# **i.MX 6Solo/6DualLite Applications Processor Reference Manual**

Document Number: IMX6SDLRM  
Rev. 2, 04/2015

# Contents

Section number	Title	Page
<b>Chapter 1</b>		
<b>Introduction</b>		
1.1	About This Document.....	197
1.1.1	Audience.....	197
1.1.2	Organization.....	197
1.1.3	Suggested Reading.....	198
1.1.3.1	General Information.....	198
1.1.3.2	Related Documentation.....	198
1.1.4	Conventions.....	198
1.1.5	Register Access.....	200
1.1.5.1	Register Diagram Field Access Type Legend.....	200
1.1.5.2	Register Macro Usage.....	200
1.1.6	Signal Conventions.....	201
1.1.7	Acronyms and Abbreviations.....	202
1.2	Introduction.....	203
1.3	Target Applications.....	204
1.4	Features.....	204
1.5	Architectural Overview.....	208
1.5.1	Block Diagram.....	208
1.5.1.1	Simplified Block Diagram.....	208
1.5.2	Architectural Partitioning.....	209
1.5.3	Endianness Support.....	211
1.5.4	Memory Interfaces.....	211
<b>Chapter 2</b>		
<b>Memory Maps</b>		
2.1	Memory system overview.....	213
2.2	ARM Platform Memory Map.....	213
2.3	DDR mapping to MMDC controller ports.....	218

Section number	Title	Page
2.4	DMA memory map.....	219
<b>Chapter 3</b>		
<b>Interrupts and DMA Events</b>		
3.1	Overview.....	221
3.2	A9 interrupts.....	221
3.3	SDMA event mapping.....	225
<b>Chapter 4</b>		
<b>External Signals and Pin Multiplexing</b>		
4.1	Overview.....	229
4.1.1	Pin Assignments.....	229
4.1.2	Muxing Options.....	291
<b>Chapter 5</b>		
<b>Fusemap</b>		
5.1	Boot Fusemap.....	333
5.2	Fusemap Description Table.....	341
<b>Chapter 6</b>		
<b>External Memory Controllers</b>		
6.1	Overview.....	349
6.2	Multi-mode DDR controller (MMDC) overview and feature summary.....	349
6.3	Raw NAND Flash controller overview.....	351
6.3.1	NAND interface features.....	352
6.3.2	NAND control features.....	353
6.3.3	Internal interface features.....	353
6.3.4	APBH-DMA overview.....	353
6.3.5	ECC-BCH features.....	353
6.4	EIM-PSRAM/NOR Flash controller overview.....	354
6.4.1	EIM features.....	354
6.4.2	EIM boot scenarios.....	355
6.4.3	EIM boot configuration.....	355
6.4.4	OneNAND requirements.....	356

Section number	Title	Page
<b>Chapter 7</b>		
<b>System Debug</b>		
7.1	Overview.....	357
7.2	Chip and ARM Platform Debug Architecture.....	357
7.2.1	Debug Features.....	358
7.2.2	Debug System components.....	359
7.2.2.1	AMBA trace bus (ATB).....	360
7.2.2.2	ATB replicator.....	360
7.2.2.3	Embedded Cross Triggering.....	360
7.2.2.3.1	Cross-Trigger Matrix (CTM).....	361
7.2.2.3.2	Cross-Trigger Interface (CTI).....	362
7.2.2.4	Debug Access Port (DAP).....	362
7.2.3	i.MX6Solo/6DualLite-Specific SJC Features.....	363
7.2.3.1	JTAG Disable Mode.....	363
7.2.3.2	JTAG ID.....	363
7.2.4	System JTAG Controller - SJC.....	364
7.2.5	System JTAG controller main features.....	364
7.2.6	SJC TAP Port.....	364
7.2.7	SJC main blocks.....	364
7.3	Smart DMA (SDMA) core.....	365
7.3.1	SDMA On Chip Emulation Module (OnCE) Feature Summary.....	366
7.3.1.1	Other SDMA Debug Functionality.....	366
7.3.1.2	SDMA ROM Patching.....	367
7.4	Miscellaneous.....	367
7.4.1	Clock/Reset/Power.....	367
7.5	Supported tools.....	368

## Chapter 8

### System Boot

8.1	Overview.....	369
-----	---------------	-----

Section number	Title	Page
8.2	Boot modes.....	370
8.2.1	Boot mode pin settings.....	371
8.2.2	High level boot sequence.....	371
8.2.3	Boot From Fuses Mode (BOOT_MODE[1:0] = 00b).....	372
8.2.4	Serial Downloader.....	373
8.2.5	Internal Boot Mode (BOOT_MODE[1:0] = 0b10).....	374
8.2.6	Boot security settings.....	375
8.3	Device Configuration.....	375
8.3.1	Boot eFUSE Descriptions.....	376
8.3.2	GPIO Boot Overrides.....	378
8.3.3	Device Configuration Data.....	380
8.4	Device Initialization.....	380
8.4.1	Internal ROM /RAM memory map.....	380
8.4.2	Boot Block Activation .....	381
8.4.3	Clocks at Boot Time.....	382
8.4.4	Enabling MMU and Caches.....	383
8.4.5	Exception Handling.....	384
8.4.6	Interrupt Handling During Boot.....	385
8.4.7	Persistent Bits.....	385
8.5	Boot Devices (Internal Boot).....	385
8.5.1	NOR Flash/OneNAND using EIM Interface.....	386
8.5.1.1	NOR Flash Boot Operation.....	387
8.5.1.2	OneNAND Flash Boot Operation.....	387
8.5.1.3	IOMUX Configuration for EIM Devices.....	388
8.5.2	NAND Flash.....	389
8.5.2.1	NAND eFUSE Configuration.....	389
8.5.2.2	NAND Flash Boot Flow and Boot Control Blocks (BCB).....	391
8.5.2.3	Firmware Configuration Block.....	394
8.5.2.4	Discovered Bad Block Table.....	396

