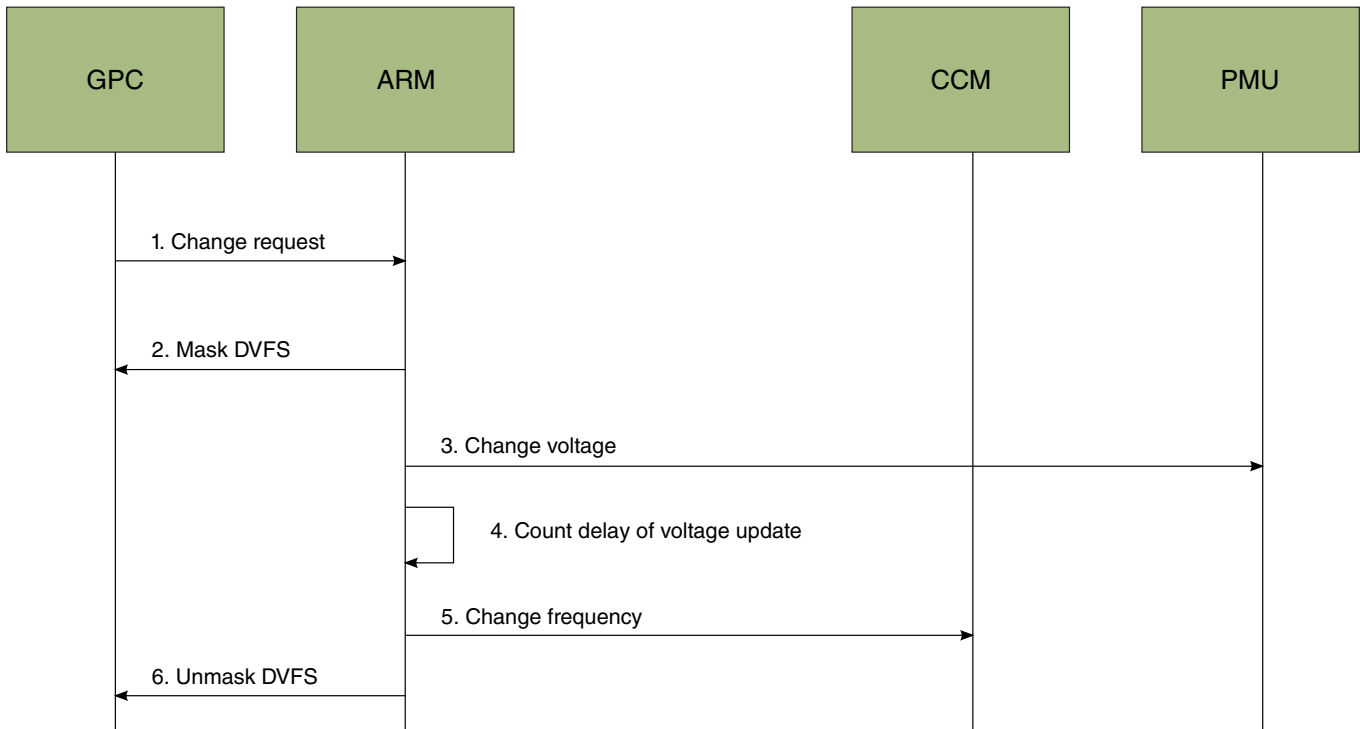

Event/interrupt will be always high as long as LBFL is '1' and is not cleared by SW. Unless DVFEV (always event) is asserted. Then the event/interrupt will be toggled up and down at every toggle of div\_3\_clk.

## 28.4.1 Interrupts

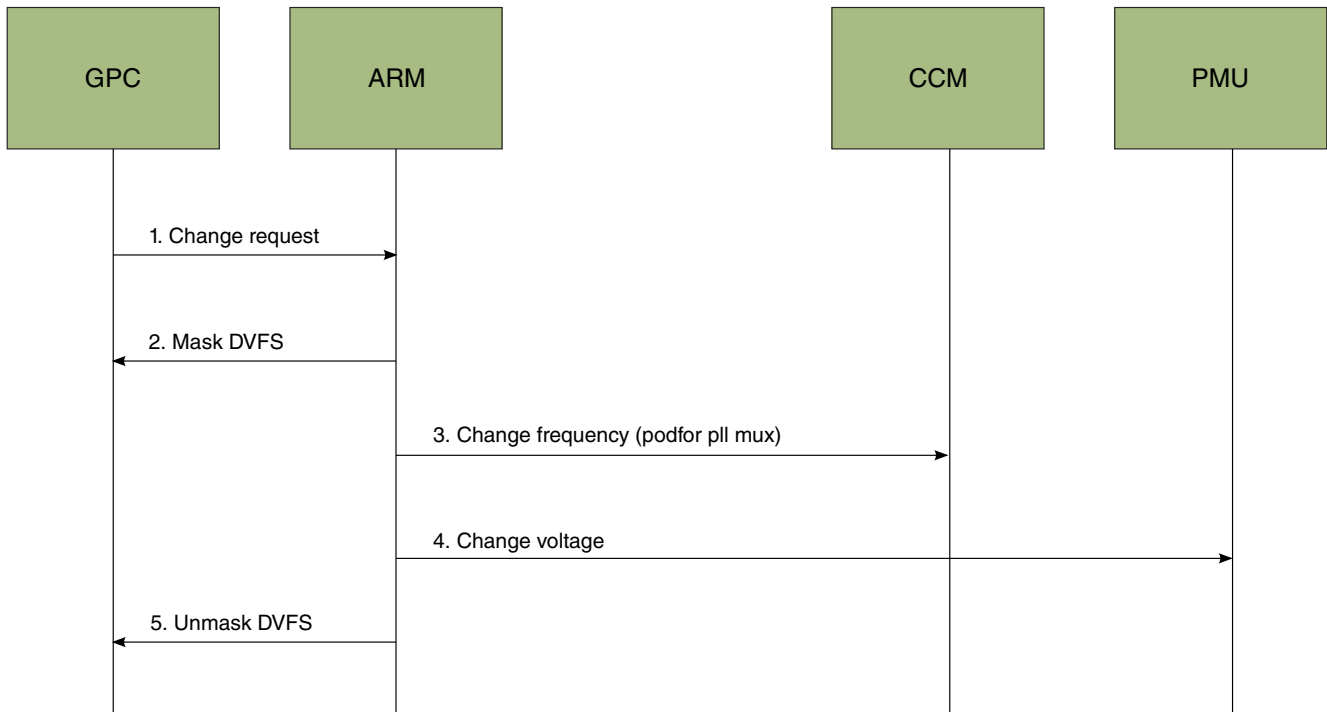

DVFS generates an interrupt that indicates that frequency and voltage update is needed. The user has to read the FSVAIM bits in order to know which change needs to be done.

## 28.4.2 DVFS Change Request Sequence Diagrams

The following figures describe the sequence on DVFS interrupt.

**Figure 28-3. DVFS - frequency increase**

**Figure 28-4. DVFS - frequency decrease**

CPU DVFS frequency change can be performed in 2 ways:

- PLL inputs muxing update
- clock dividers update

## 28.5 Power Gating Control (PGC)

Power Gating (PGC) is applied to the ARM CPU only in STOP low power mode, after all essential CPU registers data are saved by ARM dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

### PGC power down sequence:

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (PGCR registers of corresponding PGC module, bit 0).

### PGC power up sequence:

- One of the power up irq is asserted.

## Power Gating Control (PGC)

- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

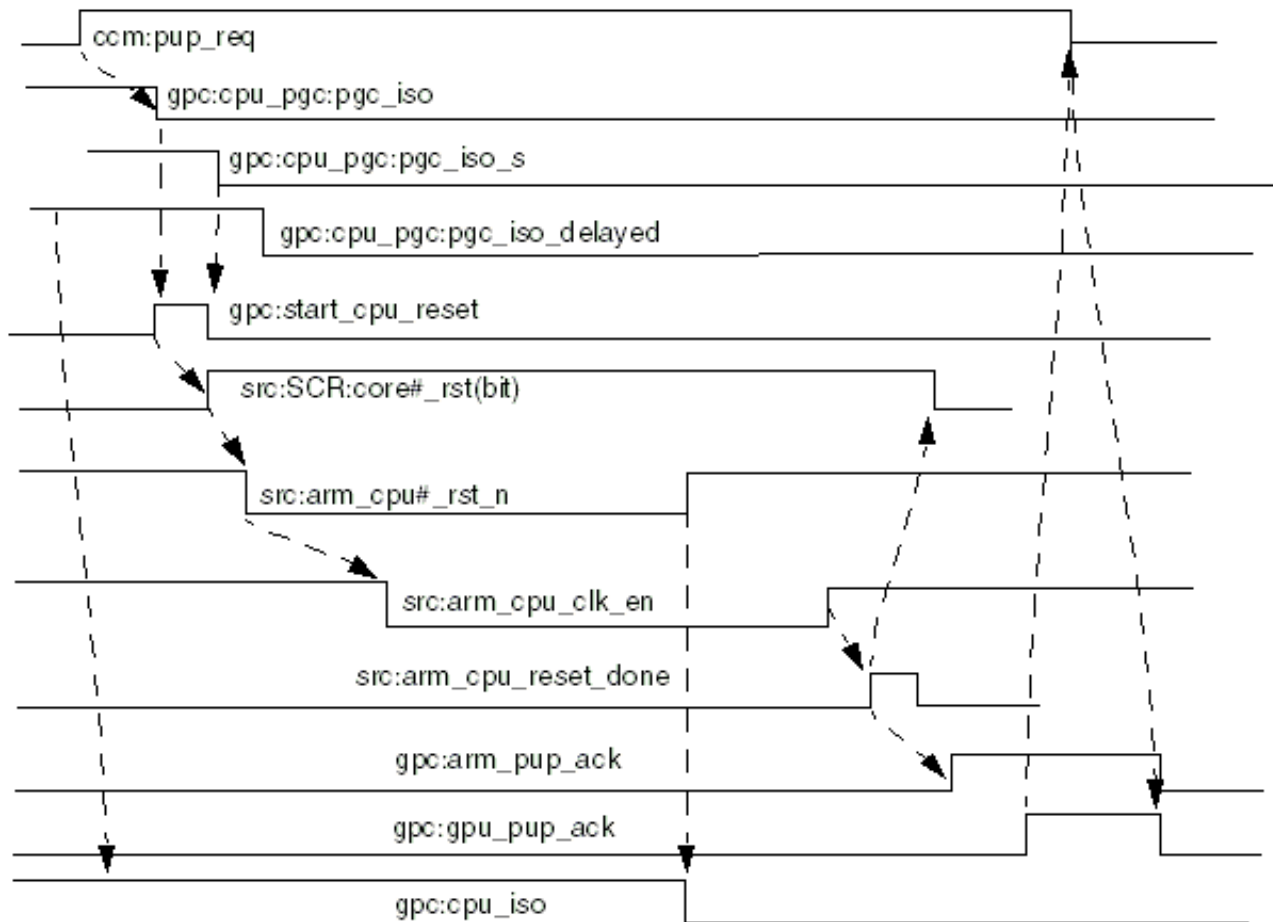

Figure 28-5. GPC-SRC handshake for reset after power gating

### 28.5.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. [Figure 28-6](#) shows PGC as part of the SoC's overall power management scheme.

Figure 28-6. PGC Block Diagram

### 28.5.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

## 28.6 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 128 interrupts.

### 28.6.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

## 28.7 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

**GPC memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20D_C000	GPC Interface control register (GPC_CNTR)	32	R/W	0010_0000h	<a href="#">28.7.1/1488</a>

W	IMR1																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### GPC\_IMR1 field descriptions

Field	Description
IMR1	IRQ[63:32] masking bits: 1-irq masked, 0-irq is not masked

### 28.7.4 IRQ masking register 2 (GPC\_IMR2)

IMR2 Register - masking of irq[95:64].

Address: 20D\_C000h base + Ch offset = 20D\_C00Ch

#### GPC\_IMR2 field descriptions

Field	Description
IMR2	IRQ[95:64] masking bits: 1-irq masked, 0-irq is not masked

### 28.7.5 IRQ masking register 3 (GPC\_IMR3)

IMR3 Register - masking of irq[127:96].

Address: 20D\_C000h base + 10h offset = 20D\_C010h

#### GPC\_IMR3 field descriptions

Field	Description
IMR3	IRQ[127:96] masking bits: 1-irq masked, 0-irq is not masked

### 28.7.6 IRQ masking register 4 (GPC\_IMR4)

IMR4 Register - masking of irq[159:128].

Address: 20D\_C000h base + 14h offset = 20D\_C014h

### GPC\_IMR4 field descriptions

Field	Description
IMR4	IRQ[159:128] masking bits: 1-irq masked, 0-irq is not masked

### 28.7.7 IRQ status resister 1 (GPC\_ISR1)

ISR1 Register - status of irq [63:32].

Address: 20D\_C000h base + 18h offset = 20D\_C018h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### GPC\_ISR1 field descriptions

Field	Description
ISR1	IRQ[63:32] status, read only

### 28.7.8 IRQ status resister 2 (GPC\_ISR2)

ISR2 Register - status of irq [95:64].

Address: 20D\_C000h base + 1Ch offset = 20D\_C01Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ISR2																															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### GPC\_ISR2 field descriptions

Field	Description
ISR2	IRQ[95:64] status, read only

### 28.7.9 IRQ status resister 3 (GPC\_ISR3)

ISR3 Register - status of irq [127:96].

Address: 20D\_C000h base + 20h offset = 20D\_C020h

#### GPC\_ISR3 field descriptions

Field	Description
ISR3	IRQ[127:96] status, read only

### 28.7.10 IRQ status resister 4 (GPC\_ISR4)

ISR4 Register - status of irq [159:128].

Address: 20D\_C000h base + 24h offset = 20D\_C024h

#### GPC\_ISR4 field descriptions

Field	Description
ISR4	IRQ[159:128] status, read only

## 28.8 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. (The hardware asserts the signal `ips_xfr_err` if the PGC has been integrated with `resp_sel` tied low.) In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

### NOTE

The base address of each PGC module instantiation is specified in the GPC module. Absolute address values will be calculated by [GPC base address] + [PGC CPU/GPU/DISPLAY Offset].

### PGC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20D_C260	PGC Control Register (PGC_GPU_CTRL)	32	R/W	0000_0000h	<a href="#">28.8.1/1495</a>

## 28.8.1 PGC Control Register (PGC\_GPU\_CTRL)

The PGCR enables the response to a power-down request.

Address: 20D\_C000h base + 260h offset = 20D\_C260h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	0																
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	0																
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	PCR

**PGC\_GPU\_CTRL field descriptions**

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PCR	<p>Power Control</p> <p><b>NOTE:</b> PCR must not change from power-down request (pdn_req) assertion until the target subsystem is completely powered up.</p> <p>0 Do not switch off power even if pdn_req is asserted.                      1 Switch off power when pdn_req is asserted.</p>

**28.8.2 Power Up Sequence Control Register (PGC\_GPU\_PUPSCR)**

The PUPSCR contains the power-up timing parameters.

Address: 20D\_C000h base + 264h offset = 20D\_C264h

**PGC\_GPU\_PUPSCR field descriptions**

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	<p>After asserting power toggle on/off signal (switch_b), the PGC waits a number of IPG clocks equal to the value of SW2ISO before negating isolation.</p> <p><b>NOTE:</b> SW2ISO must not be programmed to zero.</p>
7–6 Reserved	This read-only field is reserved and always has the value 0.
SW	<p>After a power-up request (pup_req assertion), the PGC waits a number of IPG clocks equal to the value of SW before asserting power toggle on/off signal (switch_b).</p> <p><b>NOTE:</b> SW must not be programmed to zero.</p> <p><b>NOTE:</b> The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See <a href="#">Clock Controller Module (CCM)</a>.</p>

### 28.8.3 Pull Down Sequence Control Register (PGC\_GPU\_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: 20D\_C000h base + 268h offset = 20D\_C268h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**PGC\_CPU\_PDNSCR field descriptions**

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of 32k clocks equal to the value of ISO2SW before negating . <b>NOTE:</b> ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
ISO	After a power-down request (pdn_req assertion), the PGC waits a number of 32k clocks equal to the value of ISO before asserting isolation. <b>NOTE:</b> ISO must not be programmed to zero.

**28.8.8 Power Gating Controller Status Register (PGC\_CPU\_SR)**

The PDNSCR contains the power-down timing parameters.

Address: 20D\_C000h base + 2ACh offset = 20D\_C2ACh

**PGC\_CPU\_SR field descriptions**

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PSR	Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down.  0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.

## DVFSC\_DVFSSIG0 field descriptions

Field	Description
31–29 WSW5	General purpose load tracking signal weight dvfs_w_sig[5]
28–26 WSW4	General purpose load tracking signal weight dvfs_w_sig[4]
25–23 WSW3	General purpose load tracking signal weight dvfs_w_sig[3]
22–20 WSW2	General purpose load tracking signal weight dvfs_w_sig[2]
19–12 -	This field is reserved. Reserved
11–6 WSW1	General purpose load tracking signal weight dvfs_w_sig[1]. This value is relevant during GPC1 counting period or when GPB1 is set.
WSW0	General purpose load tracking signal weight dvfs_w_sig[0]. This value is relevant during GPC0 counting period or when GPB0 is set.

## 28.9.5 DVFS general purpose bit 0 weight counter (DVFS\_C0ACT)

DVFS general purpose bits weight counter.

Address: 20D\_C180h base + 10h offset = 20D\_C190h

**DVFS\_C0ACT field descriptions**

Field	Description
31 C0STRT	C0STRT - Counter 0 start Setting of this bit will initialize down counting of the GPC0 value. Bit is self-cleared next cycle after setting. Any setting of this bit will re-start GPC0 counter to the GPC0 value. GPB0 bit disables (overrides) GPC0 counter - WSW0 weight is applicable continuously
30 C0ACT	C0ACT - Counter 0 active indicator

*Table continues on the next page...*

**DVFSC\_DVFSGPC0 field descriptions (continued)**

Field	Description
	1 General Purpose bit0 counter didn't reach value of "0" - the WSW0 is provided to DVFS calculation 0 General Purpose bit0 counter reached value of "0" - the instead of WSW0, "0" (zero) is provided to DVFS calculation
29-17 -	This field is reserved. reserved
GPBC0	GPBC0 - General Purpose bits Counter 0 During period of this counter the GeP bit 0 will be set and WSW0 will be added to the calculations.

**28.9.6 DVFS general purpose bit 1 weight counter (DVFSC\_DVFSGPC1)**

DVFS general purpose bits weight counter1.

Address: 20D\_C180h base + 14h offset = 20D\_C194h

**DVFSC\_DVFSGPC1 field descriptions**

Field	Description
31 C1STRT	C1STRT - Counter 1start Setting of this bit will initialize down counting of the GPC1 value. Bit is self-cleared next cycle after setting. Any setting of this bit will re-start GPC1 counter to the GPC1 value. GPB1 bit disables (overrides) GPC1 counter - WSW1 weight is applicable continuously
30 C1ACT	C1ACT - Counter 1 active indicator 1 General Purpose bit1 counter didn't reach value of "0" - the WSW1 is provided to DVFS calculation 0 General Purpose bit1 counter reached value of "0" - the instead of WSW1, "0" (zero) is provided to DVFS calculation
29–17 -	This field is reserved. reserved
GPBC1	GPBC1 - General Purpose bits Counter 1 During period of this counter the GeP bit 1 will be set and WSW1 will be added to the calculations.

**28.9.7 DVFS general purpose bits enables (DVFSC\_DVFSGPBT)**

Address: 20D\_C180h base + 18h offset = 20D\_C198h

**DVFSC\_DVFSGPBT field descriptions**

Field	Description
31–16 -	This field is reserved. reserved
15 GPB15	General purpose bit 15. Its weight is set by WSW15 value.
14 GPB14	General purpose bit 14. Its weight is set by WSW14 value.

*Table continues on the next page...*

**DVFSC\_DVFSGPBT field descriptions (continued)**

<b>Field</b>	<b>Description</b>
13 GPB13	General purpose bit 13. Its weight is set by WSW13 value.
12 GPB12	General purpose bit 12. Its weight is set by WSW12 value.
11 GPB11	General purpose bit 11. Its weight is set by WSW11 value.
10 GPB10	General purpose bit 10. Its weight is set by WSW10 value.
9 GPB9	General purpose bit 9. Its weight is set by WSW9 value.
8 GPB8	General purpose bit 8. Its weight is set by WSW8 value.
7 GPB7	General purpose bit 7. Its weight is set by WSW7 value.
6 GPB6	General purpose bit 6. Its weight is set by WSW6 value.
5 GPB5	General purpose bit 5. Its weight is set by WSW5 value.
4 GPB4	General purpose bit 4. Its weight is set by WSW4 value.
3 GPB3	General purpose bit 3. Its weight is set by WSW3 value.
2 GPB2	General purpose bit 2. Its weight is set by WSW2 value.
1 GPB1	General purpose bit 1. Its weight is set by WSW1 value. IF set (1), the GPBC1 operation is disregarded, WSW1 value is applied continuously.
0 GPB0	General purpose bit 0. Its weight is set by WSW0 value. IF set (1), the GPBC0 operation is disregarded, WSW0 value is applied continuously.

### 28.9.8 DVFS EMAC settings (DVFS\_DVFSEMAC)

Address: 20D\_C180h base + 1Ch offset = 20D\_C19Ch

**DVFS\_DVFSEMAC field descriptions**

Field	Description
31–26 -	This field is reserved. Reserved
25 WFIM1	DVFS Wait for Interrupt of core 1 mask bit 0 Wait for interrupt of core 1 isn't masked 1 Wait for interrupt of core 1 is masked.
24 WFIM0	DVFS Wait for Interrupt of core 0 mask bit 0 Wait for interrupt of core 0 isn't masked 1 Wait for interrupt of core 0 is masked.
23–20 -	This field is reserved. Reserved
19–18 FSVAI1[1:0]	DVFS Frequency adjustment status of core 1. These status bits indicate that frequency should be changed, following load of core 1.  00 no change 01 frequency should be increased. Low priority source for interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency).

Table continues on the next page...

**DVFS\_CNFSEMAC field descriptions (continued)**

Field	Description
	<p>10 frequency should be decreased. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MINF= 1 (lowest frequency).</p> <p>11 frequency should be increased immediately. High priority source of interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency).</p>
17–16 FSVAIO[1:0]	<p>DVFS Frequency adjustment status of core 0. These status bits indicate that frequency should be changed, following load of core 0.</p> <p>00 no change</p> <p>01 frequency should be increased. Low priority source for interrupt. 15–11 -	This field is reserved. Reserved
10 DVFEN1	<p>DVFS tracking for core1 enable.</p> <p>1 DVFS enabled.</p> <p>0 DVFS disabled.</p>
9 DVFEN0	<p>DVFS tracking for core0 enable.</p> <p>1 DVFS enabled.</p> <p>0 DVFS disabled.</p>
EMAC	EMAC - EMA control value

**28.9.9 DVFS Control (DVFS\_CNTR)****Table 28-32. DIV3CK division**

DIV3CK setting	dividing ratio	sum_3 passing bits	div_1_clk cumulative divider
00	1	4-0	1*512=512
001	4	6-2	4*512=2048
010	16	8-4	16*512=8192
011	64	10-6	64*512=32768
100	256	12-8	256*512=131072
101	1024	16-10	1024*512=524288

**Table 28-33. Preliminary Divider definition**

DIV_RATIO value	ARM clk division ratio
000000	1
000001	2
000010	3
...	...

Address: 20D\_C180h base + 20h offset = 20D\_C1A0h

**DVFS\_CNTR field descriptions**

Field	Description
31-29 DIV3CK	DIV3CK - div_3_clk division ratio inside the DVFS module. According to the <a href="#">Table 28-32</a>
28 DVFEV	Always give a DVFS event. 0 Do not give an event always. 1 Always give event.
27 LBMI	Load buffer full mask interrupt. This bit masks the generation of this interrupt. Load buffer full interrupt is masked (LBFL0 and LBFL1 bits still will be updated, but interrupt won't be generated) Load buffer full interrupt is enabled.

Table continues on the next page...

## DVFS\_CNTR field descriptions (continued)

Field	Description
26 LBFL1	Load buffer 1 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged)  1 Load buffer0 is full. 0 Load buffer0 is not full.
25 LBFL0	Load buffer 0 - full status bit. This bit indicates that log buffer registers are full. The bit is set to 1 automatically. An interrupt will be generated if LBMI bit is set to "0" Write '1' to clear. (write '0' leaves bit unchanged)  1 Load buffer1 is full. 0 Load buffer1 is not full.
24 DVFIS	DVFS Interrupt select. These bits define destination of DVFS interrupts.  1 MCU interrupt will be generated for DVFS events. 0 SDMA interrupt will be generated for DVFS events.
23 PIRQS	PIRQS - Pattern IRQ Source * write '1' to clear. Writing '1' will clear interrupt if interrupt was from pattern  1 DVFS IRQ source was from pattern 0 DVFS IRQ source was not from pattern
22 FSVAIM	DVFS Frequency adjustment interrupt mask. This bit masks the DVFS frequency adjustment interrupt. FSVAI status bits will be still asserted in relevant cases.  1 interrupt is masked. 0 interrupt is enabled.
21–20 FSVAI[1:0]	FSVAI DVFS Frequency adjustment interrupt. These status bits indicate that the system frequency should be changed.  00 no interrupt 01 frequency should be increased. Low priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency). 10 frequency should be decreased. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MINF= 1 (lowest frequency). 11 frequency should be increased immediately. High priority interrupt. Interrupt is asserted, if FSVAIM=0. Interrupt is masked if MAXF = 1 (highest frequency).
19 Reserved	This read-only field is reserved and always has the value 0.
18 MAXF	Maximum frequency reached. Interrupt will not be created in maximum frequency reached and frequency increase required.  1 max frequency reached 0 max frequency not reached
17 MINF	Minimum frequency reached. Interrupt will not be created in minimum frequency reached and frequency decrease required.

Table continues on the next page...

**DVFS\_CNTR field descriptions (continued)**

Field	Description
	1 min frequency reached 0 min frequency not reached
16–11 DIV_RATIO	DIV_RATIO - Divider value. Divider divides the input ARM clock, following the table <a href="#">Table 28-33</a>
10 Reserved	This read-only field is reserved and always has the value 0.
9 PFUE	PFUE - Period Frequency Update Enable 1 enabled 0 disabled
8–6 PFUS	PFUS - Periodic Frequency Update Status 000 no update 100 DVFSPT0 period, previous finished(can be performance level decrease) 101 DVFSPT1 period, previous finished(can be EMA-detected performance level) 110 DVFSPT2 period, previous finished(can be performance level increase) 111 DVFSPT3 period, previous finished (can be EMA-detected performance level)
5 LTBRSH	LTBRSH - Load Tracking Buffer Register Shift: 0 values of [5:2] of the selected input are saving in Load Tracking Buffer 1 values of [4:1] of the selected input are saving in Load Tracking Buffer
4–3 LTBRSR	LTBRSR - Load Tracking Buffer Register Source: 00 pre_ld_add 01 ld_add 10 ema_ld 11 reserved
Reserved	This read-only field is reserved and always has the value 0.

FPTN3	FPTN3 - Frequency pattern 3 counter  During period of this counter the frequency will be set to the EMA-detected level.

# Chapter 29

## General Purpose Input/Output (GPIO)

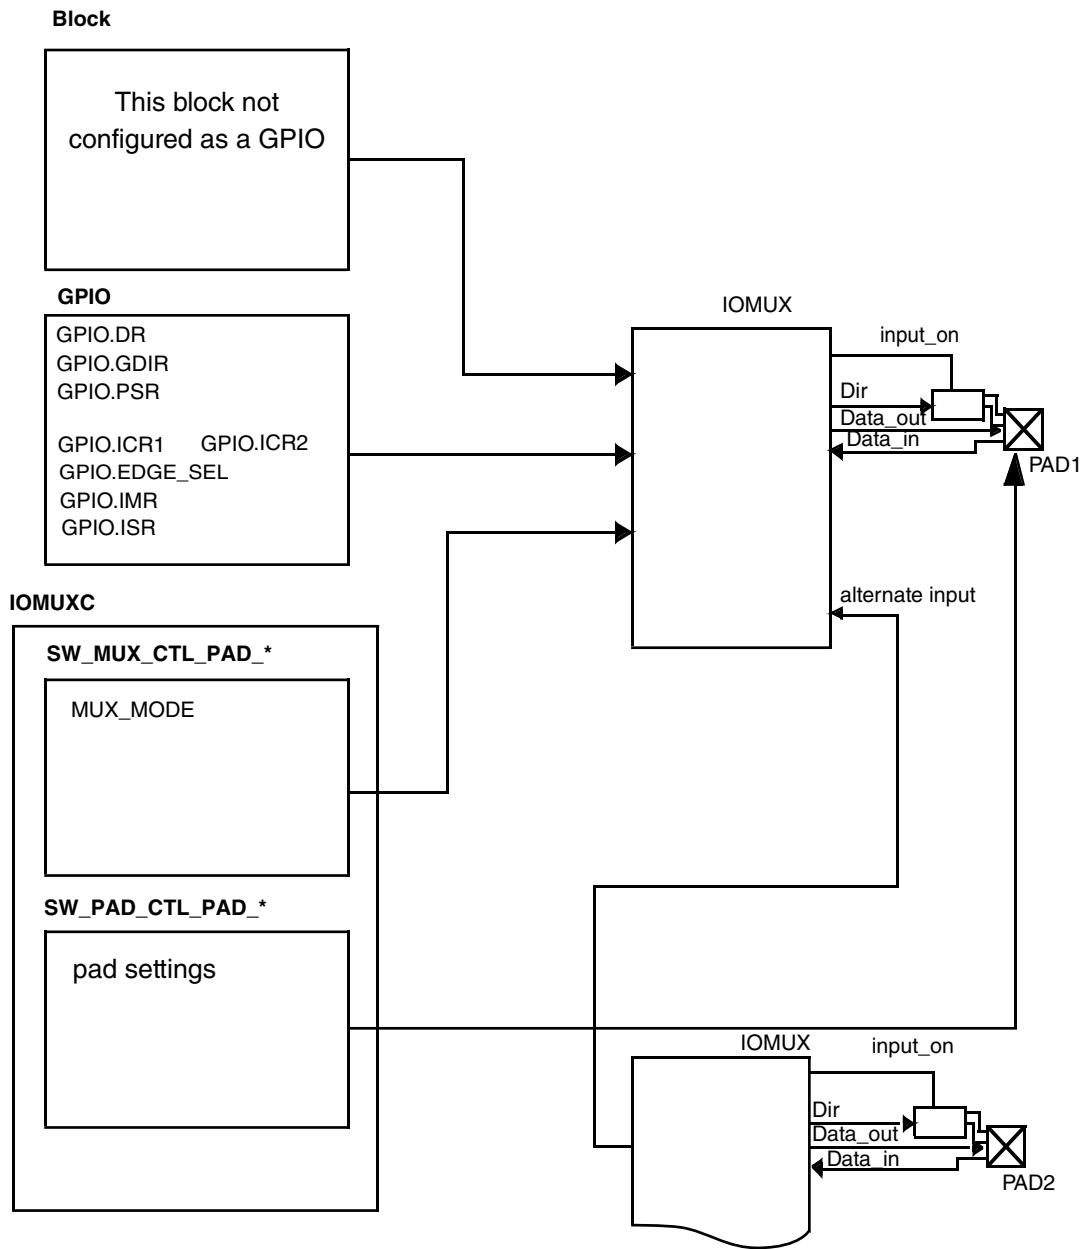

### 29.1 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

[Figure 29-1](#) shows the chip multiplexing scheme.

**Figure 29-1. Chip IOMUX Scheme**

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO\_DR)
- GPIO direction register (GPIO\_GDIR)
- Pad sample register (GPIO\_PSR)
- Interrupt control registers (GPIO\_ICR1, GPIO\_ICR2)

- Edge select register (GPIO\_EDGE\_SEL)
- Interrupt mask register (GPIO\_IMR)
- Interrupt status register (GPIO\_ISR)

These registers are described in detail in [GPIO Memory Map/Register Definition](#).

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO\_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for n = 0 – 7). However, individual interrupt indications from other GPIOx are not available.

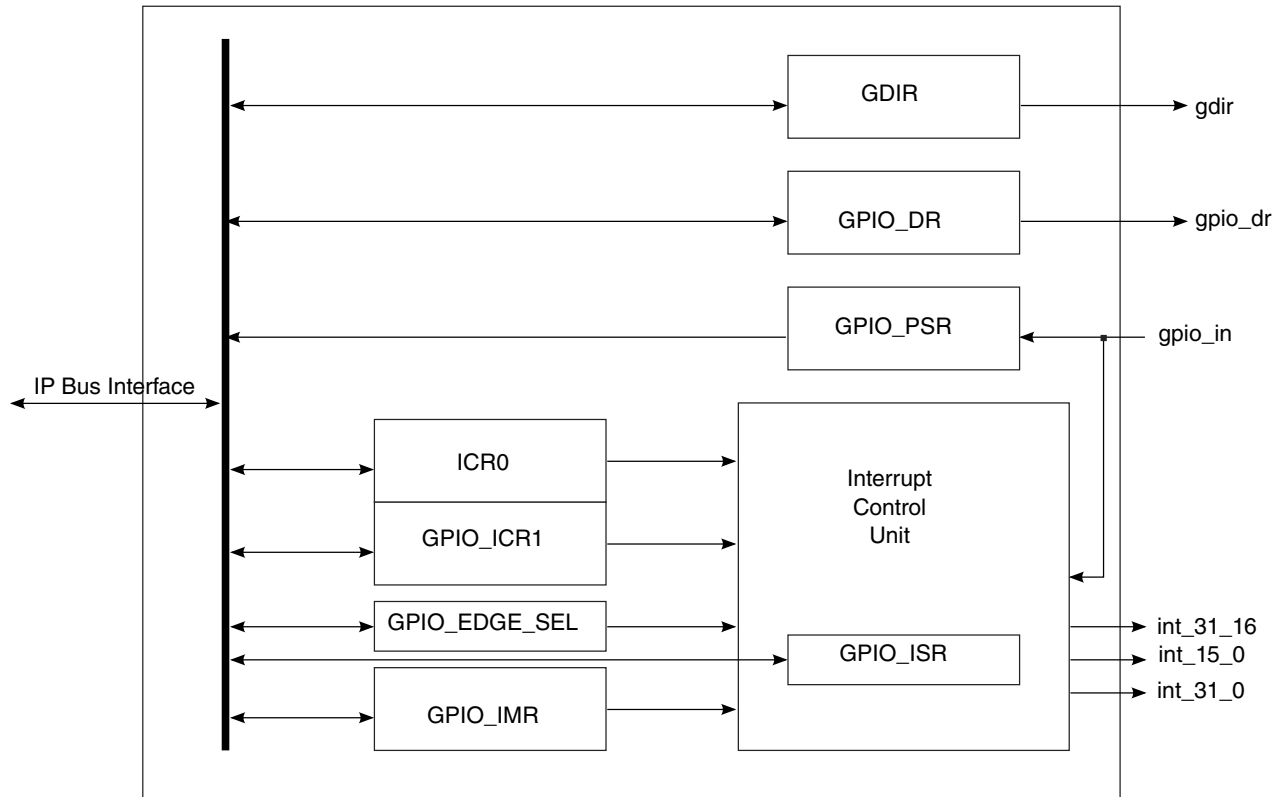

The GPIO edge detection is described further in [Interrupt Control Unit](#).

The GPIO's overall functionality is described further in [GPIO Functional Description](#).

## 29.1.1 Block Diagram

The GPIO subsystem contains 8 GPIO blocks which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in [Figure 29-2](#).

**Figure 29-2. GPIO Block Diagram**

## 29.1.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
  - Drives specific data to output using the data register (GPIO\_DR)
  - Controls the direction of the signal using the GPIO direction register (GPIO\_GDIR)
  - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO\_PSR).
- GPIO interrupt capabilities:
  - Supports up to 32 interrupts

- Identifies interrupt edges
- Generates three active-high interrupts to the SoC interrupt controller

## 29.2 External Signals

The tables found here describe the external signals of GPIO.

**Table 29-1. GPIO1 External Signals**

## 29.3 Clocks

The table found here describes the clock sources for GPIO.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 29-8. GPIO Clocks**

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 29.4 GPIO Functional Description

This section provides a complete functional description of the block.

### 29.4.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO\_GDIR).

When configured as an output (GPIO\_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO\_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO\_GDIR bit = 0), the state of the input can be read from the corresponding GPIO\_PSR bit.

## 29.4.2 GPIO pad structure

Figure 29-3. GPIO pad functional diagram

### 29.4.2.1 Input Driver

Input driver characteristics

- Selectable Schmitt trigger or CMOS input mode
- Keeper structure with buffer at the input receiver output to Core
- Receiver is tri-stated when I/O supply (OVDD) is powered down. (Keeper at receiver output keeps its previous state).

#### 29.4.2.1.1 Schmitt trigger

The anti-jamming functionality of the Schmitt trigger is illustrated below.

Figure 29-4. Schmitt trigger transfer characteristic

Figure 29-5. Receiver output in CMOS and hysteresis

### 29.4.2.1.2 Input keeper

A simple latch to hold the input value when OVDD is powered down, or the first inverter is tri-stated. Input buffer's keeper is always enabled for all the pads.

### 29.4.2.2 Output Driver

Output driver characteristics

- Selectable CMOS or open-drain output type

- Selectable pull-keeper enable signal to enable/disable the pull-up/down and output keeper
- Selectable pull-up resistors of 22K, 47K, 100K and a pull-down resistor of 100KOhm. Unsilicided P+ poly resistor is used to limit resistance variation to within +/- 20%.
- Pull-up, pull-down, and pad keeper are disabled in output mode.
- Seven drive strengths in each operating mode
- Additional 2-bit slew rate control to select between 50, 100, and 200 MHz IO cell operation range with reduced switching noise

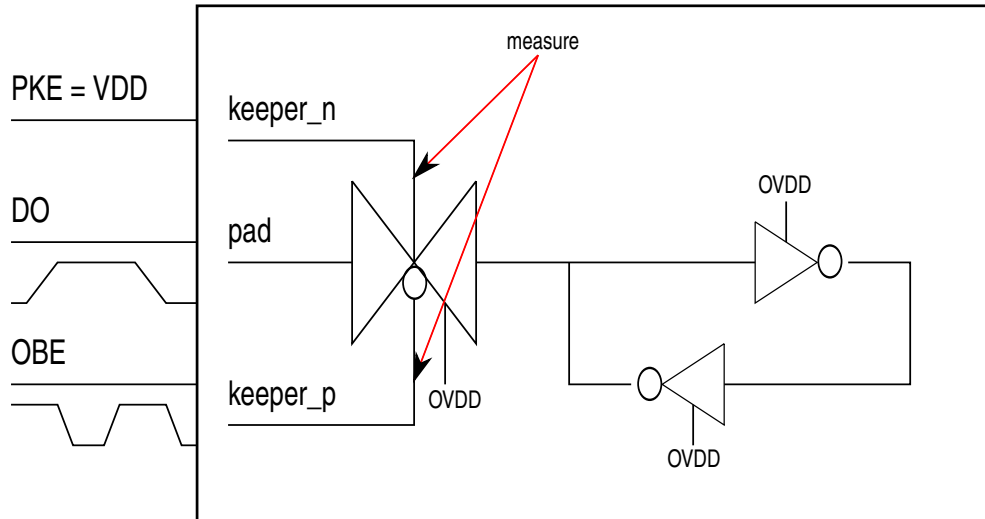

Figure 29-6. Output Driver Functional Diagram

#### 29.4.2.2.1 Drive strength

Drive strength selection can be used to make the impedance matched and get better signal integrity.

#### 29.4.2.2.2 Output keeper

A simple latch to hold the input value.

**Figure 29-7. Keeper functional diagram**

### 29.4.2.2.3 PU / PD / Keeper Logic

When Keeper is enabled, the pull-up and pull-down are disabled, and the output value of the pad depends on the Keeper. The output keeper is powered by OVDD. When the core VDD is powered down or the first inverter is tri-stated, the pad's state can be kept. Keeper and Pull can't be enabled together.

### 29.4.2.2.4 Open drain

Open drain is a circuit technique which allows multiple devices to communication over a single wire bi-directionally. Open drain drivers usually operate with an external or internal pull-up resistor that holds the signal line high until a device sinks enough current to pull the line low, usually used for a bus with multiple devices.

If internal pull-up resistor (Rpu) is used, output level will depend on OVDD1

If external Rpu is used, output level will depend on OVDD2

Figure 29-8. Output buffer in open drain mode

### 29.4.2.3 Operating Frequency

Table 29-9. IO Operating Frequency

## 29.4.3 GPIO Programming

### 29.4.3.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GPIO\_GDIR[GDIR] set to 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

#### NOTE

While the GPIO direction is set to input (GPIO\_GDIR = 0), a read access to GPIO\_DR does not return GPIO\_DR data. Instead, it returns the GPIO\_PSR data, which is the corresponding input signal value.