Section number	Title	Page
8.5.2.5	Bad Block Handling in the ROM.....	397
8.5.2.6	Toggle Mode DDR NAND Boot.....	398
8.5.2.6.1	GPMI and BCH Clocks Configuration.....	398
8.5.2.6.2	Setup DMA for DDR Transfers.....	399
8.5.2.6.3	Reconfigure Timing and Speed Using Values in FCB.....	399
8.5.2.7	Typical NAND Page Organization.....	399
8.5.2.7.1	BCH ECC Page Organization.....	400
8.5.2.7.2	Metadata.....	401
8.5.2.8	IOMUX Configuration for NAND.....	401
8.5.3	Expansion Device.....	402
8.5.3.1	Expansion Device eFUSE Configuration.....	402
8.5.3.2	MMC and eMMC Boot.....	405
8.5.3.3	SD, eSD and SDXC.....	413
8.5.3.4	IOMUX Configuration for SD/MMC.....	413
8.5.3.5	Redundant Boot Support for Expansion Device.....	414
8.5.4	Serial ROM through SPI.....	415
8.5.4.1	Serial ROM eFUSE Configuration.....	416
8.5.4.2	I2C Boot.....	417
8.5.4.2.1	I2C IOMUX Pin Configuration.....	418
8.5.4.3	ECSPI Boot.....	418
8.5.4.3.1	ECSPI IOMUX Pin Configuration.....	420
8.6	Program image.....	421
8.6.1	Image Vector Table and Boot Data.....	421
8.6.1.1	Image Vector Table Structure.....	422
8.6.1.2	Boot Data Structure.....	423
8.6.2	Device Configuration Data (DCD).....	423
8.6.2.1	Write Data Command.....	424
8.6.2.2	Check Data Command.....	426
8.6.2.3	NOP Command.....	427

Section number	Title	Page
8.6.2.4	Unlock Command.....	428
8.7	Plugin Image.....	428
8.8	Serial Downloader.....	429
8.8.1	USB.....	430
8.8.1.1	USB Configuration Details.....	431
8.8.1.2	IOMUX Configuration for USB.....	432
8.8.2	Serial Download protocol.....	432
8.8.2.1	SDP Command.....	432
8.8.2.1.1	READ REGISTER.....	433
8.8.2.1.2	WRITE REGISTER.....	433
8.8.2.1.3	WRITE_FILE.....	434
8.8.2.1.4	ERROR_STATUS.....	435
8.8.2.1.5	DCD WRITE.....	436
8.8.2.1.6	JUMP ADDRESS.....	437
8.9	Recovery Devices.....	438
8.10	USB Low Power Boot.....	438
8.11	SD/MMC Manufacture Mode.....	440
8.12	High Assurance Boot (HAB).....	440
8.12.1	HAB API Vector Table Addresses.....	442

## Chapter 9 Multimedia

9.1	Video Graphics Sub System.....	443
9.1.1	Display outputs.....	444
9.1.2	Video input.....	446
9.1.3	Synchronization Mechanisms.....	447
9.1.4	Supported applications.....	447
9.2	Image Processing Unit (IPU).....	450
9.2.1	IPU External Ports.....	452
9.2.1.1	Camera Ports.....	453

Section number	Title	Page
9.2.1.2	Display Ports.....	454
9.2.1.2.1	Access Modes.....	454
9.2.1.2.2	Synchronous Access .....	454
9.2.1.2.3	Asynchronous Access .....	455
9.2.1.2.4	Interface details.....	455
9.2.1.2.5	Connecting To Display Devices.....	456
9.2.2	Processing.....	456
9.2.2.1	Display Processor (DP).....	457
9.2.2.2	Video de-interlacer (VDIC).....	458
9.2.2.3	Image Converter (IC).....	458
9.2.2.4	Image Rotator (IRT).....	459
9.2.3	Automatic Procedures.....	459
9.3	LVDS Display Bridge (LDB).....	461
9.3.1	LDB Overview.....	461
9.3.2	LDB External Ports.....	462
9.3.3	Input Parallel Display Ports.....	462
9.3.3.1	Output LVDS Ports.....	462
9.3.3.2	Control signals.....	463
9.4	Video Data Order Adapter (VDOA).....	463
9.5	Display Content Integrity Checker (DCIC).....	463
9.6	Video Processing Unit (VPUv6).....	463
9.6.1	Basic Structure.....	465
9.6.2	Feature summary.....	466
9.7	OpenGL ES 3D Graphics Processing Unit (GPU3Dv5).....	466
9.7.1	OpenGL Overview.....	466
9.7.2	OpenGL Features.....	467
9.7.3	OpenGL Block Diagram.....	467
9.7.4	OpenGL Performance.....	467
9.7.5	OpenGL Software.....	468

<b>Section number</b>	<b>Title</b>	<b>Page</b>
9.8	2D Graphics Processing Unit (GPU2Dv2).....	468
9.8.1	2D feature summary.....	468
9.8.2	2D Block Diagram.....	469
9.8.3	2D Performance.....	470
9.8.4	2D Software.....	470
9.9	HDMI TX - HD Multimedia Interface transmitter.....	470
9.9.1	HDMI Introduction.....	471
9.9.2	Features.....	472
9.10	Display / Sensor MIPI interfaces.....	473
9.10.1	Introduction.....	473
9.10.2	DSI.....	474
9.10.3	CSI-2.....	475
9.10.4	D - PHY.....	476
9.11	Audio subsystem.....	478
9.11.1	Audio subsystem module overview.....	478
9.11.2	Synchronous Serial Interface (SSI).....	480
9.11.3	Digital Audio MUX (AUDMUX).....	481
9.11.4	Enhanced Serial Audio Interface (ESAI).....	483
9.11.5	Sony/Philips Digital Interface (SPDIF).....	483
9.11.6	Asynchronous Sample Rate Converter (ASRC).....	485

## **Chapter 10**

### **Clock and Power Management**

10.1	Introduction.....	489
10.2	Device Power Management Architecture Components.....	489
10.2.1	Centralized components of clock generation and management.....	490
10.2.2	Centralized components of power generation, distribution and management.....	491
10.2.3	Reset generation and distribution system.....	491
10.2.4	Power and clock management framework.....	491

<b>Section number</b>	<b>Title</b>	<b>Page</b>
10.3	Clock Management.....	492
10.3.1	Centralized components of clock management system.....	492
10.3.2	Clock generation.....	495
10.3.2.1	Crystal Oscillator (XTALOSC) .....	495
10.3.2.2	LVDS I/O ports.....	495
10.3.2.3	PLLs.....	495
10.3.2.3.1	General PLL Control and Status Functions.....	497
10.3.2.4	CCM .....	498
10.3.2.5	Low Power Clock Gating unit (LPCG).....	498
10.3.3	Peripheral components of clock management system.....	499
10.3.3.1	Interface and functional clock.....	500
10.3.3.2	Block level clock management.....	500
10.3.3.2.1	Master clock protocol.....	501
10.3.3.2.2	Slave clock protocol.....	501
10.3.3.3	Clock Domain(s).....	502
10.3.3.4	Domain level clock management.....	502
10.3.3.5	Domain dependencies.....	502
10.4	Power management.....	502
10.4.1	Centralized Components of Power Management System.....	503
10.4.1.1	Integrated PMU.....	503
10.4.1.1.1	Digital LDO Regulators.....	505
10.4.1.1.2	Analog LDO regulators.....	506
10.4.1.1.3	USB LDO.....	506
10.4.1.1.4	SNVS regulator.....	506
10.4.1.1.5	Reverse well biasing.....	507
10.4.1.2	GPC - General Power Controller.....	507
10.4.1.3	SRC - System reset Controller.....	508
10.4.1.4	Power domain(s).....	508
10.4.1.4.1	Power distribution .....	509

<b>Section number</b>	<b>Title</b>	<b>Page</b>
10.4.1.4.2	Domain Memory and domain logic state retention in case of Power Gating.	510
10.4.1.4.3	Power Gating Domain Management.....	510
10.4.1.4.3.1	Cortex-A9 Core Platform.....	510
10.4.1.4.3.2	GPU3D, GPU2D and VPU.....	511
10.4.1.4.3.3	SoC.....	512
10.4.1.4.4	Power Gating domain dependencies.....	512
10.4.1.5	Voltage domains.....	513
10.4.1.6	Voltage domain management.....	513
10.4.1.6.1	Dynamic.....	513
10.4.1.6.1.1	DVFS.....	513
10.4.1.6.1.2	Voltage Scaling.....	514
10.4.1.6.2	Static .....	515
10.4.1.6.2.1	Standby Leakage reduction (SLR).....	515
10.4.1.6.2.2	ANALOG PHYs IPs -.....	515
10.4.1.6.3	Voltage domain dependencies.....	516
10.4.1.6.4	IO voltage .....	516
10.4.1.7	System domains layout.....	516
10.4.2	Power management techniques.....	518
10.4.2.1	Power saving techniques.....	519
10.4.2.2	Thermal-aware power management.....	519
10.4.2.3	Peripheral Power management.....	520
10.4.2.3.1	Main memory power management.....	520
10.4.2.3.2	Video-Graphics system power management.....	521
10.4.2.3.3	IO power reduction.....	521
10.4.3	Examples of External Power Supply Interfacing in the i.MX 6Solo/6DualLite based systems .....	521
10.5	ONOFF (Button).....	526

## **Chapter 11 System Security**

11.1	Overview.....	527
------	---------------	-----

Section number	Title	Page
11.2	Central Security Unit (CSU).....	528
11.2.1	CSU Overview.....	528
11.2.2	CSU Features.....	528
11.2.3	CSU Functional Description.....	529
11.2.3.1	CSU Peripheral Access Policy.....	529
11.3	Cryptographic Acceleration and Assurance Module (CAAM).....	530
11.3.1	CAAM Overview.....	530
11.4	Secure Non-Volatile Storage (SNVS).....	531
11.4.1	SNVS Overview.....	531
11.4.2	Tamper Detection.....	532
11.5	High Assurance Boot (HAB).....	532
11.6	System JTAG Controller (SJC).....	532