### 29.4.3.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO\_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO\_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad <output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad <output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5
```

## 29.4.4 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO\_ICR1 and GPIO\_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO\_ICR1 and GPIO\_ICR2 settings, see [GPIO Memory Map/Register Definition](#).

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

## 29.5 GPIO Memory Map/Register Definition

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

**GPIO memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
209_C000	GPIO data register (GPIO1_DR)	32	R/W	0000_0000h	<a href="#">29.5.1/1539</a>
209_C004	GPIO direction register (GPIO1_GDIR)	32	R/W	0000_0000h	<a href="#">29.5.2/1540</a>
209_C008	GPIO pad status register (GPIO1_PSR)	32	R	0000_0000h	<a href="#">29.5.3/1541</a>
209_C00C	GPIO interrupt configuration register1 (GPIO1_ICR1)	32	R/W	0000_0000h	<a href="#">29.5.4/1541</a>
209_C010	GPIO interrupt configuration register2 (GPIO1_ICR2)	32	R/W	0000_0000h	<a href="#">29.5.5/1545</a>

*Table continues on the next page...*

### 29.5.1 GPIO data register (GPIOx\_DR)

The 32-bit GPIO\_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO\_DR reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[n] is set and IOMUXC input mode is GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is GPIO, then reading DR[n] returns the corresponding input signal's value.
- If GDIR[n] is set and IOMUXC input mode is not GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is not GPIO, then reading DR[n] always returns zero.

Address: Base address + 0h offset

### GPIOx\_DR field descriptions

Field	Description
DR	Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0).  <b>NOTE:</b> The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.

## 29.5.2 GPIO direction register (GPIOx\_GDIR)

GPIO\_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

Address: Base address + 4h offset

### GPIOx\_GDIR field descriptions

Field	Description
GDIR	GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal.  <b>NOTE:</b> GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO.  0 <b>INPUT</b> — GPIO is configured as input. 1 <b>OUTPUT</b> — GPIO is configured as output.

### 29.5.3 GPIO pad status register (GPIOx\_PSR)

GPIO\_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the `ipg_clk_s` clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

Address: Base address + 8h offset

#### GPIOx\_PSR field descriptions

Field	Description
PSR	GPIO pad status bits (status bits). Reading GPIO_PSR returns the state of the corresponding input signal. Settings: <b>NOTE:</b> The IOMUXC must be configured to GPIO mode for GPIO_PSR to reflect the state of the corresponding signal.

### 29.5.4 GPIO interrupt configuration register1 (GPIOx\_ICR1)

GPIO\_ICR1 contains 16 two-bit fields, where each field specifies the interrupt configuration for a different input signal.

Address: Base address + Ch offset

#### GPIOx\_ICR1 field descriptions

Field	Description
31–30 ICR15	Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 15.

Table continues on the next page...

**GPIOx\_ICR2 field descriptions (continued)**

Field	Description
	00 <b>LOW_LEVEL</b> — Interrupt n is low-level sensitive. 01 <b>HIGH_LEVEL</b> — Interrupt n is high-level sensitive. 10 <b>RISING_EDGE</b> — Interrupt n is rising-edge sensitive. 11 <b>FALLING_EDGE</b> — Interrupt n is falling-edge sensitive.
5–4 ICR18	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 18.  Settings:  Bits ICRn[1:0] determine the interrupt condition for signal n as follows:  00 <b>LOW_LEVEL</b> — Interrupt n is low-level sensitive. 01 <b>HIGH_LEVEL</b> — Interrupt n is high-level sensitive. 10 <b>RISING_EDGE</b> — Interrupt n is rising-edge sensitive. 11 <b>FALLING_EDGE</b> — Interrupt n is falling-edge sensitive.
3–2 ICR17	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 17.  Settings:  Bits ICRn[1:0] determine the interrupt condition for signal n as follows:  00 <b>LOW_LEVEL</b> — Interrupt n is low-level sensitive. 01 <b>HIGH_LEVEL</b> — Interrupt n is high-level sensitive. 10 <b>RISING_EDGE</b> — Interrupt n is rising-edge sensitive. 11 <b>FALLING_EDGE</b> — Interrupt n is falling-edge sensitive.
ICR16	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 16.  Settings:  Bits ICRn[1:0] determine the interrupt condition for signal n as follows:  00 <b>LOW_LEVEL</b> — Interrupt n is low-level sensitive. 01 <b>HIGH_LEVEL</b> — Interrupt n is high-level sensitive. 10 <b>RISING_EDGE</b> — Interrupt n is rising-edge sensitive. 11 <b>FALLING_EDGE</b> — Interrupt n is falling-edge sensitive.

**29.5.6 GPIO interrupt mask register (GPIOx\_IMR)**

GPIO\_IMR contains masking bits for each interrupt line.

Address: Base address + 14h offset

## GPIOx\_IMR field descriptions

Field	Description
IMR	<p>Interrupt Mask bits. This register is used to enable or disable the interrupt function on each of the 32 GPIO signals.</p> <p>Settings:</p> <p>Bit IMR[n] (n=0...31) controls interrupt n as follows:</p> <p>0 <b>UNMASKED</b> — Interrupt n is disabled.</p> <p>1 <b>MASKED</b> — Interrupt n is enabled.</p>

## 29.5.7 GPIO interrupt status register (GPIOx\_ISR)

The GPIO\_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ISR																															
W	w1c																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## GPIOx\_ISR field descriptions

Field	Description
ISR	<p>Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR.</p> <p>When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position.</p>

### 29.5.8 GPIO edge select register (GPIOx\_EDGE\_SEL)

GPIO\_EDGE\_SEL may be used to override the ICR registers' configuration. If the GPIO\_EDGE\_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

Address: Base address + 1Ch offset

#### GPIOx\_EDGE\_SEL field descriptions

Field	Description
GPIO_EDGE_SEL	Edge select. When GPIO_EDGE_SEL[n] is set, the GPIO disregards the ICR[n] setting, and detects any edge on the corresponding input signal.

---

# Chapter 30

## General Purpose Media Interface (GPMI)

### 30.1 Overview

The GPMI controller is a flexible interface to supporting up to four NAND flash chip selects.

- ONFI 2.2, DDR Mode, Samsung / Toshiba Toggle NAND protocol compatible.
- Fully configurable address and command behavior, providing support for future devices not yet specified.

The GPMI resides on the APBH. The GPMI also provides an interface to the BCH module to allow direct parity processing.

Registers are clocked on the HCLK domain. The I/O and pin timing are clocked on a dedicated GPMICLK domain. GPMICLK can be set to maximize I/O performance.

The following figure shows a block diagram of the GPMI controller.

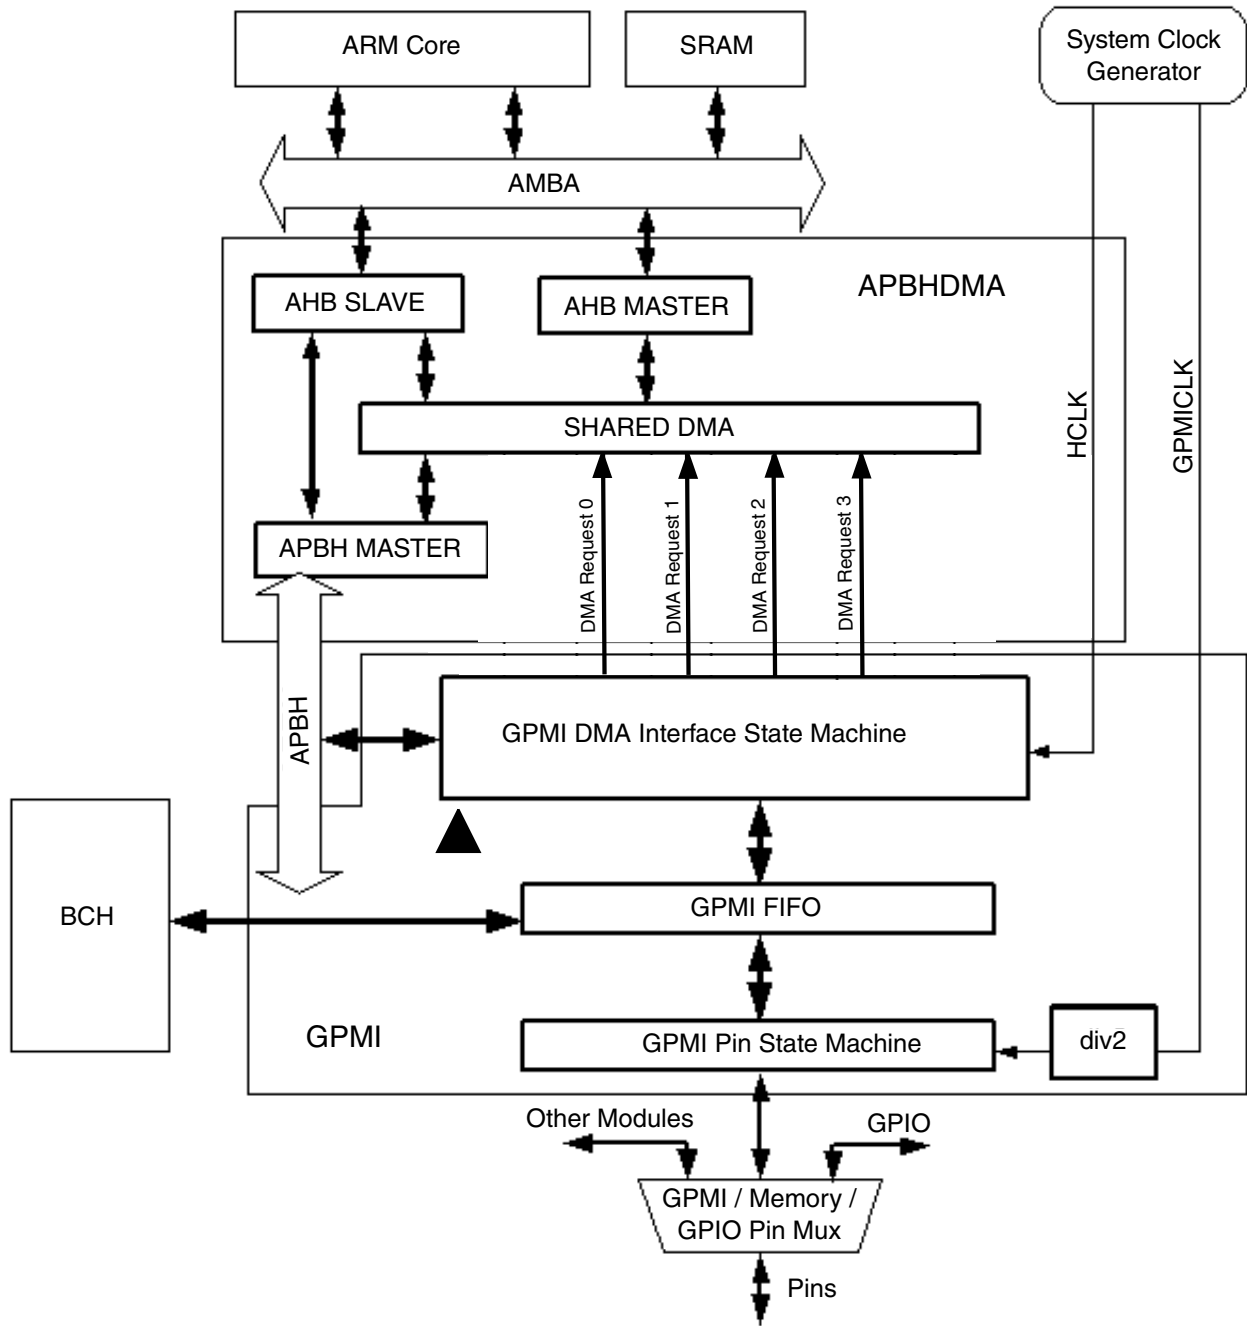

Figure 30-1. General-Purpose Media Interface Controller Block Diagram

## 30.2 External Signals

The table found here describes the external signals of GPMI.

**Table 30-1. GPMI External Signals**

Signal	Description	Pad	Mode	Direction
NAND_ALE	Address latch enable signal	NANDF_ALE	ALT0	O
NAND_CE0_B	Chip enable signal	NANDF_CS0	ALT0	O
NAND_CE1_B	Chip enable signal	NANDF_CS1	ALT0	O
NAND_CE2_B	Chip enable signal	NANDF_CS2	ALT0	O
NAND_CE3_B	Chip enable signal	NANDF_CS3	ALT0	O
NAND_CLE	Command latch enable signal	NANDF_CLE	ALT0	O
NAND_DATA00	Data signal	NANDF_D0	ALT0	I/O
NAND_DATA01	Data signal	NANDF_D1	ALT0	I/O
NAND_DATA02	Data signal	NANDF_D2	ALT0	I/O
NAND_DATA03	Data signal	NANDF_D3	ALT0	I/O
NAND_DATA04	Data signal	NANDF_D4	ALT0	I/O
NAND_DATA05	Data signal	NANDF_D5	ALT0	I/O
NAND_DATA06	Data signal	NANDF_D6	ALT0	I/O
NAND_DATA07	Data signal	NANDF_D7	ALT0	I/O
NAND_DQS	DQS signal	SD4_DAT0	ALT2	I/O
NAND_READY	Ready signal	NANDF_RB0	ALT0	I/O
NAND_RE_B	Read enable signal	SD4_CMD	ALT1	O
NAND_WE_B	Write enable signal	SD4_CLK	ALT1	O
NAND_WP_B	Wait polarity signal	NANDF_WP_B	ALT0	O

## 30.3 Clocks

The table found here describes the clock sources for GPMI.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 30-2. GPMI Clocks**

Clock name	Clock Root	Description
bch_input_apb_clk	usdhc3_clk_root	BCH to APBH input clock
gpmi_bch_input_bch_clk	usdhc4_clk_root	BCH input clock
gpmi_bch_input_gpmi_io_clk	enfc_clk_root	GPMI IO input clock
gpmi_input_apb_clk	usdhc3_clk_root	GPMI to APBH clock

## 30.4 GPMI NAND Mode

The general-purpose media interface has several features to efficiently support NAND:

- Individual chip select pins and ganged ready/busy pin for up to four NANDs.
- Individual state machine and DMA channel for each chip select.
- Special command modes work with DMA controller to perform all normal NAND functions without CPU intervention.
- Configurable timing based on a dedicated clock allows optimal balance of high NAND performance and low system power.

GPMI and DMA have been designed to handle complex multi-page operations without CPU intervention. The DMA uses a linked descriptor function with branching capability to automatically handle all of the operations needed to read/write multiple pages:

- **Data/Register Read/Write**-The GPMI can be programmed to read or write multiple cycles to the NAND address, command or data registers.
- **Wait for NAND Ready**-The GPMI's Wait-for-Ready mode can monitor the ready/busy signal of a single NAND flash and signal the DMA when the device has become ready. It also has a time-out counter and can indicate to the DMA that a time-out error has occurred. The DMAs can conditionally branch to a different descriptor in the case of an error.
- **Check Status**-The Read-and-Compare mode allows the GPMI to check NAND status against a reference. If an error is found, the GPMI can instruct the DMA to branch to an alternate descriptor, which attempts to fix the problem or asserts a CPU IRQ.

### 30.4.1 Multiple NAND Support

The GPMI supports up to four NAND chip selects, with ganged ready/busy pins.

Since they share a data bus and control lines, the GPMI can only actively communicate with a single NAND at a time. However, all NANDs can concurrently perform internal read, write, or erase operations. With fast NAND flash and software support for concurrent NAND operations, this architecture allows the total throughput to approach the data bus speed, which can be as high as 50 MB/s (8-bit bus running at 50 MHz single clock edge) in asynchronous mode and 200MB/s (8-bit bus running at 100MHz both clock edges) in Source Synchronous mode.

There are two options for controlling the four NAND chip selects via the DMA interface. The first option is the one to one mapping, where the each DMA channel is tied to its own NAND chip select. For example DMA channel 'n' accesses only NAND attached to chip select 'n'. The second option is the decoupled mode where a DMA channel can access any or all NAND chip selects connected to the GPMI. A DMA channel will signify the NAND chip select it wants to access by writing its chip select value in the GPMI\_CTRL0[CS] field and setting the GPMI\_CTRL1[DECOUPLE\_CS] to 1. This option is useful if software chooses to use only one DMA channel to access all the attached NAND devices.

## 30.4.2 GPMI NAND Timing and Clocking

The dedicated clock, GPMICK, is used as a timing reference for NAND flash I/O. Since various NANDs have different timing requirements, GPMICK may need to be adjusted for each application.

While the actual pin timings are limited by the NAND chips used and the I/O pad configuration, the GPMI can support data bus speeds of up to 200 MHz x 8 bits. The actual read/write strobe timing parameters are adjusted as indicated in the register descriptions in Memory Map.

## 30.4.3 Basic NAND Timing

### 30.4.3.1 NAND Asynchronous Timing

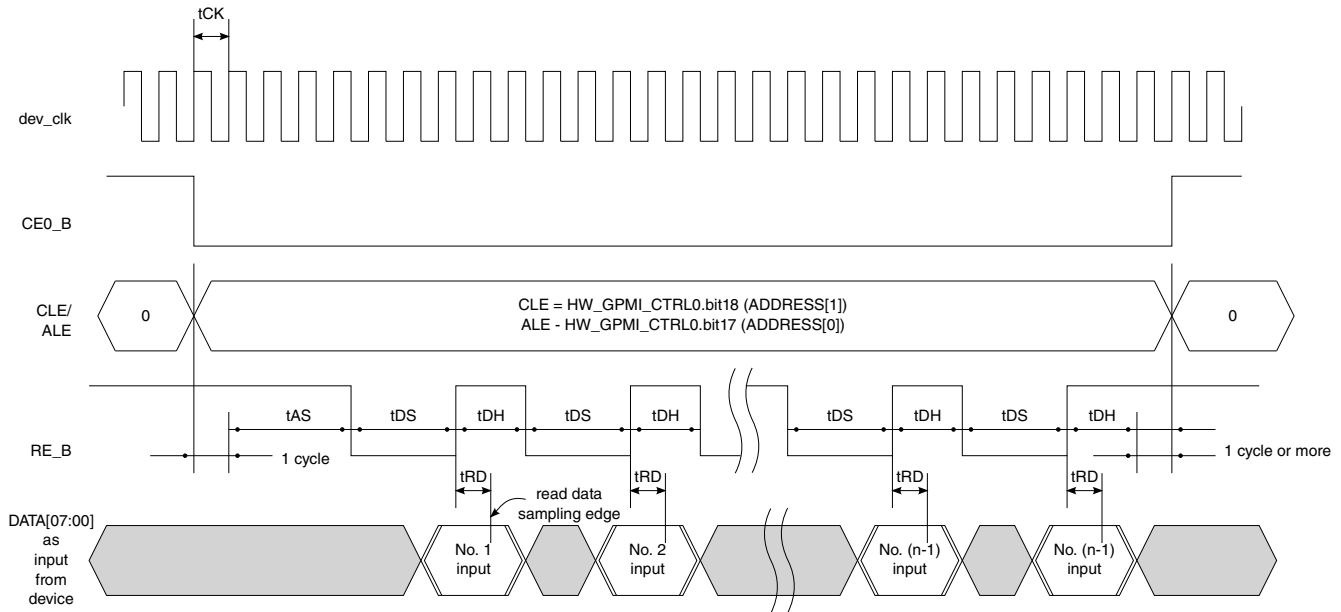

[Figure 30-3](#) and illustrates the operation of the output (from host to device) timing parameters in NAND ONFI asynchronous mode.

## GPMI NAND Mode

- $t_{AS}$  is configurable by programming HW\_GPMI\_TIMING0 Address\_Setup; in this example, Address\_Setup = 4,  $t_{AS}$  is equal to 4 dev\_clk cycles.
- $t_{DS}$  is configurable by programming HW\_GPMI\_TIMING0 Data\_Setup; in this example, Data\_Setup = 3,  $t_{DS}$  is equal to 3 dev\_clk cycles
- $t_{DH}$  is configurable by programming HW\_GPMI\_TIMING0 Data\_Hold; in this example, Data\_Hold = 2,  $t_{DH}$  is equal to 2 dev\_clk cycles
- $t_{AS}/t_{DS}/t_{DH}$  will extend, if the output data is not ready in device fifo.

**Figure 30-2. Asynchronous Mode Basic Write Timing Diagram (command write, address write, or data write)**

- $t_{AS}$  is configurable by programming HW\_GPMI\_TIMING0 Address\_Setup; in this example, Address\_Setup = 4,  $t_{AS}$  is equal to 4 dev\_clk cycles.
- $t_{DS}$  is configurable by programming HW\_GPMI\_TIMING0 Data\_Setup; in this example, Data\_Setup = 3,  $t_{DS}$  is equal to 3 dev\_clk cycles
- $t_{DH}$  is configurable by programming HW\_GPMI\_TIMING0 Data\_Hold; in this example, Data\_Hold = 2,  $t_{DH}$  is equal to 2 dev\_clk cycles
- $t_{RD}$  is the delay from RE\_B rising edge to the read data sampling edge. If SDR DLL is not enabled,  $t_{RD}$  is 0. If SDR DLL enabled, the delay depends on SDR DLL delay.
- $t_{AS}/t_{DS}/t_{DH}$  will extend, if the output data is not ready in device fifo.

Host controller drives the DATA[07:00] bus  
And also don't care if device will drive that or not and what will be driven

ONFI asynchronous mode basic read timing diagram  
(data read)

Figure 30-3. ONFI Asynchronous Mode Basic Read Timing Diagram (data read)

### 30.4.3.2 NAND Asynchronous EDO Mode Timing

In high-speed NANDS, the read data may not be valid until after the read strobe (NAND\_RE\_B) deasserts. This is the case when the minimum  $t_{DS}$  is programmed to achieve higher bandwidth.

The GPMI implements a feedback read strobe to sample the read data. The feedback read strobe can be delayed to support fast nand EDO (Extended Data Out) timing where the read strobe may deassert before the read data is valid, and read data is valid for some time after read strobe.

Nand EDO timings is applied typically for read cycle frequency above 33 MHz. See [Figure 30-4](#).

The GPMI provides control over the amount of delay applied to the feedback read strobe. This delay depends on the maximum read access time ( $t_{REA}$ ) of the nand and the read pulse width ( $t_{RP}$ ) used to access the nand.  $t_{RP}$  is specified by

GPMI\_TIMING0[DATA\_SETUP] register. When  $(t_{REA} + 4ns)$  is less than  $t_{RP}$ , no delay is required to sample to nand read data. (The 4ns provides adequate data setup time for the GPMI.) In this case set  $GPMI\_CTRL1[HALF\_PERIOD] = 0$ ;  
 $GPMI\_CTRL1[RDN\_DELAY] = 0$ ;  $GPMI\_CTRL1[DLL\_ENABLE] = 0$ .

When  $(t_{REA} + 4ns)$  is greater than or equal to  $t_{RP}$ , a delay of the feedback read strobe is required to sample to nand read data. This delay is equal to the difference between these two timings:

$$DELAY = t_{REA} + 4ns - t_{RP}.$$

Since the GPMI delay chain is limited to 12ns maximum, if  $DELAY > 12ns$  then increase  $t_{RP}$  by increasing the value of  $GPMI\_TIMING0[DATA\_SETUP]$  until  $DELAY$  is less than or equal to 12ns.

The GPMI programming for this  $DELAY$  depends on the GPMICLK period. The GPMI DLL will not function properly if the GPMICLK period is greater than 24ns: disable the DLL if this is the case. If the GPMICLK period is greater than 12ns (and not greater than 24ns), set the  $GPMI\_CTRL1[HALF\_PERIOD]=1$ ; This will cause the DLL reference period (RP) to be one-half of the GPMICLK period. If the GPMICLK period is 12ns or less then set the  $GPMI\_CTRL1[HALF\_PERIOD]=0$ ; This will cause the DLL reference period (RP) to be equal to the GPMICLK period.  $DELAY$  is a multiple (0 to 1.875) of RP.

The  $GPMI\_CTRL1[RDN\_DELAY]$  is encoded as a 1-bit integer and 3-bit fraction delay factor.  $DELAY$  is a multiple of the delay factor and the reference period. See table below for details.

**Table 30-3. RDN DELAY**

HW_GPMI_CTRL1[RDN_DELAY]	Delay Factor
0	0.000
1	0.125
2	0.250
3	0.375
4	0.500
5	0.625
6	0.750
7	0.875
8	1.000
9	1.125
10	1.250
11	1.375
12	1.500

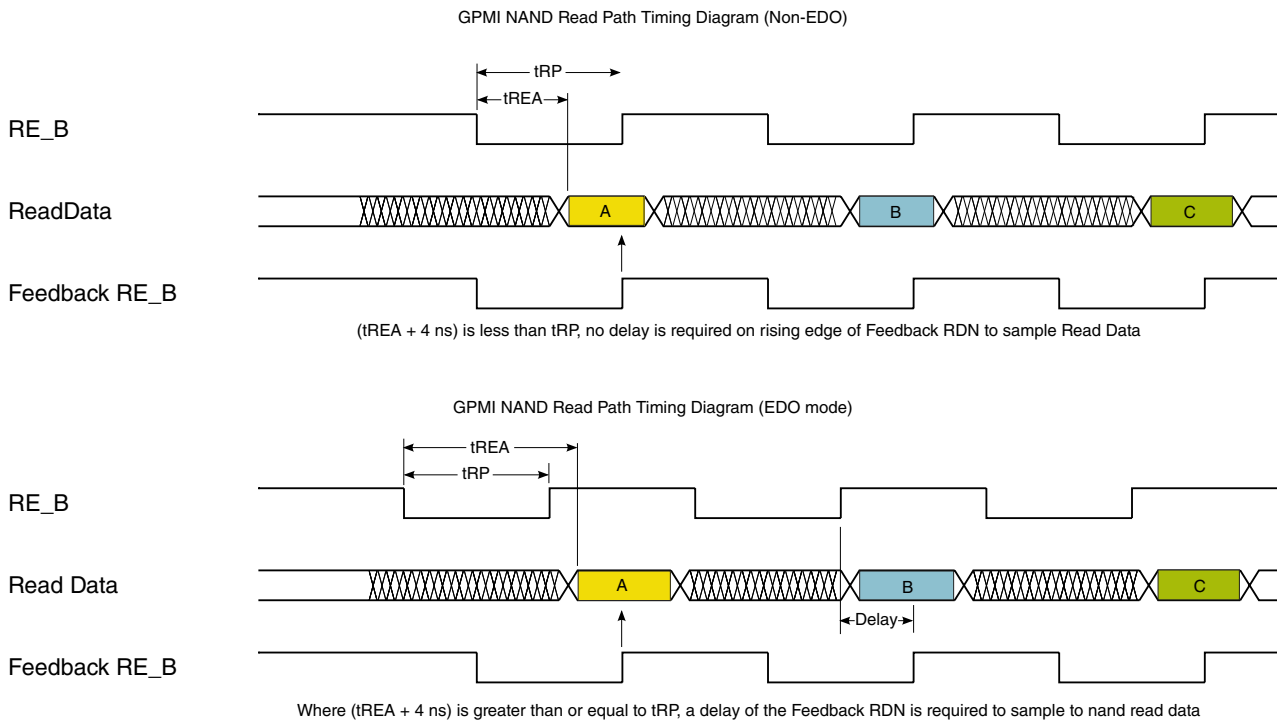

*Table continues on the next page...*

**Table 30-3. RDN DELAY (continued)**

HW_GPMI_CTRL1[RDN_DELAY]	Delay Factor
13	1.625
14	1.750
15	1.875

$DELAY = DelayFactor \times RP$  or  $DELAY = GPMI\_CTRL1[RDN\_DELAY] \times 0.125 \times RP$ .

Use this equation to calculate the value for GPMI\_CTRL1[RDN\_DELAY]. Then set GPMI\_CTRL1[DLL\_ENABLE]=1.

**Figure 30-4. NAND Read Path Timing**

For example, a NAND with  $tREA_{max} = 20$  ns,  $tRP_{min} = 12$  ns, and  $tRC_{min} = 25$  ns (read cycle time) may be programmed as follows:

- GPMICK clock frequency: Consider  $480/6 = 80$  MHz which is 12.5 ns clock period. This is too close to the minimum NAND spec if we program the data setup and hold to 1 GPMICK cycle. Consider  $480/7 = 68.57$  MHz which is 14.58 ns clock period. With data setup and hold set to 1, we have a  $tRP$  of 14.58 ns and a  $tRC$  of 29.16 ns (good margins).

## GPMI NAND Mode

- Since  $(t_{REA} + 4ns)$  is greater than  $t_{RP}$ , required  $DELAY = t_{REA} + 4ns - t_{RP} = 20 + 4 - 14.58ns = 9.42 ns$ .
- $GPMI\_CTRL1[HALF\_PERIOD] = 1$ , since GPMICLK period is large than 12ns. So  $RP = GPMICLK \text{ period} = 7.29ns$ .
- $DELAY = GPMI\_CTRL1[RDN\_DELAY] \times 0.125 \times RP$ .  $9.42 ns = GPMI\_CTRL1[RDN\_DELAY] \times 0.125 \times 7.29ns$ .  $GPMI\_CTRL1[RDN\_DELAY] = 10$  (round of 10.33)

For ONFI spec EDO timing mode 4/5, It's recommended to have below settings.

EDO timing mode 5 :

$GPMICLK = 100MHz$ ;  $GPMI\_CTRL1[RDN\_DELAY] = 8$ ;  $GPMI\_CTRL1[HALF\_PERIOD] = 0$ ;

EDO timing mode 4 :

$GPMICLK = 80MHz$ ;  $GPMI\_CTRL1[RDN\_DELAY] = 15$ ;  $GPMI\_CTRL1[HALF\_PERIOD] = 1$ ;

### NOTE

*It is recommended that the drive strength of NAND\_RE\_B and NAND\_WE\_B output pins be set to 8 mA. This will reduce the transition time under heavy loads. Low transition times will be important when NAND interface read and write cycle times are below 30 ns. The other GPMI pins may remain at 4 mA, since their frequency is only up to half that of NAND\_RE\_B and NAND\_WE\_B.*

### 30.4.3.3 NAND ONFI Source Synchronous Mode Timing

#### NOTE

*In the following figures, CLK shares the same pin as WE\_B in Async Mode. And W/R# shares the same pin as RE\_B in Async Mode.*

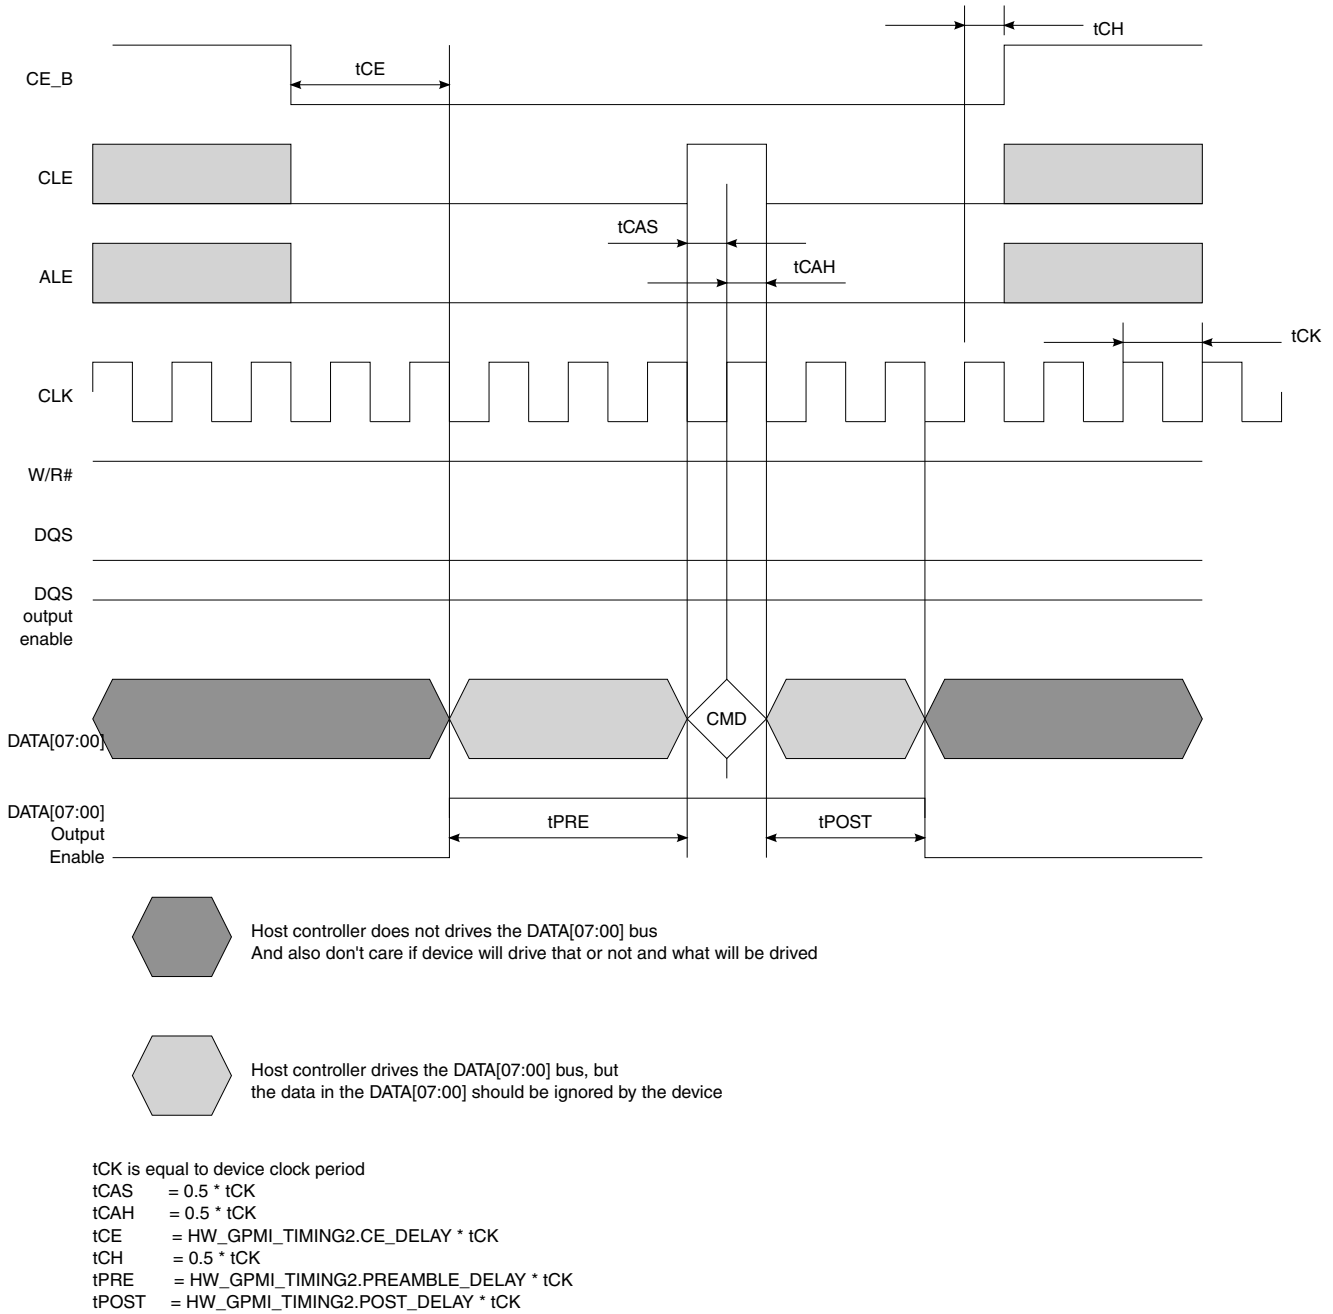

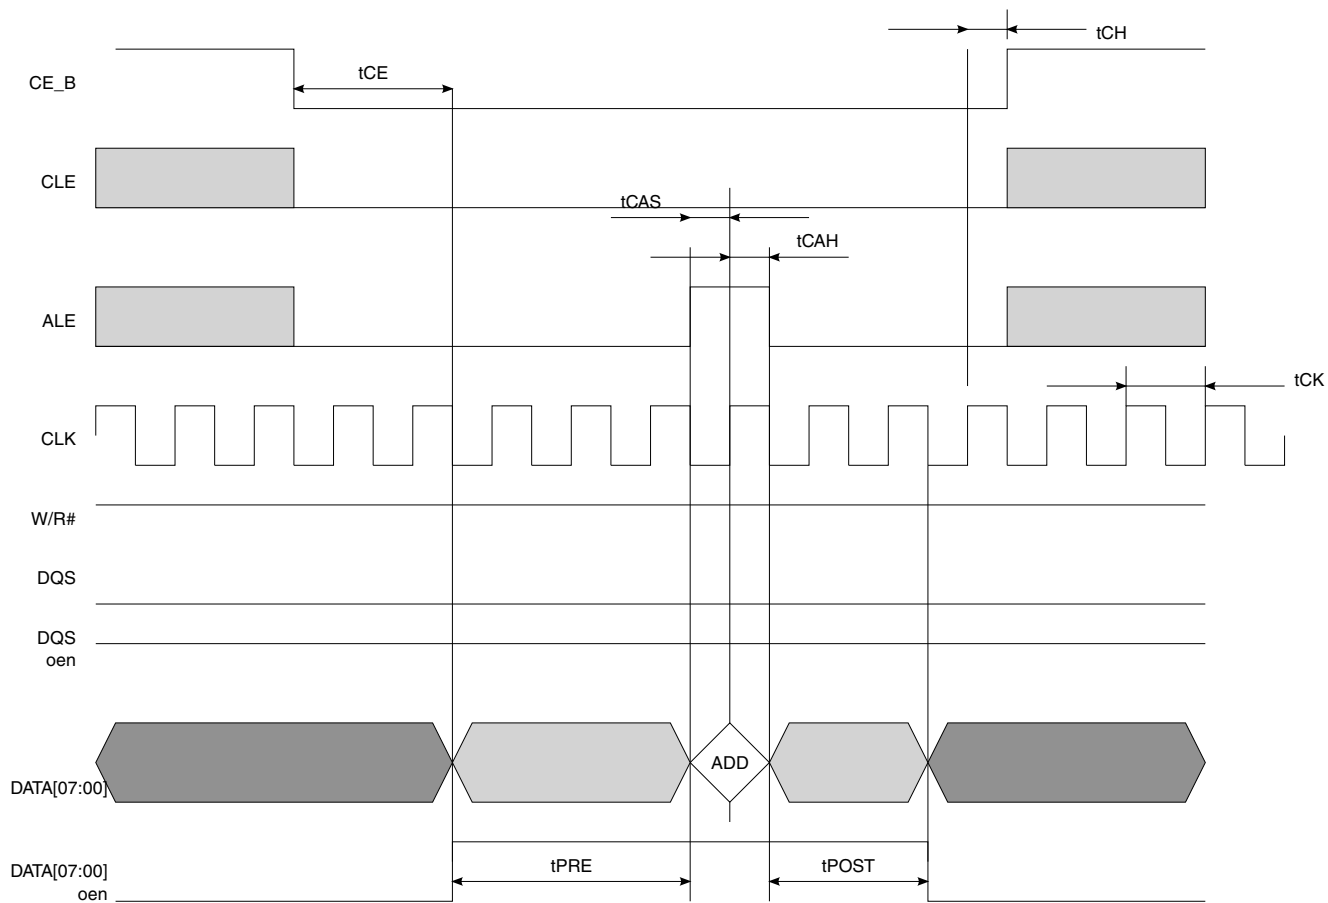

Figure 30-5. ONFI Source Synchronous Mode Basic Command Write Timing Diagram

Host controller does not drives the DATA[07:00] bus  
And also don't care if device will drive that or not and what will be driven.

Host controller drives the DATA[07:00] bus, but  
the data in the DATA[07:00] should be ignored by the device

- tCK is equal to device clock period
- tCAS = 0.5 \* tCK
- tCAH = 0.5 \* tCK
- tCE = HW\_GPMI\_TIMING2.CE\_DELAY \* tCK
- tCH = 0.5 \* tCK
- tPRE = HW\_GPMI\_TIMING2.PREAMBLE\_DELAY \* tCK
- tPOST = HW\_GPMI\_TIMING2.POST\_DELAY \* tCK

**Figure 30-6. ONFI Source Synchronous Mode Basic Address Write Timing Diagram**

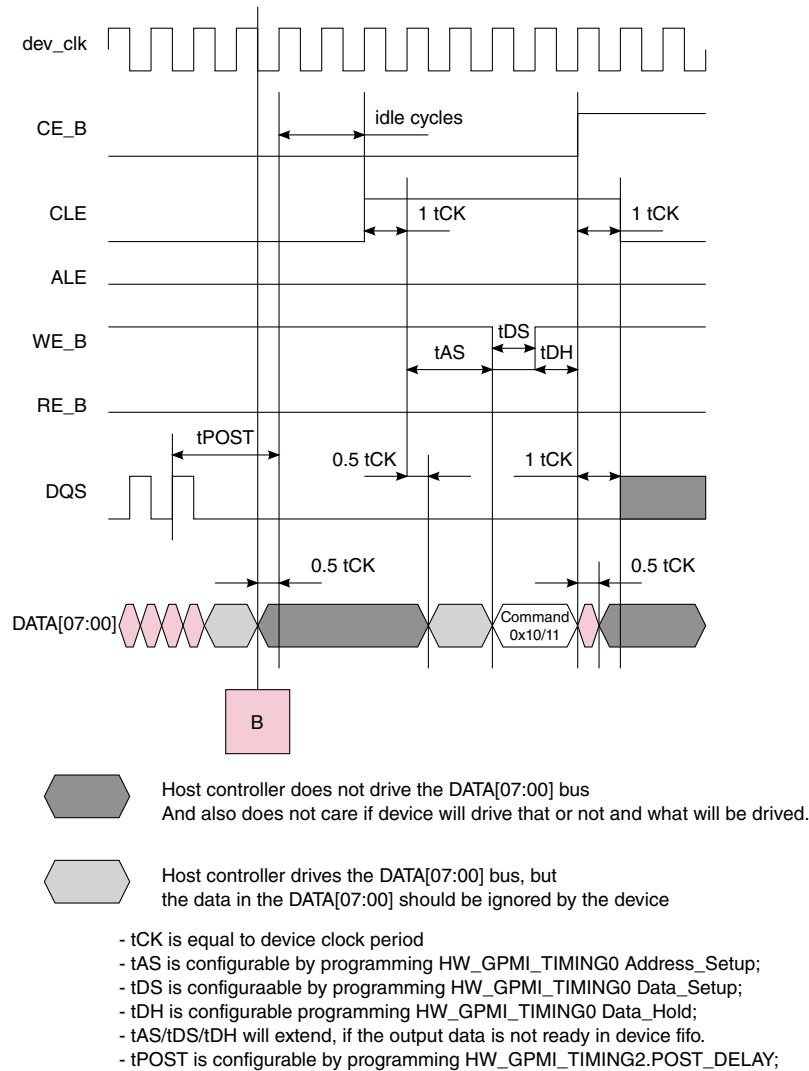

Figure 30-17. Toggle Mode Program Timing Diagram (C)

### 30.4.4 Hardware BCH Interface

The GPMI provides an interface to the BCH module. This reduces the SOC bus traffic and the software involvement.

When BCH ECC is enable, parity information is inserted on-the-fly during writes to 8-bit NAND devices. The BCH will supply payload and parity to the GPMI to write to the NAND. During NAND reads, parity is checked and ECC processing is performed after each read block. In this case the GPMI reads the NAND device and redirects the data and parity to the BCH module for ECC processing.

To program the BCH for NAND writes, remove the soft reset and clock gates from BCH\_CTRL[SFTRST] and BCH\_CTRL[CLKGATE]. The bulk of BCH programming is actually applied to the GPMI via PIO operations embedded in its DMA command structures. This has a subtle implication when writing to the GPMI ECC registers: access to these registers must be written in progressive register order. Thus, to write to the GPMI\_ECCCOUNT register, write first (in order) to registers GPMI\_CTRL0, GPMI\_COMPARE, and GPMI\_ECCCTRL before writing to GPMI\_ECCCOUNT. These additional register writes need to be accounted for in the CMDWORDS field of the respective DMA channel command register.

Note that the GPMI\_PAYLOAD and GPMI\_AUXILIARY pointers need to be word-aligned for proper ECC operation. If those pointers are non-word-aligned, then the BCH engine will not operate properly and could possibly corrupt system memory in the adjoining memory regions.

### 30.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set CLKGATE when setting SFTRST. The reset process gates the clocks automatically.

### 30.6 GPMI Memory Map/Register Definition

The following registers provide control for programmable elements of the GPMI module.

#### NOTE

All ATA or UDMA features are not supported for the chip.

#### NOTE

GPMI does not support the Set feature command in Toggle mode. The NANDF\_DQS output is only enabled in program operation for Toggle mode, but the Set feature command also needs to use the NANDF\_DQS signal to write data to Toggle NAND flash. So the Set feature command in Toggle mode is not supported.

**30.6.1 GPMI Control Register 0 Description (GPMI\_CTRL0n)**

The GPMI control register 0 specifies the GPMI transaction to perform for the current command chain item.

Address: 11\_2000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	SFTRST	CLKGATE	RUN	DEV_IRQ_EN	LOCK_CS	UDMA	COMMAND_MODE	WORD_LENGTH	CS	ADDRESS	ADDRESS_INCREMENT					
W																
Reset	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	XFER_COUNT															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**GPMI\_CTRL0n field descriptions**

Field	Description
31 SFTRST	Set to zero for normal operation. When this bit is set to one (default), then the entire block is held in its reset state. This will not work if the CLKGATE bit is already set to '1'. CLKGATE must be cleared to '0' before issuing a soft reset. Also the GPMICLK must be running for this to work properly.  RUN = 0x0 Allow GPMI to operate normally. RESET = 0x1 Hold GPMI in reset.
30 CLKGATE	Set this bit zero for normal operation. Setting this bit to one (default),

*Table continues on the next page...*

## GPMI\_CTRL0n field descriptions (continued)

Field	Description
	gates all of the block level clocks off for minimizing AC energy consumption. RUN = 0x0 Allow GPMI to operate normally. NO_CLKS = 0x1 Do not clock GPMI gates in order to minimize power consumption.
29 RUN	The GPMI is busy running a command whenever this bit is set to '1'. The GPMI is idle whenever this bit set to zero. This can be set to one by a CPU write. In addition, the DMA sets this bit each time a DMA command has finished its PIO transfer phase. IDLE = 0x0 The GPMI is idle. BUSY = 0x1 The GPMI is busy running a command.
28 DEV_IRQ_EN	When set to '1' and ATA_IRQ pin is asserted, the GPMI_IRQ output will assert.
27 LOCK_CS	For ATA/NAND mode: 0= Deassert chip select (CS) after RUN is complete. 1= Continue to assert chip select (CS) after RUN is complete. For Camera Mode: 0= Dont wait for VSYNC rising edge before capturing data. 1= Wait for VSYNC rising edge before capturing data (Camera mode only). DISABLED = 0x0 Deassert chip select (CS) after RUN is complete. ENABLED = 0x1 Continue to assert chip select (CS) after RUN is complete.
26 UDMA	DISABLED = 0x0 Use ATA-PIO mode on the external bus. ENABLED = 0x1 Use ATA-Ultra DMA mode on the external bus. 0 Use ATA-PIO mode on the external bus. 1 Use ATA-Ultra DMA mode on the external bus.
25–24 COMMAND_ MODE	WRITE = 0x0 Write mode. READ = 0x1 Read mode. READ_AND_COMPARE = 0x2 Read and Compare mode (setting sense flop). WAIT_FOR_READY = 0x3 Wait for Ready mode. For ATA WAIT_FOR_READY command set CS=01. 00 Write mode. 01 Read Mode. 10 Read and Compare Mode (setting sense flop). 11 Wait for Ready.
23 WORD_LENGTH	This bit should only be changed when RUN==0. Reserve = 0x0 Reserved. 8_BIT = 0x1 8-bit Data Bus mode. 0 Reserved. 1 8-bit Data Bus mode.
22–20 CS	Selects which chip select is active for this command. For ATA WAIT_FOR_READY command, this must be set to b01.
19–17 ADDRESS	Specifies the three address lines for ATA mode. In NAND mode, use A0 for CLE and A1 for ALE. NAND_DATA = 0x0 In NAND mode, this address is used to read and write data bytes. NAND_CLE = 0x1 In NAND mode, this address is used to write command bytes. NAND_ALE = 0x2 In NAND mode, this address is used to write address bytes.

Table continues on the next page...

**GPMI\_CTRL0n field descriptions (continued)**

Field	Description
16 ADDRESS_INCREMENT	In ATA mode, the address will increment with each cycle. In NAND mode, the address will increment once, after the first cycle (going from CLE to ALE). DISABLED = 0x0 Address does not increment. ENABLED = 0x1 Increment address.  0 Address does not increment. 1 Increment address.
XFER_COUNT	Number of bytes to transfer for this command. A value of zero will transfer 64K bytes.

**30.6.2 GPMI Compare Register Description (GPMI\_COMPARE)**

The GPMI compare register specifies the expect data and the xor mask for comparing to the status values read from the device. This register is used by the Read and Compare command.

GPMI\_COMPARE 0x010

Address: 11\_2000h base + 10h offset = 11\_2010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MASK																REFERENCE															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**GPMI\_COMPARE field descriptions**

Field	Description
31-16 MASK	16-bit mask which is applied after the read data is XORed with the REFERENCE bit field.
REFERENCE	16-bit value which is XORed with data read from the NAND device.

### 30.6.3 GPMI Integrated ECC Control Register Description (GPMI\_ECCCTRLn)

The GPMI ECC control register handles configuration of the integrated ECC accelerator.

Address: 11\_2000h base + 20h offset + (4d × i), where i=0d to 3d

**GPMI\_ECCCTRLn field descriptions**

Field	Description
31–16 HANDLE	This is a register available to software to attach an identifier to a transaction in progress. This handle will be available from the ECC register space when the completion interrupt occurs.
15 RSVD2	Always write zeroes to this bit field.
14–13 ECC_CMD	ECC Command information. DECODE = 0x0 Decode. ENCODE = 0x1 Encode. RESERVE2 = 0x2 Reserved. RESERVE3 = 0x3 Reserved.

*Table continues on the next page...*

**GPMI\_ECCCTRLn field descriptions (continued)**

Field	Description
12 ENABLE_ECC	Enable ECC processing of GPMI transfers. ENABLE = 0x1 Use integrated ECC for read and write transfers. DISABLE = 0x0 Integrated ECC remains in idle.
11–9 RSVD1	Always write zeroes to this bit field.
BUFFER_MASK	ECC buffer information. The BCH error correction only allows two configurations of the buffer mask - software may either read just the first block on the flash page or the entire flash page. Write operations must be for the entire flash page. Invalid buffer mask values will cause the DMA descriptor command to be terminated. BCH_AUXONLY = 0x100 Set to request transfer from only the auxiliary buffer (block 0 on flash). BCH_PAGE = 0x1FF Set to request transfer to/from the entire page.

**30.6.4 GPMI Integrated ECC Transfer Count Register Description (GPMI\_ECCECOUNT)**

The GPMI ECC Transfer Count Register contains the count of bytes that flow through the ECC subsystem.

GPMI\_ECCECOUNT 0x030

Address: 11\_2000h base + 30h offset = 11\_2030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD2																COUNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**GPMI\_ECCECOUNT field descriptions**

Field	Description
31–16 RSVD2	Always write zeroes to this bit field.
COUNT	Number of bytes to pass through ECC. This is the GPMI transfer count plus the syndrome count that will be inserted into the stream by the ECC. In DMA2ECC_MODE this count must match the GPMI_CTRL0_XFER_COUNT. A value of zero will transfer 64K words.

**30.6.5 GPMI Payload Address Register Description (GPMI\_PAYLOAD)**

The GPMI payload address register specifies the location of the data buffers in system memory. This value must be word aligned.

GPMI\_PAYLOAD 0x040

Address: 11\_2000h base + 40h offset = 11\_2040h

**GPMI\_PAYLOAD field descriptions**

Field	Description
31–2 ADDRESS	Pointer to an array of one or more 512 byte payload buffers.
RSVD0	Always write zeroes to this bit field.

### 30.6.6 GPMI Auxiliary Address Register Description (GPMI\_AUXILIARY)

The GPMI auxiliary address register specifies the location of the auxiliary buffers in system memory. This value must be word aligned.

GPMI\_AUXILIARY 0x050

Address: 11\_2000h base + 50h offset = 11\_2050h

**GPMI\_AUXILIARY field descriptions**

Field	Description
31–2 ADDRESS	Pointer to ECC control structure and meta-data storage.
RSVD0	Always write zeroes to this bit field.

### 30.6.7 GPMI Control Register 1 Description (GPMI\_CTRL1n)

The GPMI control register 1 specifies additional control fields that are not used on a per-transaction basis.

Address: 11\_2000h base + 60h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

## GPMI\_CTRL1n field descriptions

Field	Description
31 DEV_CLK_STOP	set this bit to 1 will stop gpmi io working clk.
30 SSYNC_CLK_STOP	set this bit to 1 will stop the source synchronous mode clk.
29 WRITE_CLK_STOP	In onfi source synchronous mode, host may save power during the data write cycles by holding the CLK signal high (i.e. stopping the CLK). The host may only stop the CLK during data write, by setting this bit to 1, if the device supports this feature as indicated in the parameter page.
28 TOGGLE_MODE	enable samsung toggle mode.
27 GPMI_CLK_DIV2_EN	This bit should be reset to 0 in asynchronous mode. The frequency ratio of (device clock : ccm gpmi clock) will be (1 : 1).  This bit should be set to 1, in source synchronous mode or toggle mode. The frequency ratio of (device clock : ccm gpmi clock) will be (1 : 2).  enable the gpmi clk divider.  0x0 internal factor-2 clock divider is disabled 0x1 internal factor-2 clock divider is enabled.
26 UPDATE_CS	force the CS value is be updated to external chip select pin, even GPMI is idle.
25 SSYNCMODE	source synchronous mode 1 or asynchronous mode 0. ASYNC = 0x0 Asynchronous mode. SSYNC = 0x1 Source Synchronous mode.
24 DECOUPLE_CS	Decouple Chip Select from DMA Channel. Setting this bit to 1 will allow a DMA channel to specify any value in the CTRL0_CS register field. Software can use one DMA channel to access all 8 Nand devices.
23–22 WRN_DLY_SEL	Since the GPMI write strobe (WRN) is a fast clock pin, the delay on this signal can be programmed to match the load on this pin.  0 = 4ns to 8ns; 1 = 6ns to 10ns; 2 = 7ns to 12ns; 3 = no delay.
21 RSVD1	Always write zeroes to this bit field.
20 TIMEOUT_IRQ_EN	Setting this bit to '1' will enable timeout IRQ for transfers in ATA mode only, and for WAIT_FOR_READY commands in both ATA and Nand mode. The Device_Busy_Timeout value is used for this timeout.
19 GANGED_RDYBUSY	Set this bit to 1 will force all Nand RDY_BUSY inputs to be sourced from (tied to) RDY_BUSY0. This will free up all, except one, RDY_BUSY input pins.
18 BCH_MODE	This bit selects which error correction unit will access GPMI. This bit must always be set to '1', since only the BCH unit is available in this design.
17 DLL_ENABLE	Set this bit to 1 to enable the GPMI DLL. This is required for fast NAND reads (above 30 MHz read strobe).  After setting this bit, wait 64 GPMI clock cycles for the DLL to lock before performing a NAND read.
16 HALF_PERIOD	Set this bit to 1 if the GPMI clock period is greater than 16ns for proper DLL operation. DLL_ENABLE must be zero while changing this field.
15–12 RDN_DELAY	This variable is a factor in the calculated delay to apply to the internal read strobe for correct read data sampling.

*Table continues on the next page...*

**GPMI\_CTRL1n field descriptions (continued)**

Field	Description
	<p>The applied delay (AD) is between 0 and 1.875 times the reference period (RP). RP is one half of the GPMI clock period if HALF_PERIOD=1</p> <p>otherwise it is the full GPMI clock period. The equation is: <math>AD = RDN\_DELAY \times 0.125 \times RP</math>. This value must not exceed 16ns.</p> <p>This variable is used to achieve faster NAND access. For example if the Read Strobe is asserted from time 0 to 13ns but the read access time is 20ns,</p> <p>then choose AD=12ns will cause the data to be sampled at time 25ns (13+12) giving a 5ns data setup time. If RP=13ns then <math>RDN\_DELAY = 12 / (0.125 \times 13ns)</math>                      = 7.38 (0111b). DLL_ENABLE must be zero while changing this field.</p>
11 DMA2ECC_MODE	This is mainly for testing HWECC without involving the Nand device. Setting this bit will cause DMA write data to redirected to HWECC module (instead of Nand Device) for encoding or decoding.
10 DEV_IRQ	This bit is set when an Interrupt is received from the ATA device. Write 0 to clear.
9 TIMEOUT_IRQ	This bit is set when a timeout occurs using the Device_Busy_Timeout value. Write 0 to clear.
8 BURST_EN	When set to 1 each DMA request will generate a 4-transfer burst on the APB bus.
7 ABORT_WAIT_REQUEST	Request to abort "wait for ready" command on channel indicated by ABORT_WAIT_FOR_READY_CHANNEL. Hardware will clear this bit when abort is done.
6-4 ABORT_WAIT_FOR_READY_CHANNEL	Abort a wait for ready command on selected channel. Set the ABORT_WAIT_REQUEST to kick of operation.
3 DEV_RESET	<p>ENABLED = 0x0 NANDF_WP_B(WPN) pin is held low (asserted).</p> <p>DISABLED = 0x1 NANDF_WP_B(WPN) pin is held high (de-asserted).</p> <p>0 NANDF_WP_B pin is held low (asserted).</p> <p>1 NANDF_WP_B pin is held high (de-asserted).</p>
2 ATA_IRQRDY_POLARITY	<p>For ATA MODE:</p> <p>Note NAND_RDY_BUSY[3:2] are not affected by this bit.</p> <p>ACTIVELOW = 0x0 ATA IORDY and IRQ are active low, or NAND_RDY_BUSY[1:0] are active low ready.</p> <p>ACTIVEHIGH = 0x1 ATA IORDY and IRQ are active high, or NAND_RDY_BUSY[1:0] are active high ready.</p> <p>0 External ATA IORDY and IRQ are active low.</p> <p>1 External ATA IORDY and IRQ are active high.</p> <p>For NAND MODE:</p> <p>0 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when low and busy when high.</p> <p>1 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when high and busy when low.</p>
1 CAMERA_MODE	When set to 1 and ATA UDMA is enabled the UDMA interface becomes a camera interface.
0 GPMI_MODE	<p>ATA mode is only supported on channel zero.</p> <p>If ATA mode is selected, then only channel three is available for NAND use.</p>

*Table continues on the next page...*

**GPMI\_CTRL1n field descriptions (continued)**

Field	Description
	NAND = 0x0 NAND mode. ATA = 0x1 ATA mode.
0	NAND mode.
1	ATA mode.

**30.6.8 GPMI Timing Register 0 Description (GPMI\_TIMING0)**

The GPMI timing register 0 specifies the timing parameters that are used by the cycle state machine to guarantee the various setup, hold and cycle times for the external media type.

GPMI\_TIMING0 0x070

Address: 11\_2000h base + 70h offset = 11\_2070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								ADDRESS_SETUP								DATA_HOLD								DATA_SETUP							
W	0																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	1

**GPMI\_TIMING0 field descriptions**

Field	Description
31–24 RSVD1	Always write zeroes to this bit field.
23–16 ADDRESS_SETUP	Number of GPMICLK cycles that the CE/ADDR signals are active before a strobe is asserted. A value of zero is interpreted as 0. For ATA PIO modes this is known in the ATA7 specification as "Address valid to DIOR-/DIOW- setup"
15–8 DATA_HOLD	Data bus hold time in GPMICLK cycles. Also the time that the data strobe is de-asserted in a cycle. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as "DIOR-/DIOW- recovery time"
DATA_SETUP	Data bus setup time in GPMICLK cycles. Also the time that the data strobe is asserted in a cycle. This value must be greater than 2 for ATA devices that use IORDY to extend transfer cycles. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as ""DIOR-/DIOW-"

**30.6.9 GPMI Timing Register 1 Description (GPMI\_TIMING1)**

The GPMI timing register 1 specifies the timeouts used when monitoring the NAND READY pin or the ATA IRQ and IOWAIT signals.

GPMI\_TIMING1 0x080

## GPMI Memory Map/Register Definition

Address: 11\_2000h base + 80h offset = 11\_2080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### GPMI\_TIMING1 field descriptions

Field	Description
31–16 DEVICE_BUSY_ TIMEOUT	Timeout waiting for NAND Ready/Busy or ATA IRQ. Used in WAIT_FOR_READY mode. This value is the number of GPMI_CLK cycles multiplied by 4096.
RSVD1	Always write zeroes to this bit field.

## 30.6.10 GPMI Timing Register 2 Description (GPMI\_TIMING2)

The GPMI timing register 2 specifies the double data rate timing parameters that are used by the cycle state machine to guarantee the various cs delay, pre-amble delay, post-amble delay, command/address delay, data delay, and read latency cycle times for the external media type.

GPMI\_TIMING2 0x090

Address: 11\_2000h base + 90h offset = 11\_2090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1						READ_ LATENC Y			RSVD0			CE_DELAY				PREAMBLE_ DELAY		POSTAMBLE_ _DELAY		CMDADD_ PAUSE		DATA_ PAUSE

### GPMI\_TIMING2 field descriptions

Field	Description
31–27 RSVD1	Always write zeroes to this bit field.
26–24 READ_ LATENCY	This field is for double data rate read latency configuration. others READ LATENCY is 3  000 READ LATENCY is 0 001 READ LATENCY is 1 010 READ LATENCY is 2 011 READ LATENCY is 3 100 READ LATENCY is 4 101 READ LATENCY is 5
23–21 RSVD0	Always write zeroes to this bit field.

Table continues on the next page...

**GPMI\_TIMING2 field descriptions (continued)**

Field	Description
20–16 CE_DELAY	GPMI dealy from CEn assert to W/Rn changing edge. value of zero is interpreted as 32.
15–12 PREAMBLE_DELAY	GPMI pre-amble delay in GPMICLK cycles. A value of zero is interpreted as 16.
11–8 POSTAMBLE_DELAY	GPMI post-amble delay in GPMICLK cycles. A value of zero is interpreted as 16.
7–4 CMDADD_PAUSE	GPMI delay time from command or adres pause to command or address resume in GPMICLK cycles. A value of zero is interpreted as 16.
DATA_PAUSE	GPMI delay time from data pause to data resume in GPMICLK cycles. A value of zero is interpreted as 16.

**30.6.11 GPMI DMA Data Transfer Register Description (GPMI\_DATA)**

The GPMI DMA data transfer register is used by the DMA to read or write data to or from the ATA/NAND control state machine.

GPMI\_DATA 0x0A0

Address: 11\_2000h base + A0h offset = 11\_20A0h

**GPMI\_DATA field descriptions**

Field	Description
DATA	In 8-bit mode, one, two, three or four bytes can be accessed to send the same number of bus cycles.

**30.6.12 GPMI Status Register Description (GPMI\_STAT)**

The GPMI control and status register provides a read back path for various operational states of the GPMI controller.

GPMI\_STAT 0x0B0

## GPMI Memory Map/Register Definition

Address: 11\_2000h base + B0h offset = 11\_20B0h

## GPMI\_STAT field descriptions

Field	Description
31–24 READY_BUSY	Read-only view of NAND Ready_Busy Input pins.
23–16 RDY_TIMEOUT	<p>State of the RDY/BUSY Timeout Flags. When any bit is set to '1' in this field, it indicates that a time out has occurred while waiting for the ready state of the requested NAND device. Multiple bits may be set simultaneously.</p> <p>When GPMI_CTRL1_DECOUPLE_CS = 0, RDY_TIMEOUT[n] is associated with the NAND device on chip_select[n].</p> <p>When GPMI_CTRL1_DECOUPLE_CS = 1, these flags become associated to a DMA channel instead of a NAND device.</p> <p>For example if DMA channel 6 sends a WAIT_FOR_READY command for NAND Device 2, and a timeout occurred on READY_BUSY2, then READY_TIMEOUT[6] will be set instead of READY_TIMEOUT[2].</p>
15 DEV7_ERROR	<p>DMA channel 7 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 7. 1 An Error has occurred on ATA/NAND Device accessed by</p>
14 DEV6_ERROR	<p>DMA channel 6 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 6. 1 An Error has occurred on ATA/NAND Device accessed by</p>
13 DEV5_ERROR	<p>DMA channel 5 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 5. 1 An Error has occurred on ATA/NAND Device accessed by</p>
12 DEV4_ERROR	<p>DMA channel 4 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 4. 1 An Error has occurred on ATA/NAND Device accessed by</p>
11 DEV3_ERROR	<p>DMA channel 3 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 3. 1 An Error has occurred on ATA/NAND Device accessed by</p>
10 DEV2_ERROR	<p>DMA channel 2 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 2. 1 An Error has occurred on ATA/NAND Device accessed by</p>
9 DEV1_ERROR	<p>DMA channel 1 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 1. 1 An Error has occurred on ATA/NAND Device accessed by</p>
8 DEV0_ERROR	<p>DMA channel 0 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 0. 1 An Error has occurred on ATA/NAND Device accessed by</p>
7–5 RSVD1	Always write zeroes to this bit field.

*Table continues on the next page...*

**GPMI\_STAT field descriptions (continued)**

Field	Description
4 ATA_IRQ	Status of the ATA_IRQ input pin.
3 INVALID_BUFFER_MASK	Buffer Mask Validity bit. 0 ECC Buffer Mask is not invalid. 1 ECC Buffer Mask is invalid.
2 FIFO_EMPTY	NOT_EMPTY = 0x0 FIFO is not empty. EMPTY = 0x1 FIFO is empty. 0 FIFO is not empty. 1 FIFO is empty.
1 FIFO_FULL	NOT_FULL = 0x0 FIFO is not full. FULL = 0x1 FIFO is full. 0 FIFO is not full. 1 FIFO is full.
0 PRESENT	UNAVAILABLE = 0x0 GPMI is not present in this product. AVAILABLE = 0x1 GPMI is present in this product. 0 GPMI is not present in this product. 1 GPMI is present is in this product.

**30.6.13 GPMI Debug Information Register Description (GPMI\_DEBUG)**

The GPMI debug information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

**GPMI\_DEBUG 0x0C0**

Address: 11\_2000h base + C0h offset = 11\_20C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**GPMI\_DEBUG field descriptions**

Field	Description
31-24 WAIT_FOR_READY_END	Read Only view of the Wait_For_Ready End toggle signals to DMA. One per channel

*Table continues on the next page...*

**GPMI\_DEBUG field descriptions (continued)**

Field	Description
23–16 DMA_SENSE	Read-only view of sense state of the 8 DMA channels. A value of "1" in any bit position indicates that a read and compare command failed or a timeout occurred for the corresponding channel.
15–8 DMAREQ	Read-only view of DMA request line for 8 DMA channels. A toggle on any bit position indicates a DMA request for the corresponding channel.
CMD_END	Read Only view of the Command End toggle signals to DMA. One per channel

**30.6.14 GPMI Version Register Description (GPMI\_VERSION)**

This register reflects the version number for the GPMI.

GPMI\_VERSION 0x0D0

Address: 11\_2000h base + D0h offset = 11\_20D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
	MSM_DMAREQ = 0x4 MSM_DMAACK = 0x5 MSM_WAITFF = 0x6 MSM_LDFIFO = 0x7 MSM_LDDMAR = 0x8 MSM_RDCMP = 0x9 MSM_DONE = 0xA
15–12 SYND2GPMI_BE	Data byte enable Input from BCH.
11 GPMI2SYND_VALID	Data handshake output to BCH.
10 GPMI2SYND_READY	Data handshake output to BCH.
9 SYND2GPMI_VALID	Data handshake Input from BCH.
8 SYND2GPMI_READY	Data handshake Input from BCH.
7 VIEW_DELAYED_RDN	Set to a 1 to select the delayed feedback RE_B to drive the GPMI_ADDR[0] (Nand CLE) pin. For debug purposes, this will allow you see if DLL is functioning properly.
6 UPDATE_WINDOW	A 1 indicates that the DLL is busy generating the required delay.
RDN_TAP	This is the DLL tap calculated by the DLL controller. The selects the amount of delay form the DLL chain.

**30.6.16 GPMI Debug3 Information Register Description (GPMI\_DEBUG3)**

The GPMI Debug3 information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI\_DEBUG3 0x0F0

Address: 11\_2000h base + F0h offset = 11\_20F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	APB_WORD_CNTR																DEV_WORD_CNTR															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## GPMI\_DEBUG3 field descriptions

Field	Description
31–16 APB_WORD_CNTR	Reflects the number of bytes remains to be transferred on the APB bus.
DEV_WORD_CNTR	Reflects the number of bytes remains to be transferred on the ATA/Nand bus.

### 30.6.17 GPMI Double Rate Read DLL Control Register Description (GPMI\_READ\_DDR\_DLL\_CTRL)

GPMI DDR Read Delay Loop Lock Control Register. This register provides programmability in DDR mode for data input timing and data formats.

GPMI\_READ\_DDR\_DLL\_CTRL 0x100

Address: 11\_2000h base + 100h offset = 11\_2100h

## GPMI\_READ\_DDR\_DLL\_CTRL field descriptions

Field	Description
31–28 REF_UPDATE_INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of $(2 + \text{REF\_UPDATE\_INT}) * \text{GPMICLK}$ . It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6–3 SLV_DLY_TARGET	The delay target for the read clock is can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from $(\text{GPMICLK}/2)/16$ to $\text{GPMICLK}/2$ .
2 SLV_FORCE_UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.

### 30.6.18 GPMI Double Rate Write DLL Control Register Description (GPMI\_WRITE\_DDR\_DLL\_CTRL)

GPMI DDR Write Delay Loop Lock Control Register. This register provides programmability in DDR mode for data output timing and data formats.

GPMI\_WRITE\_DDR\_DLL\_CTRL 0x110

Address: 11\_2000h base + 110h offset = 11\_2110h

**GPMI\_WRITE\_DDR\_DLL\_CTRL field descriptions**

Field	Description
31–28 REF_UPDATE_INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of (2 + REF_UPDATE_INT) * GPMICLK. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to tbe enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

Table continues on the next page...

**GPMI\_WRITE\_DDR\_DLL\_CTRL field descriptions (continued)**

Field	Description
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6-3 SLV_DLY_TARGET	The delay target for the read clock can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from (GPMICLK/2)/16 to GPMICLK/2.
2 SLV_FORCE_UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE_VAL, the DLL does not need to be enabled.

**30.6.19 GPMI Double Rate Read DLL Status Register Description (GPMI\_READ\_DDR\_DLL\_STS)**

GPMI Double Rate Read DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI\_READ\_DDR\_DLL\_STS 0x120

Address: 11\_2000h base + 120h offset = 11\_2120h

GPMI\_READ\_DDR\_DLL\_STS field descriptions

Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

### 30.6.20 GPMI Double Rate Write DLL Status Register Description (GPMI\_WRITE\_DDR\_DLL\_STS)

GPMI Double Rate Write DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI\_WRITE\_DDR\_DLL\_STS 0x130

## GPMI Memory Map/Register Definition

Address: 11\_2000h base + 130h offset = 11\_2130h

### GPMI\_WRITE\_DDR\_DLL\_STS field descriptions

Field	Description

**GPMI\_WRITE\_DDR\_DLL\_STS field descriptions (continued)**

<b>Field</b>	<b>Description</b>
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

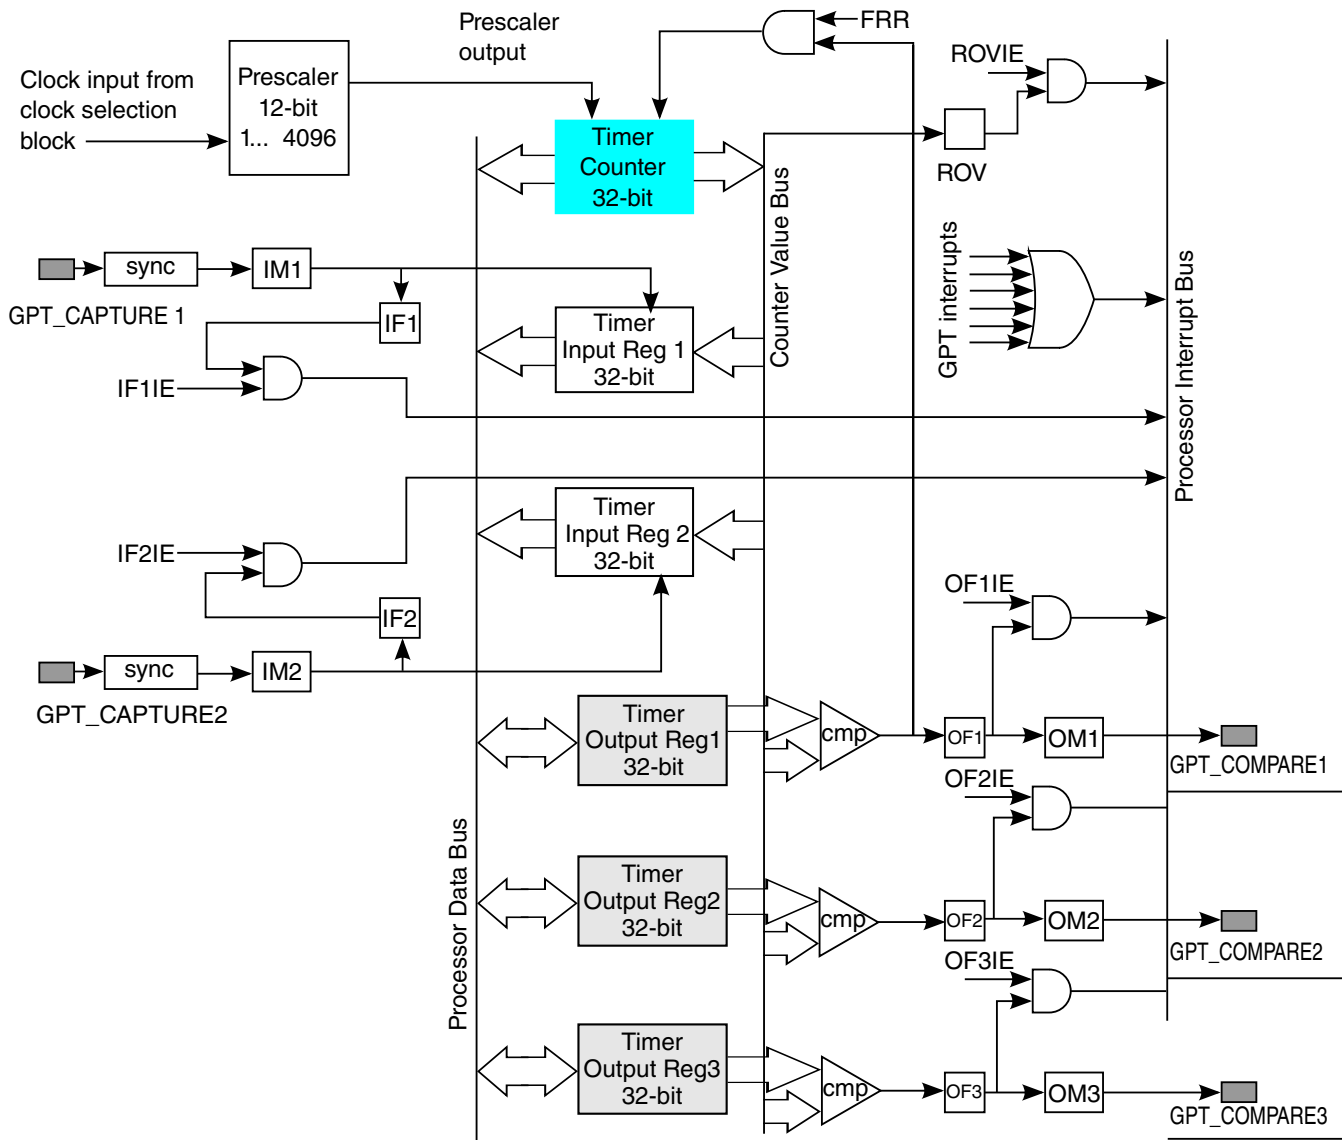

# Chapter 31

## General Purpose Timer (GPT)

### 31.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming.

The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the DO\_CMPOUT $n$  pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

**Figure 31-1. GPT Block Diagram**

The following figure shows the GPT functional clocking scheme.

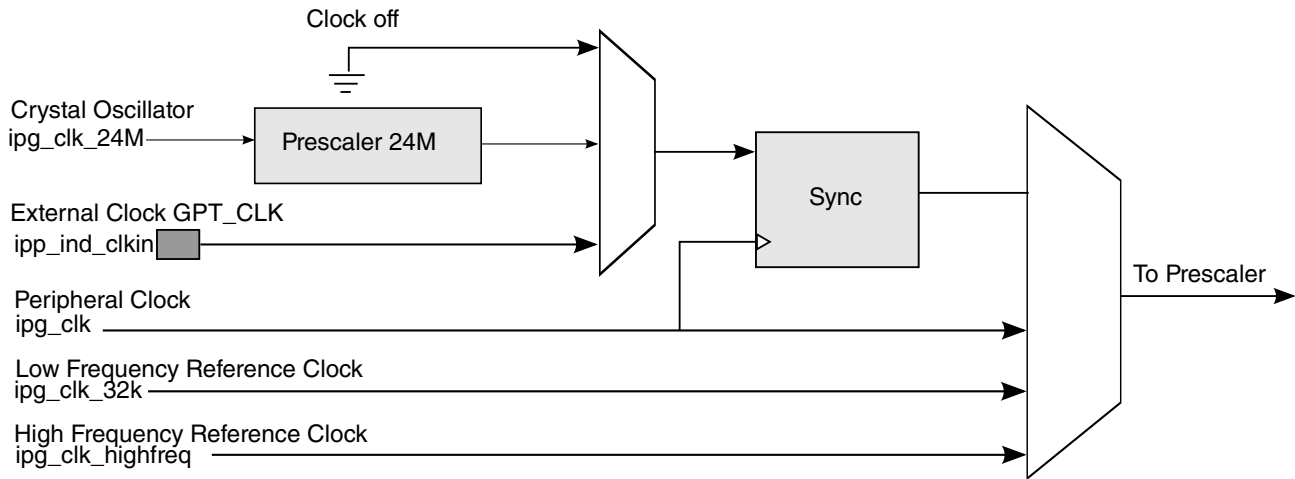

Figure 31-2. GPT Counter Clocks Diagram

### 31.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

### 31.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- [Operating Modes](#)
  - [Restart Mode](#)
  - [Free-Run Mode](#)

## 31.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip*, except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

**Table 31-1. GPT External Signals**

Signal	Description	Pad	Mode	Direction
GPT_CLK	Input pin for an external clock that the counter can be operated at.	SD1_CLK	ALT3	I
GPT_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	SD1_DAT0	ALT3	I
GPT_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	SD1_DAT1	ALT3	I
GPT_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	SD1_CMD	ALT3	O
GPT_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	SD1_DAT2	ALT2	O
GPT_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	SD1_DAT3	ALT2	O

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

### 31.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose.

The external clock input GPT\_CLK is treated as asynchronous to the peripheral clock. To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock. Hysteresis characteristics on this pad will be required because this is a clock input.

### 31.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*.

A positive or/and negative edge on these signals GPT\_CAPTURE1 , GPT\_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock. Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

### 31.2.3 Output Compare Signals

The output compare signals: GPT\_COMPARE1, GPT\_COMPARE2, GPT\_COMPARE3, indicate that output compare events have gone through a specified transition.

## 31.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources:

The following table describes the clock sources for GPT. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 31-2. GPT Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- High-Frequency Clock (ipg\_clk\_highfreq)

Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg\_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg\_clk\_32k)

This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg\_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg\_clk)

If the Peripheral Clock or the External Clock is selected (CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock can be switched OFF.

- External Clock

The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock*, and is synchronized to the Peripheral Clock, *inside* the module. Therefore, the External Clock frequency is limited to  $< 1/4$  frequency of the Peripheral Clock, for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock

This 24MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24MHz Crystal Oscillator Clock is divided by a 24MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock .

The clock input source is configured using the clock source field (CLKSRC, in the GPT\_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT\_CR control register) to 000. **The CLKSRC field value should be changed only after disabling the GPT** (by setting the EN bit in the GPT\_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

**Figure 31-3. Prescaler Value Change Timing Diagram**

## 31.4 Functional Description

This section provides a complete functional description of the GPT.

### 31.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

#### 31.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT\_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

### 31.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

### 31.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT\_CNT) that is a 32-bit free-running *up-counter*, which starts counting *after it is enabled by software* (EN=1).

The counter's clock source is the output of the prescaler labelled "Prescaler output" in [Figure 31-1](#).

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
  - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
  - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT\_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT\_CNT).
- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xffffffff.
- The software reset (SWR bit in the GPT\_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

#### 31.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT\_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle (clock selected to run the counter) *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

**Figure 31-4. Input Capture Event Timing**

### 31.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT\_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT\_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

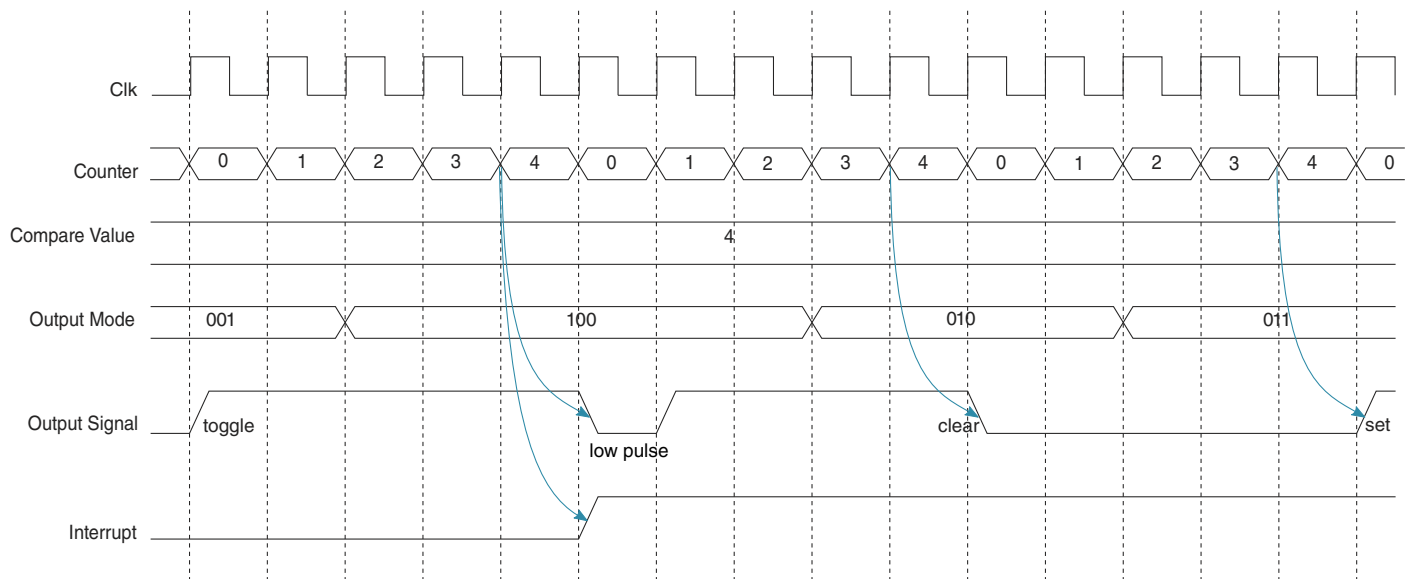

Figure 31-5. Output Compare and Interrupt Timing

### 31.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes.*

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT\_IR register; the associated status bit is the ROV bit in the GPT\_SR register.

- Input Capture Interrupt 1, 2

After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT\_IR register); the associated status bits are IF2 and IF1 (in the GPT\_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt.* The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT\_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT\_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

#### 31.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock, which can be used *only if* the Peripheral Clock is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT\_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

#### 31.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT\_CR control register), then the GPT timer is halted.

### 31.5 Initialization/ Application Information

#### 31.5.1 Selecting the Clock Source

The CLKSRC field in the GPT\_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT\_CR register.
2. Disable GPT interrupt register (GPT\_IR).

3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT\_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT\_CR
5. Change clock source CLKSRC to the desired value in GPT\_CR register.
6. Assert the SWR bit in GPT\_CR register.
7. Clear GPT status register (GPT\_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT\_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT\_CR register.
10. Enable GPT interrupt register (GPT\_IR).

## 31.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT\_CR) and the GPT Output Compare Register1 (GPT\_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT\_ICR1, GPT\_ICR2, GPT\_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips\_addr* is greater than or equal to \$BASE + \$028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

**GPT memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_8000	GPT Control Register (GPT_CR)	32	R/W	0000_0000h	<a href="#">31.6.1/1615</a>

The DBGEN read/write control bit enables GPT operation <i>during Debug mode</i> . <ul style="list-style-type: none"> <li>A hardware reset resets the DBGEN bit.</li> <li>A software reset <i>does not affect</i> the DBGEN bit.</li> </ul> 0 GPT is disabled in debug mode. 1 GPT is enabled in debug mode.