## Chapter 12 ARM Cortex A9 MPCore Platform (ARM)

12.1	Overview.....	535
12.2	External Signals.....	535
12.3	Platform configuration.....	536
12.3.1	Platform and SCU configuration.....	537
12.3.2	Core configuration.....	537
12.3.3	PL310 L2 Cache configuration.....	537
12.3.4	Endian Modes.....	538
12.3.5	Memory Parity error support .....	538
12.4	Performance and Power.....	538
12.4.1	Low-Power design.....	538
12.4.1.1	SRPG (State Retention Power Gating).....	539
12.4.1.2	Dynamic Voltage and Frequency Scaling (DVFS).....	539
12.4.2	Clocks, frequency goals.....	539
12.4.2.1	ARM Clock.....	540
12.4.2.2	Bus Clocks.....	540

Section number	Title	Page
12.4.2.3	Debug Clocks.....	540
12.5	Core Platform Sub-Blocks details.....	540
12.5.1	ARM Cortex A9 MPCore Processor.....	540
12.5.2	Media Processing Engine (MPE - NEON).....	541
12.5.3	Generic Interrupt Controller (GIC).....	541
12.5.3.1	Interrupt Controller Features.....	541
12.5.3.2	About the Interrupt Controller.....	542
12.5.3.3	Interrupt Controller Clock frequency.....	542
12.5.3.4	TrustZone support.....	542
12.5.4	Instruction and data caches (L1).....	542
12.5.4.1	L1 features.....	543
12.5.5	L2 Cache and controller (PL310).....	543
12.6	Debug and Trace Sub-blocks (CoreSight components).....	543
12.6.1	Debug Access Port (DAP) .....	543
12.6.2	Program Trace Macrocell (PTM).....	544
12.6.2.1	Program Flow Trace (PFT).....	544
12.6.3	Cross Trigger Interface (CTI).....	545
12.6.4	Embedded Trace Buffer (ETB).....	546
12.6.4.1	AMBA Trace Bus (ATB) Replicator .....	546

## Chapter 13 AHB to IP Bridge (AIPSTZ)

13.1	Overview.....	547
13.1.1	Features.....	547
13.2	Clocks.....	547
13.3	Functional Description.....	548
13.4	Access Protections.....	549
13.5	Access Support.....	549
13.6	Initialization Information.....	550
13.6.1	Security Block.....	550

Section number	Title	Page
13.7	AIPSTZ Memory Map/Register Definition.....	551
13.7.1	Master Priviledge Registers (AIPSTZ <sub>x</sub> _MPR).....	552
13.7.2	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR).....	554
13.7.3	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR1).....	558
13.7.4	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR2).....	561
13.7.5	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR3).....	564
13.7.6	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR4).....	567

## Chapter 14

### AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)

14.1	Overview.....	569
14.2	Clocks.....	570
14.3	APBH DMA.....	571
14.4	NAND Read Status Polling Example.....	576
14.5	APBH Memory Map/Register Definition.....	578
14.5.1	AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0 <sub>n</sub> ).....	584
14.5.2	AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1 <sub>n</sub> ).....	586
14.5.3	AHB to APBH Bridge Control and Status Register 2 (APBH_CTRL2 <sub>n</sub> ).....	589
14.5.4	AHB to APBH Bridge Channel Register (APBH_CHANNEL_CTRL <sub>n</sub> ).....	594
14.5.5	AHB to APBH DMA Device Assignment Register (APBH_DEVSEL).....	595
14.5.6	AHB to APBH DMA burst size (APBH_DMA_BURST_SIZE).....	596
14.5.7	AHB to APBH DMA Debug Register (APBH_DEBUG).....	597
14.5.8	APBH DMA Channel n Current Command Address Register (APBH_CH <sub>n</sub> _CURCMDAR).....	598
14.5.9	APBH DMA Channel n Next Command Address Register (APBH_CH <sub>n</sub> _NXTCMDAR).....	599
14.5.10	APBH DMA Channel n Command Register (APBH_CH <sub>n</sub> _CMD).....	599
14.5.11	APBH DMA Channel n Buffer Address Register (APBH_CH <sub>n</sub> _BAR).....	601
14.5.12	APBH DMA Channel n Semaphore Register (APBH_CH <sub>n</sub> _SEMA).....	602
14.5.13	AHB to APBH DMA Channel n Debug Information (APBH_CH <sub>n</sub> _DEBUG1).....	603
14.5.14	AHB to APBH DMA Channel n Debug Information (APBH_CH <sub>n</sub> _DEBUG2).....	606
14.5.15	APBH Bridge Version Register (APBH_VERSION).....	607

Section number	Title	Page
<b>Chapter 15</b>		
<b>Asynchronous Sample Rate Converter (ASRC)</b>		
15.1	Overview.....	609
15.1.1	Features.....	611
15.1.2	Modes of Operation.....	612
15.1.2.1	Data Transfer Schemes.....	612
15.1.2.1.1	Data Input Modes.....	612
15.1.2.1.2	Data Output Modes.....	613
15.1.2.2	Word Alignment Supported.....	614
15.1.2.2.1	Input Data Alignment Modes.....	615
15.1.2.2.2	Output Data Alignment Modes.....	615
15.2	Clocks.....	616
15.3	Interrupts.....	616
15.4	DMA requests.....	617
15.5	Functional Description.....	617
15.5.1	Algorithm Description.....	617
15.5.1.1	Signal processing flow.....	617
15.5.1.2	Operation of the Filter.....	621
15.5.1.2.1	Support of Physical Clocks.....	621
15.6	Startup Procedure.....	623
15.7	ASRC Memory Map/Register Definition.....	627
15.7.1	ASRC Control Register (ASRC_ASRCCTR).....	630
15.7.2	ASRC Interrupt Enable Register (ASRC_ASRIER).....	633
15.7.3	ASRC Channel Number Configuration Register (ASRC_ASRCNCR).....	634
15.7.4	ASRC Filter Configuration Status Register (ASRC_ASRCFG).....	636
15.7.5	ASRC Clock Source Register (ASRC_ASRCSTR).....	638
15.7.6	ASRC Clock Divider Register 1 (ASRC_ASRCDR1).....	642
15.7.7	ASRC Clock Divider Register 2 (ASRC_ASRCDR2).....	643
15.7.8	ASRC Status Register (ASRC_ASRSTR).....	644

Section number	Title	Page
15.7.9	ASRC Parameter Register n (ASRC_ASRPMn).....	647
15.7.10	ASRC ASRC Task Queue FIFO Register 1 (ASRC_ASRTFR1).....	648
15.7.11	ASRC Channel Counter Register (ASRC_ASRCCR).....	649
15.7.12	ASRC Data Input Register for Pair x (ASRC_ASRDIn).....	650
15.7.13	ASRC Data Output Register for Pair x (ASRC_ASRDOn).....	650
15.7.14	ASRC Ideal Ratio for Pair A-High Part (ASRC_ASRIDRHA).....	651
15.7.15	ASRC Ideal Ratio for Pair A -Low Part (ASRC_ASRIDRLA).....	652
15.7.16	ASRC Ideal Ratio for Pair B-High Part (ASRC_ASRIDRHB).....	652
15.7.17	ASRC Ideal Ratio for Pair B-Low Part (ASRC_ASRIDRLB).....	653
15.7.18	ASRC Ideal Ratio for Pair C-High Part (ASRC_ASRIDRHC).....	653
15.7.19	ASRC Ideal Ratio for Pair C-Low Part (ASRC_ASRIDRLC).....	654
15.7.20	ASRC 76kHz Period in terms of ASRC processing clock (ASRC_ASR76K).....	655
15.7.21	ASRC 56kHz Period in terms of ASRC processing clock (ASRC_ASR56K).....	656
15.7.22	ASRC Misc Control Register for Pair A (ASRC_ASRMCRA).....	657
15.7.23	ASRC FIFO Status Register for Pair A (ASRC_ASRFSTA).....	659
15.7.24	ASRC Misc Control Register for Pair B (ASRC_ASRMCRB).....	660
15.7.25	ASRC FIFO Status Register for Pair B (ASRC_ASRFSTB).....	662
15.7.26	ASRC Misc Control Register for Pair C (ASRC_ASRMCRC).....	663
15.7.27	ASRC FIFO Status Register for Pair C (ASRC_ASRFSTC).....	665
15.7.28	ASRC Misc Control Register 1 for Pair X (ASRC_ASRMCR1n).....	666

## Chapter 16

### Digital Audio Multiplexer (AUDMUX)

16.1	Overview.....	669
16.1.1	Features.....	671
16.1.2	Modes and Operations.....	671
16.2	External Signals.....	671
16.3	Clocks.....	672
16.3.1	Clock Inputs.....	673
16.3.2	Clock Diagram.....	673

Section number	Title	Page
16.3.3	Clocking Restrictions.....	674
16.4	Default Register Configuration.....	674
16.4.1	Default Port Configuration.....	674
16.5	Functional Description.....	674
16.5.1	Operating Modes.....	674
16.5.1.1	Port Receive Data Modes.....	676
16.5.1.1.1	Normal Mode.....	677
16.5.1.1.2	Internal Network Mode.....	678
16.5.1.1.3	Transmit Data Output Enable Assertion.....	684
16.5.1.2	Tx/Rx Switch and External Network Mode.....	685
16.5.1.3	Timing Modes.....	686
16.5.1.3.1	Synchronous Mode (4-Wire Interface).....	686
16.5.1.3.2	Asynchronous Mode (6-Wire Interface).....	688
16.5.2	Connectivity Between Ports.....	691
16.5.2.1	Internal Port to External Port Connectivity.....	692
16.5.2.2	External Port to External Port Connectivity.....	693
16.5.2.3	Internal Port to Internal Port Connectivity.....	693
16.5.2.4	Loopback Connectivity.....	694
16.6	AUDMUX Memory Map/Register Definition.....	694
16.6.1	Port Timing Control Register 1 (AUDMUX_PTCR1).....	695
16.6.2	Port Data Control Register 1 (AUDMUX_PDCR1).....	697
16.6.3	Port Timing Control Register 2 (AUDMUX_PTCR2).....	698
16.6.4	Port Data Control Register 2 (AUDMUX_PDCR2).....	700
16.6.5	Port Timing Control Register 3 (AUDMUX_PTCR3).....	701
16.6.6	Port Data Control Register 3 (AUDMUX_PDCR3).....	703
16.6.7	Port Timing Control Register 4 (AUDMUX_PTCR4).....	704
16.6.8	Port Data Control Register 4 (AUDMUX_PDCR4).....	706
16.6.9	Port Timing Control Register 5 (AUDMUX_PTCR5).....	707
16.6.10	Port Data Control Register 5 (AUDMUX_PDCR5).....	709

Section number	Title	Page
16.6.11	Port Timing Control Register 6 (AUDMUX_PTCR6).....	710
16.6.12	Port Data Control Register 6 (AUDMUX_PDCR6).....	712
16.6.13	Port Timing Control Register 7 (AUDMUX_PTCR7).....	713
16.6.14	Port Data Control Register 7 (AUDMUX_PDCR7).....	715