1 ENMOD	GPT Enable mode. When the GPT is disabled (EN=0), then both the Main Counter and Prescaler Counter <i>freeze their current count values</i> . The ENMOD bit determines the value of the GPT counter when Counter is enabled again (if the EN bit is set). <ul style="list-style-type: none"> <li>If the ENMOD bit is 1, then the Main Counter and Prescaler Counter values are reset to 0 after GPT is enabled (EN=1).</li> <li>If the ENMOD bit is 0, then the Main Counter and Prescaler Counter restart counting <i>from their frozen values</i> after GPT is enabled (EN=1).</li> <li>If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter <i>freeze at their current count values</i> when the GPT enters low power mode.</li> <li>When GPT exits low power mode, the Main Counter and Prescaler Counter start counting from their frozen values, regardless of the ENMOD bit value.</li> <li>Setting the SWR bit will clear the Main Counter and Prescaler Counter values, regardless of the value of EN or ENMOD bits.</li> <li>A hardware reset resets the ENMOD bit.</li> <li>A software reset <i>does not affect</i> the ENMOD bit.</li> </ul> 0 GPT counter will retain its value when it is disabled. 1 GPT counter value is reset to 0 when it is disabled.
0 EN	GPT Enable. The EN bit is the GPT module enable bit. <b>Before setting the EN bit</b> , we recommend that <i>all registers be properly programmed</i> . <ul style="list-style-type: none"> <li>A hardware reset resets the EN bit.</li> <li>A software reset <i>does not affect</i> the EN bit.</li> </ul> 0 GPT is disabled. 1 GPT is enabled.

## 31.6.2 GPT Prescaler Register (GPT\_PR)

The GPT Prescaler Register (GPT\_PR) contains bits that determine the *divide value* of the clock that runs the counter.

Address: 209\_8000h base + 4h offset = 209\_8004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	PRESCALER24M				PRESCALER											
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### GPT\_PR field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–12 PRESCALER24M	<p>Prescaler bits.</p> <p>24M crystal clock is divided by [PRESCALER24M + 1] before selected by the CLKSRC field. If 24M crystal clock is not selected, this feild takes no effect.</p> <p>0x0 Divide by 1 0x1 Divide by 2 ... .. 0xF Divide by 16</p>
PRESCALER	<p>Prescaler bits.</p> <p>The clock selected by the CLKSRC field is divided by [PRESCALER + 1], and then used to run the counter.</p> <ul style="list-style-type: none"> <li>A change in the value of the PRESCALER bits cause the Prescaler counter to reset and a new count period to start immediately.</li> <li>See <a href="#">Figure 31-3</a> for the timing diagram.</li> </ul> <p>0x000 Divide by 1 0x001 Divide by 2 ... .. 0xFFFF Divide by 4096</p>

### 31.6.3 GPT Status Register (GPT\_SR)

The GPT Status Register (GPT\_SR) contains bits that indicate that a counter has rolled over, and if any event has occurred on the Input Capture and Output Compare channels. The bits are cleared by writing a 1 to them.

Address: 209\_8000h base + 8h offset = 209\_8008h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	0																
W	[Shaded]

Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

#### GPT\_SR field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 ROV	Rollover Flag. The ROV bit indicates that the counter has reached its <i>maximum possible value</i> and <i>rolled over</i> to 0 (from which the counter continues counting). The ROV bit is only set if the counter has reached 0xFFFFFFFF in both Restart and Free-Run modes.  0 Rollover has not occurred. 1 Rollover has occurred.
4 IF2	IF2 Input capture 2 Flag IF1 Input capture 1 Flag The IF <sub>n</sub> bit indicates that a capture event has occurred on Input Capture channel <i>n</i> .  0 Capture event has not occurred. 1 Capture event has occurred.
3 IF1	See IF2
2 OF3	OF3 Output Compare 3 Flag OF2 Output Compare 2 Flag OF1 Output Compare 1 Flag The OF <sub>n</sub> bit indicates that a compare event has occurred on Output Compare channel <i>n</i> .

Table continues on the next page...

## GPT\_SR field descriptions (continued)

Field	Description
	0 Compare event has not occurred. 1 Compare event has occurred.
1 OF2	See OF3
0 OF1	See OF3

## 31.6.4 GPT Interrupt Register (GPT\_IR)

The GPT Interrupt Register (GPT\_IR) contains bits that control whether interrupts are generated after rollover, input capture and output compare events.

Address: 209\_8000h base + Ch offset = 209\_800Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	0															
W									ROVIE	IF2IE	IF1IE	OF3IE	OF2IE	OF1IE		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## GPT\_IR field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 ROVIE	Rollover Interrupt Enable. The ROVIE bit controls the Rollover interrupt.  0 Rollover interrupt is disabled. 1 Rollover interrupt enabled.
4 IF2IE	IF2IE Input capture 2 Interrupt Enable IF1IE Input capture 1 Interrupt Enable The IFnIE bit controls the IFnIE Input Capture <i>n</i> Interrupt Enable.

Table continues on the next page...

**GPT\_IR field descriptions (continued)**

Field	Description
	0 IF2IE Input Capture <i>n</i> Interrupt Enable is disabled. 1 IF2IE Input Capture <i>n</i> Interrupt Enable is enabled.
3 IF1IE	See IF2IE
2 OF3IE	OF3IE Output Compare 3 Interrupt Enable OF2IE Output Compare 2 Interrupt Enable OF1IE Output Compare 1 Interrupt Enable The OF <i>n</i> IE bit controls the Output Compare Channel <i>n</i> interrupt.  0 Output Compare Channel <i>n</i> interrupt is disabled. 1 Output Compare Channel <i>n</i> interrupt is enabled.
1 OF2IE	See OF3IE
0 OF1IE	See OF3IE

**31.6.5 GPT Output Compare Register 1 (GPT\_OCR1)**

The GPT Compare Register 1 (GPT\_OCR1) holds the value that determines when a compare event will be generated on Output Compare Channel 1. Any write access to the Compare register of Channel 1 while in Restart mode (FRR=0) will reset the GPT counter.

An IP Bus Write access to the GPT Output Compare Register1 (GPT\_OCR1) occurs *after* one cycle of wait state; an IP Bus Read access occurs *immediately* (0 wait states).

Address: 209\_8000h base + 10h offset = 209\_8010h

**GPT\_OCR1 field descriptions**

Field	Description
COMP	Compare Value.  When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 1.

### 31.6.6 GPT Output Compare Register 2 (GPT\_OCR2)

The GPT Compare Register 2 (GPT\_OCR2) holds the value that determines when a compare event will be generated on Output Compare Channel 2.

Address: 209\_8000h base + 14h offset = 209\_8014h

#### GPT\_OCR2 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 2.

### 31.6.7 GPT Output Compare Register 3 (GPT\_OCR3)

The GPT Compare Register 3 (GPT\_OCR3) holds the value that determines when a compare event will be generated on Output Compare Channel 3.

Address: 209\_8000h base + 18h offset = 209\_8018h

#### GPT\_OCR3 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

### 31.6.8 GPT Input Capture Register 1 (GPT\_ICR1)

The GPT Input Capture Register 1 (GPT\_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: 209\_8000h base + 1Ch offset = 209\_801Ch

**GPT\_ICR1 field descriptions**

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

### 31.6.9 GPT Input Capture Register 2 (GPT\_ICR2)

The GPT Input capture Register 2 (GPT\_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: 209\_8000h base + 20h offset = 209\_8020h

**GPT\_ICR2 field descriptions**

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

### 31.6.10 GPT Counter Register (GPT\_CNT)

The GPT Counter Register (GPT\_CNT) is the main counter's register. GPT\_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: 209\_8000h base + 24h offset = 209\_8024h

#### GPT\_CNT field descriptions

Field	Description
COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

# Chapter 32

## 2D Graphics Processing Unit (GPU2D)

### 32.1 Overview

The R2D GPU2D module is designed to display on a variety of consumer devices. Addressable screen sizes range from small displays featured on cell phones to large 1080p high definition displays.

The V2D GPU2D module is designed to display on a variety of consumer devices. Addressable screen sizes range from small displays featured on cell phones to large 1080p high definition displays.

The GPU2D cores provide powerful graphics at low power consumption, utilizing the smallest silicon footprints. Dynamic power consumption is minimized by extensive use of localized clock gating.

R2D GPU Hardware acceleration is brought to numerous 2D including graphical user interfaces (GUI), menu displays, flash animation, and gaming. The GPU R2D block diagrams is presented in the [Figure 32-1](#).

V2D GPU Hardware acceleration is brought to numerous VG applications including graphical user interfaces (GUI), menu displays, flash animation, and gaming. The GPU V2D block diagrams is presented in the [Figure 32-2](#).

### 32.2 GPU2D Block Diagram

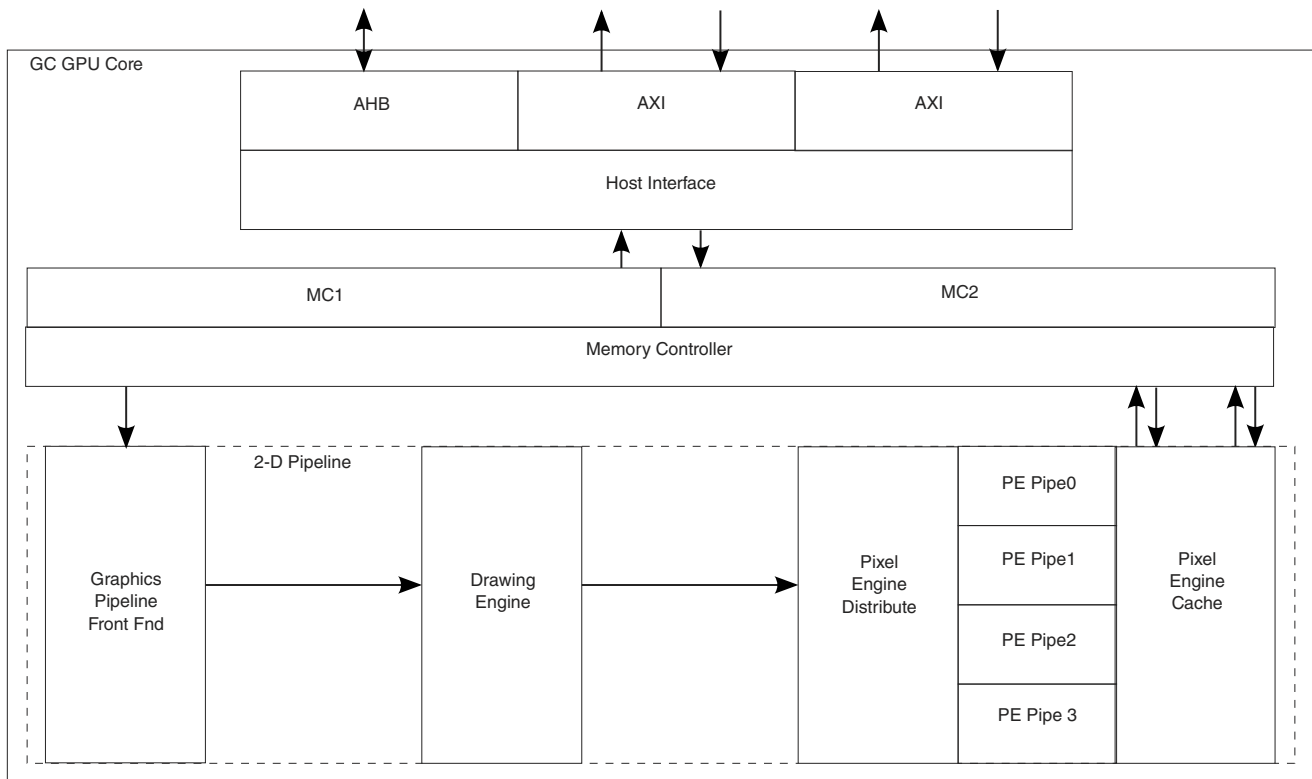

#### 32.2.1 R2D GPU

The R2D graphics processing unit (GPU) defines a high-performance 2D raster graphics core that accelerates the 2D graphics display.

## GPU2D Block Diagram

R2D GPU supports acceleration of the following graphics APIs:

- DirectFB (on Linux)
- GDI / DirectDraw (on Windows CE)

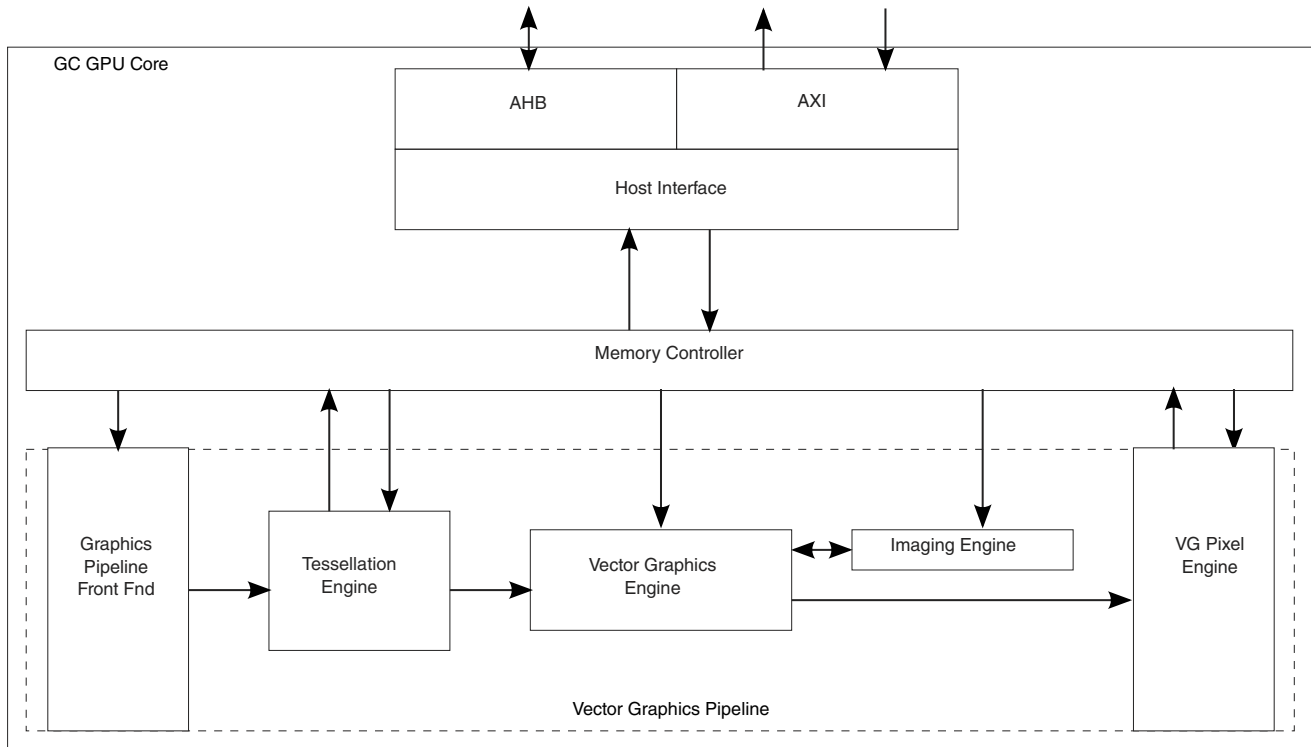

**Figure 32-1. R2D GPU Block Diagram**

### 32.2.2 V2D GPU

V2D GPU defines a high-performance graphics core designed for hardware acceleration of OpenVG vector graphics display. V2D GPU is designed for easy integration onto the SoC.

V2D GPU supports the following graphics APIs:

- OpenVG 1.1

**Figure 32-2. V2D GPU Block Diagram**

## 32.3 GPU2D Features

The following sections describe the functional features of the R2DV2D GPU.

### 32.3.1 Full Featured R2D GPU Pipeline

- Bit BLT
- Stretch BLT
- Rectangle fill and clear
- Line drawing
- Filter BLT
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending, including Java 2 Porter-Duff compositing blending rules
- 32K x 32K coordinate system
- 90 / 180 / 270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask

### 32.3.2 Full Featured V2D GPU Pipeline

- Coordinate Systems and Transformations (Image drawing uses a 3x3 perspective transformation matrix)
- Viewport Clipping, Scissoring and Alpha Masking
- Paths
- Images
- Image Filters
- Paint(gradient and pattern)
- Blending
- Higher-level Geometric Primitives
- Image Warping
- Dithering

## 32.4 GPU2D OPERATIONS

### 32.4.1 R2D GPU Operations

Information detailing the R2D GPU operations can be found in this section.

#### 32.4.1.1 Line

Lines are rendered using the Bresenham algorithm. The Bresenham algorithm has the advantage of using integer arithmetic and has no accumulation of rounding errors.

The LINE operation draws a line. Coordinates for two points are given: start point and end point. The end point is not drawn.

In the case of line, only ROP2 and ROP4 are supported. It operates on pattern and destination. The pattern should have a transparency mask in order to use ROP4.

Clipping is supported for lines on a per pixel basis.

Figure 32-3. Line

### 32.4.1.2 Rectangle Fill and Clear

Rectangle fill creates a rectangle area with a given color or a pattern fill. Essentially rectangle fill is a pattern fill, where an 8x8 pattern is initialized with the specified color. It supports ROP2 and ROP4 with the pattern and destination as its inputs. If ROP4 is used, the pattern should have a transparency mask.

Clear is similar to rectangle fill except that it does not use a pattern. A 32-bit clear value with 4-bit byte mask is used to fill the entire rectangle area.

Both rectangle fill and clear support clipping, which is performed on a per primitive basis.

### 32.4.1.3 BitBLT

Bit blit transfers data from one area of a memory (source) to another area of the memory (destination).

The source and destination can be from the same or different memory locations. Both source and destination must be described by a rectangular area. The source and destination rectangles can be the same size (most bit blits are of this nature) or they can be different sizes, in which case the operation becomes a stretch or shrink blit.

Bit blit supports ROP2, ROP3, and ROP4 which includes source, destination and pattern, and an optional transparency color.

Clipping can be performed on a primitive basis.

**Figure 32-4. BitBLT**

The BIT BLT primitive supports the following 10 source and 8 destination image formats:

**Table 32-1. Bit BLT Formats**

Formats	Source Image	Destination Image
A1R5G5B5	Yes	Yes
A4R4G4B4	Yes	Yes
X1R5G5B5	Yes	Yes
X4R4G4B4	Yes	Yes
R5G6B5	Yes	Yes
A8R8G8B8	Yes	Yes
X8R8G8B8	Yes	Yes
A8	Yes	Yes
1-bit monochrome	Yes	No
8-bit color index	Yes	No

### 32.4.1.4 Stretch BLT

The stretch blt primitive performs a bit blt operation with stretch or shrink. The modified Bresenham algorithm is used to generate corresponding coordinates for fast stretching. The stretch factor is specified in a 15.0 fixed-point format. Stretch blit is not allowed to overlap therefore no part of source and destination can share any piece of memory. Non-stretch blits can overlap. For stretch blit, clipping is performed on a per pixel basis.

### 32.4.1.5 Monochrome Expansion and Mask BLT

Monochrome expansion and mask blit are different operations, although both use the bit stream from command buffer and both can be the source for ROP4 source selection. This means that each output pixel can be a combination of source, pattern, monochrome mask (for masked blits) and destination.

#### 32.4.1.5.1 Monochrome expansion

For monochrome expansion, the bit from the stream is used to switch on/off a solid color that is defined in a register. This mechanism enables the use of just one bit per pixel to represent colors. In effect, the MONO EXPANSION primitive increases color representation from one bit per pixel to multiple bits per pixel. A typical application for mono color is font drawing.

Monochrome expansion does not support overlapping of the source and destination. It is the responsibility of the driver to make sure that the command will never be executed with overlapping source and destination.

#### 32.4.1.5.2 Mask BLT

For Mask BLT, the bit from the stream is used to toggle on/off a color in the source frame buffer. Mask BLT takes its color source from memory and its monochrome mask from the command stream. Clipping is supported and is performed on a per pixel basis.

#### 32.4.1.6 Filter BLT

Filter blit performs high quality scaling, up or down, using an FIR re-sampling filter with up to 9 taps. Sub-pixel coordinates (locations between the pixel grids) are generated by the drawing engine. The filter block in the drawing engine uses the sub-pixel information to select the appropriate filter kernel. R2D GPU processes 1 pixel every cycle when performing filter blit.

A stretch- or shrink-factor of 15.16 fixed-point format is supported. To generate a single destination pixel requires 9 source pixels. An image is scaled in two passes, one for X-dimension (HOR\_FILTER\_BLT) and the other for Y-dimension (VER\_FILTER\_BLT). Software sets up the filter kernel/coefficient table and the kernel size, as well as a temporary buffer for storing intermediate results. After the first pass is completed, intermediate results are sent back to memory, and then the second pass starts to scale the first-pass image. Because of this two-step procedure, the throughput of FILTER BLT is lower than that of STRETCH BLT. Also the Filter Kernel Table may need to be reloaded, and some cycles are consumed in calculating the stepping parameters.

## GPU2D OPERATIONS

When the stretch or shrink factor is 1, the filterBlit works as a bitBlit copy. It can be used as format converter in that case, for instance, YUV to RGB converter. To use as a format converter, only one pass (HOR\_FILTER\_BLT or VER\_FILTER\_BLT) is needed. To optimize the memory bandwidth, when using filterBlit to do YUV to RGB filtering, the temporary target buffer format can be specified as YUY2 to process Y-dimension filtering (VER\_FILTER\_BLT). This is to avoid converting YUV to A8R8G8B8 in the 1st vertical pass to reduce the memory bandwidth and increase the pixel processing rate. This is the only special case that GPU may use YUY2 as target format.

The FILTER BLT primitive supports the following 13 source and 7 destination image formats:

Filter BLT Formats

Formats		Source Image	Destination Image
A1R5G5B5		Yes	Yes
A4R4G4B4		Yes	Yes
A8R8G8B8		Yes	Yes
R5G6B5		Yes	Yes
X1R5G5B5		Yes	Yes
X4R4G4B4		Yes	Yes
X8R8G8B8		Yes	Yes
YUV	NV12 (4:2:0, 2 planes)	Yes	No
	NV16 (4:2:2, 2 planes)	Yes	No
	UYVY (4:2:2, interleave)	Yes	No
	YUY2 (4:2:2, interleave)	Yes	No
	YV12 (4:2:0, 3 planes)	Yes	No
	8-bit color index	Yes	No

### 32.4.1.7 R2D Performance of different operations

Table 32-2. Performance of different operations without rotation

Primitive	Peak Performance	Source/destination overlap	Clipping
Line	1 pixel / cycle	N/A	Done on pixel basis
Rectangle	2.4 pixel / cycle	N/A	Done on primitive basis
Clear	2.4 pixel / cycle	N/A	Done on primitive basis
Blit	2.4 pixel / cycle	Overlap is allowed	Done on primitive basis
Stretch blit	1 pixel / cycle	No overlap allowed	Done on pixel basis
Monochrome expansion	1.6 pixel / cycle	No overlap allowed	Done on pixel basis
Filter blit	1 pixel / cycle	N/A	N/A

**Table 32-3. Performance of different operations with rotation**

Primitive	Performance	Source/destination overlap	Clipping
Line	1 pixel / cycle	N/A	Done on pixel basis
Rectangle	2 pixel / cycle	N/A	Done on primitive basis
Clear	2 pixel / cycle	N/A	Done on primitive basis
Blit	2 pixel / cycle	Overlap is allowed	Done on primitive basis
Stretch blit	1 pixel / cycle	No overlap allowed	Done on pixel basis
Monochrome expansion	1 pixel / cycle	No overlap allowed	Done on pixel basis
Filter blit	1 pixel / cycle	N/A	N/A

### 32.4.1.8 Rotation

- 90° / 180° / 270° / X-Flip / Y-Flip / Mirror rotation is supported for all primitives.

### 32.4.1.9 Transparency Mode

For monochrome expansion:

- Opaque
- Conditional transparency. Transparent if the current pixel matches the specified value.

For blits:

- Opaque
- Masked transparency. Transparent if the mask for the current pixel or pattern is zero.
- Source Conditional transparency. Transparent if the source pixel is within the specified value range.
- Destination Conditional transparency. Transparent if the destination pixel is not within the specified value range.

### 32.4.1.10 Clipping

One clipping rectangle is supported for all bitBlit primitives.

### 32.4.1.11 R2D GPU Data Formats

The graphics engine supports 14 source data formats. In addition to these 14 source formats, for RGB source formats, GPU also supports their swizzle formats (ARGB, RGBA, ABGR, BGRA) for RGB formats. For YUV formats, GPU supports their U/V swap formats.

- A1R5G5B5
- A4R4G4B4
- A8R8G8B8
- R5G6B5
- X1R5G5B5
- X4R4G4B4
- X8R8G8B8
- A8
- NV12
- NV16
- UYVY (4:2:2)
- YUY2 (4:2:2)
- YV12 (4:2:0)
- 8-bit color index

There are 8 destination data formats supported by the graphics engine. In addition to these destination RGB formats, their swizzle formats (ARGB, RGBA, ABGR, BGRA) are also supported.

- A1R5G5B5
- A4R4G4B4
- A8R8G8B8
- R5G6B5
- X1R5G5B5
- X4R4G4B4
- X8R8G8B8
- A8

### 32.4.1.12 ARGB Data Conversion of R2D GPU

The pixels read from source or destination will be expanded into A8R8G8B8 format to maintain lossless pixel operations. The resulting pixels will be converted into the destination format.

### 32.4.1.13 YUV to RGB Conversion of R2D GPU

YUV data can be converted into 8-bit per component RGB format at the output of the cache only. Once converted, there is no way back to YUV format. GPU supports BT.601 and BT.709 YUV to RGB color conversion standards.

In BT.601, the YUV to RGB conversion is done using the following approximation:

$$16 \leq Y \leq 235$$

$$16 \leq U \leq 240$$

$$16 \leq V \leq 240$$

$$A = Y - 16$$

$$B = U - 128$$

$$C = V - 128$$

$$R = \text{clip}((298 * A + 410 * C + 128) \gg 8)$$

$$G = \text{clip}((298 * A - 101 * B - 209 * C + 128) \gg 8)$$

$$B = \text{clip}((298 * A + 519 * B + 128) \gg 8)$$

The Y, U and V components are clamped prior to the conversion.

Y is clamped between 16 and 235, inclusively.

U and V are clamped between 16 and 240, inclusively.

In BT.709, the R, G, B equations are slightly changed to

$$R = \text{clip}((298 * A + 461 * C + 128) \gg 8)$$

$$G = \text{clip}((298 * A - 55 * B - 137 * C + 128) \gg 8)$$

$$B = \text{clip}((298 * A + 543 * B + 128) \gg 8)$$

### 32.4.1.14 Color Index Input Conversion Support of R2D GPU

Color index is supported for source data only. A look-up table with 256 entries is provided for indexing the data. The table is fully programmable. The conversion is done when pixels are read out of the cache.

### 32.4.1.15 Source/Destination Pre-multiply and De-Multiply Support

GPU supports source pre-multiply source alpha or global alpha, or source global color for global colorizing. On destination, the GPU supports destination pre-multiply destination alpha, destination de-multiply alpha.

### 32.4.1.16 Alpha Blending

The GPU supports alpha blending together with ROP. The alpha blending function is performed on ROP function result source.

The general alpha blending equations are:

$$Cd = Fs * Cs' + Fd * Cd'$$

$$Ad = Fs * As'' + Fd * Ad''$$

Where

- Cs' is the source color component (adjusted for NPM if necessary)
- Cd' is the destination color component (adjusted for NPM if necessary)
- As'' is the modified source alpha component
- Ad'' is the modified destination alpha component
- Fs is fraction of the source that contributes to the final value
- Fd is fraction of the destination that contributes to the final value

The blending is done in 5 logical stages (not real implementation stages):

1. Transparent/opaque conversion
  - In this stage, the incoming alpha (source or destination independently) can be inverted if needed to match the internal alpha rule. Internally, an alpha of 0 means transparent, while an alpha of "0xFF" means opaque. External content might follow the opposite rule. The output of the block is either As (Ad for destination) or 1-As (1-Ad for destination).
2. Global value substitution
  - A global alpha value from a register can be used to substitute or scale the incoming alpha. An incoming alpha As can pass-through, be directly substituted by Ags (global alpha) or scaled by the global alpha value (As \* Ags). The source and destination have distinct global alpha values.
3. Blending factor generation
  - At this stages, the blending factors are generated (refer to table below). Each alpha can take the values 0, 1, A or 1-A depending on the blending mode.
4. Final blending
  - This is the final stage which implements blending equations.

The fractions take the values described in the following table, depending on the blending mode.

**Table 32-4. Blending Modes Fractions Description**

Blending Mode	Fs	Fd
Clear	0	0
SRC	1	0
DST	0	1
SRC_OVER	1	$1 - A_s$
DST_OVER	$1 - A_d$	1
SRC_IN	$A_d$	0
DST_IN	0	$A_s$
SRC_OUT	$1 - A_d$	0
DST_OUT	0	$1 - A_s$
SRC_ATOP	$A_d$	$1 - A_s$
DST_ATOP	$1 - A_d$	$A_s$
XOR	$1 - A_d$	$1 - A_s$

To control the blending modes, the following register fields are used:

- 1 bit for transparent/opaque conversion for source alpha
- 1 bit for transparent/opaque conversion for destination alpha
- 2 bits for source alpha modifications, to specify the 3 cases ( $A_s$ ,  $A_g$ ,  $A_s * A_g$ )
- 2 bits for destination alpha modifications, to specify the 3 cases ( $A_d$ ,  $A_g$ ,  $A_d * A_g$ )
- 4 bits to select between the 12 blending modes
- 8-bits for global source alpha
- 8-bits for global destination alpha

Alpha blending is supported on bit blit and filter blit primitives.

### 32.4.1.17 GPU Cache Management

SW cache flush is supported to flush the GPU cache to memory. Auto-flush of GPU cache is also supported. SW sets up the auto-flush interval, and HW will do the cache flush automatically at programmable intervals.

## 32.4.2 V2D GPU Operations

Information detailing the V2D GPU operations can be found here.

### 32.4.2.1 OPENVG 1.1-API STANDARD for VECTOR GRAPHICS ACCELERATION

OpenVG is a royalty-free, cross-platform API managed by the member-funded consortium known as Khronos Group. It provides a low-level hardware acceleration interface for vector graphics libraries such as Flash and SVG. OpenVG is used for acceleration of high-quality vector graphics for user interfaces and text on small screen devices.

#### 32.4.2.2 Advantages of Using OpenVG

- Hardware accelerators can reduce power consumption by up to 90% compared to a software engine.
- Scalability with high-quality rendering, including anti-aliasing, to different screen sizes without multiple bitmaps.

#### 32.4.2.3 OpenVG Target Applications

- SVG Viewers
- Portable Mapping Applications
- E-book Readers
- Games
- Scalable User Interface

#### 32.4.2.4 OpenVG Features

### 32.4.2.4.1 Core API

- Coordinate Systems and Transformations (Image drawing uses a 3x3 perspective transformation matrix)
- Viewport Clipping, Scissoring and Alpha Masking
- Paths
- Images
- Image Filters
- Paint (gradient and pattern)
- Blending
- Dithering

### 32.4.2.4.2 The VGU Utility Library

- Higher-level Geometric Primitives
- Image Warping

### 32.4.2.4.3 OpenVG Rendering Pipeline

- Stage 1: Path, Transformation, Stroke, and Paint
- Stage 2: Stroked Path Generation
- Stage 3: Transformation
- Stage 4: Rasterization
- Stage 5: Clipping and Masking
- Stage 6: Paint Generation
- Stage 7: Image Interpolation
- Stage 8: Blending and Anti-aliasing

## Chapter 33

# 3D Graphics Processing Unit (GPU3D)

### 33.1 Overview

The GPU3D is a high-performance core that delivers hardware acceleration for 3D graphics display.

Addressable screen sizes range from the smallest cell phones to HD 1080p displays. It provides high performance, high quality graphics, low power consumption, and the smallest silicon footprint.

GPU3D accelerates numerous 3D graphics applications, including graphical user interfaces (GUI), menu displays, flash animation, and gaming. This module supports the following graphics APIs:

- OpenGL ES 3.0
- OpenGL ES 2.0
- OpenGL ES 1.1
- OpenVG 1.1
- EGL 1.4

### 33.2 GPU3D Block Diagram

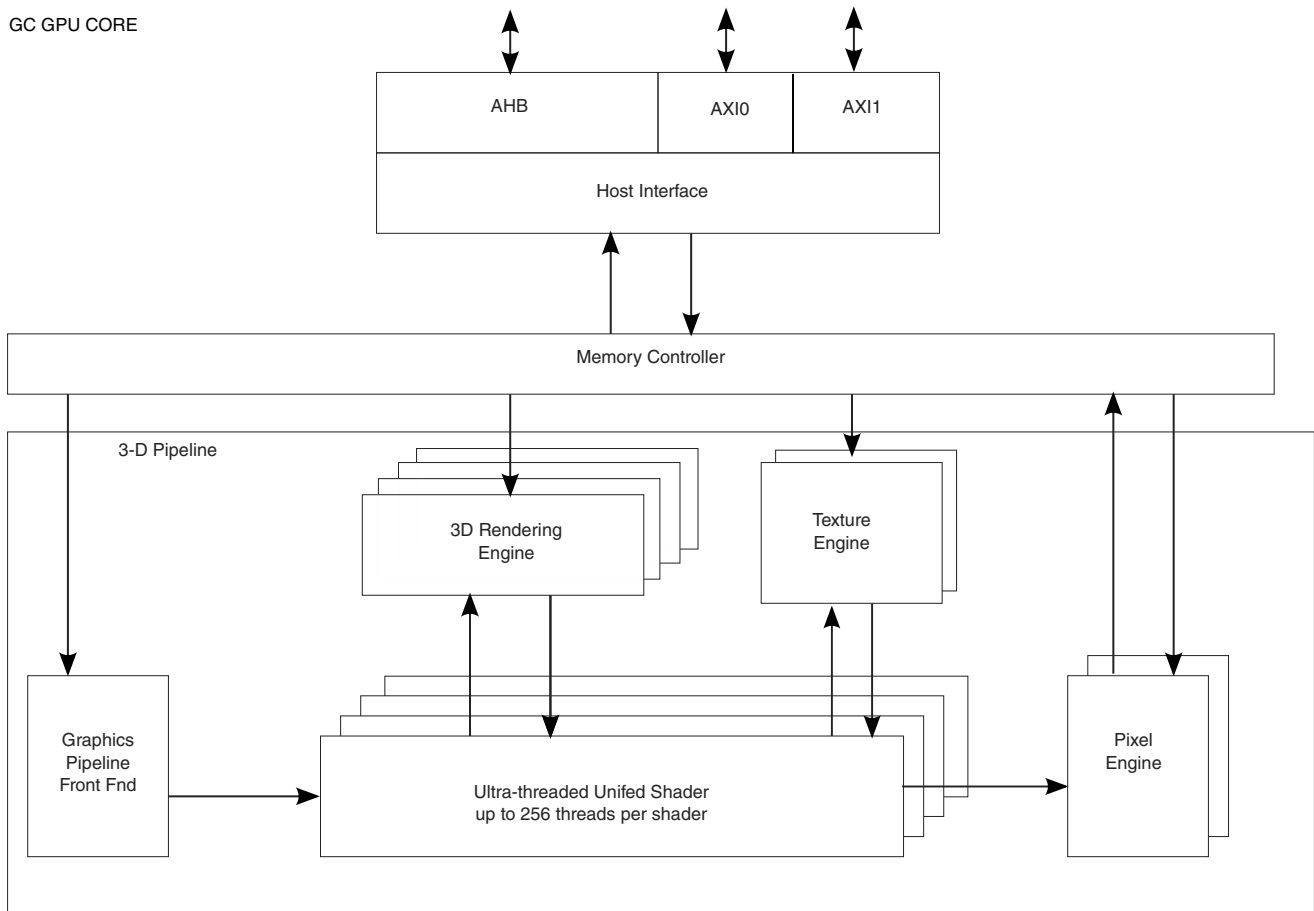

The main functional units of the GPU3D are shown in the figure below and their description is as follows:

- **Host Interface:** Allows GPU3D to communicate with external memory and the CPU through AXI or AHB bus. In this block data crosses clock domain boundaries.
- **Memory Controller:** Internal memory management unit that controls the block-to-host memory request interface.
- **Graphic Pipeline Front End:** Inserts high level primitives and commands into the graphics pipeline.

## GPU3D Block Diagram

- Ultra-threaded Unified Shader: SIMD processor that performs as both vertex shader and fragment shader. When used as a vertex shader it performs geometry transformations and lighting computations. When used as a fragment shader it applies texture data and computes color values for each pixel. GPU3D has four (4) such shaders.
- 3D Rendering Engine: Converts triangles and lines into pixels. Computes slopes of color attributes and texture coordinates. Performs clipping.
- Texture Engine: Retrieves texture information from memory upon request by the fragment shader. Performs interpolation and filtering, and transfers the computed value to the fragment shader or the vertex shader. The texture unit can process two pixels or two vertices/cycle.
- Pixel Engine/Resolve: Pixel engine does alpha blending and visible surface determination. Resolve does tiling and de-tiling as well as FSAA filtering. The pixel engine can process two pixels/cycle.

GC GPU CORE

**Figure 33-1. GPU3D Top Level Block Diagram**

There are two main clocks for the processing control: shader clk for the shader part, and core clk for the remaining part. The core clk and shader clk frequency are programmable in CCM (as the clk frequency for GPU3D\_CORE\_CLK\_ROOT, GPU3D\_SHADER\_CLK\_ROOT).

The GPU3D provides architectural support for the following features:

**Table 33-1. GPU3D Architectural Support**

Feature	GPU Support
Primary API	OpenGL ES1.1, 2.0, and 3.0
Additional API's	OpenVG1.1
Other Graphics Support	EGL1.4
Drivers	OpenGL ES1.1,2.0 and 3.0
	OpenVG1.1
	EGL1.4
Operating Systems	Windows CE
	Linux Embedded
Z (depth)	Early Z support included
Stencil	Early stencil support included
Shader Languages	GLSL ES 1.0
Shader model compatability	Shader model 3.0
Shader types and execution units	One programmable Scalable Ultra-threaded Unified Shaders (SIMD4:transcendental,ctl-flow,tx-load) one instruction issue per shader per clock; IEEE 32-bit floating-point pipeline supports long shader instructions
FSAA anti-aliasing mechanisms	High quality MSAA 4x MSAA 16x for OpenVG
Code and data memory location restrictions	Unrestricted; arbitrary memory reads and writes
Physical address	32 bits
MMU description	32-bit virtual address, 4 kB pages, error reporting outside of address space
TLB	4 cache lines per requestor
Resource locks with CPU	Semaphore lock
Max memory latency without a performance hit	128 GPU cycles

### 33.3 GPU3D Hardware Features

The GPU3D block has the following hardware features:

- OpenGL ES 2.0 compliance, including extensions; OpenGL ES 1.1; OpenVG 1.1
- IEEE 32-bit floating-point pipeline

## GPU3D Hardware Features

- Ultra-threaded, unified vertex and fragment shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 12 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Support for 8 fragment shader simultaneous textures
- Support for 4 vertex shader simultaneous textures
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear
- 8k x 8k texture size and 8k x 8k rendering target
- 4 Vertex DMA streams
- 2 texture units and 2 pixel units for higher pixel processing rate
- Supports YUV format in display output (YUYV 4:2:0)

**Table 33-2. Unified vertex-fragment shader features**

Feature	GPU Support
Shader type and execution units	Unified shader, SIMD4, SFP32 Trans
Swizzle capabilities	Full 32-bit word level swizzle in a 128-bit vector
GPR's per shader	Up to 512 general purpose registers, 128 bits each
Uniform registers	Vertex Shader: 168 registers, 128 bits each Fragment Shader: 64 registers, 128 bits each
FP denorm and rounding options	Denorms are set to zero. Supports rounding to zero.
Maximum number of data input attributes	Maximum of 12 vertex shader input elements; Maximum of 8 fragment shader input elements;
Maximum number of instructions	256 unified for vertex and 256 for fragment shaders
Maximum number of vertex streams	4
Maximum number of threads in flight per shader core	256
Subroutines	4 levels
Conditional branch support	GT, LT, EQ, GE, LE, NE
Shader instruction rate	1-cycle throughput for all shader instructions
Floating-point instruction precision	Transcendental: 22 bits SIMD4 (vector): 23.5 bits
Fragment shader video	Supports video texture
Control flow instructions	Yes

**Table 33-3. Vertex Processing Features**

Feature	GPU Support
Vx D3D, OGL ES formats supported	BYTE, UBYTE, SHORT, USHORT, INT, UINT, DEC, UDEC, FLOAT, FLOAT16, D3DCOLOR, FIXED16DOT16
Vertex data size limits	256 bytes
Pre shader cache	1 kB
Post shader cache	8 vertices

**Table 33-4. Primitive Processing Features**

Feature	GPU Support
Primitives supported	triangle strip, fan, and list; line strip line loop and list; point list
Vertex/primitive geometry input index sizes	8-bit ,16-bit and 32-bit indices
Setup parameters available to fragment shader	8 vec4 parameters; all available to fragment shader
AA line support	Yes

**Table 33-5. Texture Processing Features**

Feature	GPU Support																																																												
Fixed-point input texture formats	A8, L8, I8, A8L8, ARGB4, XRGB4, ARGB8, XRGB8, ABGR8, XBGR8, R5G6B5, A1RGB5, X1RGB5, YV12, YUY2, UYVY, D16, D24S8, A8_OES, DXT1, DXT2, DXT3, DXT4, DXT5, ETC1; all fixed-point formats are filtered.

**Table 33-5. Texture Processing Features (continued)**

Feature	GPU Support
Compressed texture formats	DXT1, DXT2, DXT3, DXT4, DXT5, ETC1 All compressed formats are filtered.
Texture size maximum	8k x 8k
Addressing modes	Wrap, mirror, clamp
Mipmap support	14 mipmap levels; programmable LOD biasing & replacement
Shadow texture	Depth texture PCF filtering
Texture cache organization	Tiled, 4x4 texels
Texture cache size	32 cache lines, with 64 bytes per cache line; 2 KB texture cache total
Texture coordinate fraction bits	5 bits
Texture sampler units	12 samplers, indexable
Textures per fragment maximum	8 texture samplers
Dependent texture operation	High performance; unlimited dependent texture reads
Dependent tx per fragment max, relative sampling	No limit
Texture repeat max	256
Texture types	2D, cube map, 1D, projected, depth, bump map, displacement map
Texture filters	Point sample, bi-linear, tri-linear
Texture component mapping: D3D, OGL, ES options	Supports both D3D and OES options
Texture size types	Power-of-2, Non-square

### 33.3.1 Rasterization

**Table 33-6. Rasterization features**

Feature	GPU Support
Interpolant attributes limit	8
Render target size	8K x 8K
Clipping window support	Clipping rectangle supported
Early Z	Yes

### 33.3.2 Fragment Processing

**Table 33-7. Fragment Processing Features**

Feature	GPU Support
FSAA mechanisms	High quality MSAA 4x, MSAA 16x for OpenVG

*Table continues on the next page...*

Table 33-7. Fragment Processing Features (continued)

Fragment color, alpha, Z, stencil precision	<b>Bits</b>	<b>Format</b>	<b>Alpha</b>	<b>R</b>	<b>B</b>	<b>G</b>

	32	RGB10_a2ui	2	10	10	10
	<b>Bits</b>	<b>Format</b>	<b>Depth</b>	<b>Stencil</b>		
	16	D16	16	0		
	32	D2488	24	8		
	Fragment storage	16-bit color and z, 32-bit color and z for each fragment. Lossless compression, no storage reduction.				
Fragment cache	16 cache lines for color 16 cache lines for Z 64 bytes per cache line 32 cache lines for Z					
Alpha support	Individual fragment alpha masking					

### 33.3.3 Dest/Alpha Blending

Table 33-8. Dest/Alpha Blending Features

Feature	GPU Support					
Destination color formats	Bits	Format	Alpha	R	B	G
	16	ARGB4444	4	4	4	4
	16	ARGB1555	1	5	5	5
	16	RGB565	0	5	6	5
	32	ARGB8888		8	8	8
	32	ABGR8888		8	8	8
Blend modes	Porter-Duff blending modes					
Render target dithering support	Yes					

### 33.3.4 Z/Stencil Buffer

Table 33-9. Z/Stencil Buffer Features

Feature	GPU Support
Z/stencil formats	16-bit Z; 24-bit Z plus 8-bit stencil, with lossless compression support
Z/stencil buffer	16 cache lines; 64 bytes per line;
Stencil compression	Yes

### 33.3.5 Render Target

Feature	GPU Support
Formats	16-bit and 32-bit, with lossless compression support

Table continues on the next page...

RT buffer cache

16 cache lines; 64 bytes per line;  
RT caches are fully set associative.

## 33.4 Usage Mode

The GPU3D should be programmed through the Freescale provided driver. Freescale does not provide support for software that directly programs the GPU3D registers. APIs for programming the GPU3D through the software driver are described in separate driver documentation.

# Chapter 34

## HDMI Transmitter (HDMI)

### 34.1 Overview

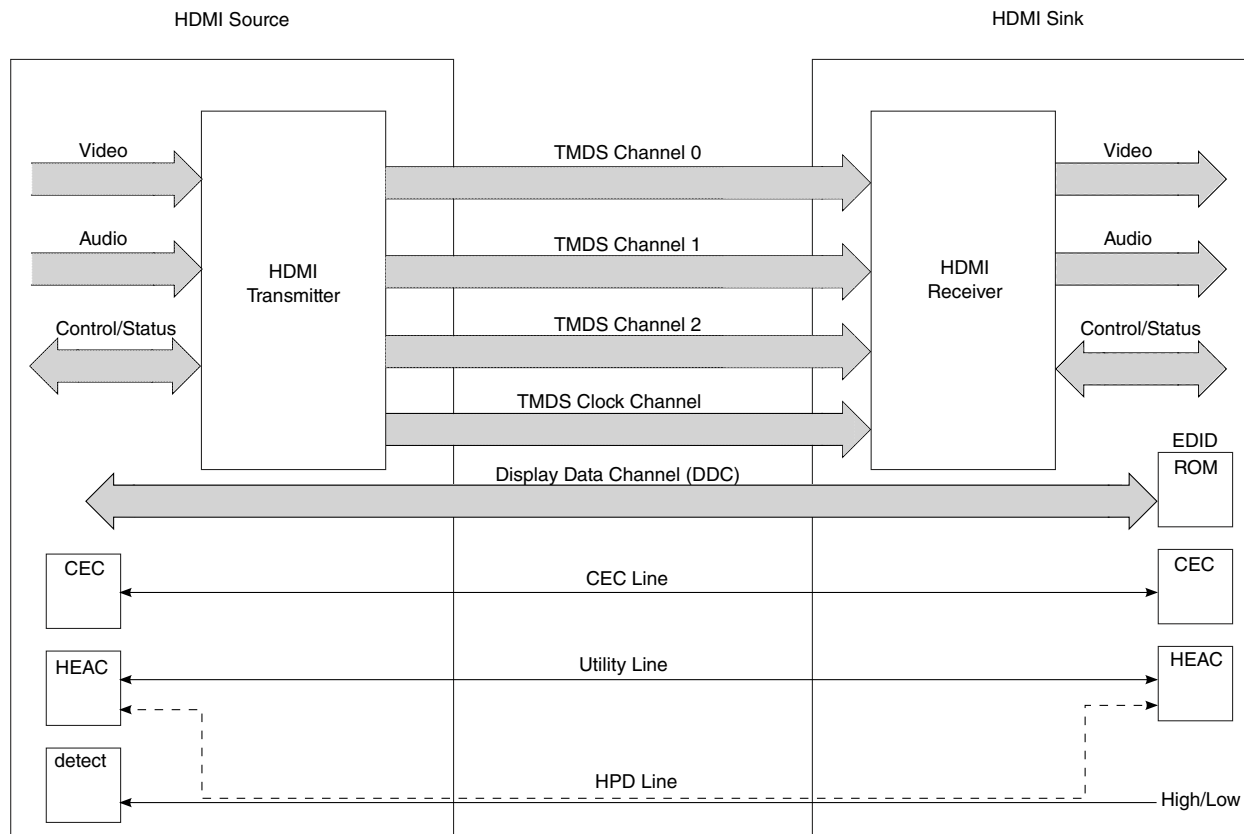

#### 34.1.1 HDMI Operational Model Overview

The High Definition Multimedia Interface (HDMI) is a wired digital interconnect that replaces the analog TV out or VGA out.

HDMI is capable of transferring uncompressed video, audio, and data using a single cable. The video pixel rates are typically from 25 MHz up to 270 MHz (and 3D video modes), but HDMI can support higher rates up to 270 MHz. It can support S/PDIF (IEC60958 L-PCM and IEC61937 compressed non-linear PCM: AC-3, MPEG-1/-2 Audio, DTS®, MPEG-2/-4 AAC, ATRAC, WMA, MAT) and Parallel HBR (high bit rate) audio interface, enabling the support of Dolby® True-HD and DTS-HD Master Audio. HDMI has the capability of automatically setting the display format configuration (intelligent link).

HDMI include a content protection system called HDCP (High-bandwidth Data Content Protection). The HDMI connections can be used to connect DVD recorders, set-top boxes, and game consoles to flat panel televisions and an AV amplifier that can act as repeater/router.

HDMI system architecture consists of sources (transmitter) and sinks (receiver). As shown in the figure below, the HDMI cable and connectors carry four differential pairs that make up the TMDS data and clock channels. These channels are used to carry video, audio, and auxiliary data. In addition, HDMI carries a VESA Data Display Channel (DDC). The DDC is used for configuration and status exchange between a single source and a single sink. The optional CEC protocol provides high-level control functions between all of the various audiovisual products in a user's environment.

**Figure 34-1. HDMI Block Diagram**

Audio, video, and auxiliary data is transmitted across the three TMDS data channels. A TMDS clock running at 1x (24-bit true color mode), the video pixel rate is transmitted on the TMDS clock channel and used by the receiver as a frequency reference for data recovery on the three TMDS data channels. Video data can have a pixel size of 24bits . Video at the default 24-bit color depth is carried at a TMDS clock rate equal to the pixel clock rate. Higher color depths are carried using a correspondingly higher TMDS clock rate. Video formats with TMDS rates below 25MHz (such as, 13.5MHz for 480i/NTSC) can be transmitted using a pixel-repetition scheme. The video pixels can be encoded in either RGB, YCBCR 4:4:4, or YCBCR 4:2:2 formats.

HDMI uses a packet structure to transmit audio and auxiliary data across the TMDS channels. To attain the highest reliability required of audio and control data, this data is protected with a BCH error correction code and is encoded using a special error reduction code to produce the transmitted 10-bit word.

Basic audio functionality consists of a single IEC 60958 L-PCM audio stream (two audio channels) at sample rates of 32 KHz, 44.1 KHz, or 48 KHz, which can accommodate any normal stereo stream. Optionally, HDMI can carry audio at sample rates up to 192KHz

and with three to eight audio channels. HDMI can also carry an IEC 61937 compressed (such as, surround sound) audio stream at bit rates up to 24.576 Mbps. For bit rates above 6.144 Mbps, compressed audio streams conforming to IEC 61937 are carried using HBR Audio Stream Packets. Each packet carries four IEC 60958 frames, which corresponds to (4x2x16 =) 128 contiguous bits of an IEC 61937 stream.

The source uses the DDC to read the sink's Enhanced Extended Display Identification Data (E-EDID) to obtain the sink's configuration and/or capabilities.

The HDMI TX Controller schedules the three periods: Video Data Period, Data Island period, and Control period. During the Video Data Period, the active pixels of an active video line are transmitted. During the Data Island period, audio and auxiliary data are transmitted using a series of packets. The Control period is used when no video, audio, or auxiliary data needs to be transmitted. A Control Period is required between any two periods that are not Control Periods.

An example of each period placement is shown in the figure below.

Figure 34-2. TMDS Periods in 720x480p Video Frame

### 34.1.1.1 Interfaces

HDMI TX has the following interfaces:

- HDCP interface
- External ROM interface for key storage
- External RAM interface for revocation
- Random number generator interface
- Video input interface
- RGB 4:4:4
- YCbCr4:2:2
- YCbCr4:4:4
- Digital audio input interface
- AHB audio DMA
- System interface
- AMBA AHB
- Scan test interface
- HDMI TX PHY interface
- CEC interface

### 34.1.1.2 Features

HDMI TX includes the following features:

- Supported video formats:
  - All CEA-861-E video formats up to 1080p at 60Hz and 720p/1080i at 120Hz
- Supported colorimetry:
  - 24bit RGB 4:4:4
  - 24bit YCbCr 4:4:4
  - 16bit YCbCr 4:2:2
  - xvYCC601
  - xvYCC709
- Integrated color space converter:
  - RGB(4:4:4) to/from YCbCr(4:4:4 or 4:2:2)
- Optional HDMI 1.4a supported video formats:
  - HDMI 1.4a 3D video modes with up to 270MHz (TMDS clock)
- Optional HDMI 1.4a supported colorimetry:
  - sYCC601
  - Adobe RGB
  - Adobe YCC601
- Optional HDMI 1.4a supported Infoframes:
  - Audio InfoFrame packet extension to support LFE playback level information
  - AVI infoFrame packet extension to support YCC Quantization range (Limited Range, Full Range)
- Range)

- AVI infoFrame packet extension to support Content type (Graphics, Photo, Cinema, Game)
- Supported Audio formats:
- Up to four I<sup>2</sup>S interface for eight-channel Linear-PCM audio
- S/PDIF interface for linear and non-linear PCM formats:
  - AC-3
  - MPEG-1/-2 Audio
  - DTS
  - MPEG- 2/-4 AAC
  - ATRAC
  - WMA
  - MAT
- Parallel audio interface for High-Bit Rate (HBR) Audio:
  - Dolby® True-HD
  - DTS®-HD Master Audio
  - Generic Parallel Audio interface
- AHB DMA Audio interface
- Up to 192 KHz IEC60958 audio sampling rate
- Pixel clock from 13.5MHz up to 270 MHz
- Option to remove pixel repetition clock (prepclk) from HDMI TX interface for an easy integration with third-party HDMI TX PHYs
- Flexible synchronous enable per clock domain to set functional power down modes
- Register access:
  - AMBA AHB
  - I<sup>2</sup>C DDC, EDID block read mode
  - Advanced PHY testability
  - Integrated CEC hardware engine

## 34.2 External Signals

See HDMI PHY for external signal information.

## 34.3 Clocks

The table found here describes the clock sources for HDMI.

## Functional Description

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 34-1. HDMI Clocks**

Clock name	Clock Root	Description
iahbclk	ahb_clk_root	Bus clock
icecclk	ckil_sync_clk_root	CEC low-frequency clock (32kHz)
ihclk	ahb_clk_root	Module clock
isfrclk	video_27m_clk_root	Internal SFR clock (video clock 27MHz)

## 34.4 Functional Description

This section describes the functional architecture of the HDMI TX controller.

### 34.4.1 HDMI TX Functional Overview

The HDMI TX provides a variety of standard audio, video, and system interfaces.

It includes an high-bandwidth data content protection (HDCP) encryption engine for HDMI receiver authentication, revocation, and data encryption.

Figure below illustrates the top level diagram of the HDMI TX solution.

**Figure 34-3. HDMI TX Top Level Block Diagram**

The HDCP encryption engine is responsible for HDMI receiver authentication, revocation, and data encryption.

The input video stream can be either RGB 4:4:4, YcbCr 4:2:2, or YcbCr 4:4:4 in single data rate (SDR) bus formats as described in [Table 34-2](#). The video mode's timing format must follow the CEA-861-E specification. An embedded color space conversion allows the pixel color format to be converted on the HDMI source side to match the best with the HDMI sink capabilities. 24

The input audio stream can be provided through audio AHB DMA interface;

Finally, HDMI\_TX can output video in full HD with up to 48-bit color mode and inserts high fidelity audio up to eight-channels over low resolution video formats by performing automatic pixel repetition over the input video stream.

### 34.4.2 Video Pixel Sampler

The Video pixel sampler block is responsible for the video data synchronization, according to the video data input mapping defined by the Color Depth (Deep Color) and format configuration.

## Functional Description

Optionally, for YCbCr 4:2:2 format, data mapping can be performed to conform to ITU.601 and ITU.656 standards but without the support of embedded synchronizers.

The video pixel sampler registers base address is 0x0200.

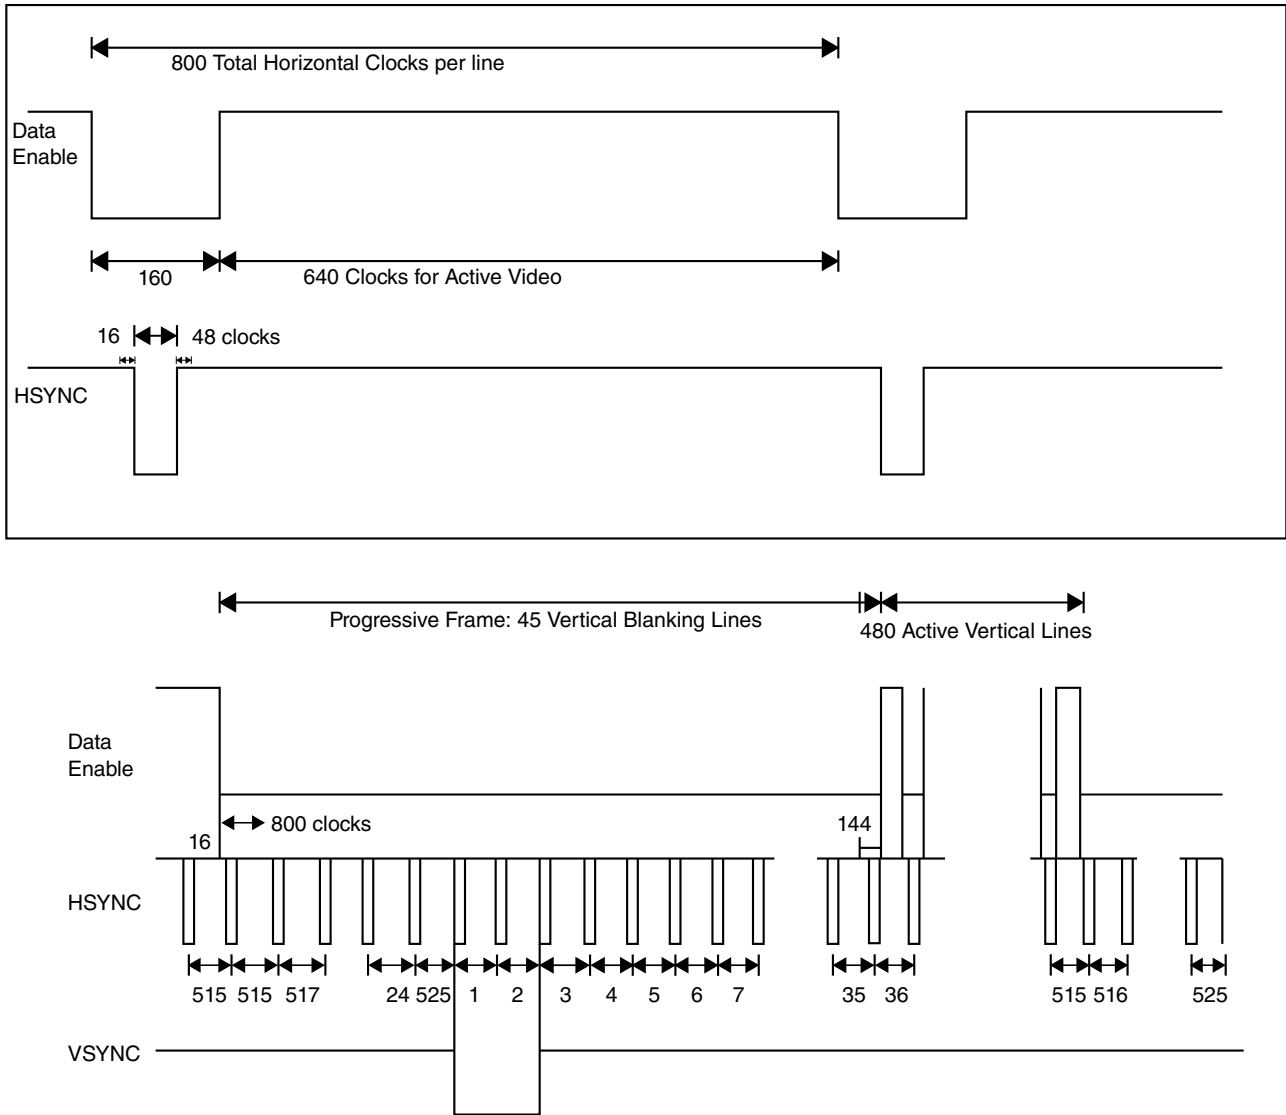

### 34.4.2.1 HDMI Transmitter Controller Databook Functional Description

Table 34-2. Input Data Mapping

Video Input Format		ivdata[47:0] mapping																										
Color Space	Color Depth	47-46	45-44	43-42	41-40	39-38	37-35	35-34	33-32	31-30	29-28	27-26	25-24	23-22	21-20	19-18	17-16	15-14	13-12	11-10	9-8	7-6	5-4	3-2	1-0			
RGB 4:4:4	8-bit	R[7:0]							G[7:0]							B[7:0]												
YCbCr 4:4:4	8-bit	Cb[7:0]							Y[7:0]							Cr[7:0]												
YCbCr 4:2:2	8-bit	Cb[7:0]							Y[7:0]																			
		Cr[7:0]							Y[7:0]																			

For each video timing format, there is a specific timing parameters defined in the CEA-861-E specification.

The following timing diagram is an example for the video mode format 1 (640x480p @ 59.94/60 Hz): Data Enable = idataen, HSYNC = ihsync, VSYNC = ivsync.

**Figure 34-4. Timing Parameters for 640x480p @ 59.94/60 Hz**

For a complete list of timing parameters and diagrams, refer to the CEA-861-E specification. The SDR video sample input format is illustrated in the figure below.

Figure 34-5. Video Sample Timing Interface for RGB and YCbCr SDR Format

### 34.4.3 Supported Video Mode

The table below shows examples of the supported video modes.

Table 34-3. Video Modes

VideoMode	Mode	H x V Active Resolution (pixel)	Refresh Rate (Hz)	2D		3D Structure						
				2D Pixel Rate (Mp/s)	Frame Packing Pixel Rate (Mp/s)	Field Alt. Pixel Rate (Mp/s)	Line Alt. Pixel Rate (Mp/s)	Side-by-Side (full) Pixel Rate (Mp/s)	L+depth Pixel Rate (Mp/s)	L+depth + graphic s+ graphic s-depth Pixel Rate (Mp/s)	Side-by-Side (Half) Pixel Rate (Mp/s)	Top-and-Bottom Pixel Rate (Mp/s)
					ALL CEA	Interlaced Only	Progr. Only	ALL CEA	Progr. Only	Progr. Only	ALL CEA	ALL CEA
Primary HDMI Video Format Timings (CEA-861-E)

### 34.4.4 Video Packetizer

This block is responsible for:

- Pixel repetition (if not already performed in the input video stream and needed by the user)
- 10-bit, 12-bit, and 16-bit packing when in deep color modes
- YCC 422 remapping according to the HDMI 1.4a specification
- Clock rate transformation from pixel or repetition clock to the final TMDS clock domain (by means of FIFOs)

The figure below depicts a functional diagram of the Video Packetizer block.

Figure 34-6. Video Packetizer Functional Diagram

### 34.4.5 Color Space Conversion

This block is responsible for carrying out the following video color space conversion functions:

- RGB to/from YCbCr
- 4:2:2 to/from 4:4:4 up (pixel repetition or linear interpolation)/down-converter
- Limited to/from full quantization range conversion

**Figure 34-7. Color Space Converter Simplified Block Diagram**

The Color Space Converter (CSC) supports all the timings reported in the CEA-861-D specification and the following pixel modes:

- RGB444 and YCbCr444: 24, 30, 36, and 48 bits
- YCbCr422: 16, 20, and 24 bits

The color space conversion matrix is ruled by the following equations listed below. The color space conversion registers base address is 0x4100.

$$\text{out}_1 = (X_1 \times \text{in}_1 / 4096 + X_2 \times \text{in}_2 / 4096 + X_3 \times \text{in}_3 / 4096 + X_4) \times 2^{\text{scale}}$$

$$\text{out}_2 = (Y_1 \times \text{in}_1 / 4096 + Y_2 \times \text{in}_2 / 4096 + Y_3 \times \text{in}_3 / 4096 + Y_4) \times 2^{\text{scale}}$$

$$\text{out}_3 = (Z_1 \times \text{in}_1 / 4096 + Z_2 \times \text{in}_2 / 4096 + Z_3 \times \text{in}_3 / 4096 + Z_4) \times 2^{\text{scale}}$$

### 34.4.6 Audio Interfaces

The supported audio input interfaces are:

- AHB Direct Memory Access (DMA)

## Functional Description

No lipsync support is available inside the HDMI TX. If necessary, this feature can be performed at the system audio processor side. From the HDMI TX, no audio/video delay or skew is added.

The audio sampler registers base address is 0x3100.

### 34.4.6.1 CTS Calculation

Because there is no audio clock carried through the HDMI link, only the pixel clock is used.

The CTS/N has to be set by software with value taken in the following table. Table below shows the CTS and N value for the supported standard. All other TMDS clocks are not supported; the TMDS clocks divided or multiplied by 1,001 coefficients are not supported.

**Table 34-4. N and CTS for 8-Bit Color Depth**

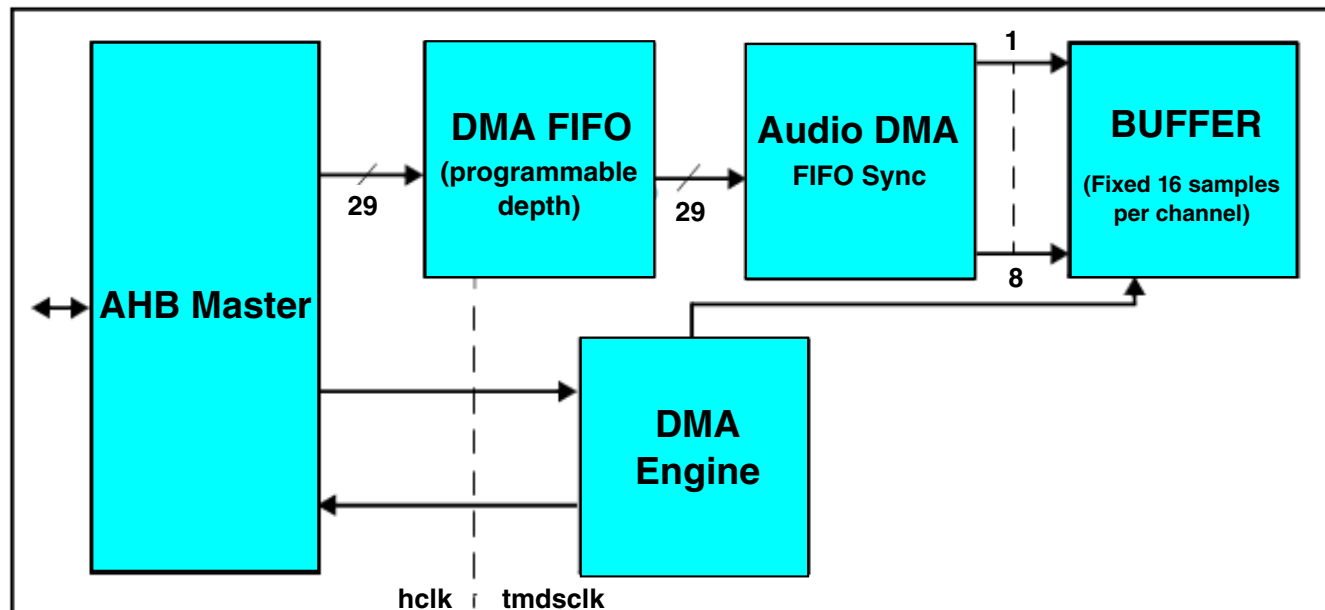

Fs (kHz)	TMDS Clock (MHz)											
	25.2		27		54		74.25		148.5		297	
	N	CTS	N	CTS	N	CTS	N	CTS	N	CTS	N	CTS
32	4096	25200	4096	27000	4096	54000	4096	74250	4096	148500	3072	222750
44.1	6272	28000	6272	30000	6272	60000	6272	82500	6272	165000	4704	247500
48	6144	25200	6144	27000	6144	54000	6144	74250	6144	148500	5120	247500
88.2	12544	28000	12544	30000	12544	60000	12544	82500	12544	165000	9408	247500
96	12288	25200	12288	27000	12288	54000	12288	74250	12288	148500	10240	247500
176.4	25088	28000	25088	30000	25088	60000	25088	82500	25088	165000	18816	247500
192	24576	25200	24576	27000	24576	54000	24576	74250	24576	148500	20480	247500
768	Used for HBR audio only. N and CTS configured for Fs=192kHz (1/4th ACR value per spec)											

To support the deep color mode and/or 3D video modes, the TMDS clock is multiplied by 4, 2, 1.5, or 1.25, depending on the mode. In this case, the CTS value must also follow the same ratio.

### 34.4.6.2 Audio DMA Interface

This audio direct memory access (DMA) interface is intended for advanced systems running 32-bit CPU SoC solutions.

This module provides a direct audio DMA interface, which is useful in systems where a DSP handles audio processing. In these systems, sending the incoming audio samples directly to the memory provides a cleaner architecture to the SoC, without the overhead of converting several audio standards.

**Figure 34-8. Audio DMA Block Diagram**

The audio DMA block combines an AHB master interface with a FIFO to perform direct memory access to audio samples stored in a system memory.

The DMA engine is configurable through programmable software registers to perform autonomous burst reading on a configured memory range.

#### 34.4.6.2.1 AHB Master

The AHB master is compliant with the AMBA AHB Specification, Revision 2.0 from ARM.

It has the following features:

- Multi-master capable operation
- 32-bit data transfer
- OKAY, ERROR, RETRY, and SPLIT slave responses
- Rescheduling of burst requirements
- IDLE, NONSEQ, and SEQ transfer types
- Incremental burst modes: unspecified lengths (upper limit is 1 kB boundary) and INCR, INCR4, INCR8, and INCR16 fixed-beat bursts
- Master burst lock mechanism

## Functional Description

- Bus access granting
- The following features are not supported:
- Write transaction
- Protection control
- BUSY transfer type
- Wrapping burst

## Data Organization in System Memory

The AHB master block fetches the samples from system memory. The Audio Samples are organized according to the channel allocation.

For example, channel 0, 1, 3, 5 are enabled (0 and 1 are always enabled). The Audio Samples must be organized in the system memory like the following:

**Table 34-5. Audio Sample Arrangement in System Memory**

Position	Sample	Channel
0	n-1	0
1	n-1	1
2	n-1	3
3	n-1	5
4	n-1	0
5	n-1	1
6	n-1	3
7	n-1	5
...	...	...

**Table 34-6. Data Arrangement in System Memory for L-PCM (24 bits)**

Bit	Description
28	B - IEC B bit
27	P - Parity bit
26	C - Channel Status bit
25	U - User Data bit
24	V - Validity Bit
[23:0]	Audio Sample Data

**Table 34-7. Data Arrangement in System Memory for L-PCM (16 bits) and NL-PCM (16 bits)**

Bit	Description
28	B - IEC B bit
27	P - Parity bit
26	C - Channel Status bit

*Table continues on the next page...*

**Table 34-7. Data Arrangement in System Memory for L-PCM (16 bits) and NL-PCM (16 bits) (continued)**

25	U - User Data bit
24	V - Validity Bit
[23:8]	Audio Sample Data
[7:0]	0x00

### 34.4.6.2.2 DMA Engine

The DMA engine is responsible for requesting burst transfers to the AHB master, taking into account the FIFO threshold and register settings.

#### 34.4.6.2.2.1 Functional Behavior

The engine:

- Arbitrates read requests to start the burst in the initial address with the size sufficient to fill the FIFO (the size of the FIFO is a parameter in the audio DMA core).
- After this first request, the DMA engine performs subsequent burst requests (incrementing accordingly `ohaddr[31:0]` and determining correct `ohburst[2:0]`) towards `final_addr[31:0]` configured at the register bank and taking into account the `AUDIO_FIFO_DEPTH` parameter and `fifo_threshold[7:0]` configuration.
- In the burst mode (`INCR4`, `INCR8`, `INCR16`), the operation stops at the end of the burst.
- Stops operation upon `ERROR` slave response, signaling `ointerror` interrupt and `staterror` signal
- Continues burst transaction:
- Upon `RETRY/SPLIT` slave response, signaling `ointretrysplit` interrupt and `statretrysplit` signal
- Upon losing ownership (no `ihgrant`) as consequence of arbiter action, signaling `ointlostownership` interrupt and `statlostownership` signal
- Decides through register configuration which burst method (unspecified length incrementing or fixed beat incrementing) to use in the read transfers
- Issues `ointdone` interrupt when it reaches final address reading or is stopped upon user request
- Automatically starts new burst requests until the `final_addr[31:0]` is reached
- The DMA engine is either stopped by the user or an error/fail condition appears at the slave response.
- Takes into account that an incrementing burst can be of any length (if unspecified `INCR` type), but upper limit is set because the address must not cross a 1kB boundary

- A maximum theoretical length of a burst is 1024. The burst size must be declared on the `mburstlength_addr[10:0]`.
- Has INCR with an unspecified burst as the default operation burst mode

### 34.4.6.2.2.2 DMA Operation

Normal operation of the DMA engine is as follows:

1. The `enable_hlock`, `incr_type[1:0]`, `burst_mode`, `fifo_threshold[7:0]`, `initial_addr[31:0]`, and `final_addr[31:0]` are configured according to desired DMA operation.

#### NOTE

Configured values have to follow these rules:

The number of memory positions (between `initial_addr` and `final_addr`) has to be a multiple of the active audio channels.

The `final_addr[31:0]` signal is always bigger than the `initial_addr[31:0]`.

2. To start the audio DMA operation, a '1' is written to `data_buffer_ready`.
3. The DMA engine starts the operation. The first burst transfer is:

```
ohaddr[31:0] = initial_addr[31:0];
ohburst[2:0] = INCR;
mburstlength[10:0] = ((initial_addr[31:0] + AUDIO_FIFO_DEPTH) <=
final_addr[31:0]) ?
((AUDIO_FIFO_DEPTH < 1024) ? AUDIO_FIFO_DEPTH : 1024) : (final_addr[31:0] -
initial_addr[31:0]);
```

4. While DMA is reading samples from the AHB master and writing samples to the Audio FIFO, a datafetch request from the internal frame composer block might happen at the Audio FIFO interface, diminishing the number of samples in the FIFO.
5. When the number of samples in the Audio FIFO is lower than the configured `fifo_threshold[7:0]`, the DMA engine requests a new burst request to the AHB master interface with:

```
ohaddr[15:0] = last address in step 5);
ohburst[2:0] = INCR;
mburstlength[10:0] = AUDIO_FIFO_DEPTH - fifo_threshold[7:0];
```

6. Steps 4) and 5) continue until the `final_addr[31:0]` is reached.

**NOTE**

In the last burst request, the DMA engine calculates the `mburstlength[10:0]` such that the last requested read position is the `final_addr[31:0]`.

7. After completion of the DMA operation, the DMA engine issues the `ointdone` interrupt signaling end of operation.

Variations of the DMA engine's behavior occur when fixed-beat, incremental bursts are used by `INCR4/INCR8/INCR16` burst selects. When this forcing mode is used, you must correctly configure the FIFO's threshold such that the last of the consecutive `INCRx` (with  $x = 4, 8, \text{ or } 16$ ) bursts correctly fill the FIFO at last burst received. Note there is a re-alignment at the 1k boundary.

The following are exceptions to the described DMA behavior:

1. When a user requests `end stop_dma_transaction`, the DMA engine stops at the end of the current burst operation and signals its completion with an `ointdone` interrupt.
2. When the AHB slave sends an error response, the DMA engine stops the current operation and signals `oerror` interrupt.

Rules for Configuration of Address Registers:

1. Configure the last 2 bits of `initial_addr` with 0.

For example, `32'h0000_0000`.

2. Configure the last 2 bits of `final_addr` with non-zero values.

For example

`32'hxxx_xxx3` or

`32'hxxx_xxx7` or

`32'hxxx_xxxB` or

`32'hxxx_xxxF`

Where  $x = \text{any value}$

3. The number of samples is calculated by using the following formula:

$$\text{Number of samples} = (\text{final\_addr} - \text{initial\_addr} + 1) / 4$$

$$\text{Therefore, final\_addr} = (\text{Number of samples} \times 4) + \text{initial\_addr} - 1$$

If a defined length burst is used, align `initial_addr`, `final_addr` and `fifo_threshold` with the value. If

the burst is not aligned, DMA uses AHB `INCR` transfers when required.

Then the number of samples = 100 (a multiple of 5)

4. The threshold must be

Greater than the selected FIFO DEPTH;  
 Greater than the number of channels enabled in channel allocation.

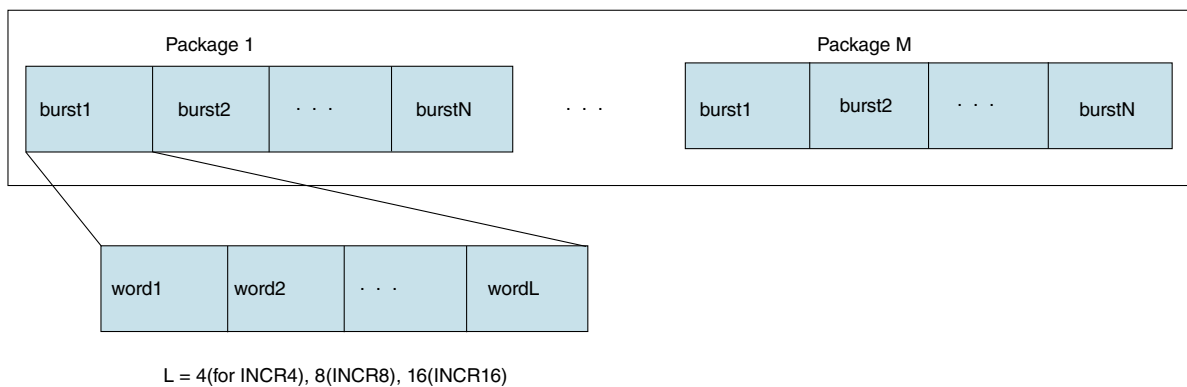

Due to the limit of audio DMA design, some registers configuration are updated by SDMA (Smart Direct Memory Access). SDMA need to do these items below:

1. clear the audio DMA done request(actually it's an interrupt); set offset 0x00120109 -- bit2.
2. configure next audio DMA start address(offset 0x00123604~0x00123607) and next stop address(offset 0x00123608~0x0012360b); Start address and stop address are provided by S/W and it's variable.
3. Set offset 0x00123601 – bit0 “1” to start DMA;

**34.4.6.2.2.3 Transfer Data, Package, and Word**

One transfer data can be composed of several transfer packages, and one transfer package can be composed of one or several transfer bursts. One transfer burst can be composed of several transfer words.

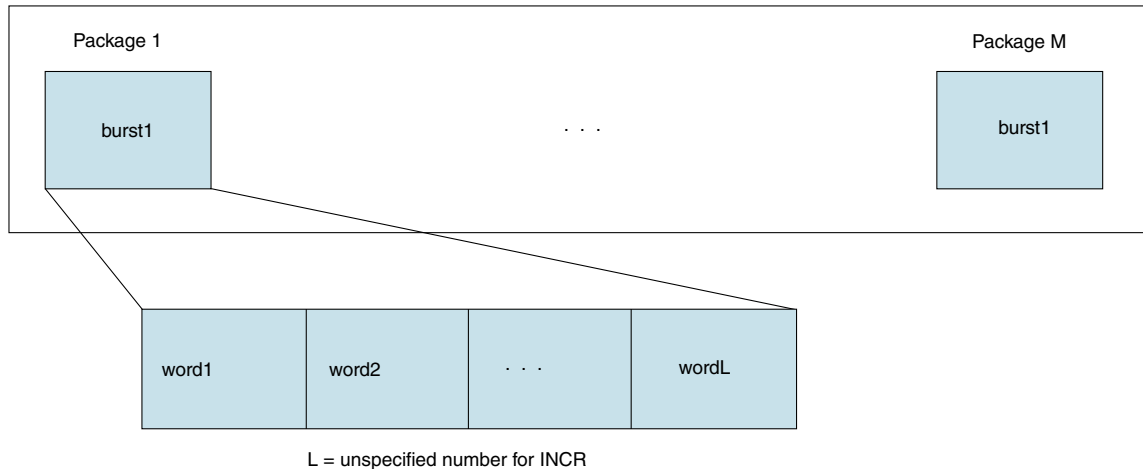

The figure below shows the transfer data structure for a fixed-beat, incremental burst.

**Figure 34-9. Transfer Data Constitution for Fixed-Beat, Incremental Burst**

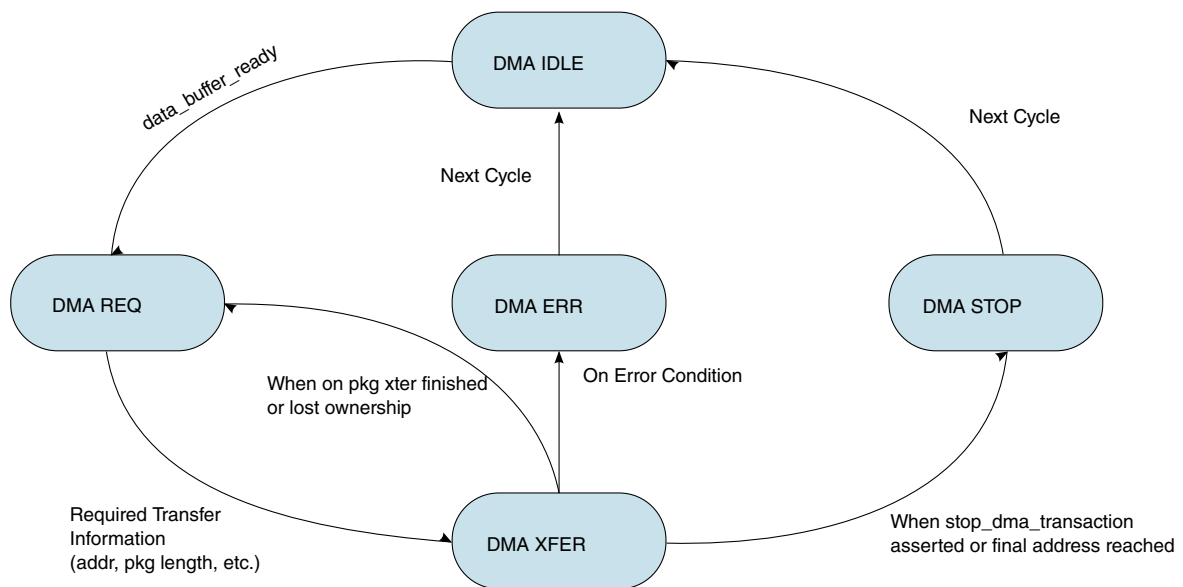

The figure below depicts the transfer data structure for an unspecified burst length.

**Figure 34-10. Transfer Data Constitution for Unspecified Burst Length**

The figure below illustrates the DMA state machine.

**Figure 34-11. DMA FSM Diagram**

1. When the operation request is written into the `data_buffer_ready`, the state switches from IDLE to DMAREQ.
2. When enough transfer information is ready, the state changes to DMAXFER.

3. When one package is completed-indicated by "OnePackOver"-or a lost ownership occurs, the state jumps back to DMAREQ, so the new transaction information can be calculated.
4. When the DMA is ready again, it jumps to DMAXFER.

The previous steps continue until you request an end operation or until the whole operation is completed.

### 34.4.6.2.3 Audio FIFO

This block contains a FIFO with a configurable depth.

The statthrfifoempty flag is a version of the FIFO empty, that is active whenever the amount of samples in the FIFO is smaller than four samples. The AHB\_DMA\_THRSLD and the statthrfifoempty indicators are different. The AHB\_DMA\_THRSLD defines the occupation of the FIFO, while statthrfifoempty helps the HDMI TX's Frame Composer in the audio packet composition (required when non-linear audio is being packed, in which case four pair of samples are needed to compose one packet).

### 34.4.6.2.4 FIFO Occupancy/FIFO Almost Empty Flags

The FIFO depth is configured by setting the AUDIO\_FIFO\_DEPTH parameter in coreConsultant. The FIFO occupancy is calculated from the pointer values.

Also, the most significant pointer bits are used to perform the following calculation:

```
occupancy = wrptr[n-1:0] - rdptr_previous[n-1:0], if wrptr > rdptr_previous
occupancy = AUDIO_FIFO_DEPTH + wrptr[n-1:0] - rdptr_previous[n-1:0], if wrptr <
rdptr_previous
```

If occupancy is less than 4, then statthrfifoempty is active.

An example of full/empty flags and FIFO occupancy is shown in the figure below.

Figure 34-12. Audio FIFO Status Indication

### 34.4.7 Supported Audio Formats

The HDMI TX has several audio interfaces and each of them has different audio format support capabilities.

Table below represents the audio interface and format dependencies.

Table 34-8. Supported Audio Formats

Audio Input Interface	Audio Format Supported
Audio DMA	Up to eight channels L-PCM/NL-PCM and HBR audio, allowing all audio formats listed to support one single audio DMA interface.

### 34.4.8 Frame Composer

This block is responsible for assembling video, audio, and data packets in a consistent frame that are streamed to the HDCP cipher and then finally to the HDMI TX PHY.

## Functional Description

The HDMI 1.3a standard precisely describes the packet insertion timing and distribution that must be followed to correctly compose an HDMI TMDS (transition minimized differential signaling) stream. In this context, there are data island packets that-when available (ready for insertion in output stream)-have higher priority over others. Two packet descriptor queues are responsible for prioritizing packet insertion.

The higher priority packets are described in Table below. These packets are inserted in the output stream as soon as data to compose them is available (see the HDMI 1.3a standard).

**Table 34-9. High Priority Data Island Packets**

Packet	Description
Audio Clock Regeneration (ACR)	Indicates to sink device the N/CTS values that should be used in the ACR process
Audio Sample (AUDS)	Transports L-PCM and IEC 61937 compressed audio
General Control (GCP)	Indicates Color Depth, Pixel Packing phase, and AV mute information to sink device

The packets described in tables below can be considered as low priority packets-even though they have precise timing insertion-because their insertion timing is large (for example, one per frame or one per two frames without specific location for some of the packet types and on user request transmit for others).

**Table 34-10. Low Priority Data Island Packets**

Packet	Description
Audio Content Protection (ACP)	Used to convey content-related information about the active audio stream transmitted
Audio InfoFrame (AUDI)	Indicates characteristics of the active audio stream by using IEC 60958 channel status bits, IEC 61937 burst info, and/or stream data (if present).
Null (NULL)	Ignored by sink devices.
International Standard Recording Code (ISRC1/ISRC2)	See HDMI 1.3a section 5.3.8.
Vendor Specific (VSD) InfoFrame	According to CEA-861-E standard.
AVI infoFrame (AVI)	Video information from source to sink.
Source Data Product Descriptor (SPD) infoFrame	Name and product type of the source device. MPEG (MPEG) Source InfoFrame packets (optional, implementation discouraged by CEA-861-E Section 6.7). Describes several aspects of the compressed video stream that were used to produce the uncompressed video.

The Frame Composer distributes and assembles the data island packets according to the module register bank configuration. The block allows extended control periods to appear with a certain programmed spacing. The Frame Composer uses two packet buffers that allow a packet to be composed while another is being sent to the output HDMI stream.

Packet requests are inserted into the packet queues by a data island flexible scheduler. The HDMI 1.3a specification requires that packet distribution and insertion timing correctly compose an output HDMI TMDS stream. In this context, there are data island packets that are sent on data availability, while others are sent once per frame or once per two frames. and finally others that are sent on user request. Classification of the packets according to this insertion timing is described in the table below.

**Table 34-11. Packet Classification**

Packet	Classification
Audio Clock Regeneration (ACR)	Sent on data availability.
Audio Sample (AUDS)	Sent on data availability (precede ACR if present).
Audio Content Protection (ACP)	On user request or automatic insertion.
Audio InfoFrame (AUDI)	Once per two frames.
Null (NULL)	On user request or automatic insertion to fill Data Island period.
General Control (GCP)	Once per frame.
International Standard Recording Code (ISRC1/ISRC2)	On user request.
Vendor Specific (VSD) InfoFrame	On user request or automatic insertion.
AVI infoFrame (AVI)	Once per frame.
Source Data Product Descriptor (SPD) infoFrame	On user request or automatic insertion.

The Data Island Scheduler (DIS) handles packet distribution in the Frame Composer. The DIS is a round-robin (RDRB) state machine that is able to schedule packet insertion on an input video frame or line basis. The DIS is fully configurable and can schedule any packet type to be inserted at a given input video frame rate or input video line rate.

While determining packet distribution on an input video frame or line basis, the DIS schedules the packets to be inserted in the output HDMI stream by inserting the packet descriptor in the corresponding packet priority queue, according to packet priority classification.

After the packet descriptor has been inserted in the packet priority queues, the Data Island Packer (DIP) is responsible for assembling and sequencing the packets for output HDMI stream insertion.

Dedicated ECC generators and checksum byte-wide sum hardware generate the BCH ECC parity codes and infoFrames checksums for all the data islands packets.

The content of GCP, ISRC1/2, VSD, AVI, SPD, and MPEG packets are configured through the registers bank starting at address 0x1000.

## 34.4.9 HDCP Encryption Engine

HDCP is designed to protect the transmission of audio-visual content between an HDCP Transmitter and an HDCP Receiver.

The system also allows for HDCP Repeaters that support downstream HDCP-protected interface ports. The HDCP system allows up to seven levels of HDCP Repeaters and as many as 128 total HDCP devices, including HDCP Repeaters, to be attached to an HDCP-protected interface port.

### NOTE

This feature must be configured and requires a separate license. Contact your Freescale representative for more information on HDCP.

The authentication protocol enables the HDCP Transmitter to verify that a given HDCP Receiver is licensed. With the legitimacy of the Receiver determined, encrypted HDCP content is transmitted between the two based on shared secrets established during authentication. In the event that legitimate devices are compromised to permit unauthorized use of the content, renewability allows an HDCP Transmitter to identify such compromised devices and prevent the transmission of the content.

The implemented HDCP functionality is compliant with HDCP revision 1.4. The HDCP transmitter implements the three layers of the HDCP cipher, including LFSR and other functions required to generate the encryption key bytes that are then XORed with the data.

## 34.4.10 EDID/HDCP I<sup>2</sup>C E-DDC Interface

The E-DDC channel is a dedicated I2C master interface that allows the read of sink E-EDID based on system needs.

Data read from sink E-EDID can be then transferred to the I2C Master register bank, starting at address 0x7E00.

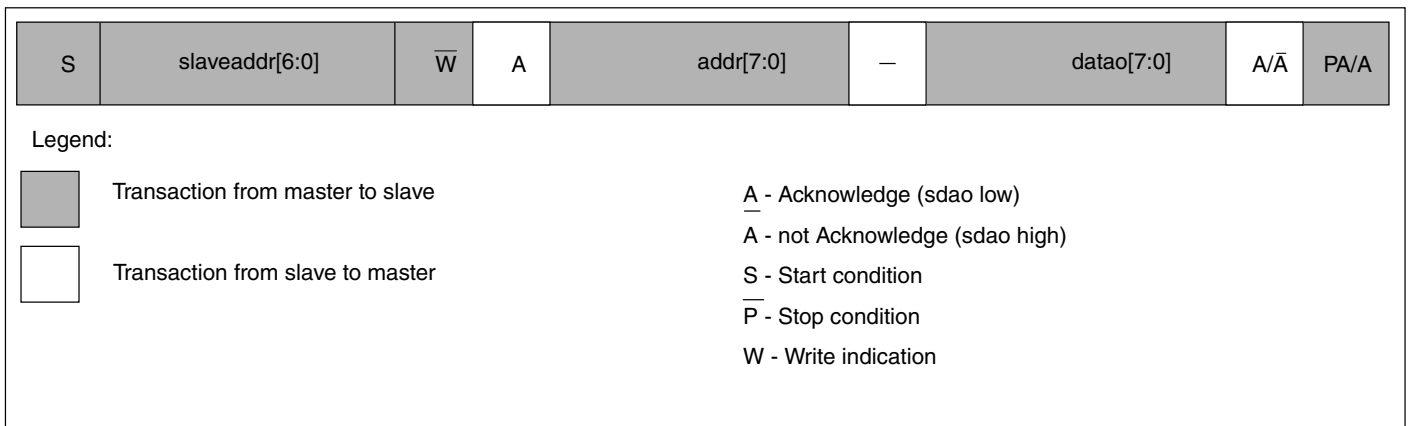

This block reads the E-EDID (and all its segments according to user configuration) and, after completion, it warns the CPU of data availability. This block also arbitrates the I2C master interface to allow the HDMI TX's HDCP authentication protocol to be performed through this interface. Sink HDCP links (with addresses 0x74 and/or 0x76) should be present at these lines to enable HDCP-compliant behavior.

The interface is shared with the DDC channel of the HDMI controller through multiplexers and is I2C compliant.

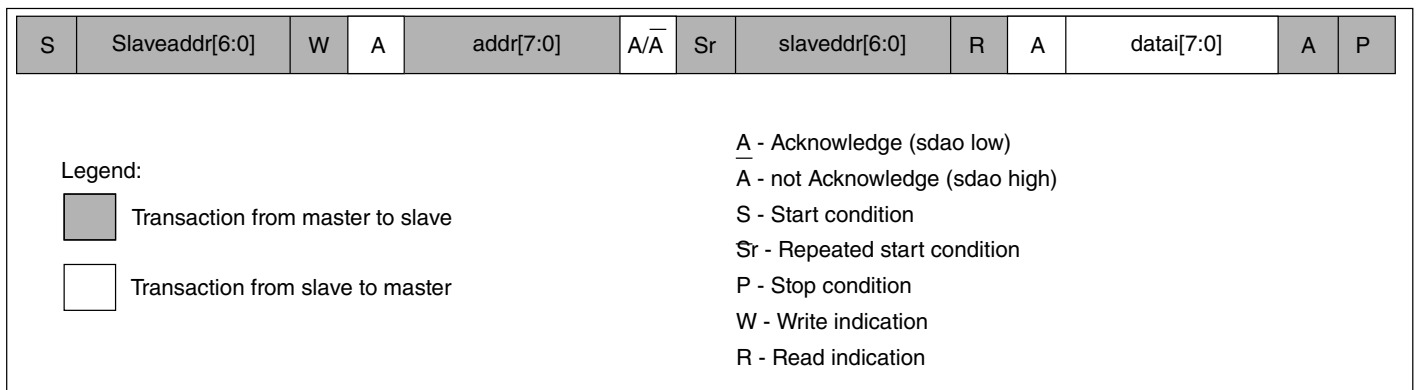

### 34.4.10.1 I<sup>2</sup>C Master Interface Normal Mode

This operation implements a single read or write operation using the Special Function Register configuration.

The I<sup>2</sup>C data transfer protocol used is the 7-bit addressed, as defined in Section 9 of the I<sup>2</sup>C-bus Specification, version 2.1.

**Figure 34-13. Data Write Transaction**

**Figure 34-14. Data Read Transaction**

### 34.4.10.2 I<sup>2</sup>C Master Interface Extended Read Mode

This I2C extended read mode operation implements a segment pointer-based read operation using the Special Register configuration.

**Figure 34-15. Extended Data Read Operation**

## 34.4.11 System Configuration Interfaces

The internal register set is distributed with the HDMI TX. The system interface (the interface that connects to the processor bus) bridges these registers using a simple standard interface.

The system interface is AMBA AHB,.

The AHB bridges the bus to the internal SFR bus.

### 34.4.11.1 AMBA AHB Slave Interface

The AMBA AHB slave interface is compatible with the AMBA Specification, revision 2.0.

The AHB slave interface is used for register configuration implementing only a simple transaction mode and single master slave operation.

The HDMI TX does not support protection control, burst transfers, or split transactions.

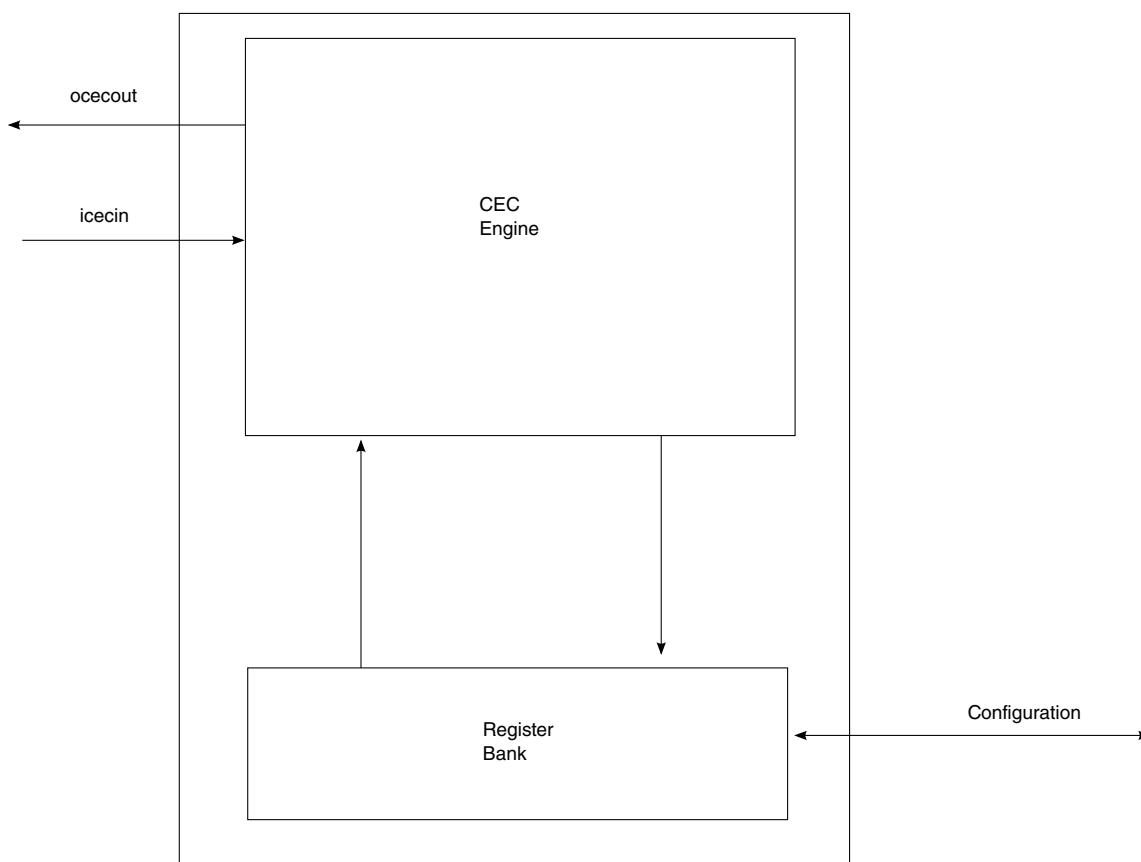

## 34.4.12 CEC Hardware Engine

Consumer Electronics Control (CEC) is a protocol that provides high-level control functions between all of the various audiovisual products in a user's environment.

It is an optional feature in the HDMI 1.3a Specification. It uses only one bidirectional line for transmission and reception.

All transactions on the CEC line consist of an initiator and one or more followers. The initiator is responsible for sending the message structure and the data. The follower is the recipient of any data and is responsible for setting any acknowledgement bits.

**Figure 34-16. CEC Engine Simplified Block Diagram**

There are two operation modes for a CEC controller.

- Initiator Mode
- In this mode, the CEC controller sends messages out and waits for a follower to feedback. The CEC controller works in this mode when it starts to send a frame. After the transmission is done, it automatically returns to the follower mode (no software control involved).

- Follower Mode
- In this mode, the CEC controller receives messages and feeds back the initiator with appropriate signals. The CEC controller always works in the follower mode whenever it is not transmitting any data.

For correct CEC controller interface operation, initial reset is required in order to set internal registers to a known state. After this reset, the interface is in an IDLE state, waiting for a read or write request coming from the register configuration.

A specific CEC API is provided that implements all necessary low-level register configuration to send and receive CEC messages. For more information, see the CEC API documentation.

The CEC engine registers base address is 0x7D00. For more information about these registers, see [HDMI Memory Map/Register Definition](#).

For more information about CEC, see *Consumer Electronics Control (CEC) Application Note*.

## 34.5 HDMI Memory Map/Register Definition

All registers are addressable on 32-bit boundaries; each unused bit or address location is reserved for future use and read back as 0.

HDMI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

## HDMI memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
12_3006	PHY RXSENSE, PLL lock, and HPD Mask Register (HDMI_PHY_MASK0)	8	R/W	00h	<a href="#">34.5.208/1827</a>
12_3007	PHY RXSENSE, PLL lock and HPD Polarity Register (HDMI_PHY_POLO)	8	R/W	F3h	<a href="#">34.5.209/1828</a>
12_3020	PHY I2C Slave Address Configuration Register (HDMI_PHY_I2CM_SLAVE_ADDR)	8	R/W	00h	<a href="#">34.5.210/1829</a>
12_3021	PHY I2C Address Configuration Register (HDMI_PHY_I2CM_ADDRESS_ADDR)	8	R/W	00h	<a href="#">34.5.211/1829</a>
12_3022	PHY I2C Data Write Register 1 (HDMI_PHY_I2CM_DATAO_1_ADDR)	8	R/W	00h	<a href="#">34.5.212/1830</a>
12_3023	PHY I2C Data Write Register 0 (HDMI_PHY_I2CM_DATAO_0_ADDR)	8	R/W	00h	<a href="#">34.5.213/1831</a>
12_3024	PHY I2C Data Read Register 1 (HDMI_PHY_I2CM_DATAI_1_ADDR)	8	R	00h	<a href="#">34.5.214/1831</a>
12_3025	PHY I2C Data Read Register 0 (HDMI_PHY_I2CM_DATAI_0_ADDR)	8	R/W	00h	<a href="#">34.5.215/1832</a>
12_3026	PHY I2C Read/Write Operation (HDMI_PHY_I2CM_OPERATION_ADDR)	8	W	00h	<a href="#">34.5.216/1832</a>
12_3027	PHY I2C Done Interrupt Register (HDMI_PHY_I2CM_INT_ADDR)	8	R/W	08h	<a href="#">34.5.217/1833</a>
12_3028	PHY I2C Done Interrupt Register (HDMI_PHY_I2CM_CTLINT_ADDR)	8	R/W	88h	<a href="#">34.5.218/1834</a>
12_3029	PHY I2C Speed Control Register (HDMI_PHY_I2CM_DIV_ADDR)	8	R/W	0Bh	<a href="#">34.5.219/1835</a>
12_302A	PHY I2C Software Reset Register (HDMI_PHY_I2CM_SOFTRSTZ_ADDR)	8	R/W	01h	<a href="#">34.5.220/1835</a>
12_302B	PHY I2C Slow Speed SCL High Level Control Register 1 (HDMI_PHY_I2CM_SS_SCL_HCNT_1_ADDR)	8	R/W	00h	<a href="#">34.5.221/1836</a>
12_302C	PHY I2C Slow Speed SCL High Level Control Register 0 (HDMI_PHY_I2CM_SS_SCL_HCNT_0_ADDR)	8	R/W	6Ch	<a href="#">34.5.222/1837</a>
12_302D	PHY I2C Slow Speed SCL Low Level Control Register 1 (HDMI_PHY_I2CM_SS_SCL_LCNT_1_ADDR)	8	R/W	00h	<a href="#">34.5.223/1837</a>
12_302E	PHY I2C Slow Speed SCL Low Level Control Register 0 (HDMI_PHY_I2CM_SS_SCL_LCNT_0_ADDR)	8	R/W	7Fh	<a href="#">34.5.224/1838</a>
12_302F	PHY I2C Fast Speed SCL High Level Control Register 1 (HDMI_PHY_I2CM_FS_SCL_HCNT_1_ADDR)	8	R/W	00h	<a href="#">34.5.225/1838</a>
12_3030	PHY I2C Fast Speed SCL High Level Control Register 0 (HDMI_PHY_I2CM_FS_SCL_HCNT_0_ADDR)	8	R/W	11h	<a href="#">34.5.226/1839</a>
12_3031	PHY I2C Fast Speed SCL Low Level Control Register 1 (HDMI_PHY_I2CM_FS_SCL_LCNT_1_ADDR)	8	R/W	00h	<a href="#">34.5.227/1839</a>
12_3032	PHY I2C Fast Speed SCL Low Level Control Register 0 (HDMI_PHY_I2CM_FS_SCL_LCNT_0_ADDR)	8	R/W	24h	<a href="#">34.5.228/1840</a>
12_3200	Audio Clock Regenerator N Value Register 1 (HDMI_AUD_N1)	8	R/W	00h	<a href="#">34.5.229/1840</a>

Table continues on the next page...

## HDMI memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
12_3201	Audio Clock Regenerator N Value Register 2 (HDMI_AUD_N2)	8	R/W	00h	34.5.230/ 1841
12_3202	Audio Clock Regenerator N Value Register 3 (HDMI_AUD_N3)	8	R/W	00h	34.5.231/ 1841
12_3203	AUD_CTS1 (HDMI_AUD_CTS1)	8	R/W	00h	34.5.232/ 1842
12_3204	AUD_CTS2 (HDMI_AUD_CTS2)	8	R/W	00h	34.5.233/ 1842
12_3205	AUD_CTS3 (HDMI_AUD_CTS3)	8	R/W	00h	34.5.234/ 1843
12_3600	Audio DMA Start Register (HDMI_AHB_DMA_CONF0)	8	R/W	00h	34.5.235/ 1843
12_3601	AHB_DMA_START (HDMI_AHB_DMA_START)	8	R/W	00h	34.5.236/ 1844
12_3602	Audio DMA Stop Register (HDMI_AHB_DMA_STOP)	8	R/W	00h	34.5.237/ 1845
12_3603	Audio DMA FIFO Threshold Register (HDMI_AHB_DMA_THRSLD)	8	R/W	0100h	34.5.238/ 1846
12_3604	Audio DMA Start Address Register 0 (HDMI_AHB_DMA_STRADDR0)	8	R/W	00h	34.5.239/ 1846
12_3605	Audio DMA Start Address Register 1 (HDMI_AHB_DMA_STRADDR1)	8	R/W	00h	34.5.240/ 1847
12_3606	Audio DMA Start Address Register 2 (HDMI_AHB_DMA_STRADDR2)	8	R/W	00h	34.5.241/ 1847
12_3607	Audio DMA Start Address Register 3 (HDMI_AHB_DMA_STRADDR3)	8	R/W	00h	34.5.242/ 1848
12_3608	Audio DMA Stop Address Register 0 (HDMI_AHB_DMA_STPADDR0)	8	R/W	00h	34.5.243/ 1848
12_3609	Audio DMA Stop Address Register 1 (HDMI_AHB_DMA_STPADDR1)	8	R/W	00h	34.5.244/ 1849
12_360A	Audio DMA Stop Address Register 2 (HDMI_AHB_DMA_STPADDR2)	8	R/W	00h	34.5.245/ 1849
12_360B	Audio DMA Stop Address Register 3 (HDMI_AHB_DMA_STPADDR3)	8	R/W	00h	34.5.246/ 1850
12_360C	Audio DMA Burst Start Address Register 0 (HDMI_AHB_DMA_BSTADDR0)	8	R	00h	34.5.247/ 1850
12_360D	Audio DMA Burst Start Address Register 1 (HDMI_AHB_DMA_BSTADDR1)	8	R	00h	34.5.248/ 1851
12_360E	Audio DMA Burst Start Address Register 2 (HDMI_AHB_DMA_BSTADDR2)	8	R	00h	34.5.249/ 1851
12_360F	Audio DMA Burst Start Address Register 3 (HDMI_AHB_DMA_BSTADDR3)	8	R	00h	34.5.250/ 1851
12_3610	Audio DMA Burst Length Register 0 (HDMI_AHB_DMA_MBLENGTH0)	8	R	00h	34.5.251/ 1852

Table continues on the next page...

## HDMI memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 34.5.1 Design Identification Register (HDMI\_DESIGN\_ID)

The following are the registers used to identify the HDMI TX controller.

- Name: Design Identification Register
- Address Offset: 0x0000
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12\_0000h base + 0h offset = 12\_0000h

**HDMI\_DESIGN\_ID field descriptions**

Field	Description
DESIGN_ID	This is a 1 byte design ID code fixed by Freescale that Identifies the main revision of the HDMI TX controller. For example, HDMI TX 1.30a, DESIGN_ID = 11h; REVISION_ID = 0Ah

**34.5.2 Revision Identification Register (HDMI\_REVISION\_ID)**

- Name: Revision Identification Register
- Address Offset: 0x0001
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12\_0000h base + 1h offset = 12\_0001h

**HDMI\_REVISION\_ID field descriptions**

Field	Description
REVISION_ID	This is a one byte revision ID code fixed by Freescale that Identifies the main revision of the HDMI TX controller. For example, HDMI TX 1.30a, DESIGN_ID = 12h; REVISION_ID = 0Ah

### 34.5.3 Product Identification Register 0 (HDMI\_PRODUCT\_ID0)

- Name: Product Identification Register 0
- Address Offset: 0x0002
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12\_0000h base + 2h offset = 12\_0002h

**HDMI\_PRODUCT\_ID0 field descriptions**

Field	Description
PRODUCT_ID0	This one byte fixed code Identifies Freescale's product line ("A0h" for HDMI TX products).

### 34.5.4 Product Identification Register 1 (HDMI\_PRODUCT\_ID1)

- Name: Product Identification Register 1
- Address Offset: 0x0003
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12\_0000h base + 3h offset = 12\_0003h

**HDMI\_PRODUCT\_ID1 field descriptions**

Field	Description
PRODUCT_ID1	This one byte fixed code identifies Freescale's product line according to: 01h HDMI TX Controller C1h HDMI TX Controller with HDCP encryption engine

### 34.5.5 Configuration Identification Register 0 (HDMI\_CONFIG0\_ID)

- Name: Configuration Identification Register 0
- Address Offset: 0x0004
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12\_0000h base + 4h offset = 12\_0004h

Bit	7	6	5	4	3	2	1	0
Read	prepen	audhbr	audspdif	audi2s	hdmi14	csc	cec	hdcp
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_CONFIG0\_ID field descriptions

Field	Description
7 prepen	Indicates if it is possible to use internal pixel repetition
6 audhbr	Indicates if HBR interface is present
5 audspdif	Indicates if SPDIF interface is present
4 audi2s	Indicates if I2S interface is present
3 hdmi14	Indicates if HDMI 1.4 features are present
2 csc	Indicates if Color Space Conversion block is present
1 cec	Indicates if CEC is present
0 hdcp	Indicates if HDCP is present

### 34.5.6 Configuration Identification Register 1 (HDMI\_CONFIG1\_ID)

- Name: Configuration Identification Register 1
- Address Offset: 0x0005
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12\_0000h base + 5h offset = 12\_0005h

**HDMI\_CONFIG1\_ID field descriptions**

Field	Description
7-5 -	This field is reserved.
4 confsrdir	Indicates that configuration interface is SFR interface
3 confi2c	Indicates that configuration interface is I2C interface
2 confocp	Indicates that configuration interface is OCP interface
1 confapb	Indicates that configuration interface is APB interface
0 confahb	Indicates that configuration interface is AHB interface

### 34.5.7 Configuration Identification Register 2 (HDMI\_CONFIG2\_ID)

- Name: Configuration Identification Register 2
- Address Offset: 0x0006
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12\_0000h base + 6h offset = 12\_0006h

**HDMI\_CONFIG2\_ID field descriptions**

Field	Description
phytype	Indicates the type of PHY interface selected: 00h Legacy PHY (HDMI TX PHY) F2h PHY_Gen2 (HDMI 3D TX PHY) E2h PHY_Gen2 (HDMI 3D TX PHY) + HEAC PHY

### 34.5.8 Configuration Identification Register 3 (HDMI\_CONFIG3\_ID)

- Name: Configuration Identification Register 3
- Address Offset: 0x0007
- Size: 8 bits
- Value after Reset: Implementation Dependent
- Access: Read

Address: 12\_0000h base + 7h offset = 12\_0007h

**HDMI\_CONFIG3\_ID field descriptions**

Field	Description
7-1 -	This field is reserved.
0 confgpaud	Indicates that configuration interface is Generic Parallel Audio (GPAUD) interface

**34.5.9 Frame Composer Interrupt Status Register 0 (HDMI\_IH\_FC\_STAT0)**

This section describes clear on write (1 to corresponding bit) status registers, which contain the following active-high, sticky bit interrupts.

HDMI TX introduces a new set of sticky bit mute control registers (IH\_MUTE\_FC\_STAT0 to IH\_MUTE\_AHBDMAAUD\_STAT0) that correspond to the interrupt registers. You can ignore a sticky bit interrupt by setting the corresponding mute control register bit to 1. This puts the global interrupt line on a higher priority than the sticky bit interrupt.

- Address Offset: 0x0100
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12\_0000h base + 100h offset = 12\_0100h

Bit	7	6	5	4	3	2	1	0
Read	AUDI	ACP	HBR	DST	OBA	AUDS	ACR	NULL
Write	w1c	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

**HDMI\_IH\_FC\_STAT0 field descriptions**

Field	Description
7 AUDI	Active after successful transmission of an Audio InfoFrame packet.
6 ACP	Active after successful transmission of an Audio Content Protection packet.
5 HBR	Active after successful transmission of an Audio HBR packet.
4 DST	Reserved
3 OBA	Reserved

*Table continues on the next page...*

**HDMI\_IH\_FC\_STAT0 field descriptions (continued)**

Field	Description
2 AUDS	Active after successful transmission of an Audio Sample packet. Due to high number of audio sample packets transmitted, this interrupt is by default masked at frame composer.
1 ACR	Active after successful transmission of an Audio Clock Regeneration (N/CTS transmission) packet.
0 NULL	Active after successful transmission of an Null packet. Due to high number of audio sample packets transmitted, this interrupt is by default masked at frame composer.

**34.5.10 Frame Composer Interrupt Status Register 1 (HDMI\_IH\_FC\_STAT1)**

- Address Offset: 0x0101
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12\_0000h base + 101h offset = 12\_0101h

Bit	7	6	5	4	3	2	1	0
Read	GMD	ISCR1	ISCR2	VSD	SPD	MPEG	AVI	GCP
Write	w1c	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

**HDMI\_IH\_FC\_STAT1 field descriptions**

Field	Description
7 GMD	Active after successful transmission of an Gamut metadata packet.
6 ISCR1	Active after successful transmission of an International Standard Recording Code 1 packet.
5 ISCR2	Active after successful transmission of an International Standard Recording Code 2 packet.
4 VSD	Active after successful transmission of an Vendor Specific Data infoFrame packet.
3 SPD	Active after successful transmission of an Source Product Descriptor infoFrame packet.
2 MPEG	Reserved
1 AVI	Active after successful transmission of an AVI infoFrame packet.
0 GCP	Active after successful transmission of an General Control Packet.

### 34.5.11 Frame Composer Interrupt Status Register 2 (HDMI\_IH\_FC\_STAT2)

- Address Offset: 0x0102
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12\_0000h base + 102h offset = 12\_0102h

**HDMI\_IH\_FC\_STAT2 field descriptions**

Field	Description
7-2 -	This field is reserved. Reserved
1 LowPriority_ overflow	Frame Composer low priority packet queue descriptor overflow indication.
0 HighPriority_ overflow	Frame Composer high priority packet queue descriptor overflow indication.

### 34.5.12 Audio Sampler Interrupt Status Register (HDMI\_IH\_AS\_STAT0)

- Address Offset: 0x0103
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12\_0000h base + 103h offset = 12\_0103h

Bit	7	6	5	4	3	2	1	0
Read	Reserved					Aud_fifo_underrun_thr	Aud_fifo_underrun	Aud_fifo_overflow
Write						w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

**HDMI\_IH\_AS\_STAT0 field descriptions**

Field	Description
7-3 -	This field is reserved. Reserved
2 Aud_fifo_underrun_thr	Audio Sampler audio FIFO empty threshold (four samples) indication. Only valid in HBR audio.
1 Aud_fifo_underrun	Audio Sampler audio FIFO empty indication.
0 Aud_fifo_overflow	Audio Sampler audio FIFO full indication.

### 34.5.13 PHY Interface Interrupt Status Register (HDMI\_IH\_PHY\_STAT0)

- Address Offset: 0x0104
- Size: 8 bits
- Value after Reset: 0x00
- Access: Clear on Write/Read

Address: 12\_0000h base + 104h offset = 12\_0104h

Bit	7	6	5	4
Read	Reserved		RX_SENSE3	RX_SENSE2
Write	Reserved		w1c	w1c
Reset	0	0	0	0
Bit	3	2	1	0
Read	RX_SENSE1	RX_SENSE0	TX_PHY_LOCK	HDP
Write	w1c	w1c	w1c	w1c
Reset	0	0	0	0

#### HDMI\_IH\_PHY\_STAT0 field descriptions

Field	Description
7-6 -	This field is reserved. Reserved
5 RX_SENSE3	TX PHY RX_SENSE indication for driver 3. You may need to mask or change polarity of this interrupt after it has become active.
4 RX_SENSE2	TX PHY RX_SENSE indication for driver 2. You may need to mask or change polarity of this interrupt after it has become active.
3 RX_SENSE1	TX PHY RX_SENSE indication for driver 1. You may need to mask or change polarity of this interrupt after it has become active.
2 RX_SENSE0	TX PHY RX_SENSE indication for driver 0. You may need to mask or change polarity of this interrupt after it has become active.
1 TX_PHY_LOCK	TX PHY PLL lock indication. Please refer to PHY datasheet for more information. You may need to mask or change polarity of this interrupt after it has become active.
0 HDP	HDMI Hot Plug Detect indication. You may need to mask or change polarity of this interrupt after it has become active.

### 34.5.14 E-DDC I2C Master Interrupt Status Register (HDMI\_IH\_I2CM\_STAT0)

- Address Offset: 0x0105
- Size: 8 bits
- Value after Reset: 0x00
- Access: Clear on Write/Read

Address: 12\_0000h base + 105h offset = 12\_0105h

Bit	7	6	5	4
Read	Reserved			
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	Reserved		I2Cmasterdone	I2CMaster_ERROR
Write			w1c	w1c
Reset	0	0	0	0

#### HDMI\_IH\_I2CM\_STAT0 field descriptions

Field	Description
7-2 -	This field is reserved. Reserved
1 I2Cmasterdone	I2C Master done indication
0 I2CMaster_ERROR	I2C Master error indication

### 34.5.15 CEC Interrupt Status Register (HDMI\_IH\_CEC\_STAT0)

- Address Offset: 0x0106
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12\_0000h base + 106h offset = 12\_0106h

Bit	7	6	5	4	3	2	1	0
Read	Reserved	WAKEUP	ERROR_FOLLOW	ERROR_INITIATOR	ARB_LOST	NACK	EOM	DONE
Write	Reserved	w1c	w1c	w1c	w1c	w1c	w1c	w1c
Reset	0	0	0	0	0	0	0	0

#### HDMI\_IH\_CEC\_STAT0 field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 WAKEUP	CEC Wake-up indication
5 ERROR_FOLLOW	CEC Error_follow indication
4 ERROR_INITIATOR	CEC Error_follow indication
3 ARB_LOST	CEC Arb_Lost indication
2 NACK	CEC Nack indication
1 EOM	CEC End of Message Indication
0 DONE	CEC Done Indication

### 34.5.16 Video Packetizer Interrupt Status Register (HDMI\_IH\_VP\_STAT0)

- Address Offset: 0x0107
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12\_0000h base + 107h offset = 12\_0107h

Bit	7	6	5	4
Read	fifofullrepet	fifoemptyrepet	fifofullpp	fifoemptypp
Write	w1c	w1c	w1c	w1c
Reset	0	0	0	0
Bit	3	2	1	0
Read	fifofullremap	fifoemptyremap	fifofullbyp	fifoemptybyp
Write	w1c	w1c	w1c	w1c
Reset	0	0	0	0

#### HDMI\_IH\_VP\_STAT0 field descriptions

Field	Description
7 fifofullrepet	Video packetizer pixel repeater FIFO full interrupt
6 fifoemptyrepet	Video packetizer pixel repeater FIFO empty interrupt
5 fifofullpp	Video packetizer pixel packing FIFO full interrupt
4 fifoemptypp	Video packetizer pixel packing FIFO empty interrupt
3 fifofullremap	Video packetizer pixel YCC 422 re-mapper FIFO full interrupt
2 fifoemptyremap	Video packetizer pixel YCC 422 re-mapper FIFO empty interrupt
1 fifofullbyp	Video packetizer 8-bit bypass fifo full interrupt
0 fifoemptybyp	Video packetizer 8-bit bypass fifo empty interrupt

### 34.5.17 PHY GEN2 I2C Master Interrupt Status Register (HDMI\_IH\_I2CMPHY\_STAT0)

This clear on write (1 to corresponding bit) register contains the following active high sticky bit interrupts. That I2C Master PHY is the I2C Master block used to access the PHY I2C Slave.

- Address Offset: 0x0108
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12\_0000h base + 108h offset = 12\_0108h

Bit	7	6	5	4
Read	Reserved			
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	Reserved		i2cmphydone	i2cmphyerror
Write			w1c	w1c
Reset	0	0	0	0

**HDMI\_IH\_I2CMPHY\_STAT0 field descriptions**

Field	Description
7-2 -	This field is reserved. Reserved
1 i2cmphydone	I2C Master PHY done indication
0 i2cmphyerror	I2C Master PHY error indication

### 34.5.18 AHB Audio DMA Interrupt Status Register (HDMI\_IH\_AHBDMAAUD\_STAT0)

Address Offset: 0x0109

Size: 8 bits

Value after Reset: 0x00

Access: Read/Clear on Write

Address: 12\_0000h base + 109h offset = 12\_0109h

Bit	7	6	5	4
Read	Reserved		ahbdmaaud_interror	ahbdmaaud_intlostownership
Write			w1c	w1c
Reset	0	0	0	0
Bit	3	2	1	0
Read	ahbdmaaud_intretrysplit	ahbdmaaud_intdone	ahbdmaaud_intbufffull	ahbdmaaud_intbuffempty
Write	w1c	w1c	w1c	w1c
Reset	0	0	0	0

**HDMI\_IH\_AHBDMAAUD\_STAT0 field descriptions**

Field	Description
7–6 -	This field is reserved. Reserved
5 ahbdmaaud_interror	AHB audio DMA error interrupt
4 ahbdmaaud_intlostownership	AHB audio DMA lost ownership interrupt
3 ahbdmaaud_intretrysplit	AHB audio DMA RETRY/SPLIT interrupt
2 ahbdmaaud_intdone	AHB audio DMA done interrupt
1 ahbdmaaud_intbufffull	AHB audio DMA Buffer full interrupt
0 ahbdmaaud_intbuffempty	AHB audio DMA Buffer empty interrupt

### 34.5.19 Frame Composer Interrupt Mute Control Register 0 (HDMI\_IH\_MUTE\_FC\_STAT0)

- Address Offset: 0x0180
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 180h offset = 12\_0180h

Bit	7	6	5	4	3	2	1	0
Read	AUDI	ACP	HBR	DST	OBA	AUDS	ACR	NULL
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_IH\_MUTE\_FC\_STAT0 field descriptions

Field	Description
7 AUDI	When set to 1, mutes IH_FC_STAT0[7]
6 ACP	When set to 1, mutes IH_FC_STAT0[6]
5 HBR	When set to 1, mutes IH_FC_STAT0[5]
4 DST	When set to 1, mutes IH_FC_STAT0[4]
3 OBA	When set to 1, mutes IH_FC_STAT0[3]
2 AUDS	When set to 1, mutes IH_FC_STAT0[2]
1 ACR	When set to 1, mutes IH_FC_STAT0[1]
0 NULL	When set to 1, mutes IH_FC_STAT0[0]

### 34.5.20 Frame Composer Interrupt Mute Control Register 1 (HDMI\_IH\_MUTE\_FC\_STAT1)

- Address Offset: 0x0181
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 181h offset = 12\_0181h

Bit	7	6	5	4	3	2	1	0
Read	GMD	ISCR1	ISCR2	VSD	SPD	MPEG	AVI	GCP
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_IH\_MUTE\_FC\_STAT1 field descriptions

Field	Description
7 GMD	When set to 1, mutes IH_FC_STAT1[7]
6 ISCR1	When set to 1, mutes IH_FC_STAT1[6]
5 ISCR2	When set to 1, mutes IH_FC_STAT1[5]
4 VSD	When set to 1, mutes IH_FC_STAT1[4]
3 SPD	When set to 1, mutes IH_FC_STAT1[3]
2 MPEG	When set to 1, mutes IH_FC_STAT1[2]
1 AVI	When set to 1, mutes IH_FC_STAT1[1]
0 GCP	When set to 1, mutes IH_FC_STAT1[0]

### 34.5.21 Frame Composer Interrupt Mute Control Register 2 (HDMI\_IH\_MUTE\_FC\_STAT2)

- Address Offset: 0x0182
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 182h offset = 12\_0182h

HDMI\_IH\_MUTE\_FC\_STAT2 field descriptions

Field	Description
7-2 -	This field is reserved. Reserved
1 LowPriority_ overflow	When set to 1, mutes IH_FC_STAT2[1]
0 HighPriority_ overflow	When set to 1, mutes IH_FC_STAT2[0]

### 34.5.22 Audio Sampler Interrupt Mute Control Register 0 (HDMI\_IH\_MUTE\_AS\_STAT0)

- Address Offset: 0x0183
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 183h offset = 12\_0183h

## HDMI\_IH\_MUTE\_AS\_STAT0 field descriptions

Field	Description
7-3 -	This field is reserved. Reserved
2 Aud_fifo_ underflow_thr	When set to 1, mutes IH_AS_STAT0[2]
1 Aud_fifo_ underflow	When set to 1, mutes IH_AS_STAT0[1]
0 Aud_fifo_ overflow	When set to 1, mutes IH_AS_STAT0[0]

### 34.5.23 PHY Interface Interrupt Mute Control Register (HDMI\_IH\_MUTE\_PHY\_STAT0)

- Address Offset: 0x0184
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 184h offset = 12\_0184h

Bit	7	6	5	4	3	2	1	0
Read	Reserved		RX_SENSE3	RX_SENSE2	RX_SENSE1	RX_SENSE0	TX_PHY_LOCK	HDP
Write	Reserved		RX_SENSE3	RX_SENSE2	RX_SENSE1	RX_SENSE0	TX_PHY_LOCK	HDP
Reset	0	0	0	0	0	0	0	0

## HDMI\_IH\_MUTE\_PHY\_STAT0 field descriptions

Field	Description
7-6 -	This field is reserved. Reserved
5 RX_SENSE3	When set to 1, mutes IH_PHY_STAT0[5]
4 RX_SENSE2	When set to 1, mutes IH_PHY_STAT0[4]
3 RX_SENSE1	When set to 1, mutes IH_PHY_STAT0[3]
2 RX_SENSE0	When set to 1, mutes IH_PHY_STAT0[2]
1 TX_PHY_LOCK	When set to 1, mutes IH_PHY_STAT0[1]
0 HDP	When set to 1, mutes IH_PHY_STAT0[0]

### 34.5.24 E-DDC I2C Master Interrupt Mute Control Register (HDMI\_IH\_MUTE\_I2CM\_STAT0)

- Address Offset: 0x0185
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 185h offset = 12\_0185h

Bit	7	6	5	4
Read	Reserved			
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	Reserved		I2Cmasterdone	I2CMASTER_ERROR
Write	Reserved		I2Cmasterdone	I2CMASTER_ERROR
Reset	0	0	0	0

**HDMI\_IH\_MUTE\_I2CM\_STAT0 field descriptions**

Field	Description
7-2 -	This field is reserved. Reserved
1 I2Cmasterdone	When set to 1, mutes IH_I2CM_STAT0[1]
0 I2CMASTER_ERROR	When set to 1, mutes IH_I2CM_STAT0[0]

### 34.5.25 CEC Interrupt Mute Control Register (HDMI\_IH\_MUTE\_CEC\_STAT0)

- Address Offset: 0x0186
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 186h offset = 12\_0186h

Bit	7	6	5	4	3	2	1	0
Read	Reserved	WAKEUP	ERROR_FOLLOW	ERROR_INITIATOR	ARB_LOST	NACK	EOM	DONE
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_IH\_MUTE\_CEC\_STAT0 field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 WAKEUP	When set to 1, mutes IH_CEC_STAT0[6]
5 ERROR_FOLLOW	When set to 1, mutes IH_CEC_STAT0[5]
4 ERROR_INITIATOR	When set to 1, mutes IH_CEC_STAT0[4]
3 ARB_LOST	When set to 1, mutes IH_CEC_STAT0[3]
2 NACK	When set to 1, mutes IH_CEC_STAT0[2]
1 EOM	When set to 1, mutes IH_CEC_STAT0[1]
0 DONE	When set to 1, mutes IH_CEC_STAT0[0]

### 34.5.26 Video Packetizer Interrupt Mute Control Register (HDMI\_IH\_MUTE\_VP\_STAT0)

- Address Offset: 0x0187
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 187h offset = 12\_0187h

Bit	7	6	5	4
Read	fifofullrepet	fifoemptyrepet	fifofullpp	fifoemptypp
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	fifofullremap	fifoemptyremap	fifofullbyp	fifoemptybyp
Write				
Reset	0	0	0	0

## HDMI\_IH\_MUTE\_VP\_STAT0 field descriptions

Field	Description
7 fifofullrepet	When set to 1, mutes IH_VP_STAT0[7]

Table continues on the next page...

**HDMI\_IH\_MUTE\_VP\_STAT0 field descriptions (continued)**

Field	Description
6 fifoemptyrepet	When set to 1, mutes IH_VP_STAT0[6]
5 fifofullpp	When set to 1, mutes IH_VP_STAT0[5]
4 fifoemptypp	When set to 1, mutes IH_VP_STAT0[4]
3 fifofullremap	When set to 1, mutes IH_VP_STAT0[3]
2 fifoemptyremap	When set to 1, mutes IH_VP_STAT0[2]
1 fifofullbyp	When set to 1, mutes IH_VP_STAT0[1]
0 fifoemptybyp	When set to 1, mutes IH_VP_STAT0[0]

**34.5.27 PHY GEN 2 I2C Master Interrupt Mute Control Register (HDMI\_IH\_MUTE\_I2CMPHY\_STAT0)**

- Address Offset: 0x0188
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 188h offset = 12\_0188h

Bit	7	6	5	4
Read	Reserved			
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	Reserved		i2cmphydone	i2cmphyerror
Write				
Reset	0	0	0	0

**HDMI\_IH\_MUTE\_I2CMPHY\_STAT0 field descriptions**

Field	Description
7-2 -	This field is reserved. Reserved
1 i2cmphydone	When set to 1, mutes IH_I2CMPHY_STAT0[1]
0 i2cmphyerror	When set to 1, mutes IH_I2CMPHY_STAT0[0]

### 34.5.28 AHB Audio DMA Interrupt Mute Control Register (HDMI\_IH\_MUTE\_AHBDMAAUD\_STAT0)

- Address Offset: 0x0189
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 189h offset = 12\_0189h

Bit	7	6	5	4
Read	Reserved		ahbdmaaud_interror	ahbdmaaud_intlostownership
Write	Reserved		ahbdmaaud_interror	ahbdmaaud_intlostownership
Reset	0	0	0	0
Bit	3	2	1	0
Read	ahbdmaaud_intretrysplit	ahbdmaaud_intdone	ahbdmaaud_intbufffull	ahbdmaaud_intbuffempty
Write	ahbdmaaud_intretrysplit	ahbdmaaud_intdone	ahbdmaaud_intbufffull	ahbdmaaud_intbuffempty
Reset	0	0	0	0

#### HDMI\_IH\_MUTE\_AHBDMAAUD\_STAT0 field descriptions

Field	Description
7-6 -	This field is reserved. Reserved
5 ahbdmaaud_interror	When set to 1, mutes IH_AHBDMAAUD_STAT0[5]
4 ahbdmaaud_intlostownership	When set to 1, mutes IH_AHBDMAAUD_STAT0[4]
3 ahbdmaaud_intretrysplit	When set to 1, mutes IH_AHBDMAAUD_STAT0[3]
2 ahbdmaaud_intdone	When set to 1, mutes IH_AHBDMAAUD_STAT0[2]
1 ahbdmaaud_intbufffull	When set to 1, mutes IH_AHBDMAAUD_STAT0[1]
0 ahbdmaaud_intbuffempty	When set to 1, mutes IH_AHBDMAAUD_STAT0[0]

### 34.5.29 Global Interrupt Mute Control Register (HDMI\_IH\_MUTE)

- Address Offset: 0x01FF
- Size: 8 bits
- Value after Reset: 0x03
- Access: Read/Write

Address: 12\_0000h base + 1FFh offset = 12\_01FFh

HDMI\_IH\_MUTE field descriptions

Field	Description
7–2 rsvd	This field is reserved.
1 mute_wakeup_interrupt	When set to 1, mutes the wake-up interrupt line. The sticky bit interrupt continues with its state; only the wake up interrupt line is muted.
0 mute_all_interrupt	When set to 1, mutes the main interrupt line (where all interrupts are ORed). The sticky bit interrupts continue with their state; only the main interrupt line will be muted.

### 34.5.30 Video Input Mapping and Internal Data Enable Configuration Register (HDMI\_TX\_INVID0)

This registers contains the input video mapping code as defined in Table 2-1.

- Address Offset: 0x0200
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

Address: 12\_0000h base + 200h offset = 12\_0200h

## HDMI\_TX\_INVID0 field descriptions

Field	Description
7 internal_de_ generator	Internal data enable (DE) generator enable. If data enable is not available for the input video the user may set this bit to one to activate the internal data enable generator.  <b>NOTE:</b> This feature only works for input video modes that have native repetition (such as, all CEA videos). No desired pixel repetition can be used with this feature because these configurations only affect the Frame Composer and not this block.
6–5 -	This field is reserved. Reserved
video_mapping	video_mapping

### 34.5.31 Video Input Stuffing Enable Register (HDMI\_TX\_INSTUFFING)

This register enables the stuffing mechanism of the Video Sampler module in order to correctly perform Color Space Conversion of the ITU.601 standard YCC video. In this case, when "de" is low, the output video components gydata[15:0], rcrdata[15:0], and bcbdata[15:0] can be configured.

- Address Offset: 0x0201
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 201h offset = 12\_0201h

Bit	7	6	5	4	3	2	1	0
Read	Reserved					BCBDATA_ STUFFING	RCRDATA_ STUFFING	GYDATA_ STUFFING
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_TX\_INSTUFFING field descriptions

Field	Description
7–3 -	This field is reserved. Reserved
2 BCBDATA_ STUFFING	BCBDATA stuffing bit  0 When the dataen signal is low, the value in the bcbdata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the bcbdata[15:0] output is given by the values in register TX_BCBDTA0 and TX_BCBDATA1.
1 RCRDATA_ STUFFING	RCRDATA stuffing bit

Table continues on the next page...

**HDMI\_TX\_INSTUFFING field descriptions (continued)**

Field	Description
	0 When the dataen signal is low, the value in the rcrdata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the rcrdata[15:0] output is given by the values in TX_RCRDTA0 and TX_RCRDATA1 registers.
0 GYDATA_STUFFING	GYDATA stuffing bit 0 when the dataen signal is low, the value in the gydata[15:0] output is the one sampled from the corresponding input data. 1 When the dataen signal is low, the value in the gydata[15:0] output is given by the values in TX_GYDTA0 and TX_GYDATA1 registers.

**34.5.32 Video Input GY Data Channel Stuffing Register 0 (HDMI\_TX\_GYDATA0)**

- Address Offset: 0x0202
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 202h offset = 12\_0202h

**HDMI\_TX\_GYDATA0 field descriptions**

Field	Description
gydata	gydata[7:0]. This register defines the value of gydata[7:0] when TX_INSTUFFING[0] (gydata_stuffing) is set to 1b.

### 34.5.33 Video Input GY Data Channel Stuffing Register 1 (HDMI\_TX\_GYDATA1)

- Address Offset: 0x0203
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 203h offset = 12\_0203h

Bit	7	6	5	4	3	2	1	0
Read	gydata							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_TX\_GYDATA1 field descriptions**

Field	Description
gydata	gydata[15:8]. This register defines the value of gydata[15:8] when TX_INSTUFFING[0] (gydata_stuffing) is set to 1b.

### 34.5.34 Video Input RCR Data Channel Stuffing Register 0 (HDMI\_TX\_RCRDATA0)

- Address Offset: 0x0204
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 204h offset = 12\_0204h

Bit	7	6	5	4	3	2	1	0
Read	rcrdata							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_TX\_RCRDATA0 field descriptions**

Field	Description
rcrdata	rcrdata[7:0]. This register defines the value of rcrdata[7:0] when TX_INSTUFFING[1] (rcrdata_stuffing) is set to 1b.

### 34.5.35 Video Input RCR Data Channel Stuffing Register 1 (HDMI\_TX\_RCRDATA1)

- Address Offset: 0x0205
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 205h offset = 12\_0205h

#### HDMI\_TX\_RCRDATA1 field descriptions

Field	Description
rcrdata	rcrdata[15:8]. This register defines the value of rcrdata[15:8] when TX_INSTUFFING[1] (rcrdata_stuffing) is set to 1b.

### 34.5.36 Video Input RCB Data Channel Stuffing Register 0 (HDMI\_TX\_BCBDATA0)

- Address Offset: 0x0206
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 206h offset = 12\_0206h

#### HDMI\_TX\_BCBDATA0 field descriptions

Field	Description
bcldata	bcldata[7:0]. This register defines the value of bcldata[7:0] when TX_INSTUFFING[2] (bcldata_stuffing) is set to 1b.

### 34.5.37 Video Input RCB Data Channel Stuffing Register 1 (HDMI\_TX\_BCBDATA1)

- Address Offset: 0x0207
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 207h offset = 12\_0207h

Bit	7	6	5	4	3	2	1	0
Read	bcbdata							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_TX\_BCBDATA1 field descriptions

Field	Description
bcbdata	bcbdata[15:8]. This register defines the value of bcbdata[15:8] when TX_INSTUFFING[2] (bcbdata_stuffing) is set to 1b.

### 34.5.38 Video Packetizer Packing Phase Status Register (HDMI\_VP\_STATUS)

- Address Offset: 0x0800
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 800h offset = 12\_0800h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				packing_phase			
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_VP\_STATUS field descriptions

Field	Description
7-4 -	This field is reserved. Reserved

Table continues on the next page...

**HDMI\_VP\_STATUS field descriptions (continued)**

Field	Description
packing_phase	Read only register that holds the "packing phase" output by the Video packetizer block. For more information about "packing" video data, refer to the HDMI1.4a specification. The register is updated at tmds clock rate.

**34.5.39 Video Packetizer Pixel Repetition and Color Depth Register (HDMI\_VP\_PR\_CD)**

This register configures the Color Depth of the input video and Pixel repetition to apply to video.

- Address Offset: 0x0801
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 801h offset = 12\_0801h

Bit	7	6	5	4	3	2	1	0
Read	color_depth[3:0]				desired_pr_factor[3:0]			
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_VP\_PR\_CD field descriptions**

Field	Description
7-4 color_depth[3:0]	Color depth configuration: other Reserved. Not used.  0000 24 bits per pixel video (8 bit per component). 8-bit packing mode. 0100 24 bits per pixel video (8 bit per component). 8-bit packing mode. 0101 30 bits per pixel video (10 bit per component). 10-bit packing mode. 0110 36 bits per pixel video (12 bit per component). 12-bit packing mode. 0111 48 bits per pixel video (16 bit per component). 16-bit packing mode.
desired_pr_factor[3:0]	Desired pixel repetition factor configuration. The configured value sets H13T PHY PLL to multiply pixel clock by the factor in order to obtain the desired repetition clock. For the CEA modes some are already defined with pixel repetition in the input video. So for CEA modes this shall be always 0. Shall only be used if the user wants to do pixel repetition using H13TCTRL core. other Reserved. Not used.  0000 No pixel repetition (pixel sent only once) 0001 Pixel sent 2 times (pixel repeated once) 0010 Pixel sent 3 times 0011 Pixel sent 4 times 0100 Pixel sent 5 times 0101 Pixel sent 6 times

Table continues on the next page...

## HDMI\_VP\_PR\_CD field descriptions (continued)

Field	Description
0110	Pixel sent 7 times
0111	Pixel sent 8 times
1000	Pixel sent 9 times
1001	Pixel sent 10 times

### 34.5.40 Video Packetizer Stuffing and Default Packing Phase Register (HDMI\_VP\_STUFF)

This register controls the Pixel repetition, pixel packing and YCC422 stuffing.

- Address Offset: 0x0802
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 802h offset = 12\_0802h

Bit	7	6	5	4
Read	Reserved		idefault_phase	ifix_pp_to_last
Write	Reserved			
Reset	0	0	0	0
Bit	3	2	1	0
Read	icx_goto_p0_st	ycc422_stuffing	pp_stuffing	pr_stuffing
Write				
Reset	0	0	0	0

### HDMI\_VP\_STUFF field descriptions

Field	Description
7–6 -	This field is reserved. Reserved
5 idefault_phase	Controls the default phase packing machine used according to: "If the transmitted video format has timing such that the phase of the first pixel of every Video Data Period corresponds to pixel packing phase 0 (for example, 10P0, 12P0, 16P0), the Source may set the Default_Phase bit in the GCP. The Sink may use this bit to optimize it's filtering or handling of the PP field." (HDMI specification version 1.4a) This means that for 10 bit mode the Htotal must be dividable by 4 and for 12 bit mode the Htotal must be dividable by 2.
4 ifix_pp_to_last	Reserved. Controls packing machine strategy.
3 icx_goto_p0_st	Reserved. Controls packing machine strategy.
2 ycc422_stuffing	YCC 422 remap stuffing control. For horizontal blanking: 0 YCC 422 remap block in direct mode (input blanking data goes directly to output). 1 YCC 422 remap block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00.

Table continues on the next page...

**HDMI\_VP\_STUFF field descriptions (continued)**

Field	Description
1 pp_stuffing	Pixel packing stuffing control 0 Pixel packing block in direct mode (input blanking data goes directly to output). 1 Pixel packing block in stuffing mode. When "de_rep" goes to low the outputs are fixed to 0x00.
0 pr_stuffing	Pixel repeater stuffing control 0 Pixel repeater block in direct mode (input blanking data goes directly to output). 1 Pixel repeater block in stuffing mode. When "de" goes to low the outputs are fixed to 0x00.

**34.5.41 Video Packetizer YCC422 Remapping Register (HDMI\_VP\_REMAP)**

This register controls YCC422 remap of the Video Packetizer. For more information about YCC422 remap refer to HDMI 1.4a specification.

- Address Offset: 0x0803
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 803h offset = 12\_0803h

**HDMI\_VP\_REMAP field descriptions**

Field	Description
7-2 -	This field is reserved. Reserved
ycc422_size[1:0]	YCC 422 remap input video size: 00 YCC 422 16-bit input video (8 bits per component). 01 YCC 422 20-bit input video (10 bits per component). 10 YCC 422 24-bit input video (12 bits per component). 11 Reserved. Not used.

### 34.5.42 Video Packetizer Output, Bypass, and Enable Configuration Register (HDMI\_VP\_CONF)

This register controls the Video Packetizer output selection, bypass select, YCC422 enable, Pixel repeater, and pixel packing enabling.

- Address Offset: 0x0804
- Size: 8 bits
- Value after Reset: 0x46
- Access: Read/Write

Address: 12\_0000h base + 804h offset = 12\_0804h

Bit	7	6	5	4	3	2	1	0
Read								
Write	Reserved	bypass_en	pp_en	pr_en	ycc422_en	BYPASS_SELECT	output_selector[1:0]	
Reset	0	1	0	0	0	1	1	0

#### HDMI\_VP\_CONF field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 bypass_en	Bypass enable. Disabling forces bypass module to output always zeros.
5 pp_en	Pixel packing enable. Disabling forces bypass module to output always zeros.
4 pr_en	Pixel repeater enable. Disabling forces bypass module to output always zeros.
3 ycc422_en	YCC 422 select enable. Disabling forces bypass module to output always zeros.
2 BYPASS_SELECT	Bypass select bit 0 Data from pixel repeater block. 1 Data from input of video packetizer block.
output_selector[1:0]	Video packetizer output selection. 00 Data from pixel packing block. 01 Data from YCC 422 remap block. 10 Data from 8-bit bypass block. 11 Data from 8-bit bypass block.

### 34.5.43 Video Packetizer Interrupt Mask Register (HDMI\_VP\_MASK)

Mask register for generation of VP\_INT interrupts.

## HDMI Memory Map/Register Definition

- Address Offset: 0x0807
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 807h offset = 12\_0807h

Bit	7	6	5	4	3	2	1	0
Read	VPMASK7	VPMASK6	VPMASK5	VPMASK4	VPMASK3	VPMASK2	VPMASK1	VPMASK0
Write								
Reset	0	0	0	0	0	0	0	0

### HDMI\_VP\_MASK field descriptions

Field	Description
7 VPMASK7	Mask bit for VP_INT[7] interrupt bit.
6 VPMASK6	Mask bit for VP_INT[6] interrupt bit.
5 VPMASK5	Mask bit for VP_INT[5] interrupt bit.
4 VPMASK4	Mask bit for VP_INT[4] interrupt bit.
3 VPMASK3	Mask bit for VP_INT[3] interrupt bit.
2 VPMASK2	Mask bit for VP_INT[2] interrupt bit.
1 VPMASK1	Mask bit for VP_INT[1] interrupt bit.
0 VPMASK0	Mask bit for VP_INT[0] interrupt bit.

## 34.5.44 Frame Composer Input Video Configuration and HDCP Keepout Register (HDMI\_FC\_INVIDCONF)

This register configures the Interlaced/progressive, Vblank variation and polarity of all video synchronism of the input video signal.

- Address Offset: 0x1000
- Size: 8 bits
- Value after Reset: 0x70
- Access: Read/Write

Address: 12\_0000h base + 1000h offset = 12\_1000h

Bit	7	6	5	4
Read	Reserved	vsync_in_polarity	hsync_in_polarity	de_in_polarity
Write				
Reset	0	1	1	1

Bit	3	2	1	0
Read	DVI_mode	Reserved	r_v_blank_in_osc	in_I_P
Write				
Reset	0	0	0	0

### HDMI\_FC\_INVIDCONF field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 vsync_in_polarity	Vsync input polarity 1 Active high 0 Active low
5 hsync_in_polarity	Hsync input polarity 1 Active high 0 Active low
4 de_in_polarity	Data enable input polarity 1 Active high 0 Active low
3 DVI_mode	Active low 0 DVI mode selected 1 HDMI mode selected
2 -	This field is reserved. Reserved
1 r_v_blank_in_osc	Used for CEA861-D modes with fractional Vblank (for example, modes 5, 6, 7, 10, 11, 20, 21, and 22. For more modes, refer to CEA861-D specification. 1 Active high
0 in_I_P	Input video mode: 1 Interlaced 0 Progressive

### 34.5.45 Frame Composer Input Video HActive Pixels Register 0 (HDMI\_FC\_INHACTIV0)

- Address Offset: 0x1001
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1001h offset = 12\_1001h

HDMI\_FC\_INHACTIV0 field descriptions

Field	Description
H_in_activ[7:0]	Input video Horizontal active pixel region width. Number of Horizontal active pixels [0...8191].

### 34.5.46 Frame Composer Input Video HActive Pixels Register 1 (HDMI\_FC\_INHACTIV1)

- Address Offset: 0x1002
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1002h offset = 12\_1002h

HDMI\_FC\_INHACTIV1 field descriptions

Field	Description
7-5 -	This field is reserved. Reserved
H_in_activ[12:8]	Input video Horizontal active pixel region width. Dependencies: Value after Reset: 0000b

Table continues on the next page...

## HDMI\_FC\_INHACTIV1 field descriptions (continued)

Field	Description
	<ul style="list-style-type: none"> <li>the higher bit of Horizontal active pixels; Number of Horizontal active pixels [0...8191].</li> </ul>

### 34.5.47 Frame Composer Input Video HBlank Pixels Register 0 (HDMI\_FC\_INHBLANK0)

- Address Offset: 0x1003
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1003h offset = 12\_1003h

Bit	7	6	5	4	3	2	1	0
Read	H_in_blank[7:0]							
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_FC\_INHBLANK0 field descriptions

Field	Description
H_in_blank[7:0]	Input video Horizontal blanking pixel region width. Number of Horizontal blanking pixels [0...4095].

### 34.5.48 Frame Composer Input Video HBlank Pixels Register 1 (HDMI\_FC\_INHBLANK1)

- Address Offset: 0x1004
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1004h offset = 12\_1004h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				H_in_blank[12:8]			
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_INHBLANK1 field descriptions**

Field	Description
7-5 -	This field is reserved. Reserved
H_in_blank[12:8]	Input video Horizontal blanking pixel region width. Dependencies: Value after Reset: 0000b <ul style="list-style-type: none"> <li>the higher bits of Horizontal blanking pixels; Number of Horizontal blanking pixels [0...8191].</li> </ul>

**34.5.49 Frame Composer Input Video VActive Pixels Register 0 (HDMI\_FC\_INVACTIVO)**

- Address Offset: 0x1005
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1005h offset = 12\_1005h

**HDMI\_FC\_INVACTIVO field descriptions**

Field	Description
V_in_activ[7:0]	Input video Vertical active pixel region width. Number of Vertical active lines [0...4095].

### 34.5.50 Frame Composer Input Video VActive Pixels Register 1 (HDMI\_FC\_INVACTIV1)

- Address Offset: 0x1006
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1006h offset = 12\_1006h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				V_in_activ[12:8]			
Write	Reserved				V_in_activ[12:8]			
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_INVACTIV1 field descriptions**

Field	Description
7-5 -	This field is reserved. Reserved
V_in_activ[12:8]	Input video Vertical active pixel region width. Dependencies: Value after Reset: 0000b <ul style="list-style-type: none"> <li>• the higher 5 bits of Vertical active line; Number of Vertical active lines [0...8191].</li> </ul>

### 34.5.51 Frame Composer Input Video VBlank Pixels Register (HDMI\_FC\_INVBLANK)

- Address Offset: 0x1007
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1007h offset = 12\_1007h

Bit	7	6	5	4	3	2	1	0
Read	V_in_blank[7:0]							
Write	V_in_blank[7:0]							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_INVBLANK field descriptions**

Field	Description
V_in_blank[7:0]	Input video Vertical blanking pixel region width. Number of Vertical blanking lines [0...255]. Value after Reset: 0x00

**34.5.52 Frame Composer Input Video HSync Front Porch Register 0 (HDMI\_FC\_HSYNCINDELAY0)**

- Address Offset: 0x1008
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1008h offset = 12\_1008h

**HDMI\_FC\_HSYNCINDELAY0 field descriptions**

Field	Description
H_in_delay[7:0]	Input video Hsync active edge delay. Integer number of pixel clock cycles from "de" non active edge of the last "de" valid period [0...4095].

**34.5.53 Frame Composer Input Video HSync Front Porch Register 1 (HDMI\_FC\_HSYNCINDELAY1)**

- Address Offset: 0x1009
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1009h offset = 12\_1009h

## HDMI\_FC\_HSYNCINDELAY1 field descriptions

Field	Description
7-5 -	This field is reserved. Reserved
H_in_delay[12:8]	Input video Hsync active edge delay. Dependencies: Value after Reset: 0000b <ul style="list-style-type: none"> <li>the higher 5 bits of delay; Integer number of pixel clock cycles from "de" non active edge of the last "de" valid period [0...8191].</li> </ul>

### 34.5.54 Frame Composer Input Video HSync Width Register 0 (HDMI\_FC\_HSYNCINWIDTH0)

- Address Offset: 0x100A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 100Ah offset = 12\_100Ah

Bit	7	6	5	4	3	2	1	0
Read	H_in_width[7:0]							
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_FC\_HSYNCINWIDTH0 field descriptions

Field	Description
H_in_width[7:0]	Input video Hsync active pulse width. Integer number of pixel clock cycles [0...511].

### 34.5.55 Frame Composer Input Video HSync Width Register 1 (HDMI\_FC\_HSYNCINWIDTH1)

- Address Offset: 0x100B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 100Bh offset = 12\_100Bh

HDMI\_FC\_HSYNCINWIDTH1 field descriptions

Field	Description
7-2 -	This field is reserved. Reserved
H_in_width[9:8]	Input video Hsync active pulse width. Dependencies: Value after Reset after Reset: 0b <ul style="list-style-type: none"> <li>• Integer number of pixel clock cycles [0...1024].</li> </ul>

### 34.5.56 Frame Composer Input Video VSync Front Porch Register (HDMI\_FC\_VSYNCINDELAY)

- Address Offset: 0x100C
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 100Ch offset = 12\_100Ch

**HDMI\_FC\_VSYNCINDELAY field descriptions**

Field	Description
V_in_delay[7..0]	Input video Vsync active edge delay. Integer number of Hsync pulses from "de" non active edge of the last "de" valid period. [0...255].

**34.5.57 Frame Composer Input Video VSync Width Register (HDMI\_FC\_VSYNCINWIDTH)**

- Address Offset: 0x100D
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 100Dh offset = 12\_100Dh

Bit	7	6	5	4	3	2	1	0
Read	Reserved				V_in_width[5..0]			
Write	Reserved				V_in_width[5..0]			
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSYNCINWIDTH field descriptions**

Field	Description
7-6 -	This field is reserved. Reserved
V_in_width[5..0]	Value after Reset: 000000b Input video Vsync active pulse width: Integer number of pixel clock cycles [0...63].

**34.5.58 Frame Composer Input Video Refresh Rate Register 0 (HDMI\_FC\_INFREQ0)**

- Address Offset: 0x100E
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 100Eh offset = 12\_100Eh

Bit	7	6	5	4	3	2	1	0
Read	infreq[7:0]							
Write	infreq[7:0]							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_INFREQ0 field descriptions**

Field	Description
infreq[7:0]	Video refresh rate in Hz*1E3 format. This registers are provided for debug and informative purposes. No data is written to this registers by the H13CTRL and the data here written by software is not used in any way by the H13CTRL.

**34.5.59 Frame Composer Input Video Refresh Rate Register 1 (HDMI\_FC\_INFREQ1)**

- Address Offset: 0x100F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 100Fh offset = 12\_100Fh

**HDMI\_FC\_INFREQ1 field descriptions**

Field	Description
infreq[7:0]	Video refresh rate in Hz*1E3 format. This registers are provided for debug and informative purposes. No data is written to this registers by the H13CTRL and the data here written by software is not used in any way by the H13CTRL.

**34.5.60 Frame Composer Input Video Refresh Rate Register 2 (HDMI\_FC\_INFREQ2)**

- Address Offset: 0x1010
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1010h offset = 12\_1010h

## HDMI\_FC\_INFREQ2 field descriptions

Field	Description
7-4 -	This field is reserved. Reserved
infreq[19:16]	Video refresh rate in Hz*1E3 format. This registers are provided for debug and informative purposes. No data is written to this registers by the H13TCTRL and the data here written by software is not used in any way by the H13TCTRL. Value after Reset: 0000b

### 34.5.61 Frame Composer Control Period Duration Register (HDMI\_FC\_CTRLDUR)

- Address Offset: 0x1011
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1011h offset = 12\_1011h

Bit	7	6	5	4	3	2	1	0
Read	ctrlperiodduration							
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_FC\_CTRLDUR field descriptions

Field	Description
ctrlperiodduration	Configuration of the control period minimum duration (min. of 12 pixel clock cycles, refer to HDMI 1.4a specification). Integer number of pixel clocks cycles [0..255].

### 34.5.62 Frame Composer Extended Control Period Duration Register (HDMI\_FC\_EXCTRLDUR)

- Address Offset: 0x1012
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1012h offset = 12\_1012h

**HDMI\_FC\_EXCTRLDUR field descriptions**

Field	Description
exctrlperiodduration	Configuration of the extended control period minimum duration (min. of 32 pixel clock cycles, see HDMI 1.4a specification). Integer number of pixel clocks cycles [0..255].

### 34.5.63 Frame Composer Extended Control Period Maximum Spacing Register (HDMI\_FC\_EXCTRLSPAC)

- Address Offset: 0x1013
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1013h offset = 12\_1013h

**HDMI\_FC\_EXCTRLSPAC field descriptions**

Field	Description
exctrlperiodspacing	Configuration of the maximum spacing between consecutive extended control periods (max of 50msec, see HDMI 1.4a specification): generated spacing = (1/freq tmds clock)*256*256*extctrlperiodspacing

### 34.5.64 Frame Composer Channel 0 Non-Preamble Data Register (HDMI\_FC\_CH0PREAM)

- Address Offset: 0x1014
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1014h offset = 12\_1014h

Bit	7	6	5	4	3	2	1	0
Read	ch0_preamble_filter							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_CH0PREAM field descriptions

Field	Description
ch0_preamble_filter	When in control mode, configures 8-bits that are going to fill the channel 0 data lines not used to transmit the preamble (for more clarifications refer to HDMI 1.4a specification).

### 34.5.65 Frame Composer Channel 1 Non-Preamble Data Register (HDMI\_FC\_CH1PREAM)

- Address Offset: 0x1015
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1015h offset = 12\_1015h

Bit	7	6	5	4	3	2	1	0
Read	Reserved		ch1_preamble_filter					
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_CH1PREAM field descriptions

Field	Description
7-6 -	This field is reserved. Reserved
ch1_preamble_filter	When in control mode, configures 6-bits that are going to fill the channel 1 data lines not used to transmit the preamble (for more clarifications refer to HDMI 1.4a specification).

### 34.5.66 Frame Composer Channel 2 Non-Preamble Data Register (HDMI\_FC\_CH2PREAM)

- Address Offset: 0x1016
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1016h offset = 12\_1016h

**HDMI\_FC\_CH2PREAM field descriptions**

Field	Description
7-6 -	This field is reserved. Reserved
ch2_preamble_filter	When in control mode, configures 6-bits that are going to fill the channel 2 data lines not used to transmit the preamble (for more clarifications, see HDMI 1.4a specification).

### 34.5.67 Frame Composer AVI Configuration Register 3 (HDMI\_FC\_AVICONF3)

- Address Offset: 0x1017
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

configuration of Quantization range and IT content type.

Address: 12\_0000h base + 1017h offset = 12\_1017h

**HDMI\_FC\_AVICONF3 field descriptions**

Field	Description
7-4 -	This field is reserved. Reserved

*Table continues on the next page...*

**HDMI\_FC\_AVICONF3 field descriptions (continued)**

Field	Description
3–2 YQ1_YQ0_YCC	Quantization range according to CEA specification.
CN1_CN0	IT content type according to CEA specification

**34.5.68 Frame Composer GCP Packet Configuration Register (HDMI\_FC\_GCP)**

Configures the General Control Packet A/V mute indicators and the default phase.

- Address Offset: 0x1018
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1018h offset = 12\_1018h

Bit	7	6	5	4	3	2	1	0
Read	Reserved					default_phase	set_avmute	clear_avmute
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_GCP field descriptions**

Field	Description
7–3 -	This field is reserved. Reserved
2 default_phase	Value of "default_phase" in the GCP packet. This data should be equal to the default phase used at Video packetizer packing machine. Value after Reset: 0b
1 set_avmute	Value of "set_avmute" in the GCP packet. Value after Reset: 0b
0 clear_avmute	Value of "clear_avmute" in the GCP packet. Value after Reset: 0b

**34.5.69 Frame Composer AVI Packet Configuration Register 0 (HDMI\_FC\_AVICONF0)**

Configures the following contents of the AVI infoFrame:

- RGB/YCC indication
- Bar information

## HDMI Memory Map/Register Definition

- Scan information
- Active format present
- Progressive/Interlaced indicator
- Active aspect ratio
- Picture aspect ratio
- Colorimetry
- IT content
- Extended colorimetry
- Quantization range
- Non-uniform picture scaling

For more information, refer to HDMI 1.4a and CEA - 861D specifications.

- Address Offset: 0x1019
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1019h offset = 12\_1019h

Bit	7	6	5	4	3	2	1	0
Read								
Write	FC_ AVICONF0_ MISC	FC_ AVICONF0_ ACTIVE_ FORMAT	FC_AVICONF0_SCAN		FC_AVICONF0_BAR		FC_AVICONF0_RGB_ YCC	
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_AVICONF0 field descriptions

Field	Description
7 FC_AVICONF0_ MISC	Frame composer AVI packet configuration bit
6 FC_AVICONF0_ ACTIVE_ FORMAT	Active format present
5-4 FC_AVICONF0_ SCAN	Scan information
3-2 FC_AVICONF0_ BAR	Bar information
FC_AVICONF0_ RGB_YCC	RGB/YCC indication Value after Reset: 0b

### 34.5.70 Frame Composer AVI Packet Configuration Register 1 (HDMI\_FC\_AVICONF1)

- Address Offset: 0x101A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 101Ah offset = 12\_101Ah

Bit	7	6	5	4	3	2	1	0
Read	FC_AVICONF0_COLOR		FC_AVICONF1_PICTURE_AR		FC_AVICONF1_ACTIVE_AR			
Write	FC_AVICONF0_COLOR		FC_AVICONF1_PICTURE_AR		FC_AVICONF1_ACTIVE_AR			
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_AVICONF1 field descriptions

Field	Description
7–6 FC_AVICONF0_COLOR	Colorimetry
5–4 FC_AVICONF1_PICTURE_AR	Picture aspect ratio
FC_AVICONF1_ACTIVE_AR	Active aspect ratio Value after Reset: 0b

### 34.5.71 FC\_AVICONF Frame Composer AVI Packet Configuration Register 2 (HDMI\_FC\_AVICONF2)

- Address Offset: 0x101B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 101Bh offset = 12\_101Bh

Bit	7	6	5	4	3	2	1	0
Read	FC_AVICONF2_IT	FC_AVICONF2_EXT_COLOR			-		FC_AVICONF2_SCALE	
Write	FC_AVICONF2_IT	FC_AVICONF2_EXT_COLOR			-		FC_AVICONF2_SCALE	
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_AVICONF2 field descriptions**

Field	Description
7 FC_AVICONF2_ IT	IT content
6-4 FC_AVICONF2_ EXT_COLOR	Extended colorimetry
3-2 -	Quantization range
FC_AVICONF2_ SCALE	Non-uniform picture scaling Value after Reset: 0b

**34.5.72 Frame Composer AVI Packet VIC Register (HDMI\_FC\_AVIVID)**

Configures the AVI infoFrame Video Identification code. For more information, refer to the CEA-861-E specification.

- Address Offset: 0x101C
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 101Ch offset = 12\_101Ch

**HDMI\_FC\_AVIVID field descriptions**

Field	Description
FC_AVIVID	the AVI infoFrame Video Identification code.

**34.5.73 Frame Composer AVI Packet End of Top Bar Register 0 (HDMI\_FC\_AVIETB0)**

These registers define the AVI infoFrame End of Top Bar value. For more information, refer to CEA-861-E specification.

- Address Offset: 0x101D
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 101Dh offset = 12\_101Dh

Bit	7	6	5	4	3	2	1	0
Read	-							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_AVIETB0 field descriptions**

Field	Description
-	Line number of end of top bar (lower 8 bits)

### 34.5.74 Frame Composer AVI Packet End of Top Bar Register 1 (HDMI\_FC\_AVIETB1)

- Address Offset: 0x101E
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 101Eh offset = 12\_101Eh

Bit	7	6	5	4	3	2	1	0
Read	-							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_AVIETB1 field descriptions**

Field	Description
-	Line number of end of top bar (upper 8 bits)

### 34.5.75 Frame Composer AVI Packet Start of Bottom Bar Register 0 (HDMI\_FC\_AVISBB0)

These registers define the AVI infoFrame Start of Bottom Bar value. For more information, refer to CEA-861D specification.

- Address Offset: 0x101F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 101Fh offset = 12\_101Fh

### HDMI\_FC\_AVISBB0 field descriptions

Field	Description
FC_AVISBB0	Line number of Start of Bottom Bar (lower 8 bits)

## 34.5.76 Frame Composer AVI Packet Start of Bottom Bar Register 1 (HDMI\_FC\_AVISBB1)

- Address Offset: 0x1020
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1020h offset = 12\_1020h

### HDMI\_FC\_AVISBB1 field descriptions

Field	Description
FC_AVISBB1	Line number of Start of Bottom Bar (upper 8 bits)

## 34.5.77 Frame Composer AVI Packet End of Left Bar Register 0 (HDMI\_FC\_AVIELB0)

These registers define the AVI infoFrame End of Left Bar value. For more information, refer to CEA-861D specification.

- Address Offset: 0x1021
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1021h offset = 12\_1021h

**HDMI\_FC\_AVIELB0 field descriptions**

Field	Description
FC_AVIELB0	Pixel number of end of left Bar (lower 8 bits)

### 34.5.78 Frame Composer AVI Packet End of Left Bar Register 1 (HDMI\_FC\_AVIELB1)

- Address Offset: 0x1022
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1022h offset = 12\_1022h

**HDMI\_FC\_AVIELB1 field descriptions**

Field	Description
FC_AVIELB1	Pixel number of end of left Bar (lower 8 bits)

### 34.5.79 Frame Composer AVI Packet Start of Right Bar Register 0 (HDMI\_FC\_AVISRB0)

These registers define the AVI infoFrame Start of Right Bar value. For more information, refer to CEA-861D specification.

- Address Offset: 0x1023
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 1023h offset = 12\_1023h

### HDMI\_FC\_AVISRB0 field descriptions

Field	Description
FC_AVISRB0	Pixel number of start of right Bar (lower 8 bits)

## 34.5.80 Frame Composer AVI Packet Start of Right Bar Register 1 (HDMI\_FC\_AVISRB1)

- Address Offset: 0x1024
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1024h offset = 12\_1024h

### HDMI\_FC\_AVISRB1 field descriptions

Field	Description
FC_AVISRB1	Pixel number of start of right Bar (upper 8 bits)

## 34.5.81 Frame Composer AUD Packet Configuration Register 0 (HDMI\_FC\_AUDICONF0)

These registers configure the following contents of the AUDIO infoFrame:

- Coding type
- Channel count
- Sampling frequency
- Sampling size
- Channel allocation
- Audio level shift value
- Down mix enable

For more information, refer to CEA-861D specification.

- Address Offset: 0x1025 to 0x1028
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For the FC\_AUDICONF0 register, bits [6:5] correspond to LFEPBL1, LFEPBL0 LFE playback level as compared to the other channels (from HDMI 1.4a specification).

Address: 12\_0000h base + 1025h offset = 12\_1025h

Bit	7	6	5	4	3	2	1	0
Read	Reserved		CC[2:0]			CT[3:0]		
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_AUDICONF0 field descriptions

Field	Description
7 -	This field is reserved. Reserved
6-4 CC[2:0]	Channel count
CT[3:0]	Coding Type

### 34.5.82 Frame Composer AUD Packet Configuration Register 1 (HDMI\_FC\_AUDICONF1)

Address: 12\_0000h base + 1026h offset = 12\_1026h

Bit	7	6	5	4	3	2	1	0
Read	Reserved		SS[1:0]		Reserved		SF[2:0]	
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_AUDICONF1 field descriptions

Field	Description
7-6 -	This field is reserved. Reserved
5-4 SS[1:0]	Sampling size
3 -	This field is reserved. Reserved
SF[2:0]	Sampling frequency

### 34.5.83 Frame Composer AUD Packet Configuration Register 2 (HDMI\_FC\_AUDICONF2)

Address: 12\_0000h base + 1027h offset = 12\_1027h

HDMI\_FC\_AUDICONF2 field descriptions

Field	Description
CA[7:0]	Channel allocation

### 34.5.84 Frame Composer AUD Packet Configuration Register 3 (HDMI\_FC\_AUDICONF3)

Address: 12\_0000h base + 1028h offset = 12\_1028h

HDMI\_FC\_AUDICONF3 field descriptions

Field	Description
7 -	This field is reserved. Reserved
6-5 LFEPBL[1:0]	LFE playback information
4 DM_INH	Down mix enable
LSV[3:0]	Level shift value (for down mixing)

### 34.5.85 Frame Composer VSI Packet Data IEEE Register 0 (HDMI\_FC\_VSDIEEID0)

These registers configure the Vendor Specific infoFrame IEEE registration identifier. For more information, refer to CEA-861D specification.

- Address Offset: 0x1029
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1029h offset = 12\_1029h

**HDMI\_FC\_VSDIEEID0 field descriptions**

Field	Description
-	the Vendor Specific infoFrame IEEE registration identifier byte 0

### 34.5.86 Frame Composer VSI Packet Data Size Register (HDMI\_FC\_VSDSIZE)

- Address Offset: 0x102A
- Size: 8 bits
- Value after Reset: 0x1B
- Access: Read/Write

configuration of Packet size.

Address: 12\_0000h base + 102Ah offset = 12\_102Ah

**HDMI\_FC\_VSDSIZE field descriptions**

Field	Description
7-5 -	This field is reserved. Reserved
VSDSIZE	Packet size as described in HDMI Vendor Specific InfoFrame (from HDMI specification).

### 34.5.87 Frame Composer VSI Packet Data IEEE Register 1 (HDMI\_FC\_VSDIEEEEID1)

- Address Offset: 0x102a
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1030h offset = 12\_1030h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI\_FC\_VSDIEEEEID1 field descriptions

Field	Description
-	the Vendor Specific infoFrame IEEE registration identifier byte 1

### 34.5.88 Frame Composer VSI Packet Data IEEE Register 2 (HDMI\_FC\_VSDIEEEEID2)

- Address Offset: 0x102b
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1031h offset = 12\_1031h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI\_FC\_VSDIEEEEID2 field descriptions

Field	Description
-	the Vendor Specific infoFrame IEEE registration identifier byte 2

### 34.5.89 Frame Composer VSI Packet Data IEEE Register 0 (HDMI\_FC\_VSDPAYLOAD0)

These registers configure the Vendor Specific infoFrame 24 bytes specific payload. For more information, refer to CEA-861D specification.

- Address Offset: 0x1032
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1032h offset = 12\_1032h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD0 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte0

### 34.5.90 Frame Composer VSI Packet Data IEEE Register 1 (HDMI\_FC\_VSDPAYLOAD1)

- Address Offset: 0x1033
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1033h offset = 12\_1033h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD1 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte1

### 34.5.91 Frame Composer VSI Packet Data IEEE Register 2 (HDMI\_FC\_VSDPAYLOAD2)

- Address Offset: 0x1034
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1034h offset = 12\_1034h

HDMI\_FC\_VSDPAYLOAD2 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte2

### 34.5.92 Frame Composer VSI Packet Data IEEE Register 3 (HDMI\_FC\_VSDPAYLOAD3)

- Address Offset: 0x1035
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1035h offset = 12\_1035h

HDMI\_FC\_VSDPAYLOAD3 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte3

### 34.5.93 Frame Composer VSI Packet Data IEEE Register 4 (HDMI\_FC\_VSDPAYLOAD4)

- Address Offset: 0x1036
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1036h offset = 12\_1036h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD4 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte4

### 34.5.94 Frame Composer VSI Packet Data IEEE Register 5 (HDMI\_FC\_VSDPAYLOAD5)

- Address Offset: 0x1037
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1037h offset = 12\_1037h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD5 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte5

### 34.5.95 Frame Composer VSI Packet Data IEEE Register 6 (HDMI\_FC\_VSDPAYLOAD6)

- Address Offset: 0x1038
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1038h offset = 12\_1038h

HDMI\_FC\_VSDPAYLOAD6 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte6

### 34.5.96 Frame Composer VSI Packet Data IEEE Register 7 (HDMI\_FC\_VSDPAYLOAD7)

- Address Offset: 0x1039
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1039h offset = 12\_1039h

HDMI\_FC\_VSDPAYLOAD7 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte7

### 34.5.97 Frame Composer VSI Packet Data IEEE Register 8 (HDMI\_FC\_VSDPAYLOAD8)

- Address Offset: 0x103a
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 103Ah offset = 12\_103Ah

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD8 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte8

### 34.5.98 Frame Composer VSI Packet Data IEEE Register 9 (HDMI\_FC\_VSDPAYLOAD9)

- Address Offset: 0x103b
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 103Bh offset = 12\_103Bh

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD9 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte9

### 34.5.99 Frame Composer VSI Packet Data IEEE Register 10 (HDMI\_FC\_VSDPAYLOAD10)

- Address Offset: 0x103c
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 103Ch offset = 12\_103Ch

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI\_FC\_VSDPAYLOAD10 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte10

### 34.5.100 Frame Composer VSI Packet Data IEEE Register 11 (HDMI\_FC\_VSDPAYLOAD11)

- Address Offset: 0x103d
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 103Dh offset = 12\_103Dh

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI\_FC\_VSDPAYLOAD11 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte11

### 34.5.101 Frame Composer VSI Packet Data IEEE Register 12 (HDMI\_FC\_VSDPAYLOAD12)

- Address Offset: 0x103e
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 103Eh offset = 12\_103Eh

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI\_FC\_VSDPAYLOAD12 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte12

### 34.5.102 Frame Composer VSI Packet Data IEEE Register 13 (HDMI\_FC\_VSDPAYLOAD13)

- Address Offset: 0x103f
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 103Fh offset = 12\_103Fh

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

HDMI\_FC\_VSDPAYLOAD13 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte13

### 34.5.103 Frame Composer VSI Packet Data IEEE Register 14 (HDMI\_FC\_VSDPAYLOAD14)

- Address Offset: 0x1040
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1040h offset = 12\_1040h

HDMI\_FC\_VSDPAYLOAD14 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte14

### 34.5.104 Frame Composer VSI Packet Data IEEE Register 15 (HDMI\_FC\_VSDPAYLOAD15)

- Address Offset: 0x1041
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1041h offset = 12\_1041h

HDMI\_FC\_VSDPAYLOAD15 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte15

### 34.5.105 Frame Composer VSI Packet Data IEEE Register 16 (HDMI\_FC\_VSDPAYLOAD16)

- Address Offset: 0x1042
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1042h offset = 12\_1042h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD16 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte16

### 34.5.106 Frame Composer VSI Packet Data IEEE Register 17 (HDMI\_FC\_VSDPAYLOAD17)

- Address Offset: 0x1043
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1043h offset = 12\_1043h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD17 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte17

### 34.5.107 Frame Composer VSI Packet Data IEEE Register 18 (HDMI\_FC\_VSDPAYLOAD18)

- Address Offset: 0x1044
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1044h offset = 12\_1044h

HDMI\_FC\_VSDPAYLOAD18 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte18

### 34.5.108 Frame Composer VSI Packet Data IEEE Register 19 (HDMI\_FC\_VSDPAYLOAD19)

- Address Offset: 0x1045
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1045h offset = 12\_1045h

HDMI\_FC\_VSDPAYLOAD19 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte19

### 34.5.109 Frame Composer VSI Packet Data IEEE Register 20 (HDMI\_FC\_VSDPAYLOAD20)

- Address Offset: 0x1046
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1046h offset = 12\_1046h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD20 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte20

### 34.5.110 Frame Composer VSI Packet Data IEEE Register 21 (HDMI\_FC\_VSDPAYLOAD21)

- Address Offset: 0x1047
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1047h offset = 12\_1047h

Bit	7	6	5	4	3	2	1	0
Read	-							
Write	-							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_VSDPAYLOAD21 field descriptions**

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte21

### 34.5.111 Frame Composer VSI Packet Data IEEE Register 22 (HDMI\_FC\_VSDPAYLOAD22)

- Address Offset: 0x1048
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1048h offset = 12\_1048h

HDMI\_FC\_VSDPAYLOAD22 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte22

### 34.5.112 Frame Composer VSI Packet Data IEEE Register 23 (HDMI\_FC\_VSDPAYLOAD23)

- Address Offset: 0x1049
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1049h offset = 12\_1049h

HDMI\_FC\_VSDPAYLOAD23 field descriptions

Field	Description
-	the Vendor Specific infoFrame 24 bytes specific payload byte23

### 34.5.113 Frame Composer SPD Packet Data Vendor Name Register 0 (HDMI\_FC\_SPDVENDORNAME0)

These registers configure the Source Product Descriptor infoFrame 8 bytes Vendor name. For more information, refer to CEA-861D specification.

- Address Offset: 0x104A to 0x1051
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 104Ah offset = 12\_104Ah

Bit	7	6	5	4	3	2	1	0
Read	vendor_name							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_SPDVENDORNAME0 field descriptions

Field	Description
vendor_name	Vendor name

### 34.5.114 Frame Composer SPD Packet Data Product Name Register 0 (HDMI\_FC\_SPDPRODUCTNAME0)

These registers configure the Source Product Descriptor infoFrame 16 bytes Product name. For more information, refer to CEA-861D specification.

- Address Offset: 0x1052 to 0x1061
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1052h offset = 12\_1052h

Bit	7	6	5	4	3	2	1	0