## Chapter 17 40-BIT Correcting ECC Accelerator (BCH)

17.1	Overview.....	717
17.2	Operation.....	719
17.2.1	BCH Limitations and Assumptions.....	720
17.2.2	Flash Page Layout.....	721
17.2.3	Determining the ECC layout for a device.....	723
17.2.3.1	4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(213).....	723
17.2.3.2	4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(213) for data and GF(214) for metadata.....	724
17.2.4	Data Buffers in System Memory.....	724
17.3	Memory to Memory (Loopback) Operation.....	727
17.4	Programming the BCH/GPMI Interfaces.....	728
17.4.1	BCH Encoding for NAND Writes.....	729
17.4.1.1	DMA Structure Code Example.....	731
17.4.1.2	Using the BCH Encoder.....	736
17.4.2	BCH Decoding for NAND Reads.....	737
17.4.2.1	DMA Structure Code Example.....	741
17.4.2.2	Using the Decoder.....	744
17.4.3	Interrupts.....	746
17.5	Behavior During Reset.....	747
17.6	BCH Memory Map/Register Definition.....	748
17.6.1	Hardware BCH ECC Accelerator Control Register (BCH_CTRL $n$ ).....	752
17.6.2	Hardware ECC Accelerator Status Register 0 (BCH_STATUS0 $n$ ).....	754
17.6.3	Hardware ECC Accelerator Mode Register (BCH_MODE $n$ ).....	756

Section number	Title	Page
17.6.4	Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR $n$ ).....	757
17.6.5	Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR $n$ ).....	757
17.6.6	Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR $n$ ).....	758
17.6.7	Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT $n$ ).....	758
17.6.8	Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0 $n$ ).....	759
17.6.9	Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1 $n$ ).....	761
17.6.10	Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0 $n$ ).....	762
17.6.11	Hardware BCH ECC Flash 1 Layout 1 Register (BCH_FLASH1LAYOUT1 $n$ ).....	764
17.6.12	Hardware BCH ECC Flash 2 Layout 0 Register (BCH_FLASH2LAYOUT0 $n$ ).....	765
17.6.13	Hardware BCH ECC Flash 2 Layout 1 Register (BCH_FLASH2LAYOUT1 $n$ ).....	767
17.6.14	Hardware BCH ECC Flash 3 Layout 0 Register (BCH_FLASH3LAYOUT0 $n$ ).....	768
17.6.15	Hardware BCH ECC Flash 3 Layout 1 Register (BCH_FLASH3LAYOUT1 $n$ ).....	770
17.6.16	Hardware BCH ECC Debug Register0 (BCH_DEBUG0 $n$ ).....	771
17.6.17	KES Debug Read Register (BCH_DBGKESREAD $n$ ).....	773
17.6.18	Chien Search Debug Read Register (BCH_DBGCSFEREAD $n$ ).....	774
17.6.19	Syndrome Generator Debug Read Register (BCH_DBGSYNDGENREAD $n$ ).....	774
17.6.20	Bus Master and ECC Controller Debug Read Register (BCH_DBGAHBMREAD $n$ ).....	775
17.6.21	Block Name Register (BCH_BLOCKNAME $n$ ).....	775
17.6.22	BCH Version Register (BCH_VERSION $n$ ).....	776
17.6.23	Hardware BCH ECC Debug Register 1 (BCH_DEBUG1 $n$ ).....	777

## Chapter 18 Clock Controller Module (CCM)

18.1	Overview.....	779
18.1.1	Features.....	779
18.1.2	CCM Block Diagram.....	780
18.2	External Signals.....	782
18.3	CCM Clock Tree.....	782
18.4	System Clocks.....	786

Section number	Title	Page
18.5	Functional Description.....	797
18.5.1	Clock Generation.....	797
18.5.1.1	External Low Frequency Clock - CKIL .....	797
	18.5.1.1.1 CKIL synchronizing to IPG_CLK.....	797
18.5.1.2	External High Frequency Clock - CKIH and internal oscillator.....	798
18.5.1.3	PLL reference clock.....	798
	18.5.1.3.1 ARM PLL.....	798
	18.5.1.3.2 USB PLLs.....	798
	18.5.1.3.3 System PLL.....	799
	18.5.1.3.4 Audio / Video PLL.....	799
	18.5.1.3.5 MLB PLL.....	800
	18.5.1.3.6 Ethernet PLL.....	800
18.5.1.4	Phase Fractional Dividers (PFD).....	800
18.5.1.5	CCM internal clock generation.....	801
	18.5.1.5.1 Clock Switcher.....	801
	18.5.1.5.2 PLL bypass procedure.....	803
	18.5.1.5.3 PLL clock change.....	803
	18.5.1.5.4 Clock Root Generator.....	803
	18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).....	814
	18.5.1.5.6 Divider change handshake.....	815
18.5.1.6	Disabling / Enabling PLLs.....	815
18.5.1.7	Clock Switching Multiplexers.....	815
18.5.1.8	Low Power Clock Gating module (LPCG).....	817
	18.5.1.8.1 MMDC handshake.....	818
18.5.2	DVFS support.....	818
18.5.3	Power modes.....	819
	18.5.3.1 RUN mode.....	819
	18.5.3.2 WAIT mode.....	819
	18.5.3.2.1 Entering WAIT mode .....	819

Section number	Title	Page
18.5.3.2.2	Exiting WAIT mode .....	820
18.5.3.3	STOP mode.....	820
18.5.3.3.1	Entering STOP mode .....	820
18.5.3.3.2	Exiting STOP mode.....	821
18.6	CCM Memory Map/Register Definition.....	821
18.6.1	CCM Control Register (CCM_CCR).....	823
18.6.2	CCM Control Divider Register (CCM_CCDR).....	825
18.6.3	CCM Status Register (CCM_CSR).....	826
18.6.4	CCM Clock Switcher Register (CCM_CCSR).....	827
18.6.5	CCM Arm Clock Root Register (CCM_CACRR).....	829
18.6.6	CCM Bus Clock Divider Register (CCM_CBCDR).....	830
18.6.7	CCM Bus Clock Multiplexer Register (CCM_CBCMR).....	832
18.6.8	CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1).....	835
18.6.9	CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2).....	838
18.6.10	CCM Serial Clock Divider Register 1 (CCM_CSCDR1).....	839
18.6.11	CCM SSI1 Clock Divider Register (CCM_CS1CDR).....	842
18.6.12	CCM SSI2 Clock Divider Register (CCM_CS2CDR).....	844
18.6.13	CCM D1 Clock Divider Register (CCM_CDCDR).....	846
18.6.14	CCM HSC Clock Divider Register (CCM_CHSCCDR).....	848
18.6.15	CCM Serial Clock Divider Register 2 (CCM_CSCDR2).....	850
18.6.16	CCM Serial Clock Divider Register 3 (CCM_CSCDR3).....	852
18.6.17	CCM Divider Handshake In-Process Register (CCM_CDHIPR).....	854
18.6.18	CCM Low Power Control Register (CCM_CLPCR).....	857
18.6.19	CCM Interrupt Status Register (CCM_CISR).....	860
18.6.20	CCM Interrupt Mask Register (CCM_CIMR).....	863
18.6.21	CCM Clock Output Source Register (CCM_CCOSR).....	866
18.6.22	CCM General Purpose Register (CCM_CGPR).....	869
18.6.23	CCM Clock Gating Register 0 (CCM_CCGR0).....	870
18.6.24	CCM Clock Gating Register 1 (CCM_CCGR1).....	872

Section number	Title	Page
18.6.25	CCM Clock Gating Register 2 (CCM_CCGR2).....	873
18.6.26	CCM Clock Gating Register 3 (CCM_CCGR3).....	875
18.6.27	CCM Clock Gating Register 4 (CCM_CCGR4).....	876
18.6.28	CCM Clock Gating Register 5 (CCM_CCGR5).....	877
18.6.29	CCM Clock Gating Register 6 (CCM_CCGR6).....	879
18.6.30	CCM Module Enable Override Register (CCM_CMEOR).....	880
18.7	CCM Analog Memory Map/Register Definition.....	881
18.7.1	Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM <i>n</i> ).....	885
18.7.2	Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1 <i>n</i> ).....	887
18.7.3	Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2 <i>n</i> ).....	889
18.7.4	Analog System PLL Control Register (CCM_ANALOG_PLL_SYS <i>n</i> ).....	891
18.7.5	528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS).....	893
18.7.6	Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM).....	893
18.7.7	Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM).....	894
18.7.8	Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO <i>n</i> ).....	895
18.7.9	Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)..	897
18.7.10	Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM).....	898
18.7.11	Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEO <i>n</i> ).....	899
18.7.12	Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)..	901
18.7.13	Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM).....	902
18.7.14	MLB PLL Control Register (CCM_ANALOG_PLL_MLB <i>n</i> ).....	903
18.7.15	Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET <i>n</i> ).....	905
18.7.16	480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480 <i>n</i> ).....	907
18.7.17	528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528 <i>n</i> ).....	909
18.7.18	Miscellaneous Register 0 (CCM_ANALOG_MISC0 <i>n</i> ).....	912
18.7.19	Miscellaneous Register 1 (CCM_ANALOG_MISC1 <i>n</i> ).....	916

Section number	Title	Page
18.7.20	Miscellaneous Register 2 (CCM_ANALOG_MISC2n).....	919

## Chapter 19 MIPI CSI to IPU Gasket (CSI2IPU)

19.1	Overview.....	925
19.1.1	CSI2IPU feature summary.....	926
19.1.2	CSI2IPU architectural description.....	926
19.2	CSI2IPU signals.....	927
19.3	Timing interface.....	928
19.4	Payload data output formats.....	929
19.5	CSI2IPU Memory Map/Register Definition.....	936
19.5.1	CSI 2 IPU Gasket Software Reset (CSI2IPU_SW_RST).....	937

## Chapter 20 Display Content Integrity Checker (DCIC)

20.1	Overview.....	939
20.1.1	Block Diagram.....	940
20.1.2	Features.....	941
20.2	Functional Description.....	941
20.2.1	Generic synchronous parallel display interface.....	941
20.2.2	CRC Polynomial.....	942
20.2.3	Mode of operation.....	943
20.2.4	Interrupts.....	943
20.2.5	Software reset.....	943
20.2.6	Clock domains.....	944
20.2.7	External controller mismatch indication signal.....	944
20.2.8	Power saving.....	944
20.2.9	System Considerations.....	944
20.3	DCIC Memory Map/Register Definition.....	945
20.3.1	DCIC Control Register (DCICx_DCICC).....	946
20.3.2	DCIC Interrupt Control Register (DCICx_DCICIC).....	947

Section number	Title	Page
20.3.3	DCIC Status Register (DCICx_DCICS).....	948
20.3.4	DCIC ROI Config Register m (DCICx_DCICRC).....	949
20.3.5	DCIC ROI Size Register m (DCICx_DCICRS).....	950
20.3.6	DCIC ROI Reference Signature Register m (DCICx_DCICRRS).....	951
20.3.7	DCIC ROI Calculated Signature m (DCICx_DCICRCS).....	951