Read	product_name							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_SPDPRODUCTNAME0 field descriptions

Field	Description
product_name	Product name

### 34.5.115 Frame Composer SPD Packet Data Source Product Descriptor Register (HDMI\_FC\_SPDDEVICEINF)

This register configures Source Product Descriptor infoFrame description device field. For more information, refer to CEA-861D specification.

- Address Offset: 0x1062
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1062h offset = 12\_1062h

**HDMI\_FC\_SPDDEVICEINF field descriptions**

Field	Description
product_descriptor	Product descriptor

### 34.5.116 Frame Composer Audio Sample Flat and Layout Configuration Register (HDMI\_FC\_AUDSCONF)

Configures the Audio sample packet sample flat and layout configuration. For more information, refer to HDMI 1.4a specification.

- Address Offset: 0x1063
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1063h offset = 12\_1063h

## HDMI\_FC\_AUDSCONF field descriptions

Field	Description
7–4 aud_packet_ sampfif[3:0]	Set the audio packet sample flat value to be sent on the packet.
3–1 -	This field is reserved. Reserved
0 aud_packet_ layout	Set the audio packet layout to be sent in the packet: 1 layout 1 0 layout 0

### 34.5.117 Frame Composer Audio Packet Sample Present Status Register (HDMI\_FC\_AUDSSTAT)

Shows the data sample present indication of the last Audio sample packet sent by the HDMI TX Controller. For more information, refer to HDMI 1.4a specification.

- Address Offset: 0x1064
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 1064h offset = 12\_1064h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				packet_samprs[3:0]			
Write	Reserved				Reserved			
Reset	0	0	0	0	0	0	0	0

## HDMI\_FC\_AUDSSTAT field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
packet_ samprs[3:0]	Shows the data sample present indication of the last Audio sample packet sent by the HDMI TX Controller. This register information is at tmds clock rate.

### 34.5.118 Frame Composer Number of High Priority Packets Attended Configuration Register (HDMI\_FC\_CTRLQHIGHIGH)

- Address Offset: 0x1073
- Size: 8 bits
- Value after Reset: 0x0F
- Access: Read/Write

Address: 12\_0000h base + 1073h offset = 12\_1073h

#### HDMI\_FC\_CTRLQHIGHIGH field descriptions

Field	Description
7-5 -	This field is reserved. Reserved
onhighattended[4:0]	Configures the number of high priority packets or audio sample packets consecutively attended before checking low priority queue status. Integer number [0..31]

### 34.5.119 Frame Composer Number of Low Priority Packets Attended Configuration Register (HDMI\_FC\_CTRLQLLOW)

- Address Offset: 0x1074
- Size: 8 bits
- Value after Reset: 0x03
- Access: Read/Write

Address: 12\_0000h base + 1074h offset = 12\_1074h

**HDMI\_FC\_CTRLQLOW field descriptions**

Field	Description
7-5 -	This field is reserved. Reserved
onlowattended[4:0]	Configures the number of low priority packets or null packets consecutively attended before checking high priority queue status or audio sample availability. Integer number [0..31]

**34.5.120 Frame Composer ACP Packet Type Configuration Register 0 (HDMI\_FC\_ACP0)**

Configures the following contents of the ACP packet. For more information, refer to the HDMI 1.4 specification.

- Address Offset: 0x1075
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1075h offset = 12\_1075h

Bit	7	6	5	4	3	2	1	0
Read	acptype[7:0]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_ACP0 field descriptions**

Field	Description
acptype[7:0]	Configures the ACP packet type.

**34.5.121 Frame Composer ACP Packet Type Configuration Register 1 (HDMI\_FC\_ACP1)**

Configures the following contents of the Audio Content Packet (ACP) body:

- Address Offset: 0x1091 to 0x1082
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 1091h offset = 12\_1091h

Bit	7	6	5	4	3	2	1	0
Read	Audio_contentpacket							
Write								
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_ACP1 field descriptions

Field	Description
Audio_contentpacket	Audio content packet

## 34.5.122 FC\_ISCR1\_Frame Composer Packet Status, Valid, and Continue Configuration Register (HDMI\_FC\_ISCR1\_0)

Configures the following contents of the ISRC1 packet:

- Address Offset: 0x1092
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, see the HDMI 1.4 specification.

Address: 12\_0000h base + 1092h offset = 12\_1092h

Bit	7	6	5	4	3	2	1	0
Read	Reserved			isrc_status[2:0]			isrc_valid	isrc_cont
Write								
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_ISCR1\_0 field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
4–2 isrc_status[2:0]	Status of ISRC1.
1 isrc_valid	Valid of ISRC1.
0 isrc_cont	Indication of ISRC2.

## 34.5.123 Frame Composer ISCR1 Packet Body Register 1 (HDMI\_FC\_ISCR1\_1)

Configures the following contents of the ISRC1 packet:

- ISRC1 packet body
- Address Offset: 0x10A2 to 0x1093
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, see the HDMI 1.4 specification.

Address: 12\_0000h base + 1093h offset = 12\_1093h

**HDMI\_FC\_ISCR1\_1 field descriptions**

Field	Description
isrc1	Configures the contents of the ISRC1 packet:

### 34.5.124 Frame Composer ISCR2 Packet Body Register 0 (HDMI\_FC\_ISCR2\_0)

Configures the following contents of the ISRC2 packet:

- ISRC2 packet body
- Address Offset: 0x10B2 to 0x10A3
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, see the HDMI 1.4 specification.

Address: 12\_0000h base + 10A3h offset = 12\_10A3h

**HDMI\_FC\_ISCR2\_0 field descriptions**

Field	Description
isrc2	Configures the contents of the ISRC1 packet:

### 34.5.125 Frame Composer Data Island Auto Packet Scheduling Register 0 (HDMI\_FC\_DATAAUTO0)

Configures the Frame Composer RDRB(1)/Manual(0) data island packet insertion for SPD, VSD, ISRC2, ISRC1 and ACP packets. On RDRB mode the described packet scheduling is controlled by registers FC\_DATAAUTO1 and FC\_DATAAUTO2, while in Manual mode register FC\_DATMAN requests to FC the insertion of the requested packet.

- Address Offset: 0x10B3
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10B3h offset = 12\_10B3h

Bit	7	6	5	4	3	2	1	0
Read	Reserved			spd_auto	vsd_auto	isrc2_auto	isrc1_auto	acp_auto
Write	Reserved			spd_auto	vsd_auto	isrc2_auto	isrc1_auto	acp_auto
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DATAAUTO0 field descriptions

Field	Description
7-5 -	This field is reserved. Reserved
4 spd_auto	Enables SPD automatic packet scheduling
3 vsd_auto	Enables VSD automatic packet scheduling
2 isrc2_auto	Enables ISRC2 automatic packet scheduling
1 isrc1_auto	Enables ISRC1 automatic packet scheduling
0 acp_auto	Enables ACP automatic packet scheduling

### 34.5.126 Frame Composer Data Island Auto Packet Scheduling Register 1 (HDMI\_FC\_DATAAUTO1)

Configures the Frame Composer (FC) RDRB frame interpolation for SPD, VSD, ISRC2, ISRC1 and ACP packet insertion on data island when FC is on RDRB mode for the listed packets.

- Address Offset: 0x10B4

- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10B4h offset = 12\_10B4h

**HDMI\_FC\_DATAUTO1 field descriptions**

Field	Description
7-4 -	This field is reserved. Reserved
AUTO_FRAME_INTERPOLATION	Packet frame interpolation, for automatic packet scheduling

**34.5.127 Frame Composer Data Island Auto Packet Scheduling Register 2 (HDMI\_FC\_DATAUTO2)**

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for SPD, VSD, ISRC2, ISRC1 and ACP packet insertion on data island when FC is on RDRB mode for the listed packets.

- Address Offset: 0x10B5
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10B5h offset = 12\_10B5h

**HDMI\_FC\_DATAUTO2 field descriptions**

Field	Description
7-4 AUTO_FRAME_PACKETS	Packets per frame, for automatic packet scheduling
AUTO_LINE_SPACING	Packets line spacing, for automatic packet scheduling

### 34.5.128 Frame Composer Data Island Manual Packet Request Register (HDMI\_FC\_DATMAN)

Requests to the Frame Composer the data island packet insertion for NULL, SPD, VSD, ISRC2, ISRC1 and ACP packets when FC\_DATAUTO0 bit is in manual mode for the packet requested.

- Address Offset: 0x10B6
- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12\_0000h base + 10B6h offset = 12\_10B6h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							
Write	Reserved		null_tx	spd_tx	vsd_tx	isrc2_tx	isr1_tx	acp_tx
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_DATMAN field descriptions**

Field	Description
7-6 -	This field is reserved. Reserved
5 null_tx	Null packet
4 spd_tx	SPD packet
3 vsd_tx	VSD packet
2 isrc2_tx	ISRC2 packet
1 isr1_tx	ISRC1 packet
0 acp_tx	ACP packet

### 34.5.129 Frame Composer Data Island Auto Packet Scheduling Register 3 (HDMI\_FC\_DATAUTO3)

Configures the Frame Composer Automatic(1)/RDRB(0) data island packet insertion for AVI, GCP, AUDI and ACR packets. In Automatic mode, the packet will be inserted on Vblanking when first line with active Vsync appears.

- Address Offset: 0x10B7
- Size: 8 bits
- Value after Reset: 0x0F
- Access: Read/Write

Address: 12\_0000h base + 10B7h offset = 12\_10B7h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				avi_auto	gcp_auto	audi_auto	acr_auto
Write								
Reset	0	0	0	0	1	1	1	1

### HDMI\_FC\_DATAUTO3 field descriptions

Field	Description
7-4 -	This field is reserved. Reserved
3 avi_auto	Enable AVI packet insertion
2 gcp_auto	Enable GCP packet insertion
1 audi_auto	Enable AUDI packet insertion
0 acr_auto	Enable ACR packet insertion

### 34.5.130 Frame Composer Round Robin ACR Packet Insertion Register 0 (HDMI\_FC\_RDRB0)

Configures the Frame Composer (FC) RDRB frame interpolation for ACR packet insertion on data island when FC is on RDRB mode for this packet.

- Address Offset: 0x10B8
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10B8h offset = 12\_10B8h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				ACRframeinterpolation			
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_FC\_RDRB0 field descriptions

Field	Description
7-4 -	This field is reserved. Reserved
ACRframeinterpolation	ACR frame interpolation

### 34.5.131 Frame Composer Round Robin ACR Packet Insertion Register 1 (HDMI\_FC\_RDRB1)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the ACR packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10B9
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10B9h offset = 12\_10B9h

Bit	7	6	5	4	3	2	1	0
Read	ACRpacketsinframe				ACRpacketlinespacing			
Write

## HDMI\_FC\_RDRB1 field descriptions

Field	Description
7-4 ACRpacketsinframe	ACR packets in frame
ACRpacketlinespacing	ACR packet line spacing

### 34.5.132 Frame Composer Round Robin ACR Packet Insertion Register 2 (HDMI\_FC\_RDRB2)

Configures the Frame Composer (FC) RDRB frame interpolation for AUDI packet insertion on data island when FC is on RDRB mode for this packet.

- Address Offset: 0x10BA
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10BAh offset = 12\_10BAh

Bit	7	6	5	4	3	2	1	0
Read	Reserved				AUDIframeinterpolation			
Write	Reserved				AUDIframeinterpolation			
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_RDRB2 field descriptions**

Field	Description
7–4 -	This field is reserved. Reserved
AUDIframeinterpolation	Audio frame interpolation

**34.5.133 Frame Composer Round Robin ACR Packet Insertion Register 3 (HDMI\_FC\_RDRB3)**

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the AUDI packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10BB
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10BBh offset = 12\_10BBh

Bit	7	6	5	4	3	2	1	0
Read	AUDIpacketsinframe				AUDIpacketlinespacing			
Write	AUDIpacketsinframe				AUDIpacketlinespacing			
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_RDRB3 field descriptions**

Field	Description
7–4 AUDIpacketsinframe	Audio packets per frame
AUDIpacketlinespacing	Audio packets line spacing

**34.5.134 Frame Composer Round Robin ACR Packet Insertion Register 4 (HDMI\_FC\_RDRB4)**

Configures the Frame Composer (FC) RDRB frame interpolation for GCP packet insertion on data island when FC is on RDRB mode for this packet.

- Address Offset: 0x10BC

## HDMI Memory Map/Register Definition

- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10BCh offset = 12\_10BCh

Bit	7	6	5	4	3	2	1	0
Read	Reserved				GCPframeinterpolation			
Write	Reserved				GCPframeinterpolation			
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_RDRB4 field descriptions

Field	Description
7-4 -	This field is reserved. Reserved
GCPframeinterpolation	GCP packets line spacing

## 34.5.135 Frame Composer Round Robin ACR Packet Insertion Register 5 (HDMI\_FC\_RDRB5)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the GCP packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10BD
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10BDh offset = 12\_10BDh

Bit	7	6	5	4	3	2	1	0
Read	GCPpacketsinframe				GCPpacketlinespacing			
Write	GCPpacketsinframe				GCPpacketlinespacing			
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_RDRB5 field descriptions

Field	Description
7-4 GCPpacketsinframe	GCP packets per frame
GCPpacketlinespacing	GCP packets line spacing

### 34.5.136 Frame Composer Round Robin ACR Packet Insertion Register 6 (HDMI\_FC\_RDRB6)

Configures the Frame Composer (FC) RDRB frame interpolation for AVI packet insertion on data island when FC is on RDRB mode for this packet.

- Address Offset: 0x10BE
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10BEh offset = 12\_10BEh

Bit	7	6	5	4	3	2	1	0
Read	Reserved				AVIframeinterpolation			
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_RDRB6 field descriptions**

Field	Description
7-4 -	This field is reserved. Reserved
AVIframeinterpolation	GCP packets line spacing

### 34.5.137 Frame Composer Round Robin ACR Packet Insertion Register 7 (HDMI\_FC\_RDRB7)

Configures the Frame Composer (FC) RDRB line interpolation and number of packets in frame for the AVI packet insertion on data island when FC is on RDRB mode this packet.

- Address Offset: 0x10BF
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10BFh offset = 12\_10BFh

Bit	7	6	5	4	3	2	1	0
Read	AVIpacketsinframe				AVIpacketlinespacing			
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_RDRB7 field descriptions**

Field	Description
7-4 AVIpacketsinframe	AVI packets per frame
AVIpacketlinespacing	AVI packets line spacing

**34.5.138 Frame Composer Packet Interrupt Mask Register 0 (HDMI\_FC\_MASK0)**

Mask register for generation of FC\_INT0 interrupts.

- Address Offset: 0x10D2
- Size: 8 bits
- Value after Reset: 0x25
- Access: Read/Write

Address: 12\_0000h base + 10D2h offset = 12\_10D2h

Bit	7	6	5	4	3	2	1	0
Read	AUDI	ACP	HBR	Reserved		AUDS	ACR	NULL
Write								
Reset	0	0	1	0	0	1	0	1

**HDMI\_FC\_MASK0 field descriptions**

Field	Description
7 AUDI	Mask bit for FC_INT0.AUDI interrupt bit Value after Reset: 0b
6 ACP	Mask bit for FC_INT0.ACP interrupt bit Value after Reset: 0b
5 HBR	Mask bit for FC_INT0.HBR interrupt bit Value after Reset: 0b
4-3 -	This field is reserved. Reserved
2 AUDS	Mask bit for FC_INT0.AUDS interrupt bit Value after Reset: 0b
1 ACR	Mask bit for FC_INT0.ACR interrupt bit Value after Reset: 0b
0 NULL	Mask bit for FC_INT0.NULL interrupt bit Value after Reset: 0b

### 34.5.139 Frame Composer Packet Interrupt Mask Register 1 (HDMI\_FC\_MASK1)

Mask register for generation of FC\_INT1 interrupts.

- Address Offset: 0x10D6
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 10D6h offset = 12\_10D6h

Bit	7	6	5	4	3	2	1	0
Read	GMD	ISCR1	ISCR2	VSD	SPD	Reserved	AVI	GCP
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_MASK1 field descriptions

Field	Description
7 GMD	Mask bit for FC_INT1.GMD interrupt bit
6 ISCR1	Mask bit for FC_INT1.ISRC1 interrupt bit
5 ISCR2	Mask bit for FC_INT1.ISRC2 interrupt bit
4 VSD	Mask bit for FC_INT1.VSD interrupt bit
3 SPD	Mask bit for FC_INT1.SPD interrupt bit
2 -	This field is reserved. Reserved
1 AVI	Mask bit for FC_INT1.AVI interrupt bit
0 GCP	Mask bit for FC_INT1.GCP interrupt bit

### 34.5.140 Frame Composer Pixel Repetition Configuration Register (HDMI\_FC\_PRCNF)

Defines the Pixel Repetition ratio factor of the input and output video signal.

- Address Offset: 0x10E0
- Size: 8 bits
- Value after Reset: 0x10
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 10E0h offset = 12\_10E0h

Bit	7	6	5	4	3	2	1	0
Read	incoming_pr_factor[3:0]				output_pr_factor[3:0]			
Write								
Reset	0	0	0	1	0	0	0	0

### HDMI\_FC\_PRCONF field descriptions

Field	Description
7-4 incoming_pr_factor[3:0]	<p>Configures the input video pixel repetition. A plus 1 factor should be added in this register configuration. For CEA modes this value should be extracted from the CEA spec for the video mode being inputted.</p> <p><b>NOTE:</b> When working in YCC422 video the actual repetition of the stream will be Incoming_pr_factor * (desired_pr_factor + 1). This calculation is done internally in the H13TCTRL and no HW overflow protection is available. Care must be taken to avoid this result passes the maximum number of 10 pixels repeated since no HDMI support is available for this in the spec and the H13TPHY does not support this higher repetition values.</p> <p>other: Reserved. Not used.</p> <p>0000 No action. Shall not be used.            0001 No pixel repetition (pixel sent only once).            0010 Pixel sent twice (pixel repeated once).            0011 Pixel sent 3 times.            0100 Pixel sent 4 times.            0101 Pixel sent 5 times.            0110 Pixel sent 6 times.            0111 Pixel sent 7 times.            1000 Pixel sent 8 times.            1001 Pixel sent 9 times.            1010 Pixel sent 10 times.</p>
output_pr_factor[3:0]	<p>Configures the video pixel repetition ratio to be sent on the AVI infoFrame. This value must be valid according to HDMI spec. The output_pr_factor = incoming_pr_factor(without the + 1 factor) * desired_pr_factor.</p> <p>other: Reserved. Not used.</p> <p>0000 No action. Shall not be used.            0001 Pixel sent twice (pixel repeated once).            0010 Pixel sent 3 times.            0011 Pixel sent 4 times.            0100 Pixel sent 5 times.            0101 Pixel sent 6 times.            0110 Pixel sent 7 times.            0111 Pixel sent 8 times.            1000 Pixel sent 9 times.            1001 Pixel sent 10 times.</p>

### 34.5.141 Frame Composer GMD Packet Status Register (HDMI\_FC\_GMD\_STAT)

Gamut metadata packet status bit information for `no_current_gmd`, `next_gmd_field`, `gmd_packet_sequence` and `current_gamut_seq_num`. For more information, refer to the HDMI 1.4a specification.

- Address Offset: 0x1100
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 1100h offset = 12\_1100h

Bit	7	6	5	4
Read	igmdno_crnt_gbd	igmddnext_field	igmdpaket_seq[1:0]	
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	igmdcurrent_gamut_seq_num[3:0]			
Write				
Reset	0	0	0	0

#### HDMI\_FC\_GMD\_STAT field descriptions

Field	Description
7 igmdno_crnt_gbd	Gamut scheduling: No current gamut data
6 igmddnext_field	Gamut scheduling: Gamut Next field
5–4 igmdpaket_seq[1:0]	Gamut scheduling: Gamut packet sequence
igmdcurrent_gamut_seq_num[3:0]	Gamut scheduling: Current Gamut packet sequence number

### 34.5.142 Frame Composer GMD Packet Enable Register (HDMI\_FC\_GMD\_EN)

This register enables Gamut metadata (GMD) packet transmission. Packets are inserted in the incoming frame, starting in the line where active Vsync indication starts. After enable of GMD packets the outgoing packet is sent with no\_current\_gmd active indication until update GMD request is performed in the controller.

- Address Offset: 0x1101
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1101h offset = 12\_1101h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							gmdenablet
Write	Reserved							x
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_GMD\_EN field descriptions**

Field	Description
7-1 -	This field is reserved. Reserved
0 gmdenabletx	Gamut Metadata packet transmission enable (1b).

### 34.5.143 Frame Composer GMD Packet Update Register (HDMI\_FC\_GMD\_UP)

This register performs an GMD packet content update according to the configured packet body (FC\_GMD\_PB0 to FC\_GMD\_PB27) and packet header (FC\_GMD\_HB). This active high auto clear register reflects the body and header configurations on the GMD packets sent arbitrating the current\_gamut\_seq\_num, gmd\_packet\_sequence and next\_gmd\_field bits on packet to correctly indicate to source the Gamut change to be performed. After enable GMD packets the first update request is also responsible for deactivating the no\_current\_gmd indication bit. Attention packet update request must only be done after correct configuration of GMD packet body and header registers. Correct affected\_gamut\_seq\_num and gmd\_profile configuration is user responsibility and must convey with HDMI 1.4a standard gamut rules.

- Address Offset: 0x1102

- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12\_0000h base + 1102h offset = 12\_1102h

**HDMI\_FC\_GMD\_UP field descriptions**

Field	Description
7–1 -	This field is reserved. Reserved
0 gmdupdatepacket	Gamut Metadata packet update.

### 34.5.144 Frame Composer GMD Packet Schedule Configuration Register (HDMI\_FC\_GMD\_CONF)

This register configures the number of GMD packets to be inserted per frame (starting always in the line where the active Vsync appears) and the line spacing between the transmitted GMD packets. Note that for profile P0 (refer to HDMI 1.4a spec) this register should only indicate one GMD packet to be inserted per video field.

- Address Offset: 0x1103
- Size: 8 bits
- Value after Reset: 0x10
- Access: Read/Write

Address: 12\_0000h base + 1103h offset = 12\_1103h

**HDMI\_FC\_GMD\_CONF field descriptions**

Field	Description
7–4 gmdpacketsinframe[3:0]	Number of GMD packets per frame or video field (profile P0)
gmdpacketlinespacing[3:0]	Number of line spacing between the transmitted GMD packets

**34.5.145 Frame Composer GMD Packet Profile and Gamut Sequence Configuration Register (HDMI\_FC\_GMD\_HB)**

This register configures the GMD packet header affected\_gamut\_seq\_num and gmd\_profile bits. For more information, refer to the HDMI 1.4a specification.

- Address Offset: 0x1104
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1104h offset = 12\_1104h

Bit	7	6	5	4	3	2	1	0
Read	Reserved		gmdgbd_profile			gmdaffected_gamut_seq_num		
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_GMD\_HB field descriptions**

Field	Description
7 -	This field is reserved. Reserved
6–4 gmdgbd_profile	GMD profile bits
gmdaffected_gamut_seq_num	Affected gamut sequence number

**34.5.146 Frame Composer GMD Packet Body Register 0 (HDMI\_FC\_GMD\_PB0)**

Configures the following contents of the GMD packet:

- GMD packet body byte0
- Address Offset: 0x1105
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1105h offset = 12\_1105h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB0							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB0 field descriptions

Field	Description
FC_GMD_PB0	Gamut Metadata packet byte0

### 34.5.147 Frame Composer GMD Packet Body Register 1 (HDMI\_FC\_GMD\_PB1)

- GMD packet body byte1
- Address Offset: 0x1106
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1106h offset = 12\_1106h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB1							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB1 field descriptions

Field	Description
FC_GMD_PB1	Gamut Metadata packet byte1

### 34.5.148 Frame Composer GMD Packet Body Register 2 (HDMI\_FC\_GMD\_PB2)

- GMD packet body byte2
- Address Offset: 0x1107
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1107h offset = 12\_1107h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB2							
Write	FC_GMD_PB2							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB2 field descriptions

Field	Description
FC_GMD_PB2	Gamut Metadata packet byte2

## 34.5.149 Frame Composer GMD Packet Body Register 3 (HDMI\_FC\_GMD\_PB3)

- GMD packet body byte3
- Address Offset: 0x1108
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1108h offset = 12\_1108h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB3							
Write	FC_GMD_PB3							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB3 field descriptions

Field	Description
FC_GMD_PB3	Gamut Metadata packet byte3

## 34.5.150 Frame Composer GMD Packet Body Register 4 (HDMI\_FC\_GMD\_PB4)

- GMD packet body byte4
- Address Offset: 0x1109
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1109h offset = 12\_1109h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB4							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB4 field descriptions

Field	Description
FC_GMD_PB4	Gamut Metadata packet byte4

### 34.5.151 Frame Composer GMD Packet Body Register 5 (HDMI\_FC\_GMD\_PB5)

- GMD packet body byte5
- Address Offset: 0x110a
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 110Ah offset = 12\_110Ah

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB5							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB5 field descriptions

Field	Description
FC_GMD_PB5	Gamut Metadata packet byte5

### 34.5.152 Frame Composer GMD Packet Body Register 6 (HDMI\_FC\_GMD\_PB6)

- GMD packet body byte6
- Address Offset: 0x110b
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 110Bh offset = 12\_110Bh

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB6							
Write	FC_GMD_PB6							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB6 field descriptions

Field	Description
FC_GMD_PB6	Gamut Metadata packet byte6

## 34.5.153 Frame Composer GMD Packet Body Register 7 (HDMI\_FC\_GMD\_PB7)

- GMD packet body byte7
- Address Offset: 0x110c
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 110Ch offset = 12\_110Ch

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB2							
Write	FC_GMD_PB2							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB7 field descriptions

Field	Description
FC_GMD_PB2	Gamut Metadata packet byte7

## 34.5.154 Frame Composer GMD Packet Body Register 8 (HDMI\_FC\_GMD\_PB8)

- GMD packet body byte8
- Address Offset: 0x110d
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 110Dh offset = 12\_110Dh

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB8							
Write

Field	Description
FC_GMD_PB14	Gamut Metadata packet byte14

## 34.5.161 Frame Composer GMD Packet Body Register 15 (HDMI\_FC\_GMD\_PB15)

- GMD packet body byte15
- Address Offset: 0x1114
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1114h offset = 12\_1114h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB15							
Write	FC_GMD_PB15							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB15 field descriptions

Field	Description
FC_GMD_PB15	Gamut Metadata packet byte15

## 34.5.162 Frame Composer GMD Packet Body Register 16 (HDMI\_FC\_GMD\_PB16)

- GMD packet body byte16
- Address Offset: 0x1115
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1115h offset = 12\_1115h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB16							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB16 field descriptions

Field	Description
FC_GMD_PB16	Gamut Metadata packet byte16

### 34.5.163 Frame Composer GMD Packet Body Register 17 (HDMI\_FC\_GMD\_PB17)

- GMD packet body byte17
- Address Offset: 0x1116
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1116h offset = 12\_1116h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB17							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB17 field descriptions

Field	Description
FC_GMD_PB17	Gamut Metadata packet byte17

### 34.5.164 Frame Composer GMD Packet Body Register 18 (HDMI\_FC\_GMD\_PB18)

- GMD packet body byte18
- Address Offset: 0x1117
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1117h offset = 12\_1117h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB18							
Write	FC_GMD_PB18							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB18 field descriptions

Field	Description
FC_GMD_PB18	Gamut Metadata packet byte18

## 34.5.165 Frame Composer GMD Packet Body Register 19 (HDMI\_FC\_GMD\_PB19)

- GMD packet body byte19
- Address Offset: 0x1118
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1118h offset = 12\_1118h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB18							
Write	FC_GMD_PB18							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB19 field descriptions

Field	Description
FC_GMD_PB18	Gamut Metadata packet byte18

## 34.5.166 Frame Composer GMD Packet Body Register 20 (HDMI\_FC\_GMD\_PB20)

- GMD packet body byte20
- Address Offset: 0x1119
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1119h offset = 12\_1119h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB20							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB20 field descriptions

Field	Description
FC_GMD_PB20	Gamut Metadata packet byte20

### 34.5.167 Frame Composer GMD Packet Body Register 21 (HDMI\_FC\_GMD\_PB21)

- GMD packet body byte21
- Address Offset: 0x111a
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 111Ah offset = 12\_111Ah

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB21							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB21 field descriptions

Field	Description
FC_GMD_PB21	Gamut Metadata packet byte21

### 34.5.168 Frame Composer GMD Packet Body Register 22 (HDMI\_FC\_GMD\_PB22)

- GMD packet body byte22
- Address Offset: 0x111b
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 111Bh offset = 12\_111Bh

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB22							
Write	FC_GMD_PB22							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB22 field descriptions

Field	Description
FC_GMD_PB22	Gamut Metadata packet byte22

## 34.5.169 Frame Composer GMD Packet Body Register 23 (HDMI\_FC\_GMD\_PB23)

- GMD packet body byte23
- Address Offset: 0x111c
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 111Ch offset = 12\_111Ch

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB23							
Write	FC_GMD_PB23							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB23 field descriptions

Field	Description
FC_GMD_PB23	Gamut Metadata packet byte23

## 34.5.170 Frame Composer GMD Packet Body Register 24 (HDMI\_FC\_GMD\_PB24)

- GMD packet body byte24
- Address Offset: 0x111d
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 111Dh offset = 12\_111Dh

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB24							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB24 field descriptions

Field	Description
FC_GMD_PB24	Gamut Metadata packet byte24

### 34.5.171 Frame Composer GMD Packet Body Register 25 (HDMI\_FC\_GMD\_PB25)

- GMD packet body byte25
- Address Offset: 0x111e
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 111Eh offset = 12\_111Eh

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB25							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_GMD\_PB25 field descriptions

Field	Description
FC_GMD_PB25	Gamut Metadata packet byte25

### 34.5.172 Frame Composer GMD Packet Body Register 26 (HDMI\_FC\_GMD\_PB26)

- GMD packet body byte26
- Address Offset: 0x111f
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 111Fh offset = 12\_111Fh

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB26							
Write	FC_GMD_PB26							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB26 field descriptions

Field	Description
FC_GMD_PB26	Gamut Metadata packet byte26

## 34.5.173 Frame Composer GMD Packet Body Register 27 (HDMI\_FC\_GMD\_PB27)

- GMD packet body byte27
- Address Offset: 0x1120
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

For more information, refer to the HDMI 1.4a specification.

Address: 12\_0000h base + 1120h offset = 12\_1120h

Bit	7	6	5	4	3	2	1	0
Read	FC_GMD_PB27							
Write	FC_GMD_PB27							
Reset	0	0	0	0	0	0	0	0

### HDMI\_FC\_GMD\_PB27 field descriptions

Field	Description
FC_GMD_PB27	Gamut Metadata packet byte27

## 34.5.174 Frame Composer Video/Audio Force Enable Register (HDMI\_FC\_DBGFORCE)

This register allows to force the controller to output audio and video data the values configured in the FC\_DBGAUD and FC\_DBGTMDS registers.

- Address Offset: 0x1200
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1200h offset = 12\_1200h

**HDMI\_FC\_DBGFORCE field descriptions**

Field	Description
7-5 -	This field is reserved. Reserved
4 forceaudio	Force fixed audio output with FC_DBGAUDxCHx registers contain.
3-1 -	This field is reserved. Reserved
0 forcevideo	Force fixed video output with FC_DBGTMDsx registers contain.

### 34.5.175 Frame Composer Audio Channel 0 Register 0 (HDMI\_FC\_DBGAUD0CH0)

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

- Address Offset: 0x1201
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1201h offset = 12\_1201h

**HDMI\_FC\_DBGAUD0CH0 field descriptions**

Field	Description
FC_DBGAUD0CH0	the audio fixed data byte0 to be used in channel 0 when in fixed audio selection

### 34.5.176 Frame Composer Audio Channel 0 Register 1 (HDMI\_FC\_DBGAUD1CH0)

- Address Offset: 0x1202
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1202h offset = 12\_1202h

#### HDMI\_FC\_DBGAUD1CH0 field descriptions

Field	Description
FC_DBGAUD1CH0	the audio fixed data byte1 to be used in channel 0 when in fixed audio selection

### 34.5.177 Frame Composer Audio Channel 0 Register 2 (HDMI\_FC\_DBGAUD2CH0)

- Address Offset: 0x1203
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1203h offset = 12\_1203h

#### HDMI\_FC\_DBGAUD2CH0 field descriptions

Field	Description
FC_DBGAUD2CH0	the audio fixed data byte2 to be used in channel 0 when in fixed audio selection

### 34.5.178 Frame Composer Audio Channel 1 Register 0 (HDMI\_FC\_DBGAUD0CH1)

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

- Address Offset: 0x1204
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1204h offset = 12\_1204h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD0CH1							
Write	FC_DBGAUD0CH1							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_DBGAUD0CH1 field descriptions**

Field	Description
FC_DBGAUD0CH1	the audio fixed data byte2 to be used in channel 0 when in fixed audio selection

### 34.5.179 Frame Composer Audio Channel 1 Register 1 (HDMI\_FC\_DBGAUD1CH1)

- Address Offset: 0x1205
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1205h offset = 12\_1205h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD1CH1							
Write	FC_DBGAUD1CH1							
Reset	0	0	0	0	0	0	0	0

**HDMI\_FC\_DBGAUD1CH1 field descriptions**

Field	Description
FC_DBGAUD1CH1	the audio fixed data byte1 to be used in channel 1 when in fixed audio selection

### 34.5.180 Frame Composer Audio Channel 1 Register 2 (HDMI\_FC\_DBGAUD2CH1)

- Address Offset: 0x1206
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1206h offset = 12\_1206h

HDMI\_FC\_DBGAUD2CH1 field descriptions

Field	Description
FC_DBGAUD2CH1	the audio fixed data byte2 to be used in channel 1 when in fixed audio selection

### 34.5.181 Frame Composer Debug Audio Channel 2 Register 0 (HDMI\_FC\_DBGAUD0CH2)

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

- Address Offset: 0x1207
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1207h offset = 12\_1207h

HDMI\_FC\_DBGAUD0CH2 field descriptions

Field	Description
FC_DBGAUD0CH2	the audio fixed data byte0 to be used in channel 2 when in fixed audio selection

### 34.5.182 Frame Composer Debug Audio Channel 2 Register 1 (HDMI\_FC\_DBGAUD1CH2)

- Address Offset: 0x1208
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1208h offset = 12\_1208h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD1CH2							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD1CH2 field descriptions

Field	Description
FC_DBGAUD1CH2	the audio fixed data byte1 to be used in channel 2 when in fixed audio selection

### 34.5.183 Frame Composer Audio Channel 2 Register 2 (HDMI\_FC\_DBGAUD2CH2)

- Address Offset: 0x1209
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1209h offset = 12\_1209h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD2CH2							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD2CH2 field descriptions

Field	Description
FC_DBGAUD2CH2	the audio fixed data byte2 to be used in channel 2 when in fixed audio selection

### 34.5.184 Frame Composer Audio Channel 3 Register 0 (HDMI\_FC\_DBGAUD0CH3)

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

- Address Offset: 0x120A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 120Ah offset = 12\_120Ah

**HDMI\_FC\_DBGAUD0CH3 field descriptions**

Field	Description
FC_DBGAUD0CH3	the audio fixed data byte0 to be used in channel 3 when in fixed audio selection

### 34.5.185 Frame Composer Audio Channel 3 Register 1 (HDMI\_FC\_DBGAUD1CH3)

- Address Offset: 0x120B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 120Bh offset = 12\_120Bh

**HDMI\_FC\_DBGAUD1CH3 field descriptions**

Field	Description
FC_DBGAUD1CH3	the audio fixed data byte1 to be used in channel 3 when in fixed audio selection

### 34.5.186 Frame Composer Audio Channel 3 Register 2 (HDMI\_FC\_DBGAUD2CH3)

- Address Offset: 0x120C
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 120Ch offset = 12\_120Ch

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD2CH3							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD2CH3 field descriptions

Field	Description
FC_DBGAUD2CH3	the audio fixed data byte2 to be used in channel 3 when in fixed audio selection

### 34.5.187 Frame Composer Audio Channel 4 Register 0 (HDMI\_FC\_DBGAUD0CH4)

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

- Address Offset: 0x120D
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 120Dh offset = 12\_120Dh

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD0CH4							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD0CH4 field descriptions

Field	Description
FC_DBGAUD0CH4	the audio fixed data byte0 to be used in channel 4 when in fixed audio selection

### 34.5.188 Frame Composer Audio Channel 4 Register 1 (HDMI\_FC\_DBGAUD1CH4)

- Address Offset: 0x120E
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 120Eh offset = 12\_120Eh

#### HDMI\_FC\_DBGAUD1CH4 field descriptions

Field	Description
FC_DBGAUD1CH4	the audio fixed data byte1 to be used in channel 4 when in fixed audio selection

### 34.5.189 Frame Composer Audio Channel 4 Register 2 (HDMI\_FC\_DBGAUD2CH4)

- Address Offset: 0x120F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 120Fh offset = 12\_120Fh

#### HDMI\_FC\_DBGAUD2CH4 field descriptions

Field	Description
FC_DBGAUD2CH4	the audio fixed data byte2 to be used in channel 4 when in fixed audio selection

### 34.5.190 Frame Composer Audio Channel 5 Register 0 (HDMI\_FC\_DBGAUD0CH5)

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

- Address Offset: 0x1210
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1210h offset = 12\_1210h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD0CH5							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD0CH5 field descriptions

Field	Description
FC_DBGAUD0CH5	the audio fixed data byte0 to be used in channel 5 when in fixed audio selection

### 34.5.191 Frame Composer Audio Channel 5 Register 1 (HDMI\_FC\_DBGAUD1CH5)

- Address Offset: 0x1211
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1211h offset = 12\_1211h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD1CH5							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD1CH5 field descriptions

Field	Description
FC_DBGAUD1CH5	the audio fixed data byte1 to be used in channel 5 when in fixed audio selection

### 34.5.192 Frame Composer Audio Channel 5 Register 2 (HDMI\_FC\_DBGAUD2CH5)

- Address Offset: 0x1212
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1212h offset = 12\_1212h

#### HDMI\_FC\_DBGAUD2CH5 field descriptions

Field	Description
FC_DBGAUD2CH5	the audio fixed data byte2 to be used in channel 5 when in fixed audio selection

### 34.5.193 Frame Composer Audio Channel 6 Register 0 (HDMI\_FC\_DBGAUD0CH6)

Configures the audio fixed data to be used in channel 0 when in fixed audio selection.

- Address Offset: 0x1213
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1213h offset = 12\_1213h

#### HDMI\_FC\_DBGAUD0CH6 field descriptions

Field	Description
FC_DBGAUD0CH6	The audio fixed data byte0 to be used in channel 6 when in fixed audio selection

### 34.5.194 Frame Composer Audio Channel 6 Register 1 (HDMI\_FC\_DBGAUD1CH6)

- Address Offset: 0x1214
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1214h offset = 12\_1214h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD1CH6							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD1CH6 field descriptions

Field	Description
FC_DBGAUD1CH6	the audio fixed data byte1 to be used in channel 6 when in fixed audio selection

### 34.5.195 Frame Composer Audio Channel 6 Register 2 (HDMI\_FC\_DBGAUD2CH6)

- Address Offset: 0x1215
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1215h offset = 12\_1215h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD2CH6							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD2CH6 field descriptions

Field	Description
FC_DBGAUD2CH6	the audio fixed data byte2 to be used in channel 6 when in fixed audio selection

### 34.5.196 Frame Composer Audio Channel 7 Register 1 (HDMI\_FC\_DBGAUD0CH7)

Configures the audio fixed data to be used in channel 7 when in fixed audio selection.

- Address Offset: 0x1216
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1216h offset = 12\_1216h

**HDMI\_FC\_DBGAUD0CH7 field descriptions**

Field	Description
FC_DBGAUD0CH7	the audio fixed data byte0 to be used in channel 7 when in fixed audio selection

### 34.5.197 Frame Composer Audio Channel 7 Register 0 (HDMI\_FC\_DBGAUD1CH7)

- Address Offset: 0x1217
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1217h offset = 12\_1217h

**HDMI\_FC\_DBGAUD1CH7 field descriptions**

Field	Description
FC_DBGAUD1CH7	the audio fixed data byte1 to be used in channel 0 when in fixed audio selection

### 34.5.198 Frame Composer Audio Channel 7 Register 2 (HDMI\_FC\_DBGAUD2CH7)

- Address Offset: 0x1218
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1218h offset = 12\_1218h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGAUD2CH7							
Write	FC_DBGAUD2CH7							
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGAUD2CH7 field descriptions

Field	Description
FC_DBGAUD2CH7	the audio fixed data byte2 to be used in channel 0 when in fixed audio selection

### 34.5.199 Frame Composer TMDS Channel 0 Register (HDMI\_FC\_DBGTMDS0)

Configures the video fixed data to be used in tmds channel 0 when in fixed video selection. This equals to set B pixel component value in RGB video or Cb pixel component value in YCbCr.

- Address Offset: 0x1219
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 1219h offset = 12\_1219h

Bit	7	6	5	4	3	2	1	0
Read	FC_DBGTMDS0							
Write	FC_DBGTMDS0							
Reset	0	0	0	0	0	0	0	0

#### HDMI\_FC\_DBGTMDS0 field descriptions

Field	Description
FC_DBGTMDS0	set B pixel component value in RGB video or Cb pixel component value in YCbCr

### 34.5.200 Frame Composer TMDs Channel 1 Register (HDMI\_FC\_DBGTMDS1)

Configures the video fixed data to be used in tmds channel 1 when in fixed video selection. This equals to set G pixel component value in RGB video or Y pixel component value in YCbCr.

- Address Offset: 0x121A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 121Ah offset = 12\_121Ah

#### HDMI\_FC\_DBGTMDS1 field descriptions

Field	Description
FC_DBGTMDS1	set G pixel component value in RGB video or Y pixel component value in YCbCr

### 34.5.201 Frame Composer TMDs Channel 2 Register (HDMI\_FC\_DBGTMDS2)

Configures the video fixed data to be used in tmds channel 2 when in fixed video selection. This equals to set R pixel component value in RGB video or Cr pixel component value in YCbCr.

- Address Offset: 0x121B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 121Bh offset = 12\_121Bh

### HDMI\_FC\_DBGTMDS2 field descriptions

Field	Description
FC_DBGTMDS2	set R pixel component value in RGB video or Cr pixel component value in YCbCr

### 34.5.202 PHY Configuration Register (HDMI\_PHY\_CONF0)

This register holds the power down, data enable polarity and interface control of the HDMI Source PHY control. For more information, refer to the DesignWare Cores HDMI TX PHY Databook.

- Address Offset: 0x3000
- Size: 8 bits
- Value after Reset: 0x06
- Access: Read/Write

Address: 12\_0000h base + 3000h offset = 12\_3000h

Bit	7	6	5	4
Read				
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read				
Write				
Reset	0	1	1	0

### HDMI\_PHY\_CONF0 field descriptions

Field	Description
7 PDZ	Power-down enable (active low 0b). Value after Reset: 0b
6 ENTMDS	Enable TMDS drivers, bias, and TMDS digital logic. Value after Reset: 0b
5 sparectrl	Reserved. Spare pin control. Value after Reset: 0b
4 gen2_pddq	PHY_Gen2 PDDQ signal Value after Reset: 0b
3 gen2_txpwrn	PHY_Gen2 TXPWRON signal Value after Reset: 0b
2 gen2_enhpdrxsense	PHY_Gen2 ENHPDRXSENSE signal Value after Reset: 1b
1 seldataenpol	Select data enable polarity. Value after Reset: 1b

Table continues on the next page...

**HDMI\_PHY\_CONF0 field descriptions (continued)**

Field	Description
0 seldipif	Select interface control. Value after Reset: 0b

**34.5.203 PHY Test Interface Register 0 (HDMI\_PHY\_TST0)**

PHY TX mapped text interface (control). For more information, refer to the DesignWare Cores HDMI TX PHY Databook.

- Address Offset: 0x3001
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3001h offset = 12\_3001h

**HDMI\_PHY\_TST0 field descriptions**

Field	Description
7–6 -	This field is reserved. Reserved
5 testclr	Enable TMDS drivers, bias and tmds digital logic. Value after Reset: 0b
4 testen	Reserved. Spare control pins. Value after Reset: 0b
3–1 -	This field is reserved. Reserved
0 testclk	Test clock signal. Value after Reset: 0b

**34.5.204 PHY Test Interface Register 1 (HDMI\_PHY\_TST1)**

PHY TX mapped text interface (data in). For more information, refer to the DesignWare Cores HDMI TX PHY Databook.

- Address Offset: 0x3002
- Size: 8 bits

- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3002h offset = 12\_3002h

**HDMI\_PHY\_TST1 field descriptions**

Field	Description
testdin[7:0]	Test data input.

### 34.5.205 PHY Test Interface Register 2 (HDMI\_PHY\_TST2)

PHY TX mapped text interface (data out). For more information, refer to the DesignWare Cores HDMI TX PHY Databook.

- Address Offset: 0x3003
- Size: 8 bits
- Value after Reset: N/A
- Access: Read

Address: 12\_0000h base + 3003h offset = 12\_3003h

**HDMI\_PHY\_TST2 field descriptions**

Field	Description
testdout[7:0]	Test data output.

### 34.5.206 PHY RXSENSE, PLL lock, and HPD Status Register (HDMI\_PHY\_STAT0)

This register contains the following active high packet sent status indications. For more information, see [Overview](#)

- Address Offset: 0x3004
- Size: 8 bits

## HDMI Memory Map/Register Definition

- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3004h offset = 12\_3004h

Bit	7	6	5	4
Read	RX_SENSE3	RX_SENSE2	RX_SENSE1	RX_SENSE0
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	Reserved		HPD	TX_PHY_LOCK
Write				
Reset	0	0	0	0

### HDMI\_PHY\_STAT0 field descriptions

Field	Description
7 RX_SENSE3	Status bit. TX PHY RX_SENSE indication for TMDS CLK driver. User may need to mask or change polarity of this interrupt after it has become active.
6 RX_SENSE2	Status bit. TX PHY RX_SENSE indication for TMDS channel 2 driver. User may need to mask or change polarity of this interrupt after it has become active.
5 RX_SENSE1	Status bit. TX PHY RX_SENSE indication for TMDS channel 1 driver. User may need to mask or change polarity of this interrupt after it has become active.
4 RX_SENSE0	Status bit. TX PHY RX_SENSE indication for TMDS channel 0 driver. User may need to mask or change polarity of this interrupt after it has become active.
3-2 -	This field is reserved. Reserved
1 HPD	Status bit. HDMI Hot Plug Detect indication. User may need to mask or change polarity of this interrupt after it has become active.
0 TX_PHY_LOCK	Status bit. TX PHY PLL lock indication. Please refer to PHY datasheet for more information. User may need to mask or change polarity of this interrupt after it has become active.

## 34.5.207 PHY RXSENSE, PLL lock, and HPD Interrupt Register (HDMI\_PHY\_INT0)

This register contains the interrupt indication of the PHY\_STAT0 status interrupts. Interrupt generation is accomplished in the following way:

`interrupt = (mask == 1'b0) && (polarity == status);`

All this interrupts are forwarded to the Interrupt Handler sticky bit registers and after ORed to a single main interrupt line to micro controller. Assertion of this interrupt implies that data related with the corresponding packet has been sent through the HDMI interface.

- Address Offset: 0x3005

- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3005h offset = 12\_3005h

Bit	7	6	5	4
Read	RX_SENSE3	RX_SENSE2	RX_SENSE1	RX_SENSE0
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	Reserved		HPD	TX_PHY_LOCK
Write				
Reset	0	0	0	0

**HDMI\_PHY\_INT0 field descriptions**

Field	Description
7 RX_SENSE3	Interrupt indication bit TX PHY RX_SENSE indication interrupt for TMDS CLK driver.
6 RX_SENSE2	Interrupt indication bit TX PHY RX_SENSE indication interrupt for TMDS channel 2 driver.
5 RX_SENSE1	Interrupt indication bit TX PHY RX_SENSE indication interrupt for TMDS channel 1 driver.
4 RX_SENSE0	Interrupt indication bit TX PHY RX_SENSE indication interrupt for TMDS channel 0 driver.
3-2 -	This field is reserved. Reserved
1 HPD	Interrupt indication bit HDMI Hot Plug Detect indication interrupt.
0 TX_PHY_LOCK	Interrupt indication bit TX PHY PLL lock indication interrupt.

**34.5.208 PHY RXSENSE, PLL lock, and HPD Mask Register (HDMI\_PHY\_MASK0)**

Mask register for generation of PHY\_INT0 interrupts.

- Address Offset: 0x3006
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 3006h offset = 12\_3006h

Bit	7	6	5	4	3	2	1	0
Read	RX_SENSE3	RX_SENSE2	RX_SENSE1	RX_SENSE0	Reserved		HPD	TX_PHY_LOCK
Write	SENSE3	SENSE2	SENSE1	SENSE0	Reserved		HPD	LOCK
Reset	0	0	0	0	0	0	0	0

### HDMI\_PHY\_MASK0 field descriptions

Field	Description
7 RX_SENSE3	Mask bit for PHY_INT0.RX_SENSE3 interrupt bit
6 RX_SENSE2	Mask bit for PHY_INT0.RX_SENSE2 interrupt bit
5 RX_SENSE1	Mask bit for PHY_INT0.RX_SENSE1 interrupt bit
4 RX_SENSE0	Mask bit for PHY_INT0.RX_SENSE0 interrupt bit
3-2 -	This field is reserved. Reserved
1 HPD	Mask bit for PHY_INT0.HPD interrupt bit
0 TX_PHY_LOCK	Mask bit for PHY_INT0.TX_PHY_LOCK interrupt bit

## 34.5.209 PHY RXSENSE, PLL lock and HPD Polarity Register (HDMI\_PHY\_POLO)

Polarity register for generation of PHY\_INT0 interrupts.

- Address Offset: 0x3007
- Size: 8 bits
- Value after Reset: 0xF3
- Access: Read/Write

Address: 12\_0000h base + 3007h offset = 12\_3007h

Bit	7	6	5	4	3	2	1	0
Read	RX_SENSE3	RX_SENSE2	RX_SENSE1	RX_SENSE0	Reserved		HPD	TX_PHY_LOCK
Write	SENSE3	SENSE2	SENSE1	SENSE0	Reserved		HPD	LOCK
Reset	1	1	1	1	0	0	1	1

### HDMI\_PHY\_POLO field descriptions

Field	Description
7 RX_SENSE3	Polarity bit for PHY_INT0.RX_SENSE3 interrupt bit

*Table continues on the next page...*

## HDMI\_PHY\_POLO field descriptions (continued)

Field	Description
6 RX_SENSE2	Polarity bit for PHY_INT0.RX_SENSE2 interrupt bit
5 RX_SENSE1	Polarity bit for PHY_INT0.RX_SENSE1 interrupt bit
4 RX_SENSE0	Polarity bit for PHY_INT0.RX_SENSE0 interrupt bit
3–2 -	This field is reserved. Reserved
1 HPD	Polarity bit for PHY_INT0.HPD interrupt bit
0 TX_PHY_LOCK	Polarity bit for PHY_INT0.TX_PHY_LOCK interrupt bit

### 34.5.210 PHY I2C Slave Address Configuration Register (HDMI\_PHY\_I2CM\_SLAVE\_ADDR)

This register writes the slave address of the I2C Master PHY.

- Address Offset: 0x3020
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3020h offset = 12\_3020h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				-			
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_PHY\_I2CM\_SLAVE\_ADDR field descriptions

Field	Description
7 -	This field is reserved. Reserved
-	Slave address to be sent during read and write operations. The PHY Gen2 slave address is: 7'h69 The HEAC PHY slave address is: 7'h49

### 34.5.211 PHY I2C Address Configuration Register (HDMI\_PHY\_I2CM\_ADDRESS\_ADDR)

This register writes the address for read and writer operations.

## HDMI Memory Map/Register Definition

- Address Offset: 0x3021
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3021h offset = 12\_3021h

### HDMI\_PHY\_I2CM\_ADDRESS\_ADDR field descriptions

Field	Description
address	Register address for read and write operations.

## 34.5.212 PHY I2C Data Write Register 1 (HDMI\_PHY\_I2CM\_DATAO\_1\_ADDR)

- Address Offset: 0x3022
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3022h offset = 12\_3022h

### HDMI\_PHY\_I2CM\_DATAO\_1\_ADDR field descriptions

Field	Description
datao[15:8]	MSB's of data to be written on register pointed by address [7:0].

### 34.5.213 PHY I2C Data Write Register 0 (HDMI\_PHY\_I2CM\_DATAO\_0\_ADDR)

- Address Offset: 0x3023
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3023h offset = 12\_3023h

**HDMI\_PHY\_I2CM\_DATAO\_0\_ADDR field descriptions**

Field	Description
datao[7:0]	LSB's of data to be written on register pointed by address [7:0].

### 34.5.214 PHY I2C Data Read Register 1 (HDMI\_PHY\_I2CM\_DATAI\_1\_ADDR)

- Address Offset: 0x3024
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3024h offset = 12\_3024h

**HDMI\_PHY\_I2CM\_DATAI\_1\_ADDR field descriptions**

Field	Description
datai[15:8]	MSB's of data read from the register pointed by address [7:0].

### 34.5.215 PHY I2C Data Read Register 0 (HDMI\_PHY\_I2CM\_DATAI\_0\_ADDR)

- Address Offset: 0x3025
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3025h offset = 12\_3025h

**HDMI\_PHY\_I2CM\_DATAI\_0\_ADDR field descriptions**

Field	Description
datai[7:0]	LSB's of data read from the register pointed by address [7:0].

### 34.5.216 PHY I2C Read/Write Operation (HDMI\_PHY\_I2CM\_OPERATION\_ADDR)

This register requests read and write operations from the I2C Master PHY. This register can only be written; reading this register always results in 00h. Writing 1'b1 simultaneously to read and write requests is considered a read request.

- Address Offset: 0x3026
- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12\_0000h base + 3026h offset = 12\_3026h

## HDMI\_PHY\_I2CM\_OPERATION\_ADDR field descriptions

Field	Description
7–5 -	This field is reserved. Reserved
4 write	Write operation request
3–1 -	This field is reserved. Reserved
0 read	Read operation request.

### 34.5.217 PHY I2C Done Interrupt Register (HDMI\_PHY\_I2CM\_INT\_ADDR)

This register contains and configures I2C master PHY done interrupt.

- Address Offset: 0x3027
- Size: 8 bits
- Value after Reset: 0x08
- Access: Read/Write

Address: 12\_0000h base + 3027h offset = 12\_3027h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				done_pol	done_mask	done_interrupt	done_status
Write					done_pol	done_mask	done_interrupt	done_status
Reset	0	0	0	0	1	0	0	0

## HDMI\_PHY\_I2CM\_INT\_ADDR field descriptions

Field	Description
7–4 -	This field is reserved. Reserved
3 done_pol	Done interrupt polarity configuration Value after Reset: 1b
2 done_mask	Done interrupt mask signal Value after Reset: 0b
1 done_interrupt	Operation done interrupt bit. {done_interrupt = (done_mask == 0b) && (done_status == done_pol)}. Value after Reset: 0b
0 done_status	Operation done status bit. Marks the end of a rd or write operation. Value after Reset: 0b

### 34.5.218 PHY I2C Done Interrupt Register (HDMI\_PHY\_I2CM\_CTLINT\_ADDR)

This register contains and configures the I2C master PHY error interrupts.

- Address Offset: 0x3028
- Size: 8 bits
- Value after Reset: 0x88
- Access: Read/Write

Address: 12\_0000h base + 3028h offset = 12\_3028h

Bit	7	6	5	4
Read	nack_pol	nack_mask	nack_interrupt	nack_status
Write				
Reset	1	0	0	0
Bit	3	2	1	0
Read	arbitration_pol	arbitration_mask	arbitration_interrupt	arbitration_status
Write				
Reset	1	0	0	0

#### HDMI\_PHY\_I2CM\_CTLINT\_ADDR field descriptions

Field	Description
7 nack_pol	Not acknowledge error interrupt polarity configuration. Value after Reset: 1b
6 nack_mask	Not acknowledge error interrupt mask signal Value after Reset: 0b
5 nack_interrupt	Not acknowledge error interrupt bit.{nack_interrupt = nack_mask==0b} && (nack_status==nack_pol}). Value after Reset: 0b
4 nack_status	Not acknowledge error status bit.Error on I2C not acknowledge. Value after Reset: 0b
3 arbitration_pol	Arbitration error interrupt polarity configuration. Value after Reset: 1b
2 arbitration_mask	Arbitration error interrupt mask signal. Value after Reset: 0b
1 arbitration_interrupt	Arbitration error interrupt bit.{arbitration_interrupt = (arbitration_mask==0b)&& (arbitration_status==arbitration_pol)}. Value after Reset: 0b
0 arbitration_status	Arbitration error status bit. Error on master I2C protocol arbitration. Value after Reset: 0b

### 34.5.219 PHY I2C Speed Control Register (HDMI\_PHY\_I2CM\_DIV\_ADDR)

This register sets the I2C Master PHY to work in either Fast or Standard mode.

- Address Offset: 0x3029
- Size: 8 bits
- Value after Reset: 0x0B
- Access: Read/Write

Address: 12\_0000h base + 3029h offset = 12\_3029h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				fast_mode			
Write	Reserved				fast_mode			
Reset	0	0	0	0	1	0	1	1

**HDMI\_PHY\_I2CM\_DIV\_ADDR field descriptions**

Field	Description
7-4 -	This field is reserved. Reserved
fast_mode	Sets the I2C Master to work in Fast Mode or Standard Mode (x implies that it can take any value) Value after Reset: 1011b 1xxx Fast Mode 0xxx Standard Mode

### 34.5.220 PHY I2C Software Reset Register (HDMI\_PHY\_I2CM\_SOFT\_RSTZ\_ADDR)

This register sets the I2C Master PHY software reset.

- Address Offset: 0x302A
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

The following \*CNT registers must be set before any I2C bus transaction can take place to ensure proper I/O timing.

The following are the I2C Master SCL clock settings:

- SS: Standard Speed

## HDMI Memory Map/Register Definition

- FS: Fast Speed
- HCNT: SCL High Level counter
- LCNT: SCL Low Level counter

Address: 12\_0000h base + 302Ah offset = 12\_302Ah

Bit	7	6	5	4	3	2	1	0
Read	Reserved							i2c_sofrst
Write	Reserved							i2c_sofrst
Reset	0	0	0	0	0	0	0	1

### HDMI\_PHY\_I2CM\_SOFTRSTZ\_ADDR field descriptions

Field	Description
7-1 -	This field is reserved. Reserved
0 i2c_sofrst	I2C Master PHY Software Reset. Active by writing a zero and auto cleared to one in the following cycle. Value after Reset: 1b

## 34.5.221 PHY I2C Slow Speed SCL High Level Control Register 1 (HDMI\_PHY\_I2CM\_SS\_SCL\_HCNT\_1\_ADDR)

- Address Offset: 0x302B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 302Bh offset = 12\_302Bh

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_ss_scl_hcnt[15:8]							
Write	i2cmp_ss_scl_hcnt[15:8]							
Reset	0	0	0	0	0	0	0	0

### HDMI\_PHY\_I2CM\_SS\_SCL\_HCNT\_1\_ADDR field descriptions

Field	Description
i2cmp_ss_scl_hcnt[15:8]	Value after Reset: 8'h00

### 34.5.222 PHY I2C Slow Speed SCL High Level Control Register 0 (HDMI\_PHY\_I2CM\_SS\_SCL\_HCNT\_0\_ADDR)

- Address Offset: 0x302C
- Size: 8 bits
- Value after Reset: 0x6C
- Access: Read/Write

Address: 12\_0000h base + 302Ch offset = 12\_302Ch

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_ss_scl_hcnt[7:0]							
Write								
Reset	0	1	1	0	1	1	0	0

#### HDMI\_PHY\_I2CM\_SS\_SCL\_HCNT\_0\_ADDR field descriptions

Field	Description
i2cmp_ss_scl_hcnt[7:0]	Value after Reset: 8'h6C

### 34.5.223 PHY I2C Slow Speed SCL Low Level Control Register 1 (HDMI\_PHY\_I2CM\_SS\_SCL\_LCNT\_1\_ADDR)

- Address Offset: 0x302D
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 302Dh offset = 12\_302Dh

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_ss_scl_lcnt[15:8]							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_PHY\_I2CM\_SS\_SCL\_LCNT\_1\_ADDR field descriptions

Field	Description
i2cmp_ss_scl_lcnt[15:8]	Value after Reset: 8'h00

### 34.5.224 PHY I2C Slow Speed SCL Low Level Control Register 0 (HDMI\_PHY\_I2CM\_SS\_SCL\_LCNT\_0\_ADDR)

- Address Offset: 0x302E
- Size: 8 bits
- Value after Reset: 0x7F
- Access: Read/Write

Address: 12\_0000h base + 302Eh offset = 12\_302Eh

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_ss_scl_lcnt[7:0]							
Write								
Reset	0	1	1	1	1	1	1	1

#### HDMI\_PHY\_I2CM\_SS\_SCL\_LCNT\_0\_ADDR field descriptions

Field	Description
i2cmp_ss_scl_lcnt[7:0]	Value after Reset: 8'h7F

### 34.5.225 PHY I2C Fast Speed SCL High Level Control Register 1 (HDMI\_PHY\_I2CM\_FS\_SCL\_HCNT\_1\_ADDR)

- Address Offset: 0x302F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 302Fh offset = 12\_302Fh

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_fs_scl_hcnt[15:8]							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_PHY\_I2CM\_FS\_SCL\_HCNT\_1\_ADDR field descriptions

Field	Description
i2cmp_fs_scl_hcnt[15:8]	Value after Reset: 8'h00

### 34.5.226 PHY I2C Fast Speed SCL High Level Control Register 0 (HDMI\_PHY\_I2CM\_FS\_SCL\_HCNT\_0\_ADDR)

- Address Offset: 0x3030
- Size: 8 bits
- Value after Reset: 0x11
- Access: Read/Write

Address: 12\_0000h base + 3030h offset = 12\_3030h

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_fs_scl_hcnt[7:0]							
Write								
Reset	0	0	0	1	0	0	0	1

#### HDMI\_PHY\_I2CM\_FS\_SCL\_HCNT\_0\_ADDR field descriptions

Field	Description
i2cmp_fs_scl_hcnt[7:0]	Value after Reset: 8'h11

### 34.5.227 PHY I2C Fast Speed SCL Low Level Control Register 1 (HDMI\_PHY\_I2CM\_FS\_SCL\_LCNT\_1\_ADDR)

- Address Offset: 0x3031
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3031h offset = 12\_3031h

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_fs_scl_lcnt[15:8]							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_PHY\_I2CM\_FS\_SCL\_LCNT\_1\_ADDR field descriptions

Field	Description
i2cmp_fs_scl_lcnt[15:8]	Value after Reset: 8'h00

### 34.5.228 PHY I2C Fast Speed SCL Low Level Control Register 0 (HDMI\_PHY\_I2CM\_FS\_SCL\_LCNT\_0\_ADDR)

- Address Offset: 0x3032
- Size: 8 bits
- Value after Reset: 0x24
- Access: Read/Write

Address: 12\_0000h base + 3032h offset = 12\_3032h

#### HDMI\_PHY\_I2CM\_FS\_SCL\_LCNT\_0\_ADDR field descriptions

Field	Description
i2cmp_fs_scl_lcnt[7:0]	Value after Reset: 8'h24

### 34.5.229 Audio Clock Regenerator N Value Register 1 (HDMI\_AUD\_N1)

For N expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3200
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3200h offset = 12\_3200h

#### HDMI\_AUD\_N1 field descriptions

Field	Description
AudN[7:0]	HDMI Audio Clock Regenerator N value

### 34.5.230 Audio Clock Regenerator N Value Register 2 (HDMI\_AUD\_N2)

For N expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3201
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3201h offset = 12\_3201h

**HDMI\_AUD\_N2 field descriptions**

Field	Description
AudN[15:8]	HDMI Audio Clock Regenerator N value

### 34.5.231 Audio Clock Regenerator N Value Register 3 (HDMI\_AUD\_N3)

For N expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3202
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3202h offset = 12\_3202h

**HDMI\_AUD\_N3 field descriptions**

Field	Description
7-4 -	This field is reserved. Reserved
AudN[19:16]	HDMI Audio Clock Regenerator N value

### 34.5.232 AUD\_CTS1 (HDMI\_AUD\_CTS1)

For CTS expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3203
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3203h offset = 12\_3203h

**HDMI\_AUD\_CTS1 field descriptions**

Field	Description
audCTS[7:0]	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

### 34.5.233 AUD\_CTS2 (HDMI\_AUD\_CTS2)

For CTS expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3204
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3204h offset = 12\_3204h

**HDMI\_AUD\_CTS2 field descriptions**

Field	Description
audCTS[15:8]	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

### 34.5.234 AUD\_CTS3 (HDMI\_AUD\_CTS3)

For CTS expected values, refer to the HDMI 1.4a specification.

- Address Offset: 0x3205
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3205h offset = 12\_3205h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				audCTS[19:16]			
Write	Reserved				audCTS[19:16]			
Reset	0	0	0	0	0	0	0	0

**HDMI\_AUD\_CTS3 field descriptions**

Field	Description
7-4 -	This field is reserved. Reserved
audCTS[19:16]	HDMI Audio Clock Regenerator CTS calculated value. This value can be manually set using the CTS_manual (AUD_CTS3) mechanism.

### 34.5.235 Audio DMA Start Register (HDMI\_AHB\_DMA\_CONF0)

This register contains the software reset bit for the audio FIFOs. It also configures operating modes of the AHB master.

- Address Offset: 0x3600
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3600h offset = 12\_3600h

Bit	7	6	5	4	3	2	1	0	
Read	sw_fifo_rst	Reserved			hbr	enable_hlock	incr_type[1:0]		burst_mode
Write	sw_fifo_rst	Reserved			hbr	enable_hlock	incr_type[1:0]		burst_mode
Reset	0	0	0	0	0	0	0	0	

**HDMI\_AHB\_DMA\_CONF0 field descriptions**

Field	Description
7 sw_fifo_rst	This is the software reset bit for the audio and FIFOs clear. Writing 0'b does not result in any action.

*Table continues on the next page...*

**HDMI\_AHB\_DMA\_CONF0 field descriptions (continued)**

Field	Description
	Writing 1'b to this register resets all audio FIFOs. Reading from this register always returns 0'b.
6–5 -	This field is reserved. Reserved
4 hbr	HBR packets enable. The HDMI TX sends the HBR packets. This bit is enabled when the audio frequency is higher than 192 KHz. If this bit is enabled, the number of channels configured in AHB_DMA_CONF1 is always 8.
3 enable_hlock	Enable request of locked burst AHB mechanism. 1 Enables the usage of ohlock for master request to arbiter of a locked complete burst. 0 Disables request of locked burst AHB mechanism
2–1 incr_type[1:0]	Forced size burst mode. 00 Corresponds to INCR4 fixed four beat incremental AHB burst mode. Only valid when burst_mode is high. 01 Corresponds to INCR8 fixed eight beat incremental AHB burst mode. Only valid when burst_mode is high. 10 Corresponds to INCR16 fixed 16 beat incremental AHB burst mode. Only valid when burst_mode is high. 11 Corresponds to INCR16 fixed 16 beat incremental AHB burst mode. Only valid when burst_mode is high.
0 burst_mode	Burst mode bit 1 Forces the burst mode to be fixed beat incremental burst mode designated by the incr_type[1:0] signal. 0 Normal operation is unspecified length incremental burst. It corresponds to INCR AHB burst mode.

**34.5.236 AHB\_DMA\_START (HDMI\_AHB\_DMA\_START)**

The data\_buffer\_ready bit field signals the AHB audio DMA to start accessing system memory in order to fetch data samples to store in the FIFO. After the operation starts, a new request for a DMA start is ignored until the DMA is stopped or it reaches the end address. Only in one of these situations will a new start request be acknowledged.

The first DMA burst request after data\_buffer\_ready configuration uses the initial\_addr[31:0] as the ohaddr[31:0] and the MBURSTLENGTH[10:0] = AUDIO\_FIFO\_DEPTH if AUDIO\_FIFO\_DEPTH < 1024 or MBURSTLENGTH[10:0] = 1024 if AUDIO\_FIFO\_DEPTH >= 1024.

- Address Offset: 0x3601
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3601h offset = 12\_3601h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							data_buffer_
Write	Reserved							ready
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_START field descriptions**

Field	Description
7-1 -	This field is reserved. Reserved
0 data_buffer_ ready	Data buffer ready

**34.5.237 Audio DMA Stop Register (HDMI\_AHB\_DMA\_STOP)**

The stop\_dma\_transaction bit field signals the AHB audio DMA to stop current memory access. After it stops, if a new start DMA operation is requested, the DMA engine restarts the memory access assuming the initial\_addr[31:0] is programmed at AHB\_DMA\_STRADDR0 to AHB\_DMA\_STRADDR3.

- Address Offset: 0x3602
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3602h offset = 12\_3602h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							stop_dma_
Write	Reserved							transaction
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_STOP field descriptions**

Field	Description
7-1 -	This field is reserved. Reserved
0 stop_dma_ transaction	Stop DMA transaction

### 34.5.238 Audio DMA FIFO Threshold Register (HDMI\_AHB\_DMA\_THRSLD)

This register defines the FIFO medium threshold occupation value.

After the AHB master successfully completes a burst transaction, the FIFO may stay remain full until the data fetch interface requests samples. The sample request from the FIFO using the data fetch mechanism drops the number of samples stored in the audio FIFO.

As soon as the number of samples in the FIFO drops lower than the `fifo_threshold[7:0]`, the DMA engine requests a new burst of samples to the AHB master with a size (`MBURSTLENGTH[10:0]`) equal to `AUDIO_FIFO_DEPTH` minus `fifo_threshold[7:0]`.

Therefore, the `fifo_threshold[7:0]` is the medium number of samples that should be available in the audio FIFO across the DMA operation.

- Address Offset: 0x3603
- Size: 8 bits
- Value after Reset: 0x04
- Access: Read/Write

Address: 12\_0000h base + 3603h offset = 12\_3603h

**HDMI\_AHB\_DMA\_THRSLD field descriptions**

Field	Description
fifo_threshold[7]	FIFO medium threshold occupation value

### 34.5.239 Audio DMA Start Address Register 0 (HDMI\_AHB\_DMA\_STRADDR0)

These registers define the `initial_addr[31:0]` used to initiate the DMA burst read transactions upon `data_buffer_ready` configuration.

- Address Offset: 0x3604 to 0x3607
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3604h offset = 12\_3604h

Bit	7	6	5	4	3	2	1	0
Read	initial_addr[7]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_STRADDR0 field descriptions**

Field	Description
initial_addr[7]	Defines init_addr[7:0] for bits 7-0 to initiate DMA burst transactions

**34.5.240 Audio DMA Start Address Register 1 (HDMI\_AHB\_DMA\_STRADDR1)**

Address: 12\_0000h base + 3605h offset = 12\_3605h

Bit	7	6	5	4	3	2	1	0
Read	initial_addr[15]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_STRADDR1 field descriptions**

Field	Description
initial_addr[15]	Defines init_addr[15:8] for bits 7-0 to initiate DMA burst transactions

**34.5.241 Audio DMA Start Address Register 2 (HDMI\_AHB\_DMA\_STRADDR2)**

Address: 12\_0000h base + 3606h offset = 12\_3606h

Bit	7	6	5	4	3	2	1	0
Read	initial_addr[23]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_STRADDR2 field descriptions**

Field	Description
initial_addr[23]	Defines init_addr[23:16] for bits 7-0 to initiate DMA burst transactions

### 34.5.242 Audio DMA Start Address Register 3 (HDMI\_AHB\_DMA\_STRADDR3)

Address: 12\_0000h base + 3607h offset = 12\_3607h

Bit	7	6	5	4	3	2	1	0
Read	initial_addr[31]							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_AHB\_DMA\_STRADDR3 field descriptions

Field	Description
initial_addr[31]	Defines init_addr[31:24] for bits 7-0 to initiate DMA burst transactions

### 34.5.243 Audio DMA Stop Address Register 0 (HDMI\_AHB\_DMA\_STPADDR0)

This registers define the final\_addr[31:0] used as the final point to the DMA burst read transactions.

Upon data\_buffer\_ready configuration, the DMA engine starts requesting burst reads from the external system memory. Each burst read can have a maximum theoretical length of 1024 words (due to the AMBA AHB specification restriction). As an example, if the first burst transaction of the AHB audio DMA has a length of 16, then the second burst starts at address ohaddr[31:0] = initial\_addr[31:0] + 16 and has a length of MBURSTLENGTH[10:0] = AUDIO\_FIFO\_DEPTH - fifo\_threshold[7:0].

The DMA engine is responsible for incrementing the burst starting address and defining its corresponding burst length to reach the final\_addr[31:0] address. The last burst request issued by the DMA engine takes into account that it should only request data until the final\_addr[31:0] address (included) and for that should calculate the correct burst length.

After reaching the final\_addr[31:0] address, the done interrupt is active to signal completion of DMA operation.

- Address Offset: 0x3608 to 0x360B
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3608h offset = 12\_3608h

Bit	7	6	5	4	3	2	1	0
Read	final_addr[7]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_STPADDR0 field descriptions**

Field	Description
final_addr[7]	Defines final_addr[7:0] for bits 7-0 to initiate DMA burst transactions

**34.5.244 Audio DMA Stop Address Register 1 (HDMI\_AHB\_DMA\_STPADDR1)**

Address: 12\_0000h base + 3609h offset = 12\_3609h

Bit	7	6	5	4	3	2	1	0
Read	final_addr[15]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_STPADDR1 field descriptions**

Field	Description
final_addr[15]	Defines final_addr[15:8] for bits 7-0 to initiate DMA burst transactions

**34.5.245 Audio DMA Stop Address Register 2 (HDMI\_AHB\_DMA\_STPADDR2)**

Address: 12\_0000h base + 360Ah offset = 12\_360Ah

Bit	7	6	5	4	3	2	1	0
Read	final_addr[23]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_STPADDR2 field descriptions**

Field	Description
final_addr[23]	Defines final_addr[23:16] for bits 7-0 to initiate DMA burst transactions

### 34.5.246 Audio DMA Stop Address Register 3 (HDMI\_AHB\_DMA\_STPADDR3)

Address: 12\_0000h base + 360Bh offset = 12\_360Bh

HDMI\_AHB\_DMA\_STPADDR3 field descriptions

Field	Description
final_addr[31]	Defines final_addr[31:24] for bits 7-0 to initiate DMA burst transactions

### 34.5.247 Audio DMA Burst Start Address Register 0 (HDMI\_AHB\_DMA\_BSTADDR0)

This read-only register composes the start address of the current burst operation. As an example, if the first burst transaction of the AHB audio DMA as a length of 16, then the second burst should start at address  $ohaddr[31:0] = initial\_addr[31:0] + 16$ . While this burst is being executed,  $burst\_start\_addr[31:0] = haddr[31:0] = initial\_addr[31:0] + 16$ .

- Address Offset: 0x360C to 0x360F
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 360Ch offset = 12\_360Ch

HDMI\_AHB\_DMA\_BSTADDR0 field descriptions

Field	Description
burst_start[7]	Start address for the current burst operation

### 34.5.248 Audio DMA Burst Start Address Register 1 (HDMI\_AHB\_DMA\_BSTADDR1)

Address: 12\_0000h base + 360Dh offset = 12\_360Dh

Bit	7	6	5	4	3	2	1	0
Read	burst_start[15]							
Write								
Reset	0	0	0	0	0	0	0	0

HDMI\_AHB\_DMA\_BSTADDR1 field descriptions

Field	Description
burst_start[15]	Start address for the current burst operation

### 34.5.249 Audio DMA Burst Start Address Register 2 (HDMI\_AHB\_DMA\_BSTADDR2)

Address: 12\_0000h base + 360Eh offset = 12\_360Eh

Bit	7	6	5	4	3	2	1	0
Read	burst_start[23]							
Write								
Reset	0	0	0	0	0	0	0	0

HDMI\_AHB\_DMA\_BSTADDR2 field descriptions

Field	Description
burst_start[23]	Start address for the current burst operation

### 34.5.250 Audio DMA Burst Start Address Register 3 (HDMI\_AHB\_DMA\_BSTADDR3)

Address: 12\_0000h base + 360Fh offset = 12\_360Fh

Bit	7	6	5	4	3	2	1	0
Read	burst_start[31]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_AHB\_DMA\_BSTADDR3 field descriptions**

Field	Description
burst_start[31]	Start address for the current burst operation

**34.5.251 Audio DMA Burst Length Register 0 (HDMI\_AHB\_DMA\_MBLENGTH0)**

These registers hold the length of the current burst operation. As an example, if the first burst transaction of the AHB audio DMA is a length of 8, then the second burst should start at address  $ohaddr[31:0] = initial\_addr[31:0] + 8$ . It will also have length  $MBURSTLENGTH[10:0] = AUDIO\_FIFO\_DEPTH - fifo\_threshold[7:0]$  while this burst is being executed,  $MBURSTLENGTH[10:0] = AUDIO\_FIFO\_DEPTH - fifo\_threshold[7:0]$ .

- Address Offset: 0x3610 to 0x3611
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3610h offset = 12\_3610h

**HDMI\_AHB\_DMA\_MBLENGTH0 field descriptions**

Field	Description
MBURSTLENGTH7	Requested burst length

### 34.5.252 Audio DMA Burst Length Register 1 (HDMI\_AHB\_DMA\_MBLENGTH1)

Address: 12\_0000h base + 3611h offset = 12\_3611h

Bit	7	6	5	4
Read	Reserved			
Write	Reserved			
Reset	0	0	0	0
Bit	3	2	1	0
Read	Reserved	MBURSTLENGTH10	MBURSTLENGTH9	MBURSTLENGTH8
Write	Reserved	Reserved	Reserved	Reserved
Reset	0	0	0	0

HDMI\_AHB\_DMA\_MBLENGTH1 field descriptions

Field	Description
7–3 -	This field is reserved. Reserved
2 MBURSTLENGTH10	Requested burst length
1 MBURSTLENGTH9	Requested burst length
0 MBURSTLENGTH8	Requested burst length

### 34.5.253 Audio DMA Interrupt Status Register (HDMI\_AHB\_DMA\_STAT)

This register contains the status bits of the following interrupts:

- Address Offset: 0x3612
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3612h offset = 12\_3612h

Bit	7	6	5	4
Read	statdone	statretrysplit	statlostownership	staterror
Write	Reserved	Reserved	Reserved	Reserved
Reset	0	0	0	0

## HDMI Memory Map/Register Definition

Bit	3	2	1	0
Read	Reserved	statthrfifoempty	statfifofull	statfifoeempty
Write				
Reset	0	0	0	0

### HDMI\_AHB\_DMA\_STAT field descriptions

Field	Description
7 statdone	Status of DMA end of operation interrupt. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated.
6 statrettrysplit	Status of retry/split interrupt. Active when AHB master receives a RETRY or SPLIT response from slave.
5 statlostownership	Status of master lost ownership when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer.
4 staterror	Status of error interrupt. Active when slave indicates error through the isresp[1:0].
3 -	This field is reserved. Reserved
2 statthrfifoempty	Status of audio FIFO empty when audio FIFO has less than four samples.
1 statfifofull	Status of audio FIFO full interrupt.
0 statfifoeempty	Status of audio FIFO empty interrupt.

## 34.5.254 Audio DMA Interrupt Register (HDMI\_AHB\_DMA\_INT)

This register contains the interrupt bits of the following interrupts:

- Address Offset: 0x3613
- Size: 8 bits per register
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3613h offset = 12\_3613h

Bit	7	6	5	4
Read	intdone	intrettrysplit	intlostownership	interror
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	Reserved	intthrfifoempty	intfifofull	intfifoeempty
Write				
Reset	0	0	0	0

## HDMI\_AHB\_DMA\_INT field descriptions

Field	Description
7 intdone	DMA end of operation interrupt. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated.
6 intretrysplit	Retry/split interrupt. Active when AHB master receives a RETRY or SPLIT response from slave.
5 intlostownership	Master lost ownership interrupt when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer.
4 interror	Error interrupt. Active when slave indicates error through the isresp[1:0].
3 -	This field is reserved. Reserved
2 intthrfifoempty	Audio FIFO empty interrupt when audio FIFO has less than four samples.
1 intfifofull	Audio FIFO full interrupt.
0 intfifoeempty	Audio FIFO empty interrupt.

### 34.5.255 Audio DMA Mask Interrupt Register (HDMI\_AHB\_DMA\_MASK)

Mask for each of the interrupts present in the AHB audio DMA module. For usage information, see [Audio DMA Interrupt Register \(HDMI\\_AHB\\_DMA\\_INT\)](#) ."

- Address Offset: 0x3614
- Size: 8 bits per register
- Value after Reset: 0xF7
- Access: Read/Write

Address: 12\_0000h base + 3614h offset = 12\_3614h

Bit	7	6	5	4
Read	done_mask	retrysplit_mask	lostownership_mask	error_mask
Write				
Reset	0	0	0	1
Bit	3	2	1	0
Read	Reserved	fifo_threempty_mask	fifo_full_mask	fifo_empty_mask
Write				
Reset	0	0	0	1

## HDMI\_AHB\_DMA\_MASK field descriptions

Field	Description
7 done_mask	DMA end of operation interrupt mask. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated.

Table continues on the next page...

**HDMI\_AHB\_DMA\_MASK field descriptions (continued)**

Field	Description
6 retrysplit_mask	Retry/split interrupt mask. Active when AHB master receives a RETRY or SPLIT response from slave.
5 lostownership_mask	Master lost ownership interrupt mask when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer.
4 error_mask	Error interrupt mask. Active when slave indicates error through the isresp[1:0].
3 -	This field is reserved. Reserved
2 fifo_threempty_mask	Audio FIFO empty interrupt mask when audio FIFO has less than four samples.
1 fifo_full_mask	Audio FIFO full interrupt mask.
0 fifo_empty_mask	Audio FIFO empty interrupt mask.

**34.5.256 Audio DMA Polarity Interrupt Register (HDMI\_AHB\_DMA\_POL)**

Polarity for each of the interrupts present in the AHB audio DMA module. For usage information, see [Audio DMA Interrupt Register \(HDMI\\_AHB\\_DMA\\_INT\)](#) ."

- Address Offset: 0x3615
- Size: 8 bits per register
- Value after Reset: 0xF7
- Access: Read/Write

Address: 12\_0000h base + 3615h offset = 12\_3615h

Bit	7	6	5	4
Read	done_polarity	retrysplit_polarity	lostownership_polarity	error_polarity
Write				
Reset	0	0	0	1
Bit	3	2	1	0
Read	Reserved	fifo_thrfifoempty_polarity	fifo_full_polarity	fifo_empty_polarity
Write				
Reset	0	0	0	1

**HDMI\_AHB\_DMA\_POL field descriptions**

Field	Description
7 done_polarity	DMA end of operation interrupt mask. Active when DMA engine reaches final_addr[15:0] or when stop DMA operation is activated.

*Table continues on the next page...*

## HDMI\_AHB\_DMA\_POL field descriptions (continued)

Field	Description
6 retrysplit_polarity	Retry/split interrupt mask. Active when AHB master receives a RETRY or SPLIT response from slave.
5 lostownership_polarity	Master lost ownership interrupt mask when in burst transfer. Active when AHB master loses BUS ownership within the course of a burst transfer.
4 error_polarity	Error interrupt mask. Active when slave indicates error through the isresp[1:0].
3 -	This field is reserved. Reserved
2 fifo_thrifoempty_polarity	Audio FIFO empty interrupt mask when audio FIFO has less than four samples.
1 fifo_full_polarity	Audio FIFO full interrupt mask.
0 fifo_empty_polarity	Audio FIFO empty interrupt mask.

### 34.5.257 Audio DMA Channel Enable Configuration Register 1 (HDMI\_AHB\_DMA\_CONF1)

- Address Offset: 0x3616
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 3616h offset = 12\_3616h

Bit	7	6	5	4	3	2	1	0
Read	CH_IN_EN7	CH_IN_EN6	CH_IN_EN5	CH_IN_EN4	CH_IN_EN3	CH_IN_EN2	CH_IN_EN1	CH_IN_EN0
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_AHB\_DMA\_CONF1 field descriptions

Field	Description
7 CH_IN_EN7	Channel 7 enable bit 1 Channel enabled 0 Channel disabled
6 CH_IN_EN6	Channel 6 enable bit 1 Channel enabled 0 Channel disabled

Table continues on the next page...

**HDMI\_AHB\_DMA\_CONF1 field descriptions (continued)**

Field	Description
5 CH_IN_EN5	Channel 5 enable bit 1 Channel enabled 0 Channel disabled
4 CH_IN_EN4	Channel 4 enable bit 1 Channel enabled 0 Channel disabled
3 CH_IN_EN3	Channel 3 enable bit 1 Channel enabled 0 Channel disabled
2 CH_IN_EN2	Channel 2 enable bit 1 Channel enabled 0 Channel disabled
1 CH_IN_EN1	Channel 1 is always enabled.
0 CH_IN_EN0	Channel 0 is always enabled.

**34.5.258 Audio DMA Buffer Interrupt Status Register (HDMI\_AHB\_DMA\_BUFFSTAT)**

- Address Offset: 0x3617
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3617h offset = 12\_3617h

**HDMI\_AHB\_DMA\_BUFFSTAT field descriptions**

Field	Description
7-2 -	This field is reserved. Reserved
1 buff_full	Buffer full flag status

*Table continues on the next page...*

**HDMI\_AHB\_DMA\_BUFFSTAT field descriptions (continued)**

Field	Description
0 buff_empty	Buffer empty flag status

**34.5.259 Audio DMA Buffer Interrupt Register (HDMI\_AHB\_DMA\_BUFFINT)**

- Address Offset: 0x3618
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 3618h offset = 12\_3618h

**HDMI\_AHB\_DMA\_BUFFINT field descriptions**

Field	Description
7-2 -	This field is reserved. Reserved
1 int_buff_full	Buffer full flag interrupt
0 int_buff_empty	Buffer empty flag interrupt

### 34.5.260 Audio DMA Buffer Mask Interrupt Register (HDMI\_AHB\_DMA\_BUFFMASK)

- Address Offset: 0x3619
- Size: 8 bits
- Value after Reset: 0x03
- Access: Read/Write

Address: 12\_0000h base + 3619h offset = 12\_3619h

HDMI\_AHB\_DMA\_BUFFMASK field descriptions

Field	Description
7-2 -	This field is reserved. Reserved
1 int_buff_full	Buffer full flag mask
0 int_buff_empty	Buffer empty flag mask

### 34.5.261 Audio DMA Buffer Polarity Interrupt Register (HDMI\_AHB\_DMA\_BUFFPOL)

- Address Offset: 0x361A
- Size: 8 bits
- Value after Reset: 0x03
- Access: Read/Write

Address: 12\_0000h base + 361Ah offset = 12\_361Ah

## HDMI\_AHB\_DMA\_BUFFPOL field descriptions

Field	Description
7-2 -	This field is reserved. Reserved
1 int_buff_full	Buffer full flag polarity
0 int_buff_empty	Buffer empty flag polarity

### 34.5.262 Main Controller Synchronous Clock Domain Disable Register (HDMI\_MC\_CLKDIS)

Main controller synchronous disable control per clock domain. Upon release of synchronous disable the corresponding sw reset NRZ request signal, to that domain, is toggled asking to the output for a synchronized active low reset to be generated to that domain.

- Address Offset: 0x4001
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI\_MC\_CLKDIS field descriptions

Field	Description
7 -	This field is reserved. Reserved
6 hdcclk_disable	This field is reserved. Reserved
5 cecclk_disable	CEC Engine clock synchronous disable signal.
4 cscclk_disable	Color Space Converter clock synchronous disable signal.
3 audclk_disable	Audio Sampler clock synchronous disable signal.
2 prepclk_disable	Pixel Repetition clock synchronous disable signal.

Table continues on the next page...

**HDMI\_MC\_CLKDIS field descriptions (continued)**

Field	Description
1 tmdsclk_disable	TMDS clock synchronous disable signal.
0 pixelclk_disable	Pixel clock synchronous disable signal.

**34.5.263 Main Controller Software Reset Register (HDMI\_MC\_SWRSTZREQ)**

Main controller software reset request per clock domain. Writing zero to a bit of this register results in an NRZ signal toggle at sfrclk rate to an output signal that indicates a software reset request. This toggle must be used to generate a synchronized reset to de corresponding domain, with at least 1 clock cycle. Register defaults back to 0xFF.

- Address Offset: 0x4002
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

Address: 12\_0000h base + 4002h offset = 12\_4002h

Bit	7	6	5	4
Read	Reserved	cecswrst_req	Reserved	
Write				
Reset	1	1	1	1
Bit	3	2	1	0
Read	Reserved	prepswrst_req	tmdsswrst_req	pixelswrst_req
Write				
Reset	1	1	1	1

**HDMI\_MC\_SWRSTZREQ field descriptions**

Field	Description
7 -	This field is reserved. Reserved
6 cecswrst_req	CEC software reset request. Defaults back to 1b after reset request.
5-3 -	This field is reserved. Reserved
2 prepswrst_req	Pixel Repetition clock synchronous disable signal.
1 tmdsswrst_req	TMDS software reset request. Defaults back to 1b after reset request.
0 pixelswrst_req	Pixel software reset request. Defaults back to 1b after reset request.

### 34.5.264 Main Controller Feed Through Control Register (HDMI\_MC\_FLOWCTRL)

- Address Offset: 0x4004
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4004h offset = 12\_4004h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							Feed_
Write	Reserved							through_off
Reset	0	0	0	0	0	0	0	0

#### HDMI\_MC\_FLOWCTRL field descriptions

Field	Description
7-1 -	This field is reserved. Reserved
0 Feed_through_off	Video path Feed Through enable bit: 1 Color Space Converter is in the video data path. 0 Color Space Converter is bypassed (not in the video data path).

### 34.5.265 Main Controller PHY Reset Register (HDMI\_MC\_PHYRSTZ)

- Address Offset: 0x4005
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4005h offset = 12\_4005h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							phyrstz
Write	Reserved							phyrstz
Reset	0	0	0	0	0	0	0	0

**HDMI\_MC\_PHYRSTZ field descriptions**

Field	Description
7-1 -	This field is reserved. Reserved
0 phyrstz	HDMI Source PHY active low reset control.

**34.5.266 Main Controller Clock Present Register (HDMI\_MC\_LOCKONCLOCK)**

- Address Offset: 0x4006
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Clear on Write

Address: 12\_0000h base + 4006h offset = 12\_4006h

**HDMI\_MC\_LOCKONCLOCK field descriptions**

Field	Description
7 -	This field is reserved. Reserved.
6 pclk	Pixel clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
5 tlktclk	TMDS clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position
4 prepclk	Pixel repetition clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.
3-1 -	This field is reserved. Reserved.
0 cecclk	CEC clock status. Indicates that the clock is present in the system. Cleared by WR 1 to this position.

### 34.5.267 Main Controller HEAC PHY Reset Register (HDMI\_MC\_HEACPHY\_RST)

- Address Offset: 0x4007
- Size: 8 bits
- Value after Reset: N/A
- Access: Read/Write

Address: 12\_0000h base + 4007h offset = 12\_4007h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							heacphyrst
Write	Reserved							heacphyrst
Reset	0	0	0	0	0	0	0	0

HDMI\_MC\_HEACPHY\_RST field descriptions

Field	Description
7-1 -	This field is reserved. Reserved
0 heacphyrst	HEAC PHY reset (active high)

### 34.5.268 Color Space Converter Interpolation and Decimation Configuration Register (HDMI\_CSC\_CFG)

Color Space Conversion configuration register. Configures YCC422 to YCC444 interpolation mode and YCC444 to YCC422 decimation mode.

- Address Offset: 0x4100
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4100h offset = 12\_4100h

Bit	7	6	5	4	3	2	1	0
Read	Reserved			INTMODE	Reserved		DECMODE	
Write	Reserved			INTMODE	Reserved		DECMODE	
Reset	0	0	0	0	0	0	0	0

HDMI\_CSC\_CFG field descriptions

Field	Description
7-6 -	This field is reserved. Reserved
5-4 INTMODE	Chroma interpolation configuration: 00 interpolation disabled 01 $H_u(z) = 1 + z^{-1}$ 10 $H_u(z) = 1/2 + Z^{-1} + 1/2 z^{-2}$ 11 interpolation disabled.
3-2 -	This field is reserved. Reserved
DECMODE	Chroma decimation configuration: DECMODE[1:0] Chroma decimation 00 decimation disabled 01 $H_d(z) = 1$ 10 $H_d(z) = 1/4 + 1/2z^{-1} + 1/4z^{-2}$ 11 $H_d(z) = 1/4 + 1/2z^{-1} + 1/4z^{-2} + 1/2z^{-3} + 1/4z^{-4} + 1/2z^{-5} + 1/4z^{-6} + 1/2z^{-7} + 1/4z^{-8} + 1/2z^{-9} + 1/4z^{-10} + 1/2z^{-11} + 1/4z^{-12} + 1/2z^{-13} + 1/4z^{-14} + 1/2z^{-15} + 1/4z^{-16} + 1/2z^{-17} + 1/4z^{-18} + 1/2z^{-19} + 1/4z^{-20} + 1/2z^{-21} + 1/4z^{-22} + 1/2z^{-23} + 1/4z^{-24} + 1/2z^{-25} + 1/4z^{-26} + 1/2z^{-27} + 1/4z^{-28} + 1/2z^{-29} + 1/4z^{-30}$

34.5.269 Color Space Converter Scale and Deep Color Configuration Register (HDMI\_CSC\_SCALE)

- Address Offset: 0x4101
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

$$\begin{bmatrix} G \\ R \\ B \end{bmatrix} = 2^{csc\ scale - 12} \times \begin{bmatrix} A_1 & A_2 & A_3 \\ B_1 & B_2 & B_3 \\ C_1 & C_2 & C_3 \end{bmatrix} + 2^{csc\ scale} \times \begin{bmatrix} A_4 \\ B_4 \\ C_4 \end{bmatrix}$$

$$\begin{bmatrix} Y \\ Cb \\ Cr \end{bmatrix} = 2^{cscscale - 12} \times \begin{bmatrix} A_1 & A_2 & A_3 \\ B_1 & B_2 & B_3 \\ C_1 & C_2 & C_3 \end{bmatrix} + 2^{cscscale} \times \begin{bmatrix} A_4 \\ B_4 \\ C_4 \end{bmatrix}$$

Figure 34-286. CSC Conversion Functions

Address: 12\_0000h base + 4101h offset = 12\_4101h

Bit	7	6	5	4	3	2	1	0
Read	csc_colorde_pt[3:0]				Reserved		-	
Write								
Reset	0	0	0	0	0	0	0	1

**HDMI\_CSC\_SCALE field descriptions**

Field	Description
7-4 csc_colorde_pt[3:0]	Color space converter color depth configuration: Other: Reserved.  0000 24 bit per pixel video (8 bit per component). 0100 24 bit per pixel video (8 bit per component). 0101 30 bit per pixel video (10 bit per component). 0110 36 bit per pixel video (12 bit per component). 0111 48 bit per pixel video (16 bit per component).
3-2 -	This field is reserved. Reserved
-	Defines the cscscale[1:0] scale factor to apply to all coefficients in Color Space Conversion. This scale factor is expressed in the number of left shifts to apply to each of the coefficients, ranging from 0 to 2.

**34.5.270 CSC\_COEF\_A1\_MSB (HDMI\_CSC\_COEF\_A1\_MSB)**

Color Space Conversion A1 coefficient.

- Address Offset: 0x4102
- Size: 8 bits
- Value after Reset: 0x20
- Access: Read/Write

Address: 12\_0000h base + 4102h offset = 12\_4102h

Field	Description
CSC_COEF_A3_MSB	Color Space Conversion A3 MSB coefficient.

### 34.5.275 CSC\_COEF\_A3\_LSB (HDMI\_CSC\_COEF\_A3\_LSB)

Color Space Conversion A3 coefficient.

- Address Offset: 0x4107
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 4107h offset = 12\_4107h

### HDMI\_CSC\_COEF\_A3\_LSB field descriptions

Field	Description
CSC_COEF_A3_LSB	Color Space Conversion A3 LSB coefficient.

## 34.5.276 CSC\_COEF\_A4\_MSB (HDMI\_CSC\_COEF\_A4\_MSB)

Color Space Conversion A4 coefficient.

- Address Offset: 0x4108
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4108h offset = 12\_4108h

### HDMI\_CSC\_COEF\_A4\_MSB field descriptions

Field	Description
CSC_COEF_A4_MSB	Color Space Conversion A4 MSB coefficient.

## 34.5.277 CSC\_COEF\_A4\_LSB (HDMI\_CSC\_COEF\_A4\_LSB)

Color Space Conversion A4 coefficient.

- Address Offset: 0x4109
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4109h offset = 12\_4109h

**HDMI\_CSC\_COEF\_A4\_LSB field descriptions**

Field	Description
CSC_COEF_A4_LSB	Color Space Conversion A4 LSB coefficient.

**34.5.278 CSC\_COEF\_B1\_MSB (HDMI\_CSC\_COEF\_B1\_MSB)**

Color Space Conversion B1 coefficient.

- Address Offset: 0x410A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 410Ah offset = 12\_410Ah

**HDMI\_CSC\_COEF\_B1\_MSB field descriptions**

Field	Description
CSC_COEF_B1_MSB	Color Space Conversion B1 MSB coefficient.

**34.5.279 CSC\_COEF\_B1\_LSB (HDMI\_CSC\_COEF\_B1\_LSB)**

Color Space Conversion B1 coefficient.

- Address Offset: 0x410B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 410Bh offset = 12\_410Bh

### HDMI\_CSC\_COEF\_B1\_LSB field descriptions

Field	Description
CSC_COEF_B1_LSB	Color Space Conversion B1 LSB coefficient.

## 34.5.280 CSC\_COEF\_B2\_MSB (HDMI\_CSC\_COEF\_B2\_MSB)

Color Space Conversion B2 coefficient.

- Address Offset: 0x410C
- Size: 8 bits
- Value after Reset: 0x20
- Access: Read/Write

Address: 12\_0000h base + 410Ch offset = 12\_410Ch

### HDMI\_CSC\_COEF\_B2\_MSB field descriptions

Field	Description
CSC_COEF_B2_MSB	Color Space Conversion B2 MSB coefficient.

## 34.5.281 CSC\_COEF\_B2\_LSB (HDMI\_CSC\_COEF\_B2\_LSB)

Color Space Conversion B2 coefficient.

- Address Offset: 0x410D
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 410Dh offset = 12\_410Dh

**HDMI\_CSC\_COEF\_B2\_LSB field descriptions**

Field	Description
CSC_COEF_B2_LSB	Color Space Conversion B2 LSB coefficient.

**34.5.282 CSC\_COEF\_B3\_MSB (HDMI\_CSC\_COEF\_B3\_MSB)**

Color Space Conversion B3 coefficient.

- Address Offset: 0x410E
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 410Eh offset = 12\_410Eh

**HDMI\_CSC\_COEF\_B3\_MSB field descriptions**

Field	Description
CSC_COEF_B3_MSB	Color Space Conversion B3 MSB coefficient.

**34.5.283 CSC\_COEF\_B3\_LSB (HDMI\_CSC\_COEF\_B3\_LSB)**

Color Space Conversion B3 coefficient.

- Address Offset: 0x410F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 410Fh offset = 12\_410Fh

### HDMI\_CSC\_COEF\_B3\_LSB field descriptions

Field	Description
CSC_COEF_B3_LSB	Color Space Conversion B3 LSB coefficient.

## 34.5.284 CSC\_COEF\_B4\_MSB (HDMI\_CSC\_COEF\_B4\_MSB)

Color Space Conversion B4 coefficient.

- Address Offset: 0x4110
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4110h offset = 12\_4110h

### HDMI\_CSC\_COEF\_B4\_MSB field descriptions

Field	Description
CSC_COEF_B4_MSB	Color Space Conversion B4 MSB coefficient.

## 34.5.285 CSC\_COEF\_B4\_LSB (HDMI\_CSC\_COEF\_B4\_LSB)

Color Space Conversion B4 coefficient.

- Address Offset: 0x4111
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4111h offset = 12\_4111h

**HDMI\_CSC\_COEF\_B4\_LSB field descriptions**

Field	Description
CSC_COEF_B4_LSB	Color Space Conversion B4 LSB coefficient.

**34.5.286 CSC\_COEF\_C1\_MSB (HDMI\_CSC\_COEF\_C1\_MSB)**

Color Space Conversion C1 coefficient.

- Address Offset: 0x4112
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4112h offset = 12\_4112h

**HDMI\_CSC\_COEF\_C1\_MSB field descriptions**

Field	Description
CSC_COEF_C1_MSB	Color Space Conversion C1 MSB coefficient.

**34.5.287 CSC\_COEF\_C1\_LSB (HDMI\_CSC\_COEF\_C1\_LSB)**

Color Space Conversion C1 coefficient.

- Address Offset: 0x4113
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 4113h offset = 12\_4113h

Read	CSC_COEFC4_MSB							
Write	CSC_COEFC4_MSB							
Reset	0	0	0	0	0	0	0	0

### HDMI\_CSC\_COEFC4\_MSB field descriptions

Field	Description
CSC_COEFC4_MSB	Color Space Conversion C4 MSB coefficient.

## 34.5.293 CSC\_COEFC4\_LSB (HDMI\_CSC\_COEFC4\_LSB)

Color Space Conversion C4 coefficient.

- Address Offset: 0x4119
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 4119h offset = 12\_4119h

**HDMI\_CSC\_COEFC4\_LSB field descriptions**

Field	Description
CSC_COEFC4_LSB	Color Space Conversion C4 LSB coefficient.

**34.5.294 CEC\_CTRL (HDMI\_CEC\_CTRL)**

CEC registers control the CEC feature that is implemented in HDMI TX. They perform various functions like controlling, monitoring, and buffering data for the transmitter and the receiver.

This register handles the main control of the CEC initiator.

- Address Offset: 0x7D00
- Size: 8 bits
- Value after Reset: 0x02
- Access: Read/Write

Address: 12\_0000h base + 7D00h offset = 12\_7D00h

**HDMI\_CEC\_CTRL field descriptions**

Field	Description
7-5 -	This field is reserved. Reserved
4 STANDBY	Standby bit 0 CEC controller responds the ACK to all messages. 1 CEC controller responds with ACK to all ping messages (only when the EOM is received) and responds with NACK to all other messages, generating wake-up status for selected opcodes. Attention that the NACK will only be posted on the last block of a frame.
3 BC_NACK	Broadcast NACK bit 0 Reset by software to ACK the received broadcast message. 1 Set by software to NACK the received broadcast message. This bit holds till software resets. The broadcasts will be answered with 1'b0. It means the follower reject the message.

*Table continues on the next page...*

**HDMI\_CEC\_CTRL field descriptions (continued)**

Field	Description
2-1 FRAME_TYP	Frame Type bit 00 Signal Free Time = 3-bit periods. Previous attempt to send frame is unsuccessful. 01 Signal Free Time = 5-bit periods. New initiator wants to send a frame. 10 Signal Free Time = 7-bit periods. Present initiator wants to send another frame immediately after its previous frame. (spec CEC 9.1) 11 Illegal value. If software write this value, hardware will set the value to the default 2'b01.
0 SEND	Send bit 0 Reset to 0 by hardware when the CEC transmission is done (no matter successful or failed). It can also work as an indicator checked by software to see whether the transmission is finished. 1 Set by software to trigger CEC sending a frame as an initiator. This bit keeps at 1 while the transmission is going on.

**34.5.295 CEC\_MASK (HDMI\_CEC\_MASK)**

This read/write register masks/unmasks the interrupt events. When the bit is set to 1 (masked), the corresponding event will not trigger an interrupt signal at the system interface. When the bit is reset to 0, the interrupt event is unmasked.

- Address Offset: 0x7D02
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7D02h offset = 12\_7D02h

Bit	7	6	5	4	3	2	1	0
Read								
Write	Reserved	WAKEUP_MASK	ERROR_FOLL_MASK	ERROR_INIT_MASK	ARB_LOST_MASK	NACK_MASK	EOM_MASK	DONE_MASK
Reset	0	0	0	0	0	0	0	0

**HDMI\_CEC\_MASK field descriptions**

Field	Description
7 -	This field is reserved. Reserved
6 WAKEUP_MASK	Follower wake-up signal mask
5 ERROR_FOLL_MASK	An error is notified by a follower. Abnormal logic data bit error (for follower).

*Table continues on the next page...*

**HDMI\_CEC\_MASK field descriptions (continued)**

Field	Description
4 ERROR_INIT_MASK	An error is detected on cec line (for initiator only).
3 ARB_LOST_MASK	The initiator loses the CEC line arbitration to a second initiator. (specification CEC 9).
2 NACK_MASK	A frame is not acknowledged in a directly addressed message. Or a frame is negatively acknowledged in a broadcast message (for initiator only).
1 EOM_MASK	EOM is detected so that the received data is ready in the receiver data buffer (for follower only).
0 DONE_MASK	The current transmission is successful (for initiator only).

**34.5.296 CEC\_ADDR\_L (HDMI\_CEC\_ADDR\_L)**

CEC\_ADDR\_L and CEC\_ADDR\_H registers indicate the logical address(es) allocated to the CEC device. The logical address mappings are shown in [CEC\\_ADDR\\_L \(HDMI\\_CEC\\_ADDR\\_L\)](#) and [CEC\\_ADDR\\_H \(HDMI\\_CEC\\_ADDR\\_H\)](#). This register is written by software when the logical allocation is finished. Bit value 1 means the corresponding logical address is allocated to this device. Bit value 0 means the corresponding logical address is not allocated to this device.

- Address Offset: 0x7D05
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7D05h offset = 12\_7D05h

Bit	7	6	5	4
Read	CEC_ADDR_L7	CEC_ADDR_L6	CEC_ADDR_L5	CEC_ADDR_L4
Write				
Reset	0	0	0	0
Bit	3	2	1	0
Read	CEC_ADDR_L3	CEC_ADDR_L2	CEC_ADDR_L1	CEC_ADDR_L0
Write				
Reset	0	0	0	0

**HDMI\_CEC\_ADDR\_L field descriptions**

Field	Description
7 CEC_ADDR_L7	Logical address 7 - Tuner 3

*Table continues on the next page...*

**HDMI\_CEC\_ADDR\_L field descriptions (continued)**

Field	Description
6 CEC_ADDR_L6	Logical address 6 - Tuner 2
5 CEC_ADDR_L5	Logical address 5 - Audio System
4 CEC_ADDR_L4	Logical address 4 - Playback Device 1
3 CEC_ADDR_L3	Logical address 3 - Tuner 1
2 CEC_ADDR_L2	Logical address 2 - Recording Device 2
1 CEC_ADDR_L1	Logical address 1 - Recording Device 1
0 CEC_ADDR_L0	Logical address 0 - Device TV

**34.5.297 CEC\_ADDR\_H (HDMI\_CEC\_ADDR\_H)**

CEC\_ADDR\_L and CEC\_ADDR\_H registers indicate the logical address(es) allocated to the CEC device. The logical address mappings are shown in [CEC\\_ADDR\\_L \(HDMI\\_CEC\\_ADDR\\_L\)](#) and [CEC\\_ADDR\\_H \(HDMI\\_CEC\\_ADDR\\_H\)](#). This register is written by software when the logical allocation is finished. Bit value 1 means the corresponding logical address is allocated to this device. Bit value 0 means the corresponding logical address is not allocated to this device.

- Address Offset: 0x7D06
- Size: 8 bits
- Value after Reset: 0x80
- Access: Read/Write

Address: 12\_0000h base + 7D06h offset = 12\_7D06h

Bit	7	6	5	4
Read	CEC_ADDR_H7	CEC_ADDR_H6	CEC_ADDR_H5	CEC_ADDR_H4
Write				
Reset	1	0	0	0
Bit	3	2	1	0
Read	CEC_ADDR_H3	CCEC_ADDR_H2	CEC_ADDR_H1	CEC_ADDR_H0
Write				
Reset	0	0	0	0

## HDMI\_CEC\_ADDR\_H field descriptions

Field	Description
7 CEC_ADDR_H7	Logical address 15 - Unregistered (as initiator address), Broadcast (as destination address)
6 CEC_ADDR_H6	Logical address 14 - Free use
5 CEC_ADDR_H5	Logical address 13 - Reserved
4 CEC_ADDR_H4	Logical address 12 - Reserved
3 CEC_ADDR_H3	Logical address 11 - Playback Device 3
2 CCEC_ADDR_H2	Logical address 10 - Tuner 4
1 CEC_ADDR_H1	Logical address 9 - Playback Device 3
0 CEC_ADDR_H0	Logical address 8 - Playback Device 2

## 34.5.298 CEC\_TX\_CNT (HDMI\_CEC\_TX\_CNT)

This register indicates the size of the frame in bytes (including header and data blocks), which are available in the transmitter data buffer.

When the value is zero, the CEC controller ignores the send command triggered by software. When the transmission is done (no matter success or not), the current value is held until it is overwritten by software.

- Address Offset: 0x7D07
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7D07h offset = 12\_7D07h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				CEC_TX_CNT			
Write	Reserved				CEC_TX_CNT			
Reset	0	0	0	0	0	0	0	0

## HDMI\_CEC\_TX\_CNT field descriptions

Field	Description
7-5 -	This field is reserved. Reserved

Table continues on the next page...

**HDMI\_CEC\_TX\_CNT field descriptions (continued)**

Field	Description
CEC_TX_CNT	CEC Transmitter Counter register: Value after Reset: 5'b00000  0 No data needs to be transmitted. 1 Frame size is 1 byte. 16 Frame size is 16 byte.

**34.5.299 CEC\_RX\_CNT (HDMI\_CEC\_RX\_CNT)**

This register indicates the size of the frame in bytes (including header and data blocks), which are available in the receiver data buffer.

Only after the whole receiving process is finished successfully, the counter is refreshed to the value which indicates the total number of data bytes in the Receiver Data Register.

- Address Offset: 0x7d08
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 7D08h offset = 12\_7D08h

**HDMI\_CEC\_RX\_CNT field descriptions**

Field	Description
7-5 -	
CEC_RX_CNT	CEC Receiver Counter register. Value after Reset: 5'b00000  0 No data received 1 1-byte data is received. 16 16-byte data is received.

### 34.5.300 CEC\_TX\_DATA (HDMI\_CEC\_TX\_DATA<sub>n</sub>)

These registers (8 bit each) are the buffers used for storing the data waiting for transmission(including header and data blocks).

- Address Offset: 0x7D10 .. 0x7D1F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 7D10h offset + (1d × i), where i=0d to 15d

Bit	7	6	5	4	3	2	1	0
Read	CEC_TX_DATA							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_CEC\_TX\_DATA<sub>n</sub> field descriptions

Field	Description
CEC_TX_DATA	Header block in CEC_TX_DATA0 Data blockn in CEC_TX_DATA <sub>n</sub>

### 34.5.301 CEC\_RX\_DATA (HDMI\_CEC\_RX\_DATA<sub>n</sub>)

These registers (8 bit each) are the buffers used for storing the received data (including header and data blocks).

- Address Offset: 0x7D20 .. 0x7D2F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 7D20h offset + (1d × i), where i=0d to 15d

Bit	7	6	5	4	3	2	1	0
Read	CEC_RX_DATA							
Write								
Reset	0	0	0	0	0	0	0	0

#### HDMI\_CEC\_RX\_DATA<sub>n</sub> field descriptions

Field	Description
CEC_RX_DATA	Header block in CEC_RX_DATA0 Data blockn in CEC_RX_DATA <sub>n</sub>

### 34.5.302 CEC\_LOCK (HDMI\_CEC\_LOCK)

- Address Offset: 0x7D30
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7D30h offset = 12\_7D30h

**HDMI\_CEC\_LOCK field descriptions**

Field	Description
7-1 -	This field is reserved. Reserved
0 LOCKED_ BUFFER	When a frame is received, this bit would be active. The CEC controller answers to all the messages with NACK until the CPU writes it to '0'.

### 34.5.303 CEC\_WKUPCTRL (HDMI\_CEC\_WKUPCTRL)

- Address Offset: 0x7D31
- Size: 8 bits
- Value after Reset: 0xFF
- Access: Read/Write

After receiving a message in the CEC\_RX\_DATA1 (OPCODE) registers, the CEC engine verifies the message opcode[7:0] against one of the previously defined values to generate the wake-up status:

Wakeupstatus is 1 when:

received opcode is 0x04 and opcode0x04en is 1 or received opcode is 0x0D and opcode0x0Den is 1 or received opcode is 0x41 and opcode0x41en is 1 or received opcode is 0x42 and opcode0x42en is 1 or received opcode is 0x44 and opcode0x44en is 1 or received opcode is 0x70 and opcode0x70en is 1 or received opcode is 0x82 and opcode0x82en is 1 or received opcode is 0x86 and opcode0x86en is 1

Wakeupstatus is 0 when none of the previous conditions are true.

This formula means that the wake-up status (on CEC\_STAT[6] register) is only '1' if the opcode[7:0] received is equal to one of the defined values and the corresponding enable bit of that defined value is set to '1'.

Address: 12\_0000h base + 7D31h offset = 12\_7D31h

Bit	7	6	5	4
Read	OPCODE0x86en	OPCODE0x82en	OPCODE0x70en	OPCODE0x44en
Write				
Reset	1	1	1	1
Bit	3	2	1	0
Read	OPCODE0x42en	OPCODE0x41en	OPCODE0x0Den	OPCODE0x04en
Write				
Reset	1	1	1	1

### HDMI\_CEC\_WKUPCTRL field descriptions

Field	Description
7 OPCODE0x86en	OPCODE 0x86 wake up enable
6 OPCODE0x82en	OPCODE 0x82 wake up enable
5 OPCODE0x70en	OPCODE 0x70 wake up enable
4 OPCODE0x44en	OPCODE 0x44 wake up enable
3 OPCODE0x42en	OPCODE 0x42 wake up enable
2 OPCODE0x41en	OPCODE 0x41 wake up enable
1 OPCODE0x0Den	OPCODE 0x0D wake up enable
0 OPCODE0x04en	OPCODE 0x04 wake up enable

### 34.5.304 I2CM\_SLAVE (HDMI\_I2CM\_SLAVE)

I2C Master Registers (E-DDC) registers are responsible for the Master's coordination with the Slave, by coordinating the Slave address, data identification, transaction status, acknowledgement, and reset functions.

- Address Offset: 0x7E00
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

## HDMI Memory Map/Register Definition

Address: 12\_0000h base + 7E00h offset = 12\_7E00h

Bit	7	6	5	4	3	2	1	0	
Read	Reserved							slaveaddr[6:0]	
Write	Reserved							slaveaddr[6:0]	
Reset	0	0	0	0	0	0	0	0	

### HDMI\_I2CM\_SLAVE field descriptions

Field	Description
7 -	This field is reserved. Reserved
slaveaddr[6:0]	Slave address to be sent during read and write normal operations.

## 34.5.305 I2CM\_ADDRESS (HDMI\_I2CM\_ADDRESS)

- Address Offset: 0x7E01
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7E01h offset = 12\_7E01h

Bit	7	6	5	4	3	2	1	0	
Read	address[7:0]							address[7:0]	
Write	address[7:0]							address[7:0]	
Reset	0	0	0	0	0	0	0	0	

### HDMI\_I2CM\_ADDRESS field descriptions

Field	Description
address[7:0]	Register address for read and write operations.

## 34.5.306 I2CM\_DATA0 (HDMI\_I2CM\_DATA0)

- Address Offset: 0x7E02
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7E02h offset = 12\_7E02h

Bit	7	6	5	4	3	2	1	0	
Read	data0[7:0]							data0[7:0]	
Write	data0[7:0]							data0[7:0]	
Reset	0	0	0	0	0	0	0	0	

## HDMI\_I2CM\_DATAO field descriptions

Field	Description
datao[7:0]	Data to be written on register pointed by address[7:0].

## 34.5.307 I2CM\_DATAI (HDMI\_I2CM\_DATAI)

- Address Offset: 0x7E03
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read

Address: 12\_0000h base + 7E03h offset = 12\_7E03h

Bit	7	6	5	4	3	2	1	0
Read	datai[7:0]							
Write	Reserved							
Reset	0	0	0	0	0	0	0	0

## HDMI\_I2CM\_DATAI field descriptions

Field	Description
datai[7:0]	Data read from register pointed by address[7:0].

## 34.5.308 I2CM\_OPERATION (HDMI\_I2CM\_OPERATION)

Read and write operation request. This register can only be written, reading this register will always result in 00h. Writing 1'b1 simultaneously to rd, rd\_ext and wr requests is considered as a read (rd) request.

- Address Offset: 0x7E04
- Size: 8 bits
- Value after Reset: 0x00
- Access: Write

Address: 12\_0000h base + 7E04h offset = 12\_7E04h

Bit	7	6	5	4	3	2	1	0	
Read	Reserved				Reserved		Reserved		
Write	Reserved				wr	Reserved		rd_ext	rd
Reset	0	0	0	0	0	0	0	0	

**HDMI\_I2CM\_OPERATION field descriptions**

Field	Description
7-5 -	This field is reserved. Reserved
4 wr	Write operation request.
3-2 -	This field is reserved. Reserved
1 rd_ext	After writing 1'b1 to rd_ext bit a extended data read operation is started (E- DDC read operation).
0 rd	Read operation request.

**34.5.309 I2CM\_INT (HDMI\_I2CM\_INT)**

This register contains and configures I2C master done interrupt.

- Address Offset: 0x7E05
- Size: 8 bits
- Value after Reset: 0x08
- Access: Read/Write

Address: 12\_0000h base + 7E05h offset = 12\_7E05h

**HDMI\_I2CM\_INT field descriptions**

Field	Description
7-4 -	This field is reserved. Reserved
3 done_pol	Done interrupt polarity configuration.
2 done_mask	Done interrupt mask signal.
1 done_interrupt	Operation done interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {done_interrupt = (done_mask==0b) && (done_status==done_pol)}.
0 done_status	Operation done status bit. Marks the end of a rd or write operation.

### 34.5.310 I2CM\_CTLINT (HDMI\_I2CM\_CTLINT)

This register contains and configures I2C master arbitration error and not acknowledge error interrupt.

- Address Offset: 0x7E06
- Size: 8 bits
- Value after Reset: 0x88
- Access: Read/Write

Address: 12\_0000h base + 7E06h offset = 12\_7E06h

Bit	7	6	5	4
Read	nack_pol	nack_mask	nack_interrupt	nack_status
Write				
Reset	1	0	0	0
Bit	3	2	1	0
Read	arbitration_pol	arbitration_mask	arbitration_interrupt	arbitration_status
Write				
Reset	1	0	0	0

#### HDMI\_I2CM\_CTLINT field descriptions

Field	Description
7 nack_pol	Not acknowledge error interrupt polarity configuration.
6 nack_mask	Not acknowledge error interrupt mask signal.
5 nack_interrupt	Not acknowledge error interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {nack_interrupt = (nack_mask==0b) && (nack_status==nack_pol)}.
4 nack_status	Not acknowledge error status bit. Error on I2C not acknowledge.
3 arbitration_pol	Arbitration error interrupt polarity configuration.
2 arbitration_mask	Arbitration error interrupt mask signal.
1 arbitration_interrupt	Arbitration error interrupt bit. Only lasts for 1 SFR clock cycle and is auto cleaned after it. {arbitration_interrupt = (arbitration_mask==0b) && (arbitration_status==arbitration_pol)}.
0 arbitration_status	Arbitration error status bit. Error on master I2C protocol arbitration.

### 34.5.311 I2CM\_DIV (HDMI\_I2CM\_DIV)

This register configures the division relation between master and scl clock.

## HDMI Memory Map/Register Definition

- Address Offset: 0x7E07
- Size: 8 bits
- Value after Reset: 0x0B
- Access: Read/Write

Address: 12\_0000h base + 7E07h offset = 12\_7E07h

Bit	7	6	5	4	3	2	1	0
Read	Reserved				fast_std_mode	Reserved		
Write	Reserved				fast_std_mode	Reserved		
Reset	0	0	0	0	1	0	1	1

### HDMI\_I2CM\_DIV field descriptions

Field	Description
7-4 -	This field is reserved. Reserved
3 fast_std_mode	Sets the I2C Master to work in Fast Mode or Standard Mode: 1 Fast Mode 0 Standard Mode
-	This field is reserved. Reserved

## 34.5.312 I2CM\_SEGADDR (HDMI\_I2CM\_SEGADDR)

This register configures the segment address for extended RD/WR destination.

- Address Offset: 0x7E08
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7E08h offset = 12\_7E08h

Bit	7	6	5	4	3	2	1	0
Read	Reserved	SEGADDR						
Write	Reserved	SEGADDR						
Reset	0	0	0	0	0	0	0	0

### HDMI\_I2CM\_SEGADDR field descriptions

Field	Description
7 -	This field is reserved. Reserved
SEGADDR	E-DDC Extended read segment address

### 34.5.313 I2CM\_SOFTRSTZ (HDMI\_I2CM\_SOFTRSTZ)

This register resets the I2C master.

- Address Offset: 0x7E09
- Size: 8 bits
- Value after Reset: 0x01
- Access: Read/Write

Address: 12\_0000h base + 7E09h offset = 12\_7E09h

Bit	7	6	5	4	3	2	1	0
Read	Reserved							i2c_softrst
Write	Reserved							i2c_softrst
Reset	0	0	0	0	0	0	0	1

#### HDMI\_I2CM\_SOFTRSTZ field descriptions

Field	Description
7-1 -	This field is reserved. Reserved
0 i2c_softrst	I2C Master Software Reset. Active by writing a zero and auto cleared to one in the following cycle. Value after Reset: 1b

### 34.5.314 I2CM\_SEGPTR (HDMI\_I2CM\_SEGPTR)

This register configures the segment pointer for extended RD/WR request.

- Address Offset: 0x7E0A
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

The following \*CNT registers must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Address: 12\_0000h base + 7E0Ah offset = 12\_7E0Ah

Bit	7	6	5	4	3	2	1	0
Read	I2CM_SEGPTR							
Write	I2CM_SEGPTR							
Reset	0	0	0	0	0	0	0	0

**HDMI\_I2CM\_SEGPTR field descriptions**

Field	Description
I2CM_SEGPTR	I2CM_SEGPTR is used for EDID reading operations, particularly for the Extended Data Read Operation (See <a href="#">I<sup>2</sup>C Master Interface Extended Read Mode</a> ") which is used for Enhanced DDC. This is all described in the VESA Enhanced Display Data Channel Standard v1.1 spec. (addresses A0h/A1h pairs and a segment pointer - 60h).

**34.5.315 I2CM\_SS\_SCL\_HCNT\_1\_ADDR (HDMI\_I2CM\_SS\_SCL\_HCNT\_1\_ADDR)**

- Address Offset: 0x7E0B
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7E0Bh offset = 12\_7E0Bh

**HDMI\_I2CM\_SS\_SCL\_HCNT\_1\_ADDR field descriptions**

Field	Description
i2cmp_ss_scl_hcnt[15:8]	Value after Reset: 8'h00

**34.5.316 I2CM\_SS\_SCL\_HCNT\_0\_ADDR (HDMI\_I2CM\_SS\_SCL\_HCNT\_0\_ADDR)**

- Address Offset: 0x7E0C
- Size: 8 bits
- Value after Reset: 0x6C
- Access: Read/Write

Address: 12\_0000h base + 7E0Ch offset = 12\_7E0Ch

## HDMI\_I2CM\_SS\_SCL\_HCNT\_0\_ADDR field descriptions

Field	Description
i2cmp_ss_scl_hcnt[7:0]	Value after Reset: 8'h6C

### 34.5.317 I2CM\_SS\_SCL\_LCNT\_1\_ADDR (HDMI\_I2CM\_SS\_SCL\_LCNT\_1\_ADDR)

- Address Offset: 0x7E0D
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7E0Dh offset = 12\_7E0Dh

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_ss_scl_lcnt[15:8]							
Write								
Reset	0	0	0	0	0	0	0	0

## HDMI\_I2CM\_SS\_SCL\_LCNT\_1\_ADDR field descriptions

Field	Description
i2cmp_ss_scl_lcnt[15:8]	Value after Reset: 8'h00

### 34.5.318 I2CM\_SS\_SCL\_LCNT\_0\_ADDR (HDMI\_I2CM\_SS\_SCL\_LCNT\_0\_ADDR)

- Address Offset: 0x7E0E
- Size: 8 bits
- Value after Reset: 0x7F
- Access: Read/Write

Address: 12\_0000h base + 7E0Eh offset = 12\_7E0Eh

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_ss_scl_lcnt[7:0]							
Write								
Reset	0	1	1	1	1	1	1	1

**HDMI\_I2CM\_SS\_SCL\_LCNT\_0\_ADDR field descriptions**

Field	Description
i2cmp_ss_scl_lcnt[7:0]	Value after Reset: 8'h7F

**34.5.319 I2CM\_FS\_SCL\_HCNT\_1\_ADDR (HDMI\_I2CM\_FS\_SCL\_HCNT\_1\_ADDR)**

- Address Offset: 0x7E0F
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7E0Fh offset = 12\_7E0Fh

**HDMI\_I2CM\_FS\_SCL\_HCNT\_1\_ADDR field descriptions**

Field	Description
i2cmp_fs_scl_hcnt[15:8]	Value after Reset: 8'h00

**34.5.320 I2CM\_FS\_SCL\_HCNT\_0\_ADDR (HDMI\_I2CM\_FS\_SCL\_HCNT\_0\_ADDR)**

- Address Offset: 0x7E10
- Size: 8 bits
- Value after Reset: 0x11
- Access: Read/Write

Address: 12\_0000h base + 7E10h offset = 12\_7E10h

**HDMI\_I2CM\_FS\_SCL\_HCNT\_0\_ADDR field descriptions**

Field	Description
i2cmp_fs_scl_hcnt[7:0]	Value after Reset: 8'h11

**34.5.321 I2CM\_FS\_SCL\_LCNT\_1\_ADDR (HDMI\_I2CM\_FS\_SCL\_LCNT\_1\_ADDR)**

- Address Offset: 0x7E11
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7E11h offset = 12\_7E11h

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_fs_scl_lcnt[15:8]							
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_I2CM\_FS\_SCL\_LCNT\_1\_ADDR field descriptions**

Field	Description
i2cmp_fs_scl_lcnt[15:8]	Value after Reset: 8'h00

**34.5.322 I2CM\_FS\_SCL\_LCNT\_0\_ADDR (HDMI\_I2CM\_FS\_SCL\_LCNT\_0\_ADDR)**

- Address Offset: 0x7E12
- Size: 8 bits
- Value after Reset: 0x24
- Access: Read/Write

Address: 12\_0000h base + 7E12h offset = 12\_7E12h

Bit	7	6	5	4	3	2	1	0
Read	i2cmp_fs_scl_lcnt[7:0]							
Write								
Reset	0	0	1	0	0	1	0	0

**HDMI\_I2CM\_FS\_SCL\_LCNT\_0\_ADDR field descriptions**

Field	Description
i2cmp_fs_scl_lcnt[7:0]	Value after Reset: 8'h24

**34.5.323 BASE\_POINTER\_ADDR (HDMI\_BASE\_POINTER\_ADDR)**

The I2C Slave Registers allow register memory pagination, and function in the incremental burst operation mode that increases the data throughput when consecutive addressed registers need to be read or write.

The I2C base pointer operation mode is aimed to allow register memory pagination. As long as this operational mode is enabled the value written to this register will be used as the seven most significant bits of the internal Special Function Register address interface (sfraddr[14:8]) for all read or write operations. I2C data transfer protocol used shall be the 7-bit addressed as defined in the section 9 of the I2C-bus Specification, version 2.1.

- Address Offset: 0x7F00
- Size: 8 bits
- Value after Reset: 0x00
- Access: Read/Write

Address: 12\_0000h base + 7F00h offset = 12\_7F00h

**HDMI\_BASE\_POINTER\_ADDR field descriptions**

Field	Description
7 en_base_pointer_addr	Enables the base pointer operation mode.
base_pointer_base_addr[6:0]	Defines the base address for base pointer operation mode. They represent the address bits [14:8]

# Chapter 35

## HDMI 3D Tx PHY (HDMI\_PHY)

### 35.1 Overview

#### 35.1.1 General Description

The HDMI 3D Tx PHY (HDMI\_PHY) is the physical layer of a single-link HDMI transmitter interface and comprises three line drivers for data transmission and an additional line driver for clock transmission. The HDMI\_PHY is designed to perform the serialization and transmission of video data and control information through an HDMI interface. It interfaces with an HDMI Tx link controller through a common graphic controller interface supporting 30- or 60-bit data transfers. A clock line driver is used for reference clock transmission.

#### 35.1.2 Applications

The HDMI\_PHY is targeted to digital video/audio transmission for high resolution display applications, supporting major display formats up to 1080 i/p in DTV applications and QXGA in graphic display applications, with true-color or deep-color resolutions. The HDMI\_PHY supports 3D video formats. At maximum pixel rate, the HDMI channel bit rate is 3.4 Gbps, providing a maximum throughput of 9.2 Gbps.

The HDMI\_PHY is an ideal solution for implementing the physical layer of a high-reliability digital video/audio interface based on HDMI technology, with reduced line count and minimum cable-wire and EMI shielding requirements. The HDMI\_PHY delivers the bandwidth needed in every time mode that demands high resolution panels, while keeping clock sources at a low frequency.

The figure below shows a typical application for HDMI\_PHY.

**Figure 35-1. Typical Application for HDMI 3D Tx PHY**

### 35.1.3 Standards Compliance

The HDMI\_PHY is fully compliant with all the required specifications of the following standards:

- *High-Definition Multimedia Interface Specification*, Version 1.4a
- *Digital Visual Interface*, Revision 1.0
- *HDMI Compliance Test Specification*, Version 1.4a

### 35.1.4 Features

The HDMI\_PHY provides the following features:

- Support for up to 720p at 100 Hz and 720i at 200 Hz or 1080p at 60 Hz and 1080i/720i at 120 Hz HDTV display resolutions and up to QXGA graphic display resolutions
- Support for 3D video formats
- Link controller flexible interface with 30- or 60-bit SDR data access
- Up to 9.2 Gbps aggregate bandwidth
- Driver with pre-emphasis and edge rate control for extra-long cable support
- Programmable source terminations
- HPD input analog comparator
- Rx sensing
- 13.5-270 MHz input reference clock

- 50% duty-cycle output clock
- Embedded Tx scope
- Embedded A/D converter and analog testbus for ATE testing
- Built-in pattern generator
- Small core area
- Low power consumption

### 35.1.5 HDMI 3D Tx PHY System-Level Overview

This section provides a system-level overview of the HDMI 3D Tx PHY.

#### 35.1.5.1 System-Level Block Diagram

The figure below shows a system-level block diagram of the HDMI Tx System.

**Figure 35-2. HDMI Tx System-Level Block Diagram**

The HDMI\_PHY macro interfaces with the HDMI Tx link controller, which provides control signals and video data to be transmitted through the TMDS lanes. Analog I/O's interface with the external world.

### 35.1.5.2 HDMI 3D Tx PHY

The HDMI 3D Tx PHY is the physical layer of an HDMI/DVI-compliant digital transmitter (source).

For a functional block diagram and a functional description of the HDMI 3D Tx PHY, see [Functional Description](#).

#### 35.1.5.2.1 Interfaces

The HDMI interface on the HDMI\_PHY block is defined by the TMDS differential lanes and the HPD/DDCCEC connections. HDMI video data is provided through three differential TMDS pairs for data and one TMDS differential pair for clock. HPD/DDC\_CEC enables detection of the HDMI sink. These signals interface the external world and connect to the HDMI connector.

On the system interface, the HDMI\_PHY connects to the HDMI Tx link controller. This block provides an input reference clock to the PHY (pixel clock). Based on the defined video mode, a pixel repetition clock and a TMDS word clock are output to the controller. The controller then generates video data on this TMDS word clock and outputs both data and clock to the HDMI\_PHY. Data is then serialized and sent to the HDMI interface.

In addition, the system side includes one standard I<sup>2</sup>C interface for configuration and testability of the PHY. Other signals correspond to control logic and are either input to the PHY or provided by the PHY to the controller block for observability.

### 35.1.5.3 HDMI 1.4 I/O Pads

HDMI 3D Tx PHY provides a set of analog ESD pads for use.

#### 35.1.5.3.1 I/O Pads Description

HDMI 3D Tx PHY I/O pads are provided as follows:

- Pad order: VPH, VP, GD, VPH, VP, GD, VPH, VP, GD, HDMI\_TX\_CLK\_P, HDMI\_TX\_CLK\_N, GD, HDMI\_TX\_DATA0\_N, HDMI\_TX\_DATA0\_P, GD, HDMI\_TX\_DATA1\_N, HDMI\_TX\_DATA1\_P, GD, HDMI\_TX\_DATA2\_N, HDMI\_TX\_DATA2\_P, GD, VP, VPH, REXT, HDMI\_TX\_HPD, HDMI\_TX\_DDC\_CEC

As shown in the figure below, for maximum performance, HDMI 3D Tx PHY I/O pads contain decoupling capacitance between VP and GD and a filter between VP and VP\_FILT (one for each VP\_FILT signal).

**Figure 35-3. I/O Pads: Decoupling Capacitance Between VP and GD, Filter Between VP and VP\_FILT**

## 35.2 External Signals

The table found here describes the external signals of HDMI.

**Table 35-1. HDMI External Signals**

Signal	Description	Pad	Mode	Direction
HDMI_TX_CEC_LINE (CEC_LINE)	CEC line between source and sink	EIM_A25	ALT6	I/O
		KEY_ROW2	ALT6	
HDMI_TX_CLK_N (CLK_N)	Negative Clock Signal	HDMI_CLKM	No Muxing	I
HDMI_TX_CLK_P (CLK_P)	Positive Clock Signal	HDMI_CLKP	No Muxing	I
HDMI_TX_DATA0_N (DATA0_N)	Negative Data Signal 0	HDMI_D0M	No Muxing	I/O
HDMI_TX_DATA0_P (DATA0_P)	Positive Data Signal 0	HDMI_D0P	No Muxing	I/O
HDMI_TX_DATA1_N (DATA1_N)	Negative Data Signal 1	HDMI_D1M	No Muxing	I/O
HDMI_TX_DATA1_P (DATA1_P)	Positive Data Signal 1	HDMI_D1P	No Muxing	I/O
HDMI_TX_DATA2_N (DATA2_N)	Negative Data Signal 2	HDMI_D2M	No Muxing	I/O

Table continues on the next page...

**Table 35-1. HDMI External Signals (continued)**

Signal	Description	Pad	Mode	Direction
HDMI_TX_DATA2_P (DATA0_P)	Positive Data Signal 2	HDMI_D2P	No Muxing	I/O
HDMI_TX_DDC_CEC (DDC_CEC)	CEC Signal	HDMI_DDCCEC	No Muxing	I/O
HDMI_TX_DDC_SCL (DDC_SCL)	SCL Signal	EIM_EB2	ALT4	I/O
		KEY_COL3	ALT2	
HDMI_TX_DDC_SDA (DDC_SDA)	SDA Signal	EIM_D16	ALT4	I/O
		KEY_ROW3	ALT2	
HDMI_TX_HPD (HPD)	HPD Signal	HDMI_HPD	No Muxing	I/O

### 35.2.1 Top-Level I/O Diagram

The figure below shows the HDMI 3D Tx PHY top-level signals.

Figure 35-4. Top-Level I/O Diagram

### 35.2.2 Top -Level Signal Descriptions

This section describes the top-level signals.

In addition to describing the function of each signal, the signal descriptions include the following information:

- **Voltage range:** Describes the voltage range expected on this pin.
- **Synchronous:** Indicates that the signal is asserted or deasserted with respect to a clock edge.
- **Asynchronous:** Indicates that the signal is not asserted or deasserted with respect to a clock edge.

### 35.2.2.1 TMDS Interface

The table below describes the Transmission Minimized Differential Signaling (TMDS) interface signals.

**Table 35-2. TMDS Interface**

Signal	I/O	Description
HDMI_TX_DATA[2:0]_P	O	<p><b>Function:</b> Positive TMDS differential line driver data output for data channels 0, 1, and 2.</p> <p><b>Voltage range:</b> For the permitted voltage range, refer to <i>High-Definition Interface Specification</i>, Version 1.4, "Electrical Specification" section.</p> <p><b>Active state:</b> N/A</p> <p><b>Synchronous to:</b> N/A</p>
HDMI_TX_DATA[2:0]_N	O	<p><b>Function:</b> Negative TMDS differential line driver data output for data channels 0, 1, and 2.</p> <p><b>Voltage range:</b> For the permitted voltage range, refer to <i>High-Definition Interface Specification</i>, Version 1.4, "Electrical Specification" section.</p> <p><b>Active state:</b> N/A</p> <p><b>Synchronous to:</b> N/A</p>
HDMI_TX_CLK_P	O	<p><b>Function:</b> Positive TMDS differential line driver clock output</p> <p><b>Voltage range:</b> For the permitted voltage range, refer to <i>High-Definition Multimedia Interface Specification</i>, Version 1.4, "Electrical Specification" section.</p> <p><b>Active state:</b> N/A</p> <p><b>Synchronous to:</b> N/A</p>
HDMI_TX_CLK_N	O	<p><b>Function:</b> Negative TMDS differential line driver clock output</p> <p><b>Voltage range:</b> For the permitted voltage range, refer to <i>High-Definition Multimedia Interface Specification</i>, Version 1.4, "Electrical Specification" section.</p> <p><b>Active state:</b> N/A</p> <p><b>Synchronous to:</b> N/A</p>

### 35.2.2.2 Reset Signals

The table below describes the reset signals.

**Table 35-3. Reset Signals**

Signal	I/O	Description
PHY_RESET	I	<p><b>Function:</b> PHY reset. This signal places the digital section of the macro into a reset state.</p> <p><b>Voltage range:</b> 0-VP</p>

**Table 35-3. Reset Signals**

Signal	I/O	Description
		<b>Activestate:</b> High <b>Synchronousto:</b> Asynchronous

### 35.2.2.3 External Component

The table below describes the top-level signals that connect to an external component.

**Table 35-4. External Component**

Signal	I/O	Description
RESREF_S	I/O	<b>Function:</b> 1600- precision resistor to ground. During resistor tuning, current is forced through the external resistor using RESREF_F, while the induced voltage is sensed on RESREF_S. <b>Voltage range:</b> N/A <b>Active state:</b> N/A <b>Synchronous to:</b> Asynchronous
RESREF_F	I/O	<b>Function:</b> Reference resistor connection <b>Voltage range:</b> N/A <b>Active state:</b> N/A <b>Synchronous to:</b> Asynchronous

## 35.3 Functional Description

This section describes the functional architecture of the HDMI 3D Tx PHY.

### 35.3.1 Functional Overview

The figure found in this section shows a functional block diagram of the HDMI\_PHY.

**Figure 35-5. HDMI 3D Tx PHY Functional Block Diagram**

The HDMI\_PHY is the physical layer of an HDMI/DVI-compliant digital transmitter (source), capable of encoding and transmitting high-speed data streams carrying RGB video, audio, and control information. The HDMI Link Controller interface conforms to a 30- or 60-bit synchronous data interface (DATA0[19:0],DATA1[19:0],DATA2[19:0]).

The PHY includes two PLLs that synthesize the high-speed serial bit clock (required by the transmitter) from a reference pixel clock with a frequency of 13.5-270 MHz, for a transmitter capable of transmitting up to 9.2 Gbps using three lanes.

The HDMI\_PHY drives audio and video across three TMDS data channels. Each serial TMDS link has a data rate range of 0.25-3.4 Gbps. The HDMI\_PHY also drives the TMDS clock at 1/10th of the serial data rate with a frequency range of 25-270 MHz.

Within the HDMI\_PHY, additional support blocks exist: the Bandgap block (for blocks biasing), the Resistor Calibration block, the ADC, and the analog test bus.

The HDMI\_PHY accepts an input pixel clock (PCLK) with a frequency range of 13.5-270 MHz and accepts three channels of parallel data (TXDATA0[19:0], TXDATA1[19:0], TXDATA2[19:0]) that is synchronous with the TMDSCLKIN input clock. The TMDSCLKIN clock has a frequency range of 12.5-270MHz.

The TMDSCCLKSRC clock output should be used by the HDMI transmitter controller as the source for TMDSCLKIN. The relation between TMDSCCLKSRC and TMDSCLKIN should be constant between resets.

The HDMI\_PHY's status and configuration is accessed through its I<sup>2</sup>C interface. In Scan mode of operation, SCANCLK is bypassed to all PHY output clocks.

### PLL/MPLL Operation

The PLL/MPLL can be configured in Coherent mode or Non-Coherent mode (default). In Coherent mode, the TMDS clock is the MPLL feedback clock, which is coherent with the MPLL's high-speed output clock, because both clocks are shaped by the MPLL response. In Non-Coherent mode, the TMDS clock is the MPLL reference clock, which is not coherent with the MPLL's high-speed output clock.

### Driver Operation

The driver differential source termination, edge rate, pre-emphasis, and voltage level can be configured for maximum performance.

## 35.3.2 Operating Modes

This section describes various operating modes of the HDMI\_PHY.

The HDMI\_PHY can be placed in two different operating modes: Power-Down and Active.

The PHY\_RESET signal is used to place the digital section of the IP in a well-defined state. Reset is active when the PHY\_RESET signal is asserted high. PHY\_RESET assertion also clears the configuration registers. Through the control registers, assertion of a soft reset to the macro is possible. This soft reset clears all system FSMs except I<sup>2</sup>C and control registers.

For each separate video mode in which the HDMI\_PHY is set to transmit, due to different operating frequency, color depth and pixel repetition that characterizes each one, you might need to configure the PHY block for correct operation and optimized performance. It is recommended that PHY configuration through the I<sup>2</sup>C interface be done while the PHY is in Power-down mode. Configuration involves programming the PLL/MPLL internal blocks as well as the analog drivers' source termination value and edge rate control, for example. This programming is done through the I<sup>2</sup>C interface. For more information about the I<sup>2</sup>C interface, see [I2C Interface Signals](#), for information about the PLL/MPLL configurations that must be made for each video mode of operation, see [PLL/MPLL Generic Configuration Settings](#), and for information about the driver configurations, see [Control Registers](#) and [Appendix A: Driver Voltage Level Configuration](#).

### **35.3.2.1 Power-Down Mode**

This mode is the lowest power consumption mode. The PHY enters this mode when the TX\_PWRON and ENHPDRXSENSE signals are set to 1'b0 and the PDDQ and PHY\_RESET signals are set to 1'b1.

This mode is characterized by having all analog blocks disabled and digital logic quiet. Current consumption in this mode corresponds to the analog blocks standby current and digital logic leakage current.

To enable the HDMI 3D Tx PHY to enter Power-down mode, after TX\_PWRON is set to 1'b0, the PCLK input must continue toggling until the TX\_READY output signal is set to 1'b0 (indicating that the PHY has been correctly set in Power-down mode). If this sequence is not followed, TX\_READY is not set to 1'b0, and the PHY remains in Active mode.

During Power-down mode, the ENHPDRXSENSE control signal can be set to 1'b1, enabling the HPD and RXSENSE-related circuitry. This setting enables the link controller to observe when an HDMI Rx is connected to the Tx and to power up the HDMI 3D Tx PHY after detecting the Rx.

During Power-down mode, if ENHPDRXSENSE is enabled, it is recommended that source terminations on both data and clock lines are enabled by setting tx\_rescal[6:0] and ck\_rescal[6:0] to 7'b1111111 on registers

0x04 and 0x05, respectively. Because the analog driver within the macro is disabled, enabling the source terminations will help pull-down the floating TMDS data/clock lines to a voltage level that will guarantee proper RXSENSE operation and output signaling when the Rx connects/disconnects from the PHY.

### 35.3.2.2 Active Mode

Active mode is the normal operational mode. To start processing received data from the link controller interface, the macro must first reach this state. The PHY is ready to transmit when TX\_READY is asserted high.

In this state, the interface signals (DATA0[19:0], DATA1[19:0], DATA2[19:0]) are sent to the HDMI interface. Data is transferred according to the HDMI specification.

After entering Active mode, the HDMI Tx macro starts serially transmitting data received from the link controller to the TMDS interface. The way in which input data is encoded (depends on whether data corresponds to Video Data Period, Data Island Period, or Control Periods) depends on the HDMI protocol sequence. Data encoding is performed by the Link controller layer.

While operating in Active mode, the HDMI\_PHY operates in one of the following modes (as defined in the HDMI specification, and as shown in the figure below):

- Video Data Period
- Data Island Period
- Control Period

**Figure 35-6. Active Mode**

Video Data Period is used for the transmission of active pixel data. Transition Minimized (TMDS) data coding (8B10B) is used for 8-bit data transfers. In Deep-color modes, pixel data words are first packed in 8-bit multiple data groups. These groups are then fragmented into 8-bit length words for TMDS encoding.

Data Island Period is used for audio or other auxiliary data information transmission. Data is transferred in packet format using a similar Transition Minimized coding, in this case a TMDS Error Reduction Coding (TERC4). This is a 4B10B code.

Finally, Control Period is used when non-active video/audio or other auxiliary information needs to be transmitted. Only control information is transmitted in this mode. In Control Periods, data is transferred using a Transition Maximized (also TMDS) data

coding, in a form of 2B10B code. This property is very useful to enable proper word alignment on the sink (receiver) side. A Control Period is always entered between any other two periods that are not Control Periods.

### 35.3.2.2.1 Wide Interface Mode

To support the full HDMI bandwidth requirement, each of the three channels accepts 9-bit data and clock at a maximum rate of 340 MHz. In this case, the WIDE\_XFACE input is set to 1'b0.

When WIDE\_XFACE is set to 1'b1, each channel accepts 20-bit data and clock at a maximum rate of 170 MHz. This mode is meant to ease interface timing while maintaining the maximum HDMI bandwidth requirement.

When WIDE\_XFACE is set to 1'b1, the TMDSCCLKSRC clock frequency is not reduced to half simply through the WIDE\_XFACE control. The frequency can be reduced to half through the I<sup>2</sup>C interface, register 0x1E, cko\_word\_div\_enb control bit. This control is independent from the WIDE\_XFACE selection.

### 35.3.2.3 Power Sequence

The HDMI\_PHY power sequence implementation controls the PLL/MPLL start of operation, resistor calibration, and clock alignment.

As shown in the figure below, during power-up, the Power Sequence finite state machine (FSM) advances through the PLL and MPLL power-up states by loading a counter at the beginning of each state (pwr\_cnt) and advancing when the counter (pwr\_cnt) decrements to 0. After the Resistor Calibration FSM is enabled in the RES\_CAL state, the FSM waits for the assertion of rcal\_adc\_done before advancing. After the Clock Alignment FSM is enabled in the TX\_CLK\_ALIGN state, the Power Sequence FSM waits for the assertion of tx\_ck\_align\_done before advancing to the TX\_READY state. The TX\_READY state asserts the TX\_READY output signal, which indicates that the HDMI\_PHY is ready to transmit the TMDS clock and data and that normal operation can begin.

If TX\_PWRON is deasserted in the TX\_READY state, the Power Sequence FSM moves to the DISABLE\_TX state. The power-down sequence is initiated. This state disables the TMDS clock and data outputs. Next, the PWR\_DN\_PLL resets the PLL and MPLL blocks. Finally, the FSM returns to the PWR\_DN state and waits for TX\_PWRON assertion to begin the power-up sequence.

The HDMI\_PHY enters Power-down mode only when the TX\_READY output is deasserted. To enable the power sequence to reach this state, when TX\_PWRON is set to 1'b0 while the HDMI\_PHY is in the "TX\_READY" state, the PCLK input must continue

## Functional Description

toggling until TX\_READY is deasserted. This sequence is required to enable the Power Sequence FSM to continue its execution and move from TX\_READY to DISABLE\_TX, later to PWR\_DN\_PLL, and finally to PWR\_DN that corresponds to the power-down state.

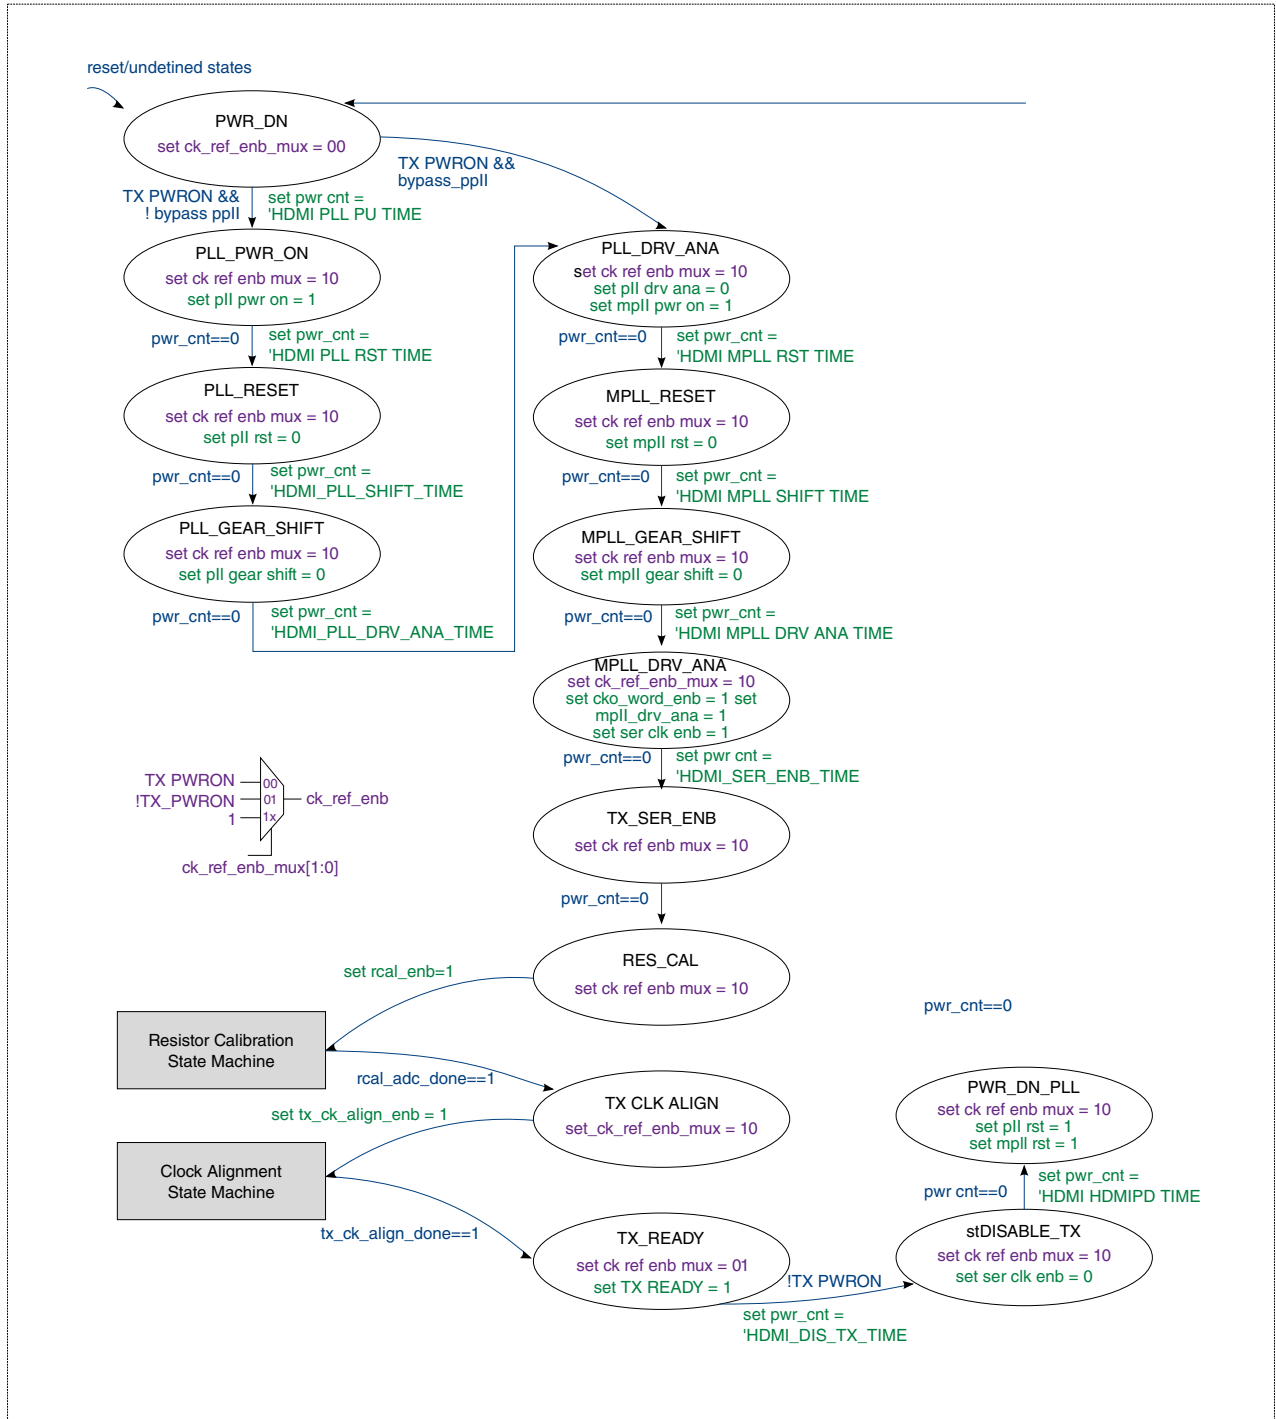

Figure 35-7. Power Sequence Finite State Machine

The following signals can be overridden through the control registers: `bypass_pll`, `pll_pwr_on`, `pll_rst`, `pll_gear_shift`, `pll_drv_ana`, `mpll_rst`, `mpll_gear_shift`, `cko_word_enb`, `mpll_drv_ana`, `ser_ckl_enb`, `rcal_enb`, `tx_clk_align_enb`, `ser_clk_enb`, and `ck_ref_enb`.

The `rcal_adc_done` and `tx_ck_align_done` signals can be observed through the control registers or through the digital test bus (`dtb[1:0]`, controlled through control registers).

The `TX_PWRON` and `TX_READY` signals belong to the HDMI 3D Tx PHY macro interface.

The power sequence can also be started through control registers, using the `tx_pwron0`, `tx_pwron1`, `tx_pwron2`, and `ck_pwron` signals.

`TX_READY` can also be overridden through control registers.

The clock source that clocks the Power Sequence FSM is controlled by the `refclk_enb` signal. This signal is asserted when `TX_PWRON` is asserted or when the state machine is in a state other than `PWR_DN`. This signal can be overridden through the control registers.

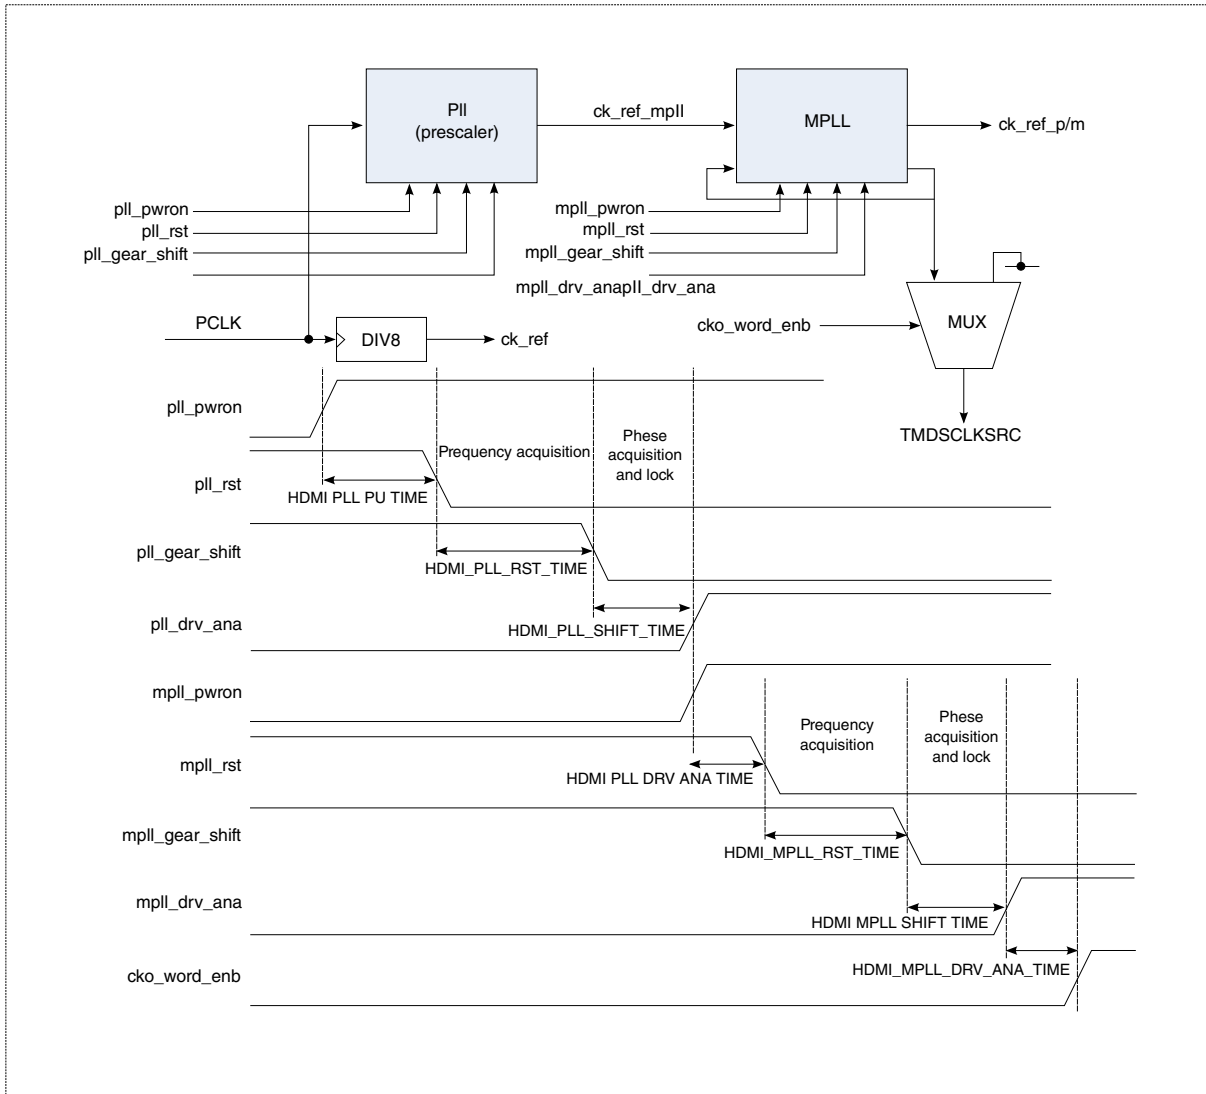

### NOTE

Due to a potential different state on some analog nodes, it is recommended that the power-up sequence be run twice (after the first `TX_READY` assertion, the PHY can be powered down, then powered up again).

The clock alignment procedure can be done differently for each of the power-up sequence runs. For the first run, the clock alignment can be set to be performed channel-by-channel (`tx_ck_align_mode = 1'b1`, register `0x1C`); for the second power-up, the clock alignment can be set to be performed for all channels at the same time (`tx_ck_align_mode = 1'b0`, register `0x1C`) to ensure inter-pair skew close to 0 UI.

#### 35.3.2.3.1 PLL/MPLL

During power-up, the PLL block and (optionally) MPLL block receive the `pwrn`, `rst`, `gear_shift`, and `drv_ana` signals, as shown in the figure below. The minimum and maximum timing for these signals is listed in the table below. The power sequence then initiates the resistor calibration and clock alignment steps.

**Figure 35-8. PLL/MPLL Power-Up Sequence**

The following signals can be overridden through the control registers: pll\_pwron, pll\_rst, pll\_gear\_shift, pll\_drv\_ana, mpll\_pwron, mpll\_rst, mpll\_gear\_shift, mpll\_drv\_ana, and cko\_word\_enb.

ck\_ref, ck\_ref\_p/m, and ck\_ref\_mpll are internal signals, while PCLK and TMDSCCLKSRC belong to the HDMI 3D Tx PHY macro interface.

The table below provides the PLL/MPLL power-up times.

**Table 35-5. PLL/MPLL Power-Up Time**

Count Name	Count Value	Minimum Time ( $\mu\text{s}$ ) (T(refclk) = 0.00294 $\mu\text{s}$ )	Maximum Time ( $\mu\text{s}$ ) (T(refclk = 0.07407 $\mu\text{s}$ )
HDMI_PLL_PU_TIME	125	2.294	74.074
HDMI_PLL_RST_TIME	1250	22.940	740.740
HDMI_PLL_SHIFT_TIME	50	0.918	29.630
HDMI_PLL_DRV_ANA_TIME	125	2.294	74.074
HDMI_MPLL_RST_TIME	2500	45.880	1481.480
HDMI_MPLL_SHIFT_TIME	1000	18.352	592.592
HDMI_MPLL_DRV_ANA_TIME	50	0.918	29.630
HDMI_SER_ENB_TIME	50	0.918	29.630
<b>Total PLL and MPLL Power-up Time</b>		<b>94.513</b>	<b>3,051.849</b>

### 35.3.2.3.2 Resistor, ADC Calibration

Users can set the single-ended source termination resistance via the `d_tx_term[2:0]` control register bits, according to the table below.

**Table 35-6. Single-Ended Source Termination Resistance Settings**

N	<code>d_tx_term[2:0]</code>	R( $\Omega$ )
0	000	50
1	001	56.14
2	010	66.67
3	011	80
4	100	100
5	101	133.33
6	110	200
7	111	Open

To accurately set the specified termination, the resistor calibration measures the actual resistance of the external resistor. The resistance is measured using successive approximations of a 7-bit termination value by enabling each bit (one-hot) from MSB to LSB.

Users select the termination value by setting the `d_tx_term[2:0]` control register bits. The HDMI 3D Tx PHY includes differential source termination on the drivers.

**Figure 35-9. External Resistor Measurement**

The exact value of  $R_{ext}$  is determined to create an exact termination.

The analog support block applies a current to the external resistor and compares the resultant voltage. The result (`sup_comp_rt_result`) is registered by the Calibration block.

The source termination is then set according to the following equation:

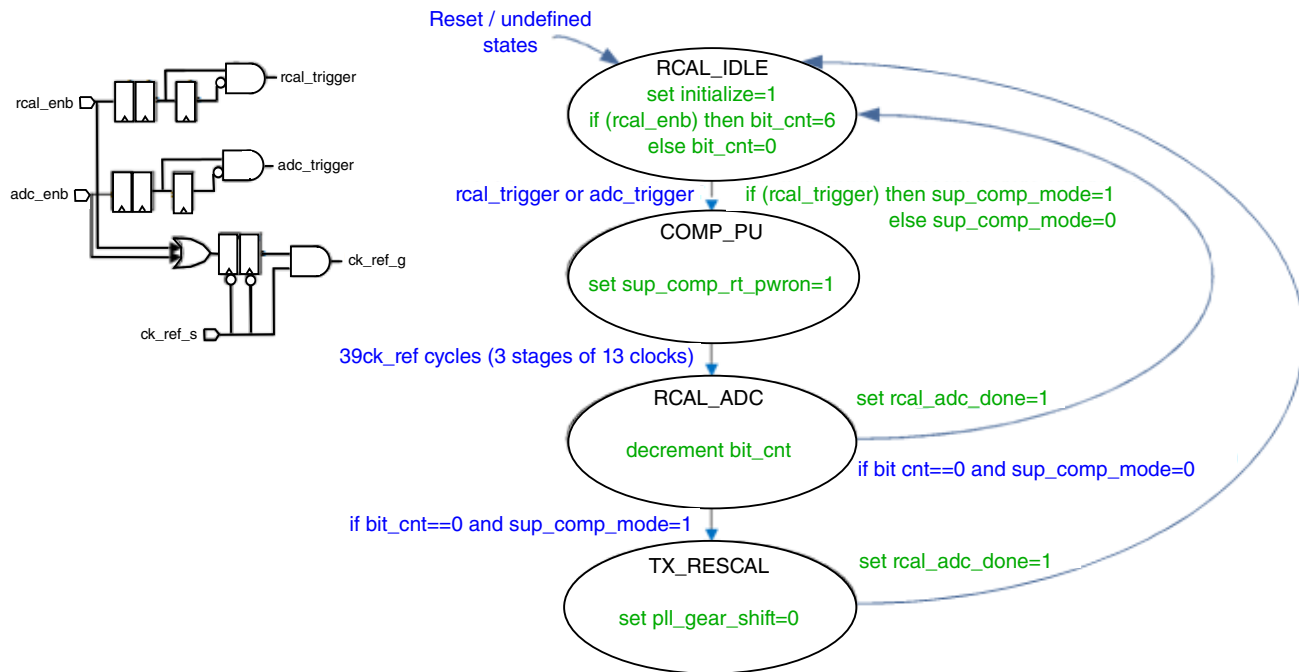

$$tx\_rescal = rescal\_rep \times ( 1 - 0.125 \times N )$$

Instead of subtracting by  $(1/8th \times rescal\_rep \times N)$ , `rescal_rep` is initially multiplied by 8 (left shift by 3 bits), then `tx_rescal` is subtracted  $N$  number of times.  $N$  sets `clk_cnt`, which sets the number of subtraction loops, as shown in the table below. This table represents the `clk_cnt` required to trigger `tx_rescal_done`. The final result is divided by 8 (right shift by 3 bits) and rounded up if necessary.

**Table 35-7. `clk_cnt` Necessary to Trigger `tx_rescal_done`**

<code>N/d_tx_term</code>	<code>clk_cnt</code> to Trigger <code>tx_rescal_done</code>
0	<all>
1	0
2	1
3	2
4	3
5	4
6	5
7	<all>

The figure below shows the FSM for the resistor and ADC calibration.

**Figure 35-10. Finite State Machine for the Resistor and ADC Calibration**

The rcal\_enb signal is asserted by the Power Sequence FSM, but this signal can be overridden through the control registers.

The rescal\_rep, sup\_comp\_mode, sup\_comp\_rt\_r, sup\_comp\_rt\_result, tx\_rescal, sup\_comp\_rt\_pwrn, and adc\_enb signals can be overridden through the control registers.

The rcal\_adc\_done signal can be observed through the control registers or through the digital test bus (dtb[1:0], controlled through control registers).

### 35.3.2.3.3 Clock Alignment

There are two clocks in the transmit clock path, TMDSCCLKIN (from the parallel HDMI controller interface), and internal ck\_tx\_out (a divided-down clock, generated from the MPLL clock). These two clocks must be properly synchronized, aligning them before transmitting data through the HDMI 3D Tx PHY.

The alignment results in the internal tx\_ser\_clk (buffered version of TMDSCCLKIN) being delayed in the range of 0.6-0.8 UI with respect to the TMDSCCLKIN clock.

The Clock Alignment module adjusts the alignment between TMDSCCLKIN and tx\_ser\_clk by generating internal clock kill signals called tx\_ser\_clk\_kill[2:0]. On the rising edge of each tx\_ser\_clk\_kill[2:0] signal, the corresponding tx\_ser\_clk[2:0] is delayed by 0.2 UI.

The clock alignment enable input, `tx_ck_align_enb`, is generated by the power sequence, but this input can also be overridden through the control registers.

Because it is assumed that channel 1 (the middle channel) has the median delays among the three channels, the state machine will compare `TMDSCLKIN` and `tx_ser_clk[1]` only when the register bit, `tx_ck_align_mode`, is low (default). In this case, `tx_ser_clk_kill[2:0]` is asserted simultaneously. When `tx_ck_align_mode` is high, each channel is aligned individually. Channel 2 is aligned first, followed by channel 0 and lastly channel 1. The `tx_ck_align_mode` signal is controlled through the control registers.

The internal clock kill signals, `tx_ser_clk_kill2`, `tx_ser_clk_kill1`, and `tx_ser_clk_kill0`, are generated by the Clock Alignment state machine, but these signals can be overridden through the control registers.

### 35.3.2.4 Color Depth and Color Mode Selection

This section describes HDMI 3D Tx PHY color depth and color mode selection.

#### 35.3.2.4.1 Pixel Repetition Clock Generation Selection

For small displays operating a TMDS clock below 25 MHz or applications that require an increase in available bandwidth for audio and auxiliary information transmission, the `HDMI_PHY` can generate pixel repetition clocks.

Pixel repetition signals are dedicated to configure pixel repetition rates. These signals affect only the relation between `PCLK` and `PREPCLK`.

$PCLK \ 1 / (\text{pixel repetition}) \times PREPCLK$

### 35.3.3 Configuration and Test Mode

This section describes HDMI 3D Tx PHY configuration and test mode operation.

The HDMI 3D Tx PHY can be configured and set in test mode through the supported I<sup>2</sup>C interface.

To avoid transient periods in the macro operation during reconfiguration procedures, it is highly recommended that the I<sup>2</sup>C interface be used while the HDMI 3D Tx PHY is in Power-down mode.

[Control Registers](#) describes all the registers and corresponding fields that are available through the I<sup>2</sup>C interface.

### 35.3.3.1 Power-Up Configuration

Before powering up the HDMI 3D Tx PHY, configure the PHY for proper operation and performance.

Configuring the PHY through the I<sup>2</sup>C interface is as follows.

#### NOTE

The recommended settings for the PLL/MPLL mode of operation and driver configurations provided in this section are presented as the default value that should be considered and initially configured. Unless stated otherwise, these recommended settings apply to all operating frequencies.

#### PLL/MPLL Mode of Operation

Configuration summary: Configure PLL/MPLL mode of operation as Single or Two-PLL in Coherent or Non-Coherent mode. For more information about these modes of operation, see [Power-Up Requirements](#).

**Table 35-8. PLL/MPLL Mode of Operation**

Fields	Bits	Default
<b>Register0x13</b>		
bypass_ppll	11	1'b0
<b>Register0x17</b>		
cko_sel	2-1	2'b11

#### PLL/MPLL Clock Dividers and Analog Configuration

Configuration summary: Configured for each video mode. For information about the PLL and MPLL divider settings, see Table B-2 .

**Table 35-9. PLL/MPLL Clock Dividers and Analog Configuration**

Fields	Bits
<b>Register 0x06</b>	
prep_div[1:0]	14-13
mpll_n_ctrl[1:0]	8-7
ppll_n_ctrl[1:0]	6-5
pixel_rep[2:0]	4-2
clr_dpth[1:0]	1-0

*Table continues on the next page...*

**Table 35-9. PLL/MPLL Clock Dividers and Analog Configuration  
(continued)**

Fields	Bits
<b>Register 0x10</b>	
mppll_prop_cntrl[2:0]	11-9
mppll_int_cntrl[2:0]	8-6
pll_prop_cntrl[2:0]	5-3
pll_int_cntrl[2:0]	2-0
<b>Register 0x15</b>	
pll_gmp_cntrl[1:0]	3-2
mppll_gmp_cntrl[1:0]	1-0

### Driver Edge Rate Control

Configuration summary: This bus controls the slew rate of the clock and data output drivers.

**Table 35-10. Driver Edge Rate Control**

Fields	Bits	Default
<b>Register 0x06</b>		
tx_edgerate[1:0]	12-11	2'b00
ck_edgerate[1:0]	10-9	2'b00

### Driver Single-Ended Source Termination

Configuration summary: This bus controls the driver single-ended source termination.

**Table 35-11. Driver Single-Ended Source Termination**

d-tx_term	R (ohm)
000	50
001	56.14
010	66.67
011	80
100	100
101	133.33
110	200
111	Open circuit

## Functional Description

Fields	Bits	Default
Register 0x19		
d_tx_term[2:0]	2-0	3'b101

## Driver Voltage Level

Configuration summary: For information about the driver voltage level settings, see [Appendix A: Driver Voltage Level Configuration](#). Driver voltage level configuration is dependent on driver differential source termination and driver pre-emphasis settings.

**Table 35-13. Driver Voltage Level**

Fields	Bits	Default
Register 0x0E		
sup_tx_lv[4:0]	9-5	25-148.5 MHz: 5'b10000 222.75-297 MHz: 5'b01111 340 MHz: 5'b01110
sup_ck_lv[4:0]	4-0	25-148.5 MHz: 5'b10000 222.75-297 MHz: 5'b01111 340 MHz: 5'b01110

## Driver Pre-Emphasis

Configuration summary: Enables trailer drivers to enable pre-emphasis operation. Pre-emphasis is achieved by reducing the drive level of a non-transition bit with respect to a transition bit. The following table summarizes the total output current configured with pre-emphasis (I is current of unit current source).

**Table 35-14. Driver Pre-Emphasis**

Total Output Current	tx_symon	tx_traon	tx_trbon
0 * I	0	0	0
36 * I	1	0	0
36 * I + 3 * I	1	0	1
36 * I + 6 * I	1	1	0
36 * I + 6 * I + 3 * I	1	1	1

The amount of pre-emphasis is programmed through the tx\_traon and tx\_trbon signals in the control register, address 0x09 as follows.

Field	Bit	Default

*Table continues on the next page...*

tx_trbon	1	25-148.5 MHz: 1'b0 222.75-340 MHz: 1'b1
tx_traon	2	1'b0

## 35.4 System-Level Implementation

### 35.4.1 System Operation

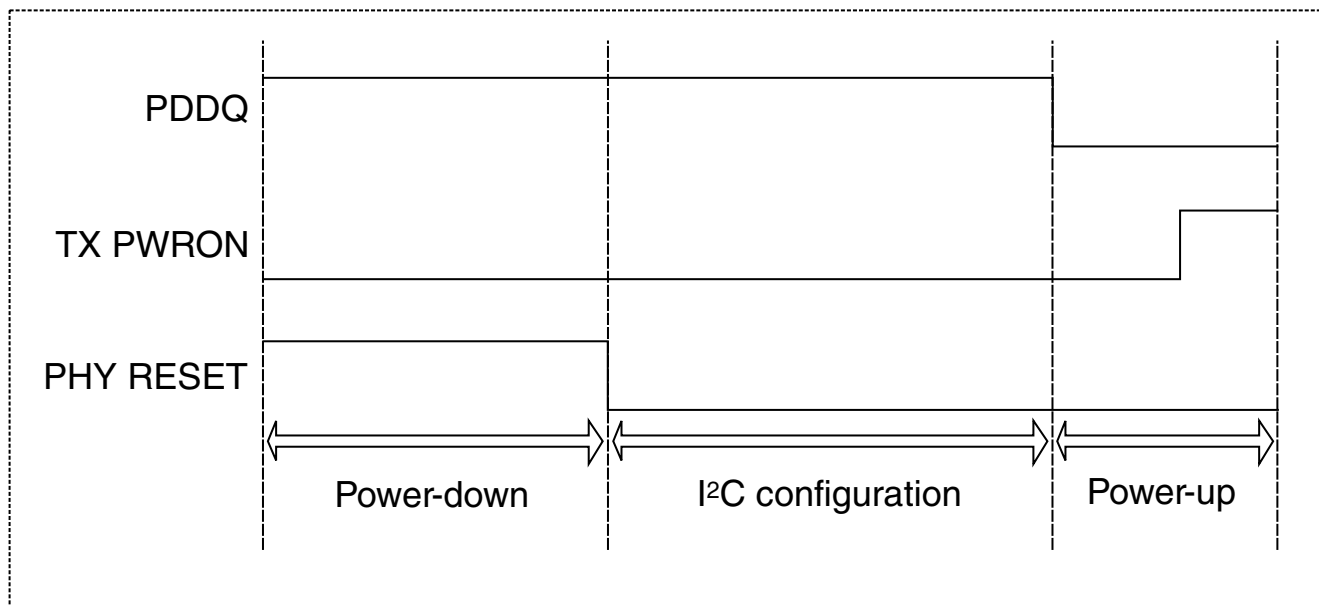

This section describes HDMI 3D Tx PHY system operation including power-up/power-down and power- on reset.

#### 35.4.1.1 Powering Up and Powering Down

To set the HDMI\_PHY in Power-down mode, set the TX\_PWRON signal to 1'b0 and the PDDQ signal to 1'b1. To power up the HDMI 3D Tx PHY and place it in Active mode, set TX\_PWRON to 1'b1 and PDDQ to 1'b0.

Any configuration programmed on the HDMI\_PHY must be done in Power-down mode. To configure the PHY through the I<sup>2</sup>C interface, set PHY\_RESET to 1'b0 (to move the digital core from a reset state and to enable programming).

The figure below shows the power-down and power-up sequences.

**Figure 35-11. Power-Down and Power-Up Sequence**

The power-up sequence starts by advancing one finite state machine (FSM) through the Phase-Locked Loop (PLL) and Multiplexed Phase-Locked Loop (MPLL) power-up states. Afterwards, resistor calibration is performed and clock alignment is enabled. When clock alignment is completed, the TX\_READY signal is set to 1'b1 to indicate that the PHY is ready to transmit the TMDS clock and that data transmission and normal operation can start.

In Power-down mode, TMDS clock and data lines are disabled.

### Power-Up Configuration

Before powering up the HDMI\_PHY, configure the PHY for proper operation and performance. The following PHY characteristics can be configured:

- PLL/MPLL mode of operation: Configure PLL/MPLL mode of operation as Single or Two-PLL in Coherent or Non-Coherent mode.
- PLL/MPLL clock dividers and analog configuration: Configure for each video mode.
- Driver edge rate control: Slew rate of clock and data output drivers
- Driver differential source termination: Differential source termination of clock and data output drivers
- Driver voltage level: Voltage reference level for clock and data channels
- Driver pre-emphasis: Enable and control pre-emphasis operation

For more information about this configuration and the associated control registers and signals, see [Power-Up Configuration](#).

### 35.4.1.2 Active Mode Requirements

During normal operation, the RXSENSE circuitry must always be enabled (ENHPDRXSENSE asserted high).

During normal operation, if ENHPDRXSENSE is deactivated (asserted low), the PHY's analog portion is turned off.

### 35.4.1.3 Power-Up Requirements

Before setting the TX\_PWRON signal high and the PDDQ signal low to power up the HDMI 3D Tx PHY, the PCLK and TMDSCLKIN input reference clocks must be stable and within their specified parameters, and power supply rails must be stable and within the specifications.

### 35.4.1.4 Power Supply Sequence When the HDMI 3D Tx PHY is Not Used

The HDMI 3D Tx PHY supports power collapsing.

There is no constraint on the power supply sequence when the HDMI 3D Tx PHY is not used. However, it is recommended that you short the data/clock lines to ground (or leave them floating). Activity at the data/clock lines or shorting the data/clock lines to the 3v3 rail (from Rx) should be avoided.

### 35.4.1.5 Power-Down Requirements

To enable the HDMI 3D Tx PHY to enter Power-down mode, after TX\_PWRON is set to 1'b0, the PCLK input must continue toggling until the TX\_READY output signal is set to 1'b0 (indicating that the PHY has been correctly set in Power-down mode). This sequence is required to enable the power-sequence machine to continue its execution and move from its states until the machine reaches the power-down state.

If this sequence is not followed, TX\_READY is not set to 1'b0, and the HDMI 3D Tx PHY remains in Active mode.

## 35.5 Reference Clock

This chapter describes the reference clock that the HDMI\_PHY supports.

The HDMI\_PHY system requires an input clock signal that must be applied to the PCLK input with the following constraints:

- Minimum PCLK period/frequency (pixel repetition): 74 ns/13.5 MHz
- Minimum PCLK period/frequency (no pixel repetition): 39.7 ns/24.175 MHz
- PCLK duty cycle: 40-60%
- Maximum PCLK long-term RMS jitter: 100 ps

## 35.6 Control Registers

### 35.6.1 Control Registers Module Design Architecture

The Control Registers module is designed to provide the HDMI 3D Tx PHY with a file register component (36 words where each word comprises 16 bits).

Each register is designed to correspond to one of the following access types.

- **Read-only:** The HDMI controller can only read from this register. No writing by the HDMI controller is permitted.
- **Read/write:** The HDMI controller can read from and write to this register.
- **Read/write/override:** The HDMI controller can read from and write to this register. However, if the MSB of the register is set to 0, the value read by the HDMI controller will not be the value stored in the register; instead, the value will be the internal value of the HDMI PHY. In particular, this event occurs for 0x14, 0x18, 0x0A, and 0x0F where the value is read from the I<sup>2</sup>C interface when PHY\_RESET and TX\_PWRON are low.
- **Read/write/asynchronous set-on-done:** The HDMI controller can read from and write to this register synchronously. However, three internal modules (Resistance Calibration, Clock Alignment, and Tx Scope) can write to this register asynchronously.

## 35.7 HDMI\_PHY Memory Map/Register Definition

### NOTE

HDMI\_PHY registers are accessed through the I2C Master Interface of the HDMI Controller. See [HDMI Transmitter \(HDMI\)](#) for more information.

Write								
Reset	0	0	0	0	0	0	0	0

### HDMI\_PHY\_PWRCTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–5 -	This field is reserved. Reserved
4 tx_pwron	Transmitter Power-On This bit enables users to power down the entire PHY through the I2C interface.  0 Power off the PHY, if the Override bit is 1. 1 Power on the PHY, if the Override bit is 1.
3 tx_pwron0	Transmitter Power-On 0 This bit powers on or powers off the transmitter driver for channel 0.  0 Power off the transmitter driver for the first channel, if the Override bit is 0. 1 Power on the transmitter driver for the first channel, if the Override bit is 0.
2 tx_pwron1	Transmitter Power-On 1 This bit powers on or powers off the transmitter driver for channel 1.  0 Power off the transmitter driver for the second channel, if the Override bit is 0. 1 Power on the transmitter driver for the second channel, if the Override bit is 0.
1 tx_pwron2	Transmitter Power-On 2 This bit powers on or powers off the transmitter driver for channel 2.  0 Power off the transmitter driver for the third channel, if the Override bit is 0. 1 Power on the transmitter driver for the third channel, if the Override bit is 0.
0 ck_pwron	Clock Power-On This bit powers on or powers off the clock driver.  0 Power off the clock driver, if the Override bit is 0. 1 Power on the clock driver, if the Override bit is 0.

### 35.7.2 Serializer Divider Control (HDMI\_PHY\_SERDIVCTRL)

Register name: SERDIVCTRL

Access type: Read/write/override

Address: 0x01

Value at reset: 0x0000

Address: 0h base + 1h offset = 1h

#### HDMI\_PHY\_SERDIVCTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–3 -	This field is reserved. Reserved
2 tx_ser_div_en0	Transmitter Serializer Divider Enable 0 This bit enables or disables the low-speed clock in serializer 0.  0 Disable the low-speed clock in the first serializer, if the Override bit is 0. 1 Enable the low-speed clock in the first serializer, if the Override bit is 0.
1 tx_ser_div_en1	Transmitter Serializer Divider Enable 1 This bit enables or disables the low-speed clock in serializer 1.  0 Disable the low-speed clock in the second serializer, if the Override bit is 0. 1 Enable the low-speed clock in the second serializer, if the Override bit is 0.
0 tx_ser_div_en2	Transmitter Serializer Divider Enable 2 This bit enables or disables the low-speed clock in serializer 2.  0 Disable the low-speed clock in the third serializer, if the Override bit is 0. 1 Enable the low-speed clock in the third serializer, if the Override bit is 0.

### 35.7.3 Serializer Clock Control (HDMI\_PHY\_SERCKCTRL)

Register name: SERCKCTRL

**Access type:** Read/write/override

**Address:** 0x02

**Value at reset:** 0x0000

Address: 0h base + 2h offset = 2h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 35.7.8 Tx and Clock Measure Control (HDMI\_PHY\_TXCLKMEASCTRL)

**Register name:** TXCKMEASCTRL

**Access type:** Read/write

**Address:** 0x07

**Value at reset:** 0x0000

**Table 35-25. tx\_meas\_iv2[7:0]**

Effective Bit	Register Value	Description
tx_meas_iv2[0]	00000001	Connect $V_{cm\_p}$ (common DC voltage of the positive side of scope) to the analog test bus.
tx_meas_iv2[1]	00000010	Connect $V_{cm\_m}$ (common DC voltage of the negative side of scope) to the analog test bus.
tx_meas_iv2[2]	00000100	Connect $V_{bg3by4\_reg}$ (output node of tx_vreg_vbgby2 block) to the analog test bus.
tx_meas_iv2[3]	00001000	Connect $t_{x\_vref}$ (reference voltage of tx_biasgen block) to the analog test bus.
tx_meas_iv2[4]	00010000	Connect $V_{rep\_fb}$ (feedback voltage of the replica circuit of tx_biasgen block) to the analog test bus.
tx_meas_iv2[5]	00100000	In the event that bleed current is too large, this bit can be used to force vb closer to gnd and disable/reduce the bleed current. (This bit is a debug feature, which does not pull vb to gnd properly.)
tx_meas_iv2[6]	01000000	Connect $V_p$ (low power supply) to the analog test bus.
tx_meas_iv2[7]	10000000	Connect $V_{cm}$ (common DC voltage of the scope) to the analog test bus.

**Table 35-26. ck\_meas\_iv[7:0]**

Effective Bit	Register Value	Description
ck_meas_iv[0]	00000001	Connect $V_{cm\_p}$ (common DC voltage of the positive side of scope) to the analog test bus.
ck_meas_iv[1]	00000010	Connect $V_{cm\_m}$ (common DC voltage of the negative side of scope) to the analog test bus.
ck_meas_iv[2]	00000100	Connect $V_{bg3by4\_reg}$ (output node of tx_vreg_vbgby2 block) to the analog test bus.

*Table continues on the next page...*

**Table 35-26. ck\_meas\_iv[7:0] (continued)**

ck_meas_iv[3]	00001000	Connect $t_{x\_vref}$ (reference voltage of tx_biasgen block) to the analog test bus.
ck_meas_iv[4]	00010000	Connect $V_{rep\_fb}$ (feedback voltage of the replica circuit of tx_biasgen block) to the analog test bus.
ck_meas_iv[5]	00100000	In the event that bleed current is too large, this bit can be used to force $v_b$ closer to gnd and disable/reduce the bleed current. (This bit is a debug feature, which does not pull $v_b$ to gnd properly.)
ck_meas_iv[6]	01000000	Connect $V_p$ (low power supply) to the analog test bus.
ck_meas_iv[7]	10000000	Connect $V_{cm}$ (common DC voltage of scope) to the analog test bus.

Address: 0h base + 7h offset = 7h

**HDMI\_PHY\_TXMEASCTRL field descriptions**

Field	Description
15–8 tx_meas_iv0[7:0]	Transmitter Measure Internal Voltage 0 This bus is used to test specific voltages for the first transmitter lane/channel by applying voltages on the atb_sense port based on configured currents, as described in the tx_meas_iv0[7:0] table.
tx_meas_iv1[7:0]	Transmitter Measure Internal Voltage 1 This bus is used to test specific voltages for the second transmitter lane/channel by applying voltages on the atb_sense port based on configured currents, as described in the tx_meas_iv1[7:0] table.

## 35.7.10 Clock Symbol and Transmitter Control (HDMI\_PHY\_CKSYMTXCTRL)

**Register name:** CKSYMTXCTRL

**Access type:** Read/write/override

**Address:** 0x09

**Value at reset:** 0x0009

Address: 0h base + 9h offset = 9h

Bit	15	14	13	12	11	10	9	8
Read	Override	Reserved						
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	Reserved				tx_symon	tx_traon	tx_trbon	ck_symon
Write								
Reset	0	0	0	0	0	0	0	0

### HDMI\_PHY\_CKSYMTXCTRL field descriptions

Field	Description
15 Override	Writing a 0 to the override bit causes the register to set the value 0x0F, regardless of the other bit settings. Setting the override bit to 1 causes tx_symon, tx_traon, tx_trbon, and ck_symon bits to work per the register settings. These bits must be set at the same time the override bit is set to 1, or while the override bit remains at 1.
14–4 -	This field is reserved. Reserved
3 tx_symon	Transmitter Symbol On This bit enables the transmitter symbol driver(s). To enable the transmitter driver(s), the tx_pwron bit for each channel must be high.  0 Disable the transmitter symbol driver(s). 1 Enable the transmitter symbol driver(s).
2 tx_traon	Transmitter Trailer A On This bit enables the transmitter trailer A driver(s). To enable the transmitter trailer A driver(s) and to enable pre-emphasis, the tx_pwron bit for each channel must be high.  0 Disable the transmitter trailer A driver(s). 1 Enable the transmitter trailer A driver(s).
1 tx_trbon	Transmitter Trailer B On This bit enables the transmitter trailer B driver(s). To enable the transmitter trailer B driver(s) and to enable pre-emphasis, the tx_pwron bit for each channel must be high.  0 Disable the transmitter trailer B driver(s). 1 Enable the transmitter trailer B driver(s).

*Table continues on the next page...*

**HDMI\_PHY\_CKSYMTXCTRL field descriptions (continued)**

Field	Description
0 ck_symon	<p>Clock Symbol On</p> <p>This bit enables the clock symbol driver. To enable the clock driver, the ck_powon bit must be high. In addition, there is no pre-emphasis enable for the clock driver.</p> <p>0 Disable the clock symbol driver. 1 Enable the clock symbol driver.</p>

**35.7.11 Comparator Sequence Control (HDMI\_PHY\_CMPSEQCTRL)**

**Register name:** CMPSEQCTRL

**Access type:** Read/write/override

**Address:** 0x0A

**Value at reset:** 0x0000

Address: 0h base + Ah offset = Ah

**HDMI\_PHY\_CMPSEQCTRL field descriptions**

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–1 -	This field is reserved. Reserved
0 sup_comp_rt_r	<p>Support Comparator Resistance Termination</p> <p>This bit controls the comparator sequence.</p> <p>0 Latch the first input, if the Override bit is 0. 1 Latch the second input, then set the comparator's output pin by the result of comparison, if the Override bit is 0.</p>

### 35.7.12 Comparator Power Control (HDMI\_PHY\_CMPPWRCTRL)

**Register name:** CMPPWRCTRL

**Access type:** Read/write/override

**Address:** 0x0B

**Value at reset:** 0x0000

Address: 0h base + Bh offset = Bh

**HDMI\_PHY\_CMPPWRCTRL field descriptions**

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–1 -	This field is reserved. Reserved
0 sup_comp_rt_pwrn	Support Comparator Resistance Termination Power-On This bit powers on the Comparator module.  0 Power off the Comparator module and connect the comparator's output to ground, if the Override bit is 0. 1 Power on the Comparator module, if the Override bit is 0.

### 35.7.13 Comparator Mode Control (HDMI\_PHY\_CMPMODECTRL)

**Register name:** CMPMODECTRL

**Access type:** Read/write/override

**Address:** 0x0C

**Value at reset:** 0x0000

## HDMI\_PHY Memory Map/Register Definition

Address: 0h base + Ch offset = Ch

Bit	15	14	13	12	11	10	9	8
Read	Override				Reserved			
Write

Write					on_rext			on_atb
Reset	0	0	0	0	0	0	0	0

## HDMI\_PHY\_MEASCTRL field descriptions

Field	Description
15–4 -	This field is reserved. Reserved
3 sup_atb_on_rext	Support Analog Test Bus On External Calibration Resistance This bit connects or disconnects the $V_{\text{rext}}$ node to/from the analog test bus.  0 Disconnect the $V_{\text{rext}}$ node from the analog test bus. 1 Connect the $V_{\text{rext}}$ node to the analog test bus.
2–1 sup_por_meas_iv[1:0]	Support Power Measure Internal Voltage This bus connects or disconnects a single output signal on the analog test bus to measure the voltage of two nodes of the support power block.  01 Connect $V_{\text{be}}$ (Bipolar transistor voltage) to the analog test bus. 10 Connect $V_{\text{bg}}$ (Band-gap voltage) to the analog test bus.
0 sup_dac_on_atb	Support Digital-to-Analog Converter On Analog Test Bus This bit connects or disconnects the DAC's output on the analog test bus to test the performance of the DAC through Integral Non-Linearity (INL) and Differential Non-Linearity (DNL).  0 Disconnect the DAC's output from the analog test bus. 1 Connect the DAC's output to the analog test bus.

## 35.7.15 Voltage Level Control (HDMI\_PHY\_VLEVCTRL)

Register name: VLEVCTRL

Access type: Read/write

Address: 0x0E

Value at reset: 0x0000

Address: 0h base + Eh offset = Eh

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	Reserved							sup_tx_lv[4:0]				sup_ck_lv[4:0]				
Write	Reserved							sup_tx_lv[4:0]				sup_ck_lv[4:0]				
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## HDMI\_PHY\_VLEVCTRL field descriptions

Field	Description
15–10 -	This field is reserved. Reserved
9–5 sup_tx_lv[4:0]	Support Transmitter Level This bus controls the reference voltage level of the three transmitter channel modules. This voltage reference has a direct relation with the output signal voltage level. For more information about the driver voltage level configuration, see <a href="#">Appendix A: Driver Voltage Level Configuration</a> .

Table continues on the next page...

**HDMI\_PHY\_VLEVCTRL field descriptions (continued)**

Field	Description
sup_ck_lv[4:0]	Support Clock Level  This bus controls the reference voltage level of the Clock Channel module. This voltage reference has a direct relation with the output signal voltage level. For more information about the driver voltage level configuration, see <a href="#">Appendix A: Driver Voltage Level Configuration</a> .

**35.7.16 Digital-to-Analog Control (HDMI\_PHY\_D2ACTRL)**

Register name: D2ACTRL

Access type: Read/write/override

Address: 0x0F

Value at reset: 0x0000

Address: 0h base + Fh offset = Fh

Bit	15	14	13	12	11	10	9	8
Read	Override	Reserved				sup_dac_n[7:0]		
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	sup_dac_n[7:0]				sup_dac_th_n[2:0]			
Write								
Reset	0	0	0	0	0	0	0	0

**HDMI\_PHY\_D2ACTRL field descriptions**

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–11 -	This field is reserved. Reserved
10–3 sup_dac_n[7:0]	Support Analog-to-Digital Inverted  This bus represents the LSB's of the 9-bit DAC value.
sup_dac_th_n[2:0]	Support Digital-to-Analog Thermometer Inverted  This bus value is inverted and defined in the thermometer code to represent the binary code of the two MSB's of the 9-bit DAC value.  <b>Note:</b> To increase the stability of the DAC block, the two MSB's of the 9-bit DAC value are represented in thermometer code, not in binary code. The MSB's of the 9-bit DAC value is split into two thermometer-code bits. A transition from 0 to 1 of the 9-bit DAC value's MSB is represented by "00" -> "01" -> "11" in thermometer code.

### 35.7.17 Current Control (HDMI\_PHY\_CURRCTRL)

**Register name:** CURRCTRL

**Access type:** Read/write

**Address:** 0x10

**Value at reset:** 0x08AB

Address: 0h base + 10h offset = 10h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	Reserved				mpll_prop_cntrl[2:0]			mpll_int_cntrl[2:0]			pll_prop_cntrl[2:0]			pll_int_cntrl[2:0]		
Write	Reserved				mpll_prop_cntrl[2:0]			mpll_int_cntrl[2:0]			pll_prop_cntrl[2:0]			pll_int_cntrl[2:0]		
Reset	0	0	0	0	1	0	0	0	1	0	1	0	1	0	1	1

#### HDMI\_PHY\_CURRCTRL field descriptions

Field	Description
15–12 -	This field is reserved. Reserved
11–9 mpll_prop_cntrl[2:0]	MPLL Proportional Control This bus controls the MPLL charge pump proportional current. Eight levels of charge pump proportional current value are possible. The specific values are defined in <a href="#">PLL/MPLL Generic Configuration Settings</a> . Default (reset) value of pll_prop_cntrl[1:0] is 100.
8–6 mpll_int_cntrl[2:0]	MPLL Integral Control This bus controls the charge pump integral current. Eight levels of charge pump integral current value are possible. The specific values are defined in <a href="#">PLL/MPLL Generic Configuration Settings</a> . Default (reset) value of pll_int_cntrl[1:0] is 100.
5–3 pll_prop_cntrl[2:0]	PLL Proportional Control This bus controls the PLL charge pump proportional current. Eight levels of charge pump proportional current value are possible. The specific values are defined in <a href="#">PLL/MPLL Generic Configuration Settings</a> . Default (reset) value of pll_int_cntrl is 011.
pll_int_cntrl[2:0]	PLL Charge Pump Integral Control This bus controls the PLL charge pump integral current. Eight levels of charge pump integral current value are possible. The specific values are defined in <a href="#">PLL/MPLL Generic Configuration Settings</a> . Default (reset) value of pll_int_cntrl[2:0] is 100.

### 35.7.18 Drive Analog Control (HDMI\_PHY\_DRVANACTRL)

**Register name:** DRVANACTRL

**Access type:** Read/write/override

**Address:** 0x11

## HDMI\_PHY Memory Map/Register Definition

**Value at reset:** 0x0003

Address: 0h base + 11h offset = 11h

Bit	15	14	13	12	11	10	9	8
Read	Override	Reserved						
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	Reserved						pll_drv_ana	mpll_drv_ana
Write								
Reset	0	0	0	0	0	0	1	1

### HDMI\_PHY\_DRVANACTRL field descriptions

Field	Description
15 Override	If the Override bit is set to 1, the working value is the Override bit value, not the registered value.
14–2 -	This field is reserved. Reserved
1 pll_drv_ana	PLL Drive Analog This bit enables or disables driving the ck_ref_mpll_p/m clocks to the MPLL module. Default (reset) value of pll_drv_ana is 1. 0 Set ck_ref_mpll low, if the Override bit is 0. 1 Enable 25-340 MHz output clock (ck_ref_mpll_p/m) to be driven to MPLL, if the Override bit is 0.
0 mpll_drv_ana	MPLL Drive Analog This bit enables or disables driving the ck_ref_p/m clocks to all transmitters (tx_topa). Default (reset) value of mpll_drv_ana is 1. 0 Set ck_ref_p high; ck_ref_m low, if the Override bit is 0. 1 Enable ck_ref_mpll output clock (125-1700 MHz ck_ref_p/m) to be driven to all transmitters (tx_topa), if the Override bit is 0.

## 35.7.19 PLL Measure Control (HDMI\_PHY\_PLLMEASCTRL)

**Register name:** PLLMEASCTRL

**Access type:** Read/write

**Address:** 0x12

**Value at reset:** 0x0000

**NOTE**

With the exception of `pll_atb_sense_sel` and `pll_meas_iv[9]`, two or more of the previous register bits must not be set to 1 simultaneously; doing so can lead to a hardware problem.

The table below describes the `pll_meas_iv[10:0]` bit settings.

**Table 35-40. pll\_meas\_iv[10:0]**

Effective Bit	PlI_meas_iv[10:0] Value	Description
PlI_meas_iv[0]	0000000001	Not used.
PlI_meas_iv[1]	0000000010	Not used in <code>pll_top</code> . Connected to <code>fast_tech</code> pins of PLL and MPLL in <code>hdmi_topa</code> .
PlI_meas_iv[2]	0000000100	Connects VP supply voltage to the <code>atb_sense</code> line.
PlI_meas_iv[3]	0000001000	Connects <code>vp_cp</code> to the <code>atb_sense</code> line.
PlI_meas_iv[4]	0000010000	Connects internal supply voltage of the VCO ( <code>ivco</code> ) to the <code>atb_sense</code> line.
PlI_meas_iv[5]	0000010000	Connects <code>vp_cko</code> voltage to the <code>atb_sense</code> line.
PlI_meas_iv[6]	0000100000	Connects node <code>vpsf</code> to the <code>atb_sense</code> line.
PlI_meas_iv[7]	0001000000	Connects <code>vref</code> to <code>atb_sense</code> line.
PlI_meas_iv[8]	0010000000	Connects <code>vcntrl</code> to <code>atb_sense</code> line.
PlI_meas_iv[9]	0100000000	Enables the phase mixer and <code>pll_cko_pm_p/m</code> .
PlI_meas_iv[10]	1000000000	Measures the voltage corresponding to the output phase of the <code>clr_dpth</code> divider ( <code>fb_clk</code> ) with respect to <code>refclk</code> .

## HDMI\_PHY\_GMPCTRL field descriptions

Field	Description
15–4 -	This field is reserved. Reserved
3–2 pll_gmp_cntrl[1:0]	PLL gmp Control This bus controls the effective loop-filter resistance (equal) to increase or decrease PLL bandwidth and to compensate for changes in the Divider module (n_cntrl).  00 TMDS rate up to 45.25 MHz 01 TMDS rate of 45.26-92.5 MHz 10 TMDS rate of 92.51-185 MHz 11 TMDS rate of 184.1-370 MHz
mpll_gmp_cntrl[1:0]	MPLL gmp Control This bus controls the effective loop-filter resistance (= 1/gmp) to increase or decrease MPLL bandwidth and to compensate for changes in the Divider module (n_cntrl).  00 TMDS rate up to 45.25 MHz 01 TMDS rate of 45.26-92.5 MHz 10 TMDS rate of 92.51-185 MHz 11 TMDS rate of 184.1-370 MHz

## 35.7.23 MPLL Measure Control (HDMI\_PHY\_MPLLMEASCTRL)

Register name: MPLLMEASCTRL

Access type: Read/write

Address: 0x16

Value at reset: 0x0000

**NOTE**

With the exception of `mpll_atb_sense_sel`, `mpll_meas_iv[9]`, and `mpll_meas_iv[11]`, two or more of the previous register bits must not be set to 1 simultaneously, because doing so can lead to a hardware problem.

The table below describes the `mpll_meas_iv[11:0]` bit settings.

**Table 35-45. mpll\_meas\_iv[11:0]**

Effective Bit	mpll_meas_iv[11:0] Value	Description
mpll_meas_iv[0]	000000000001	Connects the internal positive DCC control line (vc0p) to the atb_sense line.
mpll_meas_iv[1]	000000000010	Connects the internal negative DCC control line (vc0m) to the atb_sense line.

*Table continues on the next page...*

**Table 35-45. mppll\_meas\_iv[11:0] (continued)**

Effective Bit	mppll_meas_iv[11:0] Value	Description
mppll_meas_iv[2]	00000000100	Connects VP supply voltage to the atb_sense line.
mppll_meas_iv[3]	00000001000	Connects vp_cp to the atb_sense line.
mppll_meas_iv[4]	00000010000	Connects the internal supply voltage of the VCO (ivco) to the atb_sense line through a low-pass filter.
mppll_meas_iv[5]	00000100000	Connects the vp_cko voltage to the atb_sense line.
mppll_meas_iv[6]	00000100000	Connects the vpsf node to the atb_sense line.
mppll_meas_iv[7]	00001000000	Connects vref to the atb_sense line.
mppll_meas_iv[8]	00010000000	Connects vcntrl to the atb_sense line.
mppll_meas_iv[9]	00100000000	Enables the phase mixer and cko_pm_p/m.
mppll_meas_iv[10]	01000000000	Measures the voltage corresponding to the phase of the divide-by-5 output (fb_clk) with respect to the phase of the mppll_ana input (ck_refclk_p).
mppll_meas_iv[11]	10000000000	Forces div_x1 low; therefore, bitclk_p/m is multiplexed to ck_ref_p/m (normally, if n_cntrl = 00, ck0_p/m is multiplexed to ck_ref_p/m and DCC loop is enabled).

Address: 0h base + 16h offset = 16h

**HDMI\_PHY\_MPLLMEASCTRL field descriptions**

Field	Description
15–14 -	This field is reserved. Reserved
13 mppll_atb_sense_sel	MPLL Analog Test Bus Sense Select This bit enables or disables internal signals of the PLL to be connected to the analog test bus. Without setting this bit, no measurements can be made on the atb_sense line. Default (reset) value of mppll_atb_sense_sel is 0.  0 Disable the ability to measure internal DC signals on the atb_sense line in the PLL. 1 Enable the ability to measure internal DC signals on the atb_sense line in the PLL.

Table continues on the next page...

**HDMI\_PHY\_MPLLMEASCTRL field descriptions (continued)**

Field	Description
12–1 mpll_meas_iv[11:0]	MPLL Measure Internal Voltage This bus enables or disables measuring various PLL node voltages and branch currents. For information about the bit settings, see the mppll_meas_iv[11:0] table.
0 mppll_meas_gd	MPLL Measure Ground This bit connects or disconnects the ground signal to the atb_sense (analog test bus) bus.  0 Disconnect the ground signal from the atb_sense bus. 1 Connect the ground signal to the atb_sense bus.

**35.7.24 MPLL and PLL Phase, Scope Clock Select, and MUX Clock Control (HDMI\_PHY\_MSM\_CTRL)****Register name:** -**Access type:** Read/write**Address:** 0x17**Value at reset:** 0x0000

The table below describes the cko\_sel[1:0] bit settings. (The cko\_sel[1:0] default value is 00.)

**Table 35-47. cko\_sel[1:0]**

cko_sel[1:0]	TMDS Clock Mode	PLL and MPLL Mode	Output TMDS Clock on TMDS Channel
00	Non-Coherent	Normal	ck_ref_mpll_p/m (Pre-PLL out)
01	Off (PLL and MPLL are both off)	Normal	Off (No output TMDS clock)
10	Test (PHY in test mode)	Normal	PCLK (Input reference clock to HDMI 3D Tx PHY)
11	Coherent	Normal	fb_clk (MPLL feedback clock)
00	Off (PLL and MPLL are both off)	Bypass	Off (No output TMDS clock)
01	Off (PLL and MPLL are both off)	Bypass	Off (No output TMDS clock)
10	Non-Coherent	Bypass	PCLK (Input reference clock to HDMI 3D Tx PHY)
11	Coherent	Bypass	fb_clk (MPLL feedback clock)

**HDMI\_PHY\_SCOPECNTMSB2CK field descriptions**

Field	Description
15–13 -	This field is reserved. Reserved
12–6 ck_scope_ones_ cnt[21:16]	Clock Scope 1's Counter This register carries the number of counted 1's on the clock channel. These 1's are the MSB bits only.
scope_ones_ cnt2[21:16]	Scope 1's Counter 2 This register carries the number of counted 1's on channel 2. These 1's are the MSB bits only.

## 35.8 Appendix A: Driver Voltage Level Configuration

This appendix describes the driver voltage level configuration.

This configuration depends on the source termination value, the driver pre-emphasis settings, and the target signal voltage level swing.

A correct configuration must be set to meet both eye diagram mask and the specified high and low signal voltage levels.

To correctly configure the driver voltage level, the following parameters and signals (represented through their symbol) must be taken into consideration:

- $V_{PH_{RXTERM}} = 3.3 \text{ V}$  -> 3.3-V supply rail connected to HDMI PHY sink termination resistors
- $R_{XTERM} = 50 \Omega$  -> HDMI PHY sink termination resistors

Control Register	Signal	Symbol
0x19	d_tx_temp[2:0]	RTERM
0x0E	sup_tx_lv[4.:0]	TXLVL
0x0E	sup_ck_lv[4.:0]	CKLVL
0x09	tx_symon	SYMON
0x09	tx_traon	TRAON
0x09	tx_trbon	TRBON

The following table defines the pre-emphasis factor (PREEMPH) to be used in the information that follows.

SYMON	TRAON	TRBON	PREEMPH
0	0	0	-
1	0	0	0.00
1	0	1	0.08
1	1	0	0.17
1	1	1	0.25

The following equations can be used to calculate-for a certain signal voltage swing (VSWING) and PHY configuration (PREEMPH, RTERM)-the signal's high and low voltage levels (VHI, VLO).

$$VHI = VLO + VSWING$$

$$TXLVL = CKLVL = [ 0.772 - ( VPHRXTERM - VLO ) ] / 0.01405$$

For a certain termination value and pre-emphasis configuration (factor), users input only the VSWING value. With this data, users can obtain the respective VHI and VLO DC levels and the TXLVL and CKLVL configuration to apply to the PHY.

Lower TXLVL/CKLVL values result in higher signal amplitudes, while higher TXLVL/CKLVL values result in lower signal amplitudes.

Values for VSWING, VHI, and VLO must be within HDMI 1.4a specification limits. The table below provides driver voltage level settings for some example scenarios.

**Table 35-65. Example Driver Voltage Level Settings**

RTERM	SYMON	TRAON	TRBON	VHI (V)	VLO (V)	VSWING (V)	TXLVL	TXLVL (BIN)	CKLVL	CKLVL (BIN)

## 35.9 Appendix B

This appendix describes the PLL/MPLL configurations that must be made for each video mode of operation.

The PLL/MPLL configurations are divided in two distinct sections. [Power-Up Requirements](#) describes how to configure the PLL/MPLL mode of operation, and [PLL/MPLL Generic Configuration Settings](#) describes all the settings required to configure the PLL/MPLL for each specific video mode.

### 35.9.1 Single or Two-PLL in Coherent or Non-Coherent Mode of Operation

**Table 35-66. Single or Two-PLL in Coherent or Non-Coherent Mode of Operation**

Mode of Operation	bypass_ppll Register address: 0013: Bit 11	cko_sel<1> Register address: 0017: Bit 2	cko_sel<0> Register address: 0017: Bit 1
Two-PLL Non-Coherent (default)	0	0	0
Two-PLL Coherent	0	1	1
Single-PLL Non-Coherent	1	1	0
Single-PLL Coherent	1	1	1

#### NOTE

Single-PLL Coherent and Non-Coherent modes can be set for only video formats with no pixel repetition and color depth equal to 8 bits.

### 35.9.2 PLL/MPLL Generic Configuration Settings

Each supported video format can be referred to by its input pixel clock frequency, pixel repetition, and color depth in bits.

The table below provides all the PLL/MPLL settings necessary to completely configure the blocks for any supported video format.

## 35.10 Appendix C: 3D Video Formats

3D video formats are created from any of the supported VICs. The 3D structure in which the frames are organized determines the way data is transferred.

The 3D video format is indicated using the VIC in the AVI InfoFrame (indicating one of the 2D formats defined in the CEA-861-D standard) in conjunction with the 3D\_Structure field in the HDMI vendor-specific InfoFrame.

For Side-by-Side (Half) and Top-and-Bottom 3D structures, pixel clock frequency is equal to the original VIC pixel clock frequency.

For the L+depth+GFX+GFX-depth 3D structure, pixel clock frequency is equal to 4x the original VIC pixel clock frequency.

For other 3D structures, pixel clock frequency is equal to 2x the original VIC pixel clock frequency.

The following table summarizes the original 2D VIC pixel clock frequencies required to support the 3D structures.

**Table 35-68. 2D VIC Pixel Clock Frequencies Required to Support 3D Structures**

3D Structure	2D Pixel Clock Frequency
0000 (Frame Packing)	2x 2D pixel clock frequency
0001 (Field alternative)	2x 2D pixel clock frequency
0010 (Line alternative)	2x 2D pixel clock frequency
0011 (Side-by-Side (Full))	2x 2D pixel clock frequency
0100 (L + depth)	2x 2D pixel clock frequency
0101 (L + depth + GPX + GFX-depth)	4x 2D pixel clock frequency
0110 (Top-and-Bottom)	2D pixel clock frequency
1000 (Side-by-Side (Half))	2D pixel clock frequency

VIC-specific PLL/MPLL configurations apply to Side-by-Side (Half) and Top-and-Bottom 3D structures. To obtain the PLL/MPLL configuration for a specific VIC used within a 3D structure, see [PLL/MPLL Generic Configuration Settings](#). Each configuration corresponds to a specific video format's pixel clock, pixel repetition, and color depth combination.

**Example:**

VIC 32: No pixel repetition, PCLK = 74.25 MHz, CD = 8,10,12,16

VIC 32 within 3D structure:

- Side-by-Side (Half) 3D structure (same pixel clock frequency): Same PLL/MPLL configuration as for VIC 32.
- Frame Packing (doubled pixel clock frequency): PLL/MPLL configuration corresponds to a row in [Table 35-67](#) with the following: no pixel repetition, PCLK = 148.5 MHz, CD = 8,10,12,16.

For VICs where PCLK = 148.5 MHz, no color depth is supported for 3D video format, because the pixel clock frequency would be greater than 340 MHz.

Table 35-69 provides examples of primary 3D video format timings, and Table 35-70 provides examples of other 3D video format timings. Secondary 3D video format timings can be found in the HDMI specification.

**Table 35-69. Primary 3D Video Format Timings**

# Chapter 36

## I2C Controller (I2C)

### 36.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

**References:** This document assumes an understanding of the following document:

- *The I2C Bus Specification, Version 2.1*, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

#### **NOTE**

Four independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

**Figure 36-1. Connection of devices to I2C bus**

The I2C interface speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

**Figure 36-2. I2C block diagram**

### 36.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

### 36.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

## 36.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn\_SCL and I2Cn\_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn\_SCL and I2Cn\_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADs are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

**Table 36-1. I2C External Signals**

Signal	Description	Pad	Mode	Direction
I2C1_SCL (SCL)	Serial Clock	CSI0_DAT9	ALT4	IO
		EIM_D21	ALT6	
I2C1_SDA (SDA)	Serial Data	CSI0_DAT8	ALT4	IO
		EIM_D28	ALT1	
I2C2_SCL (SCL)	Serial Clock	EIM_EB2	ALT6	IO
		KEY_COL3	ALT4	
I2C2_SDA (SDA)	Serial Data	EIM_D16	ALT6	IO
		KEY_ROW3	ALT4	
I2C3_SCL (SCL)	Serial Clock	EIM_D17	ALT6	IO
		GPIO_3	ALT2	

*Table continues on the next page...*

**Table 36-1. I2C External Signals (continued)**

Signal	Description	Pad	Mode	Direction
I2C3_SDA (SDA)	Serial Data	GPIO_5	ALT6	IO
		EIM_D18	ALT6	
		GPIO_6	ALT2	
I2C4_SCL (SCL)	Serial Clock	GPIO_16	ALT6	IO
		ENET_TX_EN	ALT9	
		GPIO_7	ALT8	
I2C4_SDA (SDA)	Serial Data	NANDF_WP_B	ALT9	IO
		ENET_TXD1	ALT9	
		GPIO_8	ALT8	
		NANDF_CS3	ALT9	

### 36.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 36-2. I2C Clocks**

Clock name	Clock Root	Description
ipg_clk_patref	perclk_clk_root	Module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- Peripheral clock (ipg\_clk\_s): This clock is used for peripheral bus register read/writes.
- Module clock (ipg\_clk\_patref): This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

### 36.4 Functional description

This section provides a complete functional description of the block.

### 36.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see [Initialization sequence](#).

#### NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

### 36.4.2 Arbitration procedure

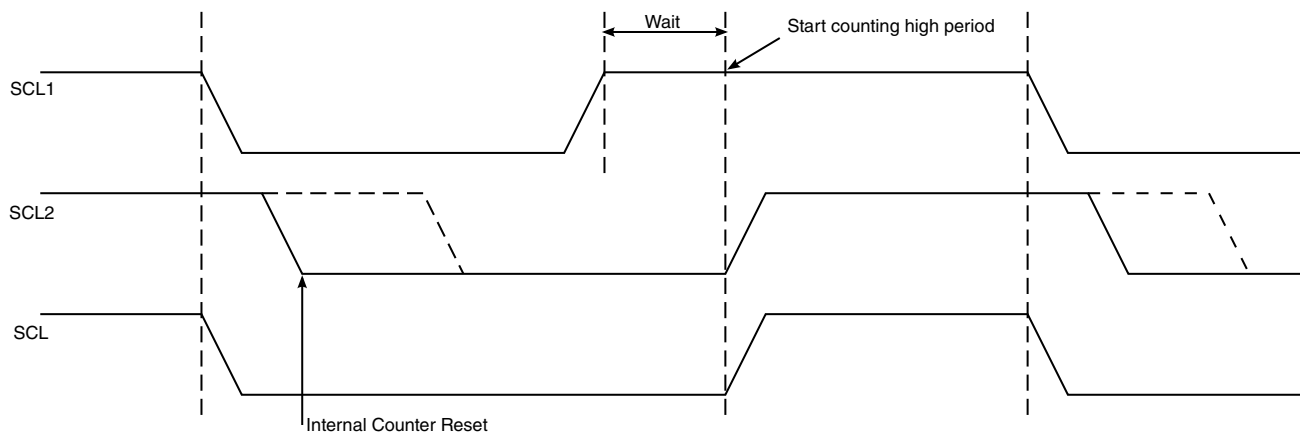

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn\_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C\_I2SR[IAL] to indicate loss of arbitration).

### 36.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see [Figure 36-3](#)). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

**Figure 36-3. Synchronized clock SCL**

### 36.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

### 36.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

### 36.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

### 36.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

### 36.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C\_IADR and I2C\_IFDR registers) initiated by deasserting the I2C\_I2CR[IEN] bit

### 36.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C\_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

### 36.4.10 Byte order

The block only supports the Little-Endian mode.

## 36.5 Initialization

### NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

### 36.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C\_IFDR[IC]) to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C\_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C\_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C\_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

### 36.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C\_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is not busy after writing the calling address to the data register (I2C\_I2DR), before proceeding to load data into the data register (I2C\_I2DR).

### 36.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C\_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C\_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C\_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C\_I2SR[IIF]) in the interrupt routine.

See the flow chart in [Figure 36-5](#).

The data transferring bit (I2C\_I2SR[ICF]) is cleared either by reading from I2C\_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C\_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C\_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C\_I2CR[MTX] should be toggled and a dummy read of the I2C\_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C\_I2SR[IAAS] = 1), the slave read/write bit I2C\_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C\_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

### 36.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C\_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

### 36.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

### 36.5.6 Slave mode

In the slave interrupt service routine (see [Figure 36-5](#)), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C\_I2CR[MTX]) according to the I2C\_I2SR[SRW]. Writing to the I2C\_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C\_I2DR for slave transmits, or read from I2C\_I2DR in Slave Receive mode. A dummy read of I2C\_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C\_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C\_I2DR) then releases SCL so the master can generate a Stop signal.

### 36.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn\_SDA stops, but 12Cn\_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C\_I2SR[IAL] = 1), and the Slave mode is selected (I2C\_I2CR[MSTA] = 0).

See the flow chart in [Figure 36-5](#).

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C\_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C\_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C\_I2SR[IAL] bit gets set only for 12Cn\_SDA=0, 12Cn\_SCL=0/1, 12Cn\_SDA=1, and 12Cn\_SCL=0; but not for 12Cn\_SDA=1 and I2Cn\_SCL=1, which is the equivalent of Bus Idle state.

Figure 36-4. I2C Programming state diagram

Figure 36-5. Flowchart of typical I2C interrupt routine

## NOTE

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C\_I2DR register should be performed so I2C can read the next receive data.

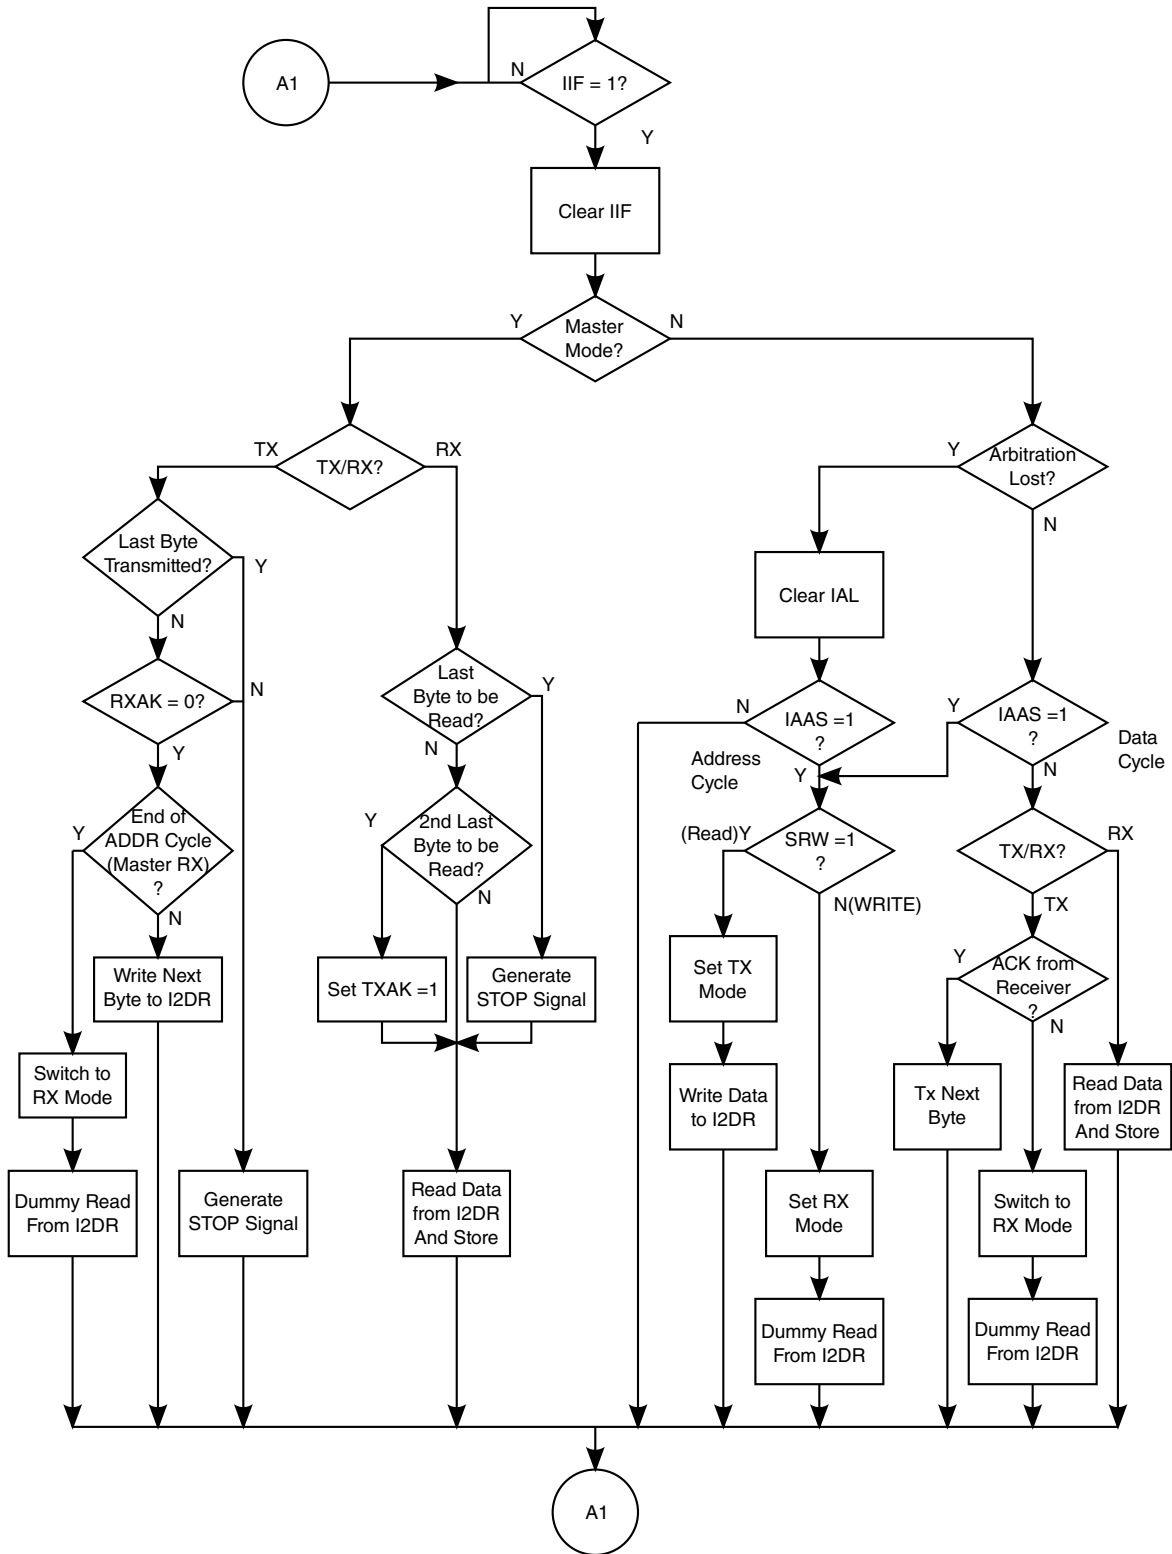

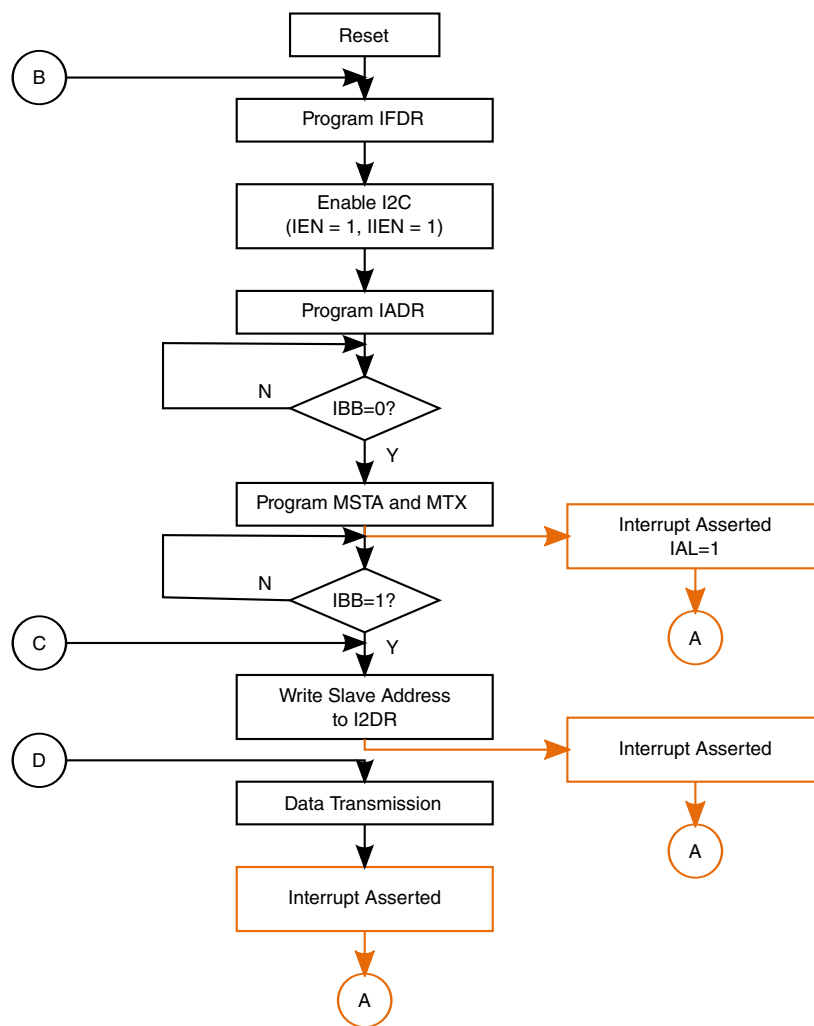

Figure 36-6. Flowchart for typical I2C polling routine

**NOTE**

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is  $T_{min} = 25 \mu s$  ( $= 2.5 \times 10 \mu s$ ). This value can be calculated for any bus frequency. The formula is  $T_{min} = 10/F_{SCL}$ , where  $F_{SCL}$  is the frequency of the I2C clock (SCL).

**Figure 36-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1**

**Figure 36-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2**

Figure 36-7 and Figure 36-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C\_I2CR register
- Perform the next data transfer by writing to the I2C\_I2DR register

#### NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

## 36.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C\_I2CR[RSTA] bit and before writing to the I2C\_I2DR register. The maximum possible clock period of the module clock is 78 ns.

## 36.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

### NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

### I2C memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 36.7.1 I2C Address Register (I2Cx\_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Read	0								ADR								0
Write																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

#### I2Cx\_IADR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus.  <b>NOTE:</b> The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

### 36.7.2 I2C Frequency Divider Register (I2Cx\_IFDR)

The I2C\_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

I2C clock is sourced from PERCLK\_ROOT which is routed from IPG\_CLK\_ROOT. I2C clock frequency can easily be obtained by using the following formula:

**I2C clock Frequency = (PERCLK\_ROOT frequency)/(division factor corresponding to IFDR)**

By default, IPG\_CLK\_ROOT and PERCLK\_ROOT frequencies are set to 49.5MHz, where the root clock is sourced from PLL2's PFD2. Obtaining the frequencies can be accomplished by:

$$\text{PLL2} = 528\text{MHz}$$

$$\text{PLL2\_PFD2} = 528\text{MHz} * 18 / 24 = 396\text{MHz}$$

$$\text{IPG\_CLK\_ROOT} = (\text{PLL2\_PFD2} / \text{ahb\_podf}) / \text{ipg\_podf} = (396\text{MHz}/4)/2 = 49.5\text{MHz}$$

$$\text{PER\_CLK\_ROOT} = \text{IPG\_CLK\_ROOT}/\text{perclk\_podf} = 49.5\text{MHz}/1 = 49.5\text{MHz}$$

**NOTE**

The above calculation assumes that the default CCM register settings, routing, and division factors are used. If different routing, PFD values, and/or division factors are used, the user must adjust the parameters accordingly to calculate the correct clock frequency.

The following table describes the divider and register values for the register field "IC."

**Table 36-13. I2C\_IFDR Register Field Values**

IC	Divider		IC	Divider		IC	Divider		IC	Divider
0x00	30		0x10	288		0x20	22		0x30	160
0x01	32		0x11	320		0x21	24		0x31	192
0x02	36		0x12	384		0x22	26		0x32	224
0x03	42		0x13	480		0x23	28		0x33	256
0x04	48		0x14	576		0x24	32		0x34	320

Address: Base address + 4h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0										IC					
Write	0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**I2Cx\_IFDR field descriptions**

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
IC	I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register.  <b>NOTE:</b> The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.

### 36.7.3 I2C Control Register (I2Cx\_I2CR)

The I2C\_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read						0	0	
Write	IEN	IEN	MSTA	MTX	TXAK	RSTA		
Reset	0	0	0	0	0	0	0	0

#### I2Cx\_I2CR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal.  0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.
6 I2EN	I2C interrupt enable.  <b>NOTE:</b> If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written.  0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.
5 MSTA	Master/Slave mode select bit. If the master loses arbitration, MSTA is cleared without generating a Stop signal.  <b>NOTE:</b> The module clock should be on for writing to the MSTA bit.  <b>NOTE:</b> The MSTA bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.

*Table continues on the next page...*

I2Cx\_I2CR field descriptions (continued)

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers.  0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit.  In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers.  <b>NOTE:</b> Writing TXAK applies only when the I2C bus is a receiver.  0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration.  0 No repeat start 1 Generates a Repeated Start condition
Reserved	This read-only field is reserved and always has the value 0.

### 36.7.4 I2C Status Register (I2Cx\_I2SR)

The I2C\_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write	[Shaded]							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	ICF	IAAS	IBB	IAL	0	SRW	IIF	RXAK
Write	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]	[Shaded]
Reset	1	0	0	0	0	0	0	1

## I2Cx\_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[I IEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus. <b>NOTE:</b> When I2C is enabled (I2C_I2CR[I IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): <ul style="list-style-type: none"> <li>I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle.</li> <li>I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle.</li> </ul> For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle. <ul style="list-style-type: none"> <li>A Start cycle is attempted when the bus is busy.</li> <li>A Repeated Start cycle is requested in Slave mode.</li> <li>A Stop condition is detected when the master did not request it.</li> </ul> <b>NOTE:</b> Software cannot set the bit. 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. <b>NOTE:</b> The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending.

*Table continues on the next page...*

**I2Cx\_I2SR field descriptions (continued)**

Field	Description
	<p>This causes a processor interrupt request (if the interrupt enable is asserted [I IEN = 1]). The interrupt is set when one of the following occurs:</p> <ul style="list-style-type: none"> <li>• One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).</li> <li>• An address is received that matches its own specific address in Slave Receive mode.</li> <li>• Arbitration is lost.</li> </ul>
0 RXAK	<p>Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle.</p> <p>0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus.            1 A "No acknowledge" signal was detected at the ninth clock.</p>

**36.7.5 I2C Data I/O Register (I2Cx\_I2DR)**

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

**I2Cx\_I2DR field descriptions**

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
DATA	<p>Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received.</p> <p><b>NOTE:</b> The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.</p>

# Chapter 37

## IOMUX Controller (IOMUXC)

### 37.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

[Figure 37-1](#) illustrates the IOMUX/IOMUXC connectivity in the system.

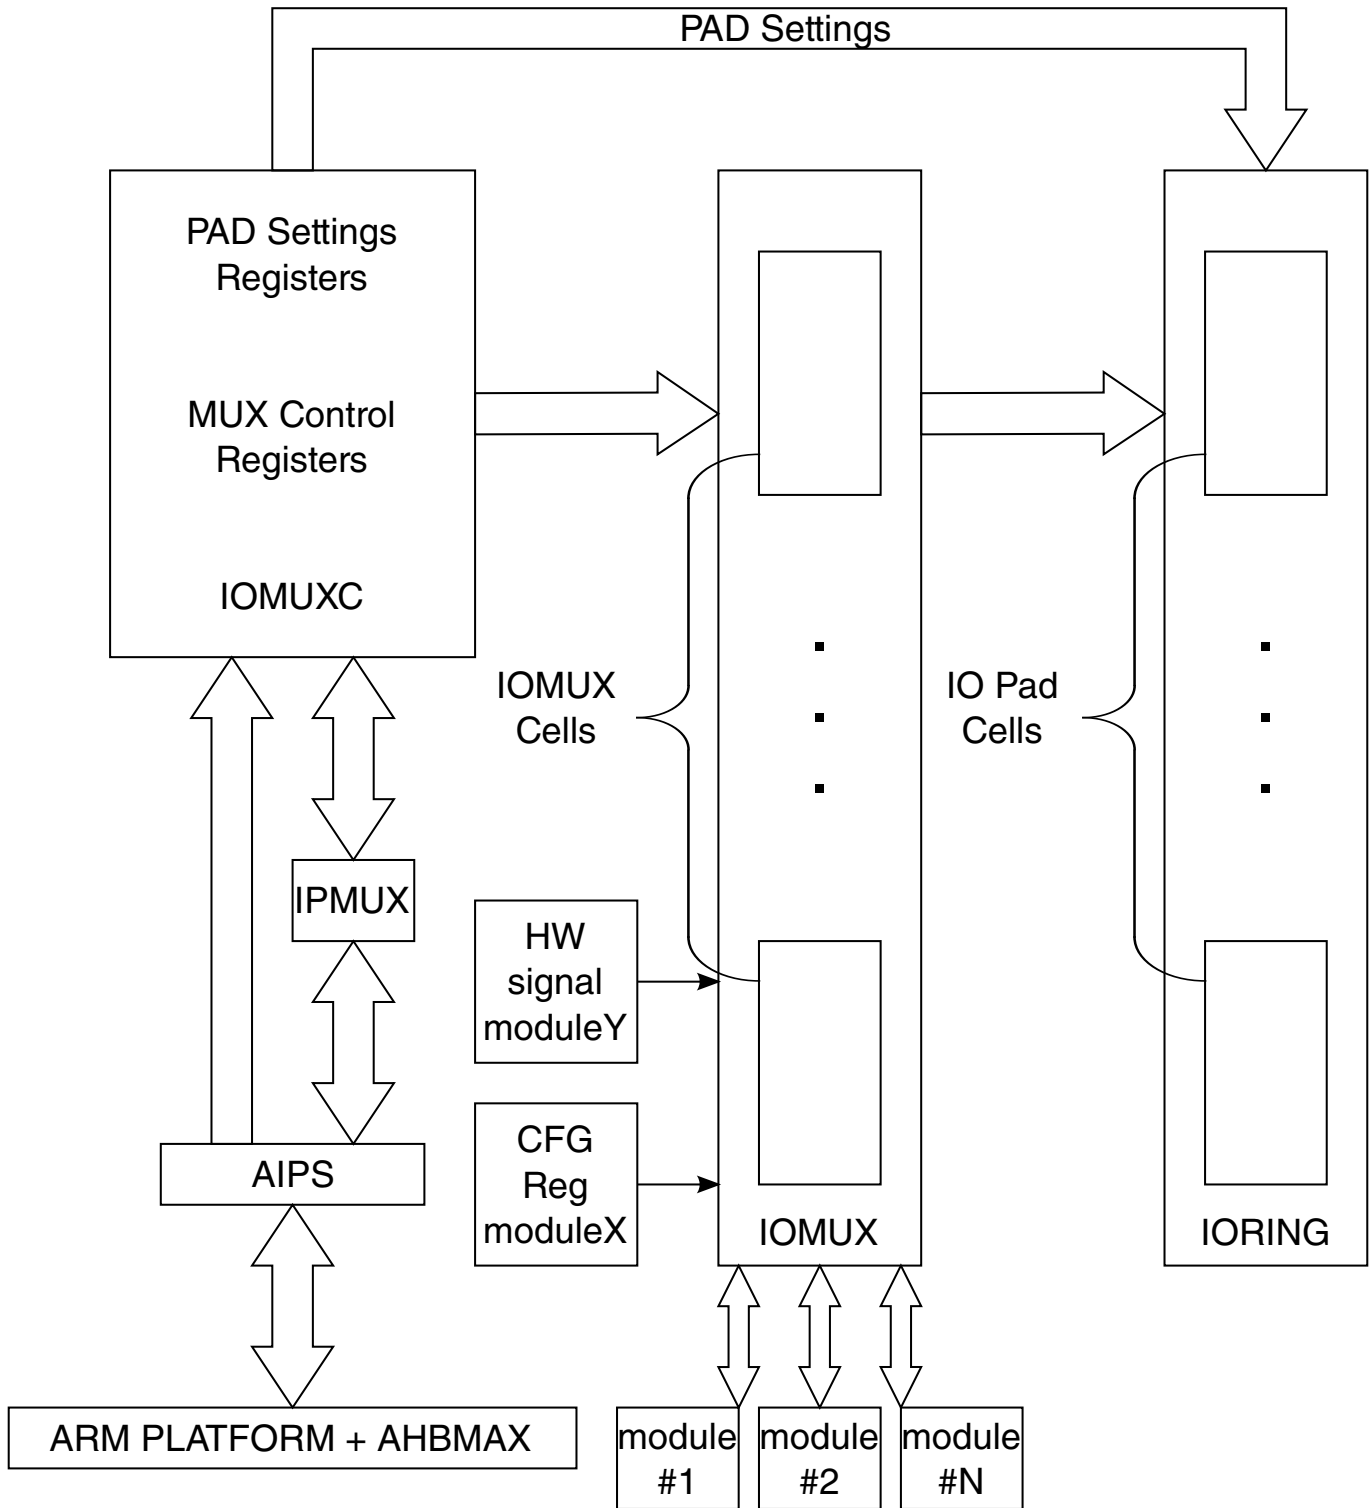

Figure 37-1. IOMUX SoC Level Block Diagram

### 37.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC\_SW\_MUX\_CTL\_PAD\_<PAD NAME> or IOMUXC\_SW\_MUX\_CTL\_GRP\_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX\_MODE fields of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC\_SW\_PAD\_CTL\_PAD\_<PAD\_NAME> or IOMUXC\_SW\_PAD\_CTL\_GRP\_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 14 (GPR0 to GPR13) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX\_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

## 37.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 37-1. IOMUXC Clocks**

Clock name	Clock Root	Description
ipt_clk_io	enfc_clk_root	IO clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

### 37.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC\_REGISTERS includes all of the IOMUXC registers (see [Features](#)).
- IOMUXC\_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux\_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux\_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in [Figure 37-2](#).

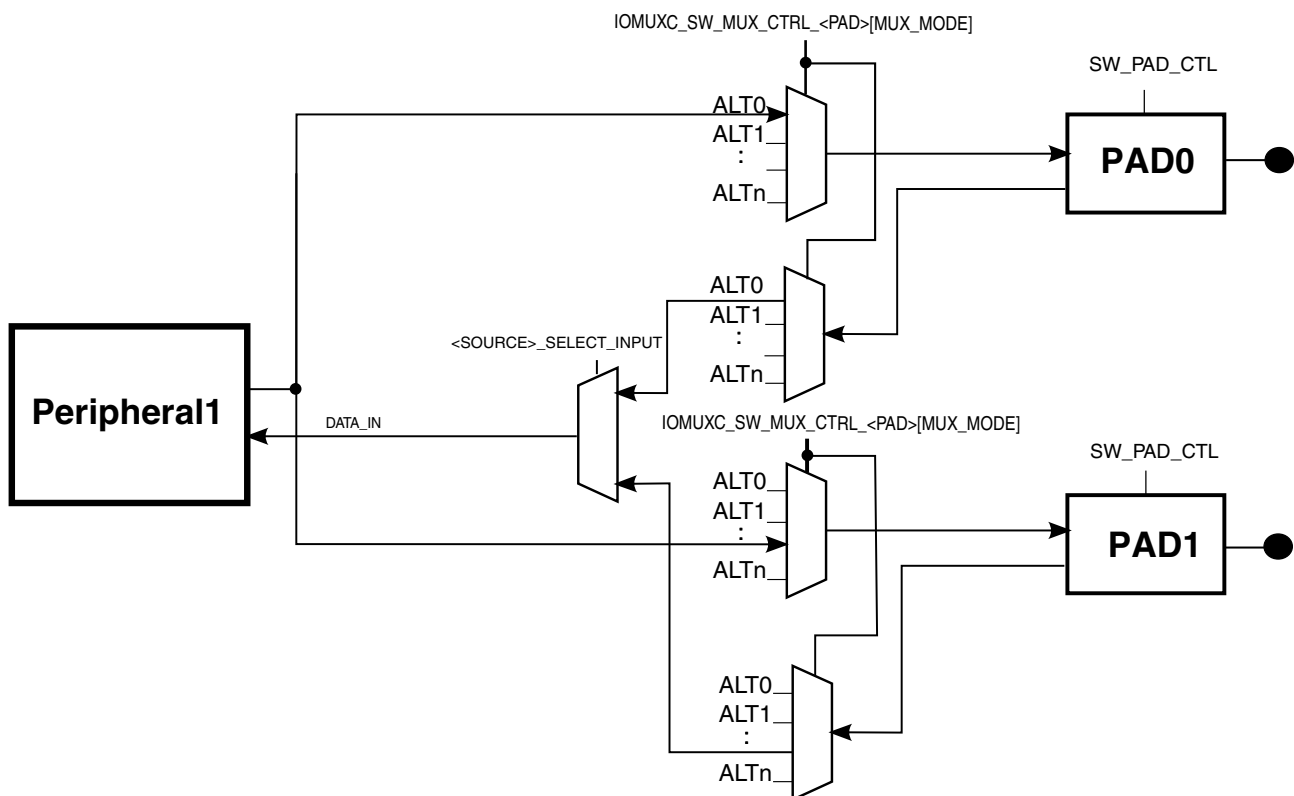

Figure 37-2. IOMUX Cell Block Diagram

### 37.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

### 37.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (`ipp_ibe==1'b1`) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC\_SW\_MUX\_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.
- GPIO Capture - Module x drives the pad and the value is captured by GPIO.

### 37.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC\_SW\_MUX\_CTL\_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC\_SW\_MUX\_CTL\_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

Figure 37-3. Daisy chain illustration

## 37.4 IOMUXC Memory Map/Register Definition

IOMUXC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

## IOMUXC\_GPR0 field descriptions

Field	Description
31–30 CLOCK_8_MUX_SEL	Selects the source of asrck_clock_8 in ASRC according to clock muxing scheme 00 audmux.amx_output_rxclk_p7 muxed with ssi3.ssi_srck 01 audmux.amx_output_rxclk_p7 10 ssi3.ssi_srck 11 ssi3.rx_bit_clk
29–28 CLOCK_0_MUX_SEL	Selects the source of asrck_clock_0 in ASRC according to clock muxing scheme: 00 esai.ipp_ind_sckr muxed with esai.ipp_do_sckr 01 esai.ipp_ind_sckr 10 esai.ipp_do_sckr 11 Reserved
27–26 CLOCK_B_MUX_SEL	Selects the source of asrck_clock_b in ASRC according to clock muxing scheme: 00 audmux.amx_output_txclk_p7 muxed with ssi3.ssi_stck 01 audmux.amx_output_txclk_p7 10 ssi3.ssi_stck 11 ssi3.tx_bit_clk
25–24 CLOCK_3_MUX_SEL	Selects the source of asrck_clock_3 in ASRC according to clock muxing scheme: 00 audmux.amx_output_rxclk_p7 muxed with ssi3.ssi_srck 01 audmux.amx_output_rxclk_p7 10 ssi3.ssi_srck 11 ssi3.rx_bit_clk
23–22 CLOCK_A_MUX_SEL	Selects the source of asrck_clock_a in ASRC according to clock muxing scheme: 00 audmux.amx_output_txclk_p2 muxed with ssi2.ssi_stck 01 audmux.amx_output_txclk_p2 10 ssi2.ssi_stck 11 ssi2.tx_bit_clk
21–20 CLOCK_2_MUX_SEL	Selects the source of asrck_clock_2 in ASRC according to clock muxing scheme: 00 audmux.amx_output_rxclk_p2 muxed with ssi2.ssi_srck 01 audmux.amx_output_rxclk_p2 10 ssi2.ssi_srck 11 ssi2.rx_bit_clk
19–18 CLOCK_9_MUX_SEL	Selects the source of asrck_clock_9 in ASRC according to clock muxing scheme: 00 audmux.amx_output_txclk_p1 muxed with ssi1.ssi_stck 01 audmux.amx_output_txclk_p1 10 ssi1.ssi_stck 11 ssi1.tx_bit_clk
17–16 CLOCK_1_MUX_SEL	Selects the source of asrck_clock_1 in ASRC according to clock muxing scheme: 00 audmux.amx_output_rxclk_p1 muxed with ssi1.ssi_srck 01 audmux.amx_output_rxclk_p1 10 ssi1.ssi_srck 11 ssi1.rx_bit_clk

Table continues on the next page...

## IOMUXC\_GPR0 field descriptions (continued)

Field	Description
15–14 TX_CLK2_MUX_SEL	Selects the source of tx_clk2 in SPDIF according to ASRC clock muxing scheme: 00 same source as for asrc.asrck_clock_1 01 same source as for asrc.asrck_clock_2 10 same source as for asrc.asrck_clock_3 11 Reserved
13–11 -	
10–8 PCIE_RX0_EQ	control pcie phy's rx0_eq bits
7 DMAREQ_MUX_SEL7	Selects between two possible sources for SDMA_EVENT[14]: 0 spdif.drq0_spdif_b 1 iomux.sdma_ext_events[1] - External DMA Request via DISP0_DAT17 or GPIO_18
6 DMAREQ_MUX_SEL6	Selects between two possible sources for SDMA_EVENT[23]: 0 esai. 1 i2c3.ipi_int_b
5 DMAREQ_MUX_SEL5	Selects between two possible sources for SDMA_EVENT[9]: 0 ecspi4.ipd_req_csipi_rdma_b 1 epit2.ipi_int_epit_oc
4 DMAREQ_MUX_SEL4	Selects between two possible sources for SDMA_EVENT[10]: 0 ecspi4.ipd_req_csipi_tdma_b 1 i2c1.ipi_int_b
3 DMAREQ_MUX_SEL3	Selects between two possible sources for SDMA_EVENT[5]: 0 ecspi2.ipd_req_csipi_rdma_b 1 i2c1.ipi_int_b
2 DMAREQ_MUX_SEL2	Selects between two possible sources for SDMA_EVENT[4]: 0 ecspi1.ipd_req_csipi_tdma_b 1 i2c2.ipi_int_b
1 DMAREQ_MUX_SEL1	Selects between two possible sources for SDMA_EVENT[3]: 0 ecspi1.ipd_req_csipi_rdma_b 1 i2c3.ipi_int_b
0 DMAREQ_MUX_SEL0	Selects between two possible sources for SDMA_EVENT[2]: 0 ipu1. 1 iomux.sdma_events[0] - External DMA Request from pad DISP0_DAT16 or GPIO_17

#### IOMUXC\_GPR1 field descriptions

Field	Description
31 CFG_L1_CLK_REMOVAL_EN	PCIe_CTL (CLK LOGIC CONTROLLER GLUE) - Enable the reference clock removal in L1 state. This is a bit from application register.
30 APP_CLK_REQ_N	PCIe_CTL (CLK LOGIC CONTROLLER GLUE) - Indicates that application logic is ready to have reference clock removed.
29 Reserved	This read-only field is reserved and always has the value 0.
28 APP_REQ_EXIT_L1	PCIe_CTL - Application Request to Exit L1. Request from the application to exit ASPM state L1. 0 PCIe application request is not set 1 PCIe application request is set
27 APP_READY_ENTR_L23	PCIe_CTL - Application Ready to Enter L23. Indication from the application that it is ready to enter the L23 state. 0 PCIe application is not ready to enter L23 1 PCIe application is ready to enter L23

Table continues on the next page...

## IOMUXC\_GPR1 field descriptions (continued)

Field	Description
26 APP_REQ_ENTR_L1	PCIe_CTL - Application Request to Enter L1. Request from the application to enter ASPM state L1. 0 PCIe application request is not set 1 PCIe application request is set
25 MIPI_COLOR_SW	MIPI color switch control 0 MIPI color switch request is not set 1 MIPI color switch request is set
24 MIPI_DPI_OFF	MIPI DPI shutdown request 0 MIPI DPI shutdown request is not set 1 MIPI DPI shutdown request is set
23 Reserved	This read-only field is reserved and always has the value 0.
22 EXC_MON	Exclusive monitor response select of illegal command (of lal gaskets, except MMDC) 0 OKEY response 1 SLVError (default)
21 ENET_CLK_SEL	choose enet reference clk mode 0 get enet tx reference clk from pad (external OSC for both external PHY and Internal Controller) 1 get enet tx reference clk from internal clock from anatop (loopback through pad), this clock also sent out to external PHY
20–19 -	0 Gasket is selected 1 IOMUX is selected
18 TEST_POWERDOWN	PCIe_PHY - All Circuits Power-Down Control Function: Powers down all circuitry in the PHY for IDDQ testing. 0 Power down is not requested 1 Power down is requested
17 -	This field is reserved.
16 REF_SSP_EN	PCIe_PHY - Reference Clock Enable for SS function. Function: Enables the reference clock to the prescaler. The phy_ref_ssp_en signal must remain deasserted until the reference clock is running at the appropriate frequency, at which point phy_ref_ssp_en can be asserted. For lower power states, phy_ref_ssp_en can also be deasserted. 0 PCIe PHY reference clock is disabled 1 PCIe PHY reference clock is enabled
15 USB_EXP_MODE	USB Exposure mode 0 Exposure mode is disabled. 1 Exposure mode is enabled.
14 SYS_INT	PCIe_CTL - When SYS_INT goes from low to high, the core generates an Assert_INTx Message. When sys_int goes from high to low, the core generates a Deassert_INTx Message. 0 PCIe system interrupt request is not asserted 1 PCIe system interrupt request is asserted

Table continues on the next page...

## IOMUXC\_GPR1 field descriptions (continued)

Field	Description
13 -	"usb_otg_id" pin iomux select control. (It functions as the 'daisy chain' mux control)  0 selects ENET_RX_ER 1 selects GPIO_1.
12 GINT	Global interrupt "0" bit (connected to ARM IRQ#0 and GPC)  0 Global interrupt request is not asserted 1 Global interrupt request is asserted
11–10 ADDRS3[10]	Active Chip Select and Address Space.  Each of the ACT_CSx represents one of the four chip selects of the EIM. When ACT_CSx=1'b1, the corresponding chip select is active and has a valid address space according to its address space configuration determined by ADDRSx[10] bits  ADDRSx[10] is setting the space for each chip select which is active. The address space of the first active chip select must be the biggest one, the following active chip select address spaces may be equal or lower.  Total address space size is 128 MByte.  The supported configurations are: CS0(128M), CS1 (0M), CS2 (0M), CS3(0M) [default configuration] CS0(64M), CS1(64M), CS2(0M), CS3(0M) CS0(64M), CS1(32M), CS2(32M), CS3(0M) CS0(32M), CS1(32M), CS2(32M), CS3(32M)  Address Space Configuration options (ADDRSx[10]):  00 32 MByte 01 64 MByte 10 128 MByte 11 Reserved
9 ACT_CS3	See description for ADDRS3[10]
8–7 ADDRS2[10]	See description for ADDRS3[10]
6 ACT_CS2	See description for ADDRS3[10]
5–4 ADDRS1[10]	See description for ADDRS3[10]
3 ACT_CS1	See description for ADDRS3[10]
2–1 ADDRS0[10]	See description for ADDRS3[10]
0 ACT_CS0	See description for ADDRS3[10]

#### IOMUXC\_GPR2 field descriptions

Field	Description
31–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 COUNTER_RESET_VAL[10]	Reset value for the LDB counter which determines when the shift registers are loaded with data. <b>NOTE:</b> Used for debug purposes only. In normal functional operation must be '00' 00 Reset value is 5 01 Reset value is 3 10 Reset value is 4 11 Reset value is 6
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 LVDS_CLK_SHIFT[2:0]	Shifts the LVDS output clock in relation to the data. <b>NOTE:</b> Used for debug purposes only. In normal functional operation must be '000' 000 Output clock is '1100011' (normal operation) 001 Output clock is '1110001' 010 Output clock is '1111000' 011 Output clock is '1000111' 100 Output clock is '0001111' 101 Output clock is '0011111' 110 Output clock is '0111100' 111 Output clock is '1100011'
15–11 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

## IOMUXC\_GPR2 field descriptions (continued)

Field	Description
10 DI1_VS_ POLARITY	Vsync polarity for IPU's DI1 interface. 0 ipu_di1_vsync is active high. 1 ipu_di1_vsync is active low.
9 DI0_VS_ POLARITY	Vsync polarity for IPU's DI0 interface. 0 ipu_di0_vsync is active high. 1 ipu_di0_vsync is active low.
8 BIT_MAPPING_ CH1	Data mapping for LVDS channel 1. 0 Use SPWG standard. 1 Use JEIDA standard.
7 DATA_WIDTH_ CH1	Data width for LVDS channel 1. <b>NOTE:</b> This bit must be set when using JEIDA standard (bit_mapping_ch1 is set) 0 Data width is 18 bits wide (lvds1_tx3 is not used) 1 Data width is 24 bits wide.
6 BIT_MAPPING_ CH0	Data mapping for LVDS channel 0. 0 Use SPWG standard. 1 Use JEIDA standard.
5 DATA_WIDTH_ CH0	Data width for LVDS channel 0. <b>NOTE:</b> This bit must be set when using JEIDA standard (bit_mapping_ch0 is set) 0 Data width is 18 bits wide (lvds0_tx3 is not used) 1 Data width is 24 bits wide.
4 SPLIT_MODE_ EN	Enable split mode. 0 Split mode is disabled. 1 Split mode is enabled. In this mode both channels should be enabled and working with the same DI (ch0_mode and ch1_mode should both be either '01' or '11')
3-2 CH1_MODE[10]	LVDS channel 1 operation mode 00 Channel disabled. 01 Channel enabled, routed to DI0 10 Channel disabled. 11 Channel enabled, routed to DI1.
CH0_MODE[10]	LVDS channel 0 operation mode 00 Channel disabled. 01 Channel enabled, routed to DI0 10 Channel disabled. 11 Channel enabled, routed to DI1.

### 37.4.4 GPR3 (IOMUXC\_GPR3)

Address: 20E\_0000h base + Ch offset = 20E\_000Ch

IOMUXC\_GPR3 field descriptions

Field	Description
31	This field is reserved.

Field	Description
30–29 GPU_DBG	GPU debug busses to IOMUX 00 GPU3D 01 GPU2D 10 OpenVG 11 Reserved
28 BCH_WR_CACHE_CTL	Control BCH block cacheable attribute of AXI write transactions <sup>1</sup> 0 Cacheable attribute is off for write transactions. 1 Cacheable attribute is on for write transactions.
27 BCH_RD_CACHE_CTL	Control BCH block cacheable attribute of AXI read transactions <sup>1</sup> 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
26 uSDHCx_WR_CACHE_CTL	Control uSDHCx [1-4] blocks cacheable attribute of AXI write transactions <sup>1</sup> 0 Cacheable attribute is off for write transactions. 1 Cacheable attribute is on for write transactions.
25 uSDHCx_RD_CACHE_CTL	Control uSDHCx [1-4] blocks cacheable attribute of AXI read transactions <sup>1</sup> 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
24–21 OCRAM_CTL	OCRAM_CTL[24] write address pipeline control bit. When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the write access on the memory cell at high frequency. Enable this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data. When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle). 0 write address pipeline is disabled 1 write address pipeline is enabled OCRAM_CTL[23] - write data pipeline control bit When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the write access on the memory cell at high frequency. Enable this feature would cost at most 1 more clock cycle for each AXI write transaction, i.e., at most 1 more clock cycle for each write burst with multiple beats of data. When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle). 0 write data pipeline is disabled 1 write data pipeline is enabled OCRAM_CTL[22] read address pipeline control bit. When this feature is enabled, the read address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM. This can avoid setup time issue for the read access on the memory cell at high frequency. Enable this feature would cost at most 1 more clock cycle for each AXI read transaction, i.e., at most 1 more clock cycle for each read burst with multiple beats of data. When this

## IOMUXC\_GPR3 field descriptions (continued)

Field	Description
	<p>feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait).</p> <p>0 read address pipeline is disabled 1 read address pipeline is enabled</p> <p>OCRAM_CTL[21] - read data wait state control bit</p> <p>When theread data wait state is enabled, it will cost 2 cycles for each read access, (each beat of a read burst). This can avoid the potential timing problem caused by the relatively longer memory access time at higher frequency. When this feature is disabled, it only costs 1 clock cycle to finish a read transaction, i.e., get read data back in the next cycle of read request becomes valid on the bus.</p> <p>0 read data pipeline is disabled 1 read data pipeline is enabled</p>
20–17 OCRAM_STATUS	<p>This field shows the OCRAM pipeline settings status, controlled by OCRAM_CTL[24:21] bits respectively. When the control bit is changed, the corresponding status bit goes high and keeps high until this new configuration is applied the internal logic. This provides a way for software to detect that the configuration has become valid. The suggested flow for changing the configuration in software is:</p> <ul style="list-style-type: none"> <li>• set/clear the control bit</li> <li>• poll the status bit until it goes to 0</li> </ul> <p>OCRAM_STATUS[17] shows the write address pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory.</p> <p>OCRAM_STATUS[18] shows the write data pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory.</p> <p>OCRAM_STATUS[19] shows the read address pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory.</p> <p>OCRAM_STATUS[20] shows the read data pipeline status. This bit value reflects the propagation of the respective control bit to OCRAM memory.</p> <p>0 read data pipeline configuration valid 1 read data pipeline control bit changed</p>
16–15 -	<p>Mask control of Core 2 debug acknowledge to global debug acknowledge</p> <p>0 Core 2 debug acknowledge is part of global acknowledge. 1 Core 2 debug acknowledge is masked by this bit, and it is not part of global acknowledge.</p>
14 CORE1_DBG_ACK_EN	<p>Mask control of Core 1 debug acknowledge to global debug acknowledge.</p> <p>0 Core 1 debug acknowledge is part of global acknowledge. 1 Core 1 debug acknowledge is masked by this bit, and it is not part of global acknowledge.</p>
13 CORE0_DBG_ACK_EN	<p>Mask control of Core 1 debug acknowledge to global debug acknowledge</p> <p>0 Core 0 debug acknowledge is part of global acknowledge. 1 Core 0 debug acknowledge is masked by this bit, and it is not part of global acknowledge.</p>
12 TZASC2_BOOT_LOCK	<p>TZASC-2 secure boot lock</p> <p>0 secure boot lock is disabled. 1 secure boot lock is enabled</p>

*Table continues on the next page...*

-	This field is reserved. Reserved

1. Set of the cache bits, enable packet optimization through the bus system to DDR controller. The only side affect - is that bus may change the nature of the accesses, which may lead to problems when accessing FIFO type address. In most typical cases - these bits should be set. For the GPU3D, GPU2D and OpenVG, such settings is possible through the IP programming model. For few peripherals, for these bits to take effect, it is required to also select set '1' to 'cache-mux' control bit.

### 37.4.5 GPR4 (IOMUXC\_GPR4)

Address: 20E\_0000h base + 10h offset = 20E\_0010h

IOMUXC\_GPR4 field descriptions

Field	Description
31 VDOA_WR_CACHE_SEL	This bit selects the cacheable attribute of VDOA AXI write transactions <sup>1</sup> 0 The write transactions cacheable attribute is driven by the VDOA core 1 The write transactions cacheable attribute is driven by VDOA_WR_CACHE_VAL.

Table continues on the next page...

## IOMUXC\_GPR4 field descriptions (continued)

Field	Description
30 VDOA_RD_CACHE_SEL	This bit selects the cacheable attribute of VDOA AXI read transactions) <sup>1</sup> 0 The read transaction cacheable attribute is driven by the VDOA core 1 The read transaction cacheable attribute is driven by VDOA_RD_CACHE_VAL.
29 VDOA_WR_CACHE_VAL	VDOA block cacheable attribute value of AXI write transactions The value of VDOA_WR_CACHE_VAL is affecting the transactions only if VDOA_WR_CACHE_SEL is set. <sup>1</sup> 0 Cacheable attribute is off for write transactions. 1 Cacheable attribute is on for write transactions.
28 VDOA_RD_CACHE_VAL	VDOA block cacheable attribute value of AXI read transactions The value of VDOA_RD_CACHE_VAL is affecting the transactions only if VDOA_RD_CACHE_SEL is set. <sup>1</sup> 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
27 PCle_WR_CACHE_SEL	This bit selects the cacheable attribute of PCle AXI write transactions) <sup>1</sup> 0 The write transactions cacheable attribute is driven by the PCle core 1 The write transactions cacheable attribute is driven by PCle_WR_CACHE_VAL.
26 PCle_RD_CACHE_SEL	This bit selects the cacheable attribute of PCle AXI read transactions) <sup>1</sup> 0 The read transaction cacheable attribute is driven by the PCle core 1 The read transaction cacheable attribute is driven by PCle_RD_CACHE_VAL.
25 PCle_WR_CACHE_VAL	PCle block cacheable attribute value of AXI write transactions The value of PCle_WR_CACHE_VAL is affecting the transactions only if PCle_WR_CACHE_SEL is set. <sup>1</sup> 0 Cacheable attribute is off for write transactions. 1 Cacheable attribute is on for write transactions.
24 PCle_RD_CACHE_VAL	PCle block cacheable attribute value of AXI read transactions The value of PCle_RD_CACHE_VAL is affecting the transactions only if PCle_RD_CACHE_SEL is set. <sup>1</sup> 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
23–20 Reserved	This read-only field is reserved and always has the value 0.
19 SDMA_STOP_ACK	SDMA stop acknowledge. This is status (read only) bit. 0 SDMA stop acknowledge is not asserted. 1 SDMA stop acknowledge is asserted, SDMA is in STOP mode.
18 CAN2_STOP_ACK	CAN-2 stop acknowledge. This is status (read only) bit. 0 CAN-2 stop acknowledge is not asserted. 1 CAN-2 stop acknowledge is asserted, CAN-2 is in STOP mode.
17 CAN1_STOP_ACK	CAN-1 stop acknowledge. This is status (read only) bit. 0 CAN-1 stop acknowledge is not asserted. 1 CAN-1 stop acknowledge is asserted, CAN-1 is in STOP mode.

Table continues on the next page...

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 ARMP_IPG_ CLK_EN	ARM platform IPG clock enable 0 IPG clock is not running (gated). 1 IPG clock is running (enabled).
26 ARMP_AHB_ CLK_EN	ARM platform AHB clock enable 0 IPG clock is not running (gated). 1 IPG clock is running (enabled).
25 ARMP_ATB_ CLK_EN	ARM platform ATB clock enable 0 IPG clock is not running (gated). 1 IPG clock is running (enabled).
24 ARMP_APB_ CLK_EN	ARM platform APB clock enable 0 IPG clock is not running (gated). 1 IPG clock is running (enabled).
23–21 PCle_CTL_7	PCle control of diagnostic bus select TBD
20–17 DIAG_STATUS_ BUS_SELECT	PCle_CTL - used for debug to select what part of diag_status_bus will be reflected on the 32 bits of the iomux
16 APPS_PM_XMT_ TURNOFF	PCle_CTL - Request from the application to generate a PM_Turn_Off Message.
15–12 DEVICE_TYPE	PCle_CTL - Device/Port Type. Indicates the specific type of this PCI Express Function (EP or RC) DEVICE_TYPE field values 0011-1111 are reserved.  0000 <b>PCIE_EP</b> — EP Mode 0010 <b>PCIE_RC</b> — RC Mode
11 APP_INIT_RST	PCle_CTL - Request from the application to send a Hot Reset to the downstream device.
10 APP_LTSSM_ ENABLE	PCle_CTL - Driven low by the application after reset to hold the LTSSM in the Detect state until the application is ready. When the application has finished initializing the core configuration registers, it asserts app_ltssm_enable to allow the LTSSM to continue Link establishment.  0 Application is not ready. 1 Application is not ready.
9 APPS_PM_XMT_ PME	PCle_CTL - Wake Up. Used by application logic to wake up the PMC state machine from a D1, D2 or D3 power state. Upon wake-up, the core sends a PM_PME Message
8–4 LOS_LEVEL	PCle_PHY - Loss-of-Signal Detector Sensitivity Level Control Function: Sets the sensitivity level for the Loss-of-Signal detector. This signal must be set to 0x9
3–2 uSDHC_DBG_ MUX	uSDHC debug mux control TBD
Reserved	This read-only field is reserved and always has the value 0.

#### IOMUXC\_SW\_MUX\_CTL\_PAD\_EIM\_DATA31 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field.  Force the selected mux mode input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad EIM_D31. 0 <b>DISABLED</b> — Input Path is determined by functionality of the selected mux mode (regular).
MUX_MODE	MUX Mode Select Field.  Select 1 of 9 iomux modes to be used for pad: EIM_D31.  NOTE: Pad EIM_D31 is involved in Daisy Chain.  0000 <b>ALT0</b> — Select signal EIM_DATA31. 0001 <b>ALT1</b> — Select signal IPU1_DISP1_DATA20. 0010 <b>ALT2</b> — Select signal IPU1_DIO_PIN12. 0011 <b>ALT3</b> — Select signal IPU1_CSI0_DATA02. 0100 <b>ALT4</b> — Select signal UART3_RTS_B.  - Configure register <a href="#">IOMUXC_UART3_UART_RTS_B_SELECT_INPUT</a> for mode ALT4. 0101 <b>ALT5</b> — Select signal GPIO3_IO31. 0110 <b>ALT6</b> — Select signal USB_H1_PWR. 1000 <b>ALT8</b> — Select signal EPDC_SDCLK_P. 1001 <b>ALT9</b> — Select signal EIM_ACLK_FREERUN.

### 37.4.93 Pad Mux Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_EIM\_AD00)

Address: 20E\_0000h base + 184h offset = 20E\_0184h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	0																
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO19 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field.  Force the selected mux mode input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO_19. 0 <b>DISABLED</b> — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field.  Select 1 of 7 iomux modes to be used for pad: GPIO_19. NOTE: Pad GPIO_19 is involved in Daisy Chain.  000 <b>ALT0</b> — Select signal KEY_COL5. - Configure register <a href="#">IOMUXC_KEY_COL5_SELECT_INPUT</a> for mode ALT0. 001 <b>ALT1</b> — Select signal ENET_1588_EVENT0_OUT. 010 <b>ALT2</b> — Select signal SPDIF_OUT. 011 <b>ALT3</b> — Select signal CCM_CLKO1. 100 <b>ALT4</b> — Select signal ECSPI1_RDY. 101 <b>ALT5</b> — Select signal GPIO4_IO05. 110 <b>ALT6</b> — Select signal ENET_TX_ER.

### 37.4.133 Pad Mux Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO02)

Address: 20E\_0000h base + 224h offset = 20E\_0224h

## IOMUXC\_SW\_PAD\_CTL\_PAD\_CSI0\_DATA12 field descriptions (continued)

Field	Description
	10 <b>100K_OHM_PU</b> — 100K Ohm Pull Up 11 <b>22K_OHM_PU</b> — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: CSI0_DAT12. 0 <b>KEEP</b> — Keeper Enabled 1 <b>PULL</b> — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: CSI0_DAT12. 0 <b>DISABLED</b> — Pull/Keeper Disabled 1 <b>ENABLED</b> — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 <b>DISABLED</b> — Output is CMOS. 1 <b>ENABLED</b> — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field  <b>NOTE:</b> The operational frequency on GPIO pads is dependent on slew rate (SRE) and supply voltage (OVDD). Please see GPIO <a href="#">Operating Frequency</a> for more details.  00 <b>LOW</b> — 50 MHz (SRE=x) 01 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V 10 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V 11 <b>MAXIMUM</b> — 100 MHz, if SRE=1: 150MHz @ 1.8V, 200MHz @ 3.3V
5–3 DSE	Drive Strength Field Select one of next values for pad: CSI0_DAT12.  000 <b>HIZ</b> — HI-Z 001 <b>260_OHM</b> — 157 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 <b>130_OHM</b> — 78 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 <b>88_OHM</b> — 53 Ohm @ 3.3V, 88 Ohm @ 1.8V 100 <b>65_OHM</b> — 39 Ohm @ 3.3V, 65 Ohm @ 1.8V 101 <b>52_OHM</b> — 32 Ohm @ 3.3V, 52 Ohm @ 1.8V 110 <b>43_OHM</b> — 26 Ohm @ 3.3V, 43 Ohm @ 1.8V 111 <b>37_OHM</b> — 23 Ohm @ 3.3V, 37 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control.

### IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR11 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_A11. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_A11.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR11 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_A11.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.265 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR12)

Address: 20E\_0000h base + 434h offset = 20E\_0434h

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR12 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_A12. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_A12.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR12 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_A12.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

## 37.4.266 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR13)

Address: 20E\_0000h base + 438h offset = 20E\_0438h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR15 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_A15. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_A15.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR15 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_A15.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.269 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR02)

Address: 20E\_0000h base + 444h offset = 20E\_0444h

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR02 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_A2. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_A2.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR02 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_A2.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.270 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR03)

Address: 20E\_0000h base + 448h offset = 20E\_0448h

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR03 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_A3. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_A3.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR03 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_A3.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.271 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR04)

Address: 20E\_0000h base + 44Ch offset = 20E\_044Ch

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR04 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_A4. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_A4.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR04 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_A4.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.272 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR05)

Address: 20E\_0000h base + 450h offset = 20E\_0450h

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR05 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_A5. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_A5.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR05 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_A5.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.273 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_ADDR06)

Address: 20E\_0000h base + 454h offset = 20E\_0454h

### 37.4.285 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM5)

Address: 20E\_0000h base + 484h offset = 20E\_0484h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0								DDR_SEL				DDR_INPUT	HYS		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				0	ODT			0	DSE			0			
W																
Reset	1	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0

#### IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM5 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_DQM5. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_DQM5.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM5 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_DQM5.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_DQM5.  000 <b>HIZ</b> — HI-Z 001 <b>240_OHM</b> — 240 Ohm 010 <b>120_OHM</b> — 120 Ohm 011 <b>80_OHM</b> — 80 Ohm 100 <b>60_OHM</b> — 60 Ohm 101 <b>48_OHM</b> — 48 Ohm 110 <b>40_OHM</b> — 40 Ohm 111 <b>34_OHM</b> — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.286 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM6)

Address: 20E\_0000h base + 488h offset = 20E\_0488h

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM6 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_DQM6. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_DQM6.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM6 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_DQM6.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_DQM6.  000 <b>HIZ</b> — HI-Z 001 <b>240_OHM</b> — 240 Ohm 010 <b>120_OHM</b> — 120 Ohm 011 <b>80_OHM</b> — 80 Ohm 100 <b>60_OHM</b> — 60 Ohm 101 <b>48_OHM</b> — 48 Ohm 110 <b>40_OHM</b> — 40 Ohm 111 <b>34_OHM</b> — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

## 37.4.287 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM7)

Address: 20E\_0000h base + 48Ch offset = 20E\_048Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0								DDR_SEL				DDR_INPUT	HYS		
W	[Reserved]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				0	ODT			0	DSE			0			
W	[Reserved]															
Reset	1	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0

### IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM7 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_DQM7. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_DQM7.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_DQM7 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_DQM7.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_DQM7.  000 <b>HIZ</b> — HI-Z 001 <b>240_OHM</b> — 240 Ohm 010 <b>120_OHM</b> — 120 Ohm 011 <b>80_OHM</b> — 80 Ohm 100 <b>60_OHM</b> — 60 Ohm 101 <b>48_OHM</b> — 48 Ohm 110 <b>40_OHM</b> — 40 Ohm 111 <b>34_OHM</b> — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

## 37.4.288 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_RAS\_B)

Address: 20E\_0000h base + 490h offset = 20E\_0490h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0								DDR_SEL				DDR_INPUT	HYS		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				0	ODT			0	DSE			0			
W																
Reset	1	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0

### IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_RAS\_B field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_RAS. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_RAS.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_RAS\_B field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_RAS.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field Select one of next values for pad: DRAM_RAS.  000 <b>HIZ</b> — HI-Z 001 <b>240_OHM</b> — 240 Ohm 010 <b>120_OHM</b> — 120 Ohm 011 <b>80_OHM</b> — 80 Ohm 100 <b>60_OHM</b> — 60 Ohm 101 <b>48_OHM</b> — 48 Ohm 110 <b>40_OHM</b> — 40 Ohm 111 <b>34_OHM</b> — 34 Ohm
Reserved	This read-only field is reserved and always has the value 0.

## 37.4.289 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_RESET)

Address: 20E\_0000h base + 494h offset = 20E\_0494h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0												DDR_SEL		DDR_INPUT	HYS
W	[Reserved]												[Reserved]		[Reserved]	[Reserved]
Reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				0	ODT			0		DSE			0		
W	[Reserved]				[Reserved]	[Reserved]			[Reserved]		[Reserved]			[Reserved]		
Reset	0	0	1	1	0	0	0	0	0	0	1	1	0	0	0	0

### IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_RESET field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field Select one of next values for pad: DRAM_RESET. 00 <b>DDR3_LPDDR2</b> — DDR3 and LPDDR2 mode. 01 <b>RESERVED1</b> — Reserved 10 <b>RESERVED2</b> — Reserved 11 <b>RESERVED3</b> — Reserved
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_RESET. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_RESET. 0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_RESET field descriptions (continued)

Field	Description
10–8 ODT	<p>On Die Termination Field</p> <p>Select one of next values for pad: DRAM_RESET.</p> <p>000 <b>DISABLED</b> — Disabled</p> <p>001 <b>120_OHM</b> — 120 Ohm ODT</p> <p>010 <b>60_OHM</b> — 60 Ohm ODT</p> <p>011 <b>40_OHM</b> — 40 Ohm ODT</p> <p>100 <b>30_OHM</b> — 30 Ohm ODT</p> <p>101 <b>24_OHM</b> — 24 Ohm ODT</p> <p>110 <b>20_OHM</b> — 20 Ohm ODT</p> <p>111 <b>17_OHM</b> — 17 Ohm ODT</p>
7–6 Reserved	This read-only field is reserved and always has the value 0.

Reserved	This read-only field is reserved and always has the value 0.

### 37.4.290 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA0)

Address: 20E\_0000h base + 498h offset = 20E\_0498h

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA0 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDBA0. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDBA0.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA0 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDBA0.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.291 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA1)

Address: 20E\_0000h base + 49Ch offset = 20E\_049Ch

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA1 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDBA1. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDBA1.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA1 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDBA1.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_ADDDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

## 37.4.292 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA2)

Address: 20E\_0000h base + 4A0h offset = 20E\_04A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0								DDR_SEL				DDR_INPUT	HYS

W	[Reserved]															
Reset	1	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0

### IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA2 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDBA2. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDBA2.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDBA2 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDBA2.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_CTLDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.293 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDCKE0)

Address: 20E\_0000h base + 4A4h offset = 20E\_04A4h

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDCKE0 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDCKE0. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDCKE0.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDCKE0 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDCKE0.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–3 DSE	Drive Strength Field  This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_CTLDS</a> Note: The value of this field does not reflect the value of the Group Control Register.
Reserved	This read-only field is reserved and always has the value 0.

### 37.4.294 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDCKE1)

Address: 20E\_0000h base + 4A8h offset = 20E\_04A8h

IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDCKE1 field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: <a href="#">IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE</a> Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_SDCKE1. 0 <b>CMOS</b> — CMOS input mode. 1 <b>DIFFERENTIAL</b> — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_SDCKE1.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_DRAM\_SDCKE1 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–12 -	This field is reserved. Reserved
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_SDCKE1.  000 <b>DISABLED</b> — Disabled 001 <b>120_OHM</b> — 120 Ohm ODT 010 <b>60_OHM</b> — 60 Ohm ODT 011 <b>40_OHM</b> — 40 Ohm ODT 100 <b>30_OHM</b> — 30 Ohm ODT 101 <b>24_OHM</b> — 24 Ohm ODT 110 <b>20_OHM</b> — 20 Ohm ODT 111 <b>17_OHM</b> — 17 Ohm ODT
7–6 Reserved	This read-only field is reserved and always has the value 0.

#### IOMUXC\_SW\_PAD\_CTL\_PAD\_GPIO17 field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: GPIO_17. 0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: GPIO_17. 00 <b>100K_OHM_PD</b> — 100K Ohm Pull Down 01 <b>47K_OHM_PU</b> — 47K Ohm Pull Up 10 <b>100K_OHM_PU</b> — 100K Ohm Pull Up 11 <b>22K_OHM_PU</b> — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: GPIO_17. 0 <b>KEEP</b> — Keeper Enabled 1 <b>PULL</b> — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: GPIO_17. 0 <b>DISABLED</b> — Pull/Keeper Disabled 1 <b>ENABLED</b> — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin.

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_GPIO17 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — Output is CMOS. 1 <b>ENABLED</b> — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field  <b>NOTE:</b> The operational frequency on GPIO pads is dependent on slew rate (SRE) and supply voltage (OVDD). Please see GPIO <a href="#">Operating Frequency</a> for more details.  Read Only Field The value of this field is fixed and cannot be changed.  10 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V
5–3 DSE	Drive Strength Field Select one of next values for pad: GPIO_17.  000 <b>HIZ</b> — HI-Z 001 <b>260_OHM</b> — 157 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 <b>130_OHM</b> — 78 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 <b>88_OHM</b> — 53 Ohm @ 3.3V, 88 Ohm @ 1.8V 100 <b>65_OHM</b> — 39 Ohm @ 3.3V, 65 Ohm @ 1.8V 101 <b>52_OHM</b> — 32 Ohm @ 3.3V, 52 Ohm @ 1.8V 110 <b>43_OHM</b> — 26 Ohm @ 3.3V, 43 Ohm @ 1.8V 111 <b>37_OHM</b> — 23 Ohm @ 3.3V, 37 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control.  0 <b>SLOW</b> — Slow Slew Rate 1 <b>FAST</b> — Fast Slew Rate

## IOMUXC\_SW\_PAD\_CTL\_PAD\_NAND\_DATA00 field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: NANDF_D0.  0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: NANDF_D0.  00 <b>100K_OHM_PD</b> — 100K Ohm Pull Down 01 <b>47K_OHM_PU</b> — 47K Ohm Pull Up 10 <b>100K_OHM_PU</b> — 100K Ohm Pull Up 11 <b>22K_OHM_PU</b> — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: NANDF_D0.  0 <b>KEEP</b> — Keeper Enabled 1 <b>PULL</b> — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: NANDF_D0.

*Table continues on the next page...*

## IOMUXC\_SW\_PAD\_CTL\_PAD\_NAND\_DATA00 field descriptions (continued)

Field	Description
	0 <b>DISABLED</b> — Pull/Keeper Disabled 1 <b>ENABLED</b> — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin.  0 <b>DISABLED</b> — Output is CMOS. 1 <b>ENABLED</b> — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field  <b>NOTE:</b> The operational frequency on GPIO pads is dependent on slew rate (SRE) and supply voltage (OVDD). Please see GPIO <a href="#">Operating Frequency</a> for more details.  00 <b>LOW</b> — 50 MHz (SRE=x) 01 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V 10 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V 11 <b>MAXIMUM</b> — 100 MHz, if SRE=1: 150MHz @ 1.8V, 200MHz @ 3.3V
5–3 DSE	Drive Strength Field Select one of next values for pad: NANDF_D0.  000 <b>HIZ</b> — HI-Z 001 <b>260_OHM</b> — 157 Ohm @ 3.3V, 260 Ohm @ 1.8V 010 <b>130_OHM</b> — 78 Ohm @ 3.3V, 130 Ohm @ 1.8V 011 <b>88_OHM</b> — 53 Ohm @ 3.3V, 88 Ohm @ 1.8V 100 <b>65_OHM</b> — 39 Ohm @ 3.3V, 65 Ohm @ 1.8V 101 <b>52_OHM</b> — 32 Ohm @ 3.3V, 52 Ohm @ 1.8V 110 <b>43_OHM</b> — 26 Ohm @ 3.3V, 43 Ohm @ 1.8V 111 <b>37_OHM</b> — 23 Ohm @ 3.3V, 37 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control.  0 <b>SLOW</b> — Slow Slew Rate 1 <b>FAST</b> — Fast Slew Rate

10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field  <b>NOTE:</b> The operational frequency on GPIO pads is dependent on slew rate (SRE) and supply voltage (OVDD). Please see GPIO <a href="#">Operating Frequency</a> for more details. 00 <b>LOW</b> — 50 MHz (SRE=x) 01 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V 10 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V 11 <b>MAXIMUM</b> — 100 MHz, if SRE=1: 150MHz @ 1.8V, 200MHz @ 3.3V
5–3 DSE	Drive Strength Field Select one of next values for pad: SD2_DAT2. 000 <b>HIZ</b> — HI-Z 001 <b>260_OHM</b> — 157 Ohm @ 3.3V, 260 Ohm @ 1.8V

Table continues on the next page...

**IOMUXC\_SW\_PAD\_CTL\_PAD\_SD2\_DATA2 field descriptions (continued)**

Field	Description
010	<b>130_OHM</b> — 78 Ohm @ 3.3V, 130 Ohm @ 1.8V
011	<b>88_OHM</b> — 53 Ohm @ 3.3V, 88 Ohm @ 1.8V
100	<b>65_OHM</b> — 39 Ohm @ 3.3V, 65 Ohm @ 1.8V
101	<b>52_OHM</b> — 32 Ohm @ 3.3V, 52 Ohm @ 1.8V
110	<b>43_OHM</b> — 26 Ohm @ 3.3V, 43 Ohm @ 1.8V
111	<b>37_OHM</b> — 23 Ohm @ 3.3V, 37 Ohm @ 1.8V
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SRE	Slew Rate Field Slew rate control. 0 <b>SLOW</b> — Slow Slew Rate 1 <b>FAST</b> — Fast Slew Rate

**37.4.440 Pad Control Register (IOMUXC\_SW\_PAD\_CTL\_PAD\_SD2\_DATA3)**

Address: 20E\_0000h base + 6F0h offset = 20E\_06F0h

**IOMUXC\_SW\_PAD\_CTL\_PAD\_SD2\_DATA3 field descriptions**

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 HYS	Hysteresis Enable Field Select one of next values for pad: SD2_DAT3. 0 <b>DISABLED</b> — CMOS input 1 <b>ENABLED</b> — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: SD2_DAT3. 00 <b>100K_OHM_PD</b> — 100K Ohm Pull Down 01 <b>47K_OHM_PU</b> — 47K Ohm Pull Up

Table continues on the next page...

## IOMUXC\_SW\_PAD\_CTL\_PAD\_SD2\_DATA3 field descriptions (continued)

Field	Description
	10 <b>100K_OHM_PU</b> — 100K Ohm Pull Up 11 <b>22K_OHM_PU</b> — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: SD2_DAT3. 0 <b>KEEP</b> — Keeper Enabled 1 <b>PULL</b> — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: SD2_DAT3. 0 <b>DISABLED</b> — Pull/Keeper Disabled 1 <b>ENABLED</b> — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 <b>DISABLED</b> — Output is CMOS. 1 <b>ENABLED</b> — Output is Open Drain.
10–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 SPEED	Speed Field  <b>NOTE:</b> The operational frequency on GPIO pads is dependent on slew rate (SRE) and supply voltage (OVDD). Please see GPIO <a href="#">Operating Frequency</a> for more details.  00 <b>LOW</b> — 50 MHz (SRE=x) 01 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V 10 <b>MEDIUM</b> — 100 MHz, if SRE=1: 100MHz @ 1.8V, 150MHz @ 3.3V 11 <b>MAXIMUM</b> — 100 MHz, if SRE=1: 150MHz @ 1.8V, 200MHz @ 3.3V