## Chapter 21 Enhanced Configurable SPI (ECSPI)

21.1	Overview.....	953
21.1.1	Features.....	954
21.1.2	Modes and Operations.....	954
21.2	External Signals.....	955
21.3	Clocks.....	958
21.4	Functional Description.....	958
21.4.1	Master Mode.....	959
21.4.2	Slave Mode.....	959
21.4.3	Low Power Modes.....	959
21.4.4	Operations.....	959
21.4.4.1	Typical Master Mode.....	959
21.4.4.1.1	Master Mode with SPI_RDY.....	960
21.4.4.1.2	Master Mode with Wait States.....	962
21.4.4.1.3	Master Mode with SS_CTL[3:0] Control.....	962
21.4.4.1.4	Master Mode with Phase Control.....	963
21.4.4.2	Typical Slave Mode.....	964
21.4.5	Reset.....	965
21.4.6	Interrupts.....	965
21.4.7	DMA .....	966
21.4.8	Byte Order.....	967
21.5	Initialization.....	968
21.6	Applications.....	968

Section number	Title	Page
21.7	ECSPI Memory Map/Register Definition.....	969
21.7.1	Receive Data Register (ECSPiX_RXDATA).....	971
21.7.2	Transmit Data Register (ECSPiX_TXDATA).....	972
21.7.3	Control Register (ECSPiX_CONREG).....	972
21.7.4	Config Register (ECSPiX_CONFIGREG).....	975
21.7.5	Interrupt Control Register (ECSPiX_INTREG).....	977
21.7.6	DMA Control Register (ECSPiX_DMAREG).....	978
21.7.7	Status Register (ECSPiX_STATREG).....	980
21.7.8	Sample Period Control Register (ECSPiX_PERIODREG).....	981
21.7.9	Test Control Register (ECSPiX_TESTREG).....	983
21.7.10	Message Data Register (ECSPiX_MSGDATA).....	984

## Chapter 22 External Interface Module (EIM)

22.1	Overview.....	985
22.1.1	Features.....	987
22.1.2	Modes of Operation.....	987
22.1.2.1	Asynchronous Mode.....	988
22.1.2.2	Asynchronous Page Read Mode.....	988
22.1.2.3	Multiplexed Address/Data Mode.....	988
22.1.2.4	Burst Clock Mode.....	989
22.1.2.5	Low Power Modes.....	990
22.1.2.6	Boot Mode.....	990
22.2	External Signals.....	990
22.2.1	Other Important Block I/O Signals Internal to the SoC.....	995
22.3	Clocks.....	996
22.4	Chip Select Memory Map.....	997
22.5	Functional Description.....	997
22.5.1	Continuous BCLK.....	997

Section number	Title	Page
22.5.2	Bus Sizing Configuration.....	998
22.5.2.1	8 BIT PORT SUPPORT.....	998
22.5.2.1.1	MOTOROLA 68000.....	999
22.5.2.1.2	INTEL 386.....	999
22.5.3	EIM Operational Modes.....	999
22.5.4	Burst Mode (Synchronous) Memory Operation.....	1000
22.5.5	Burst Clock Divisor (BCD).....	1001
22.5.6	Burst Clock Start (BCS).....	1001
22.5.7	Multiplexed Address/Data Mode Support.....	1002
22.5.8	Mixed Master/Memory Burst Modes Support.....	1002
22.5.9	AXI (Master) Bus Cycles Support.....	1002
22.5.10	WAIT_B Signal, RWSC and WWSC bit fields Usage.....	1005
22.5.11	IPS Register Interface.....	1005
22.5.12	MRS Set for PSRAM.....	1005
22.5.13	EIM Access Termination .....	1005
22.5.14	Error Conditions.....	1006
22.5.15	DTACK Mode.....	1006
22.5.16	RDY_INT Signal as Interrupt.....	1007
22.5.17	RDY_INT Signal as Ready After Reset Indication.....	1007
22.5.18	EIM_GRANT / EIM_BUSY Handshake Description.....	1007
22.5.19	LPMD / LPACK Handshake Description.....	1008
22.5.20	Endianness.....	1008
22.5.21	Strobe Signal Use.....	1009
22.6	Initialization Information.....	1010
22.6.1	Booting from EIM.....	1010
22.7	Typical Application.....	1010
22.7.1	Access to Intel Sibley Flash.....	1011
22.7.1.1	Intel Sibley Flash Asynchronous Mode Configuration.....	1011
22.7.1.2	Intel Sibley Flash Synchronous Mode Configuration.....	1011

Section number	Title	Page
22.7.1.3	Intel Sibley Flash Utility.....	1011
22.7.2	Access to MDOC Device.....	1012
22.7.2.1	MDOC Device Boot.....	1012
22.7.2.2	MDOC Device Asynchronous Mode Configuration.....	1012
22.7.2.3	MDOC Device Utility.....	1012
22.7.3	Access to Micron PSRAM .....	1012
22.7.3.1	Micron PSRAM Asynchronous Mode Configuration.....	1012
22.7.3.2	Micron PSRAM Synchronous Mode Configuration.....	1013
22.7.4	Access to Samsung OneNAND .....	1013
22.7.4.1	Samsung OneNAND Boot.....	1013
22.7.4.2	Samsung OneNAND Asynchronous Mode Configuration.....	1014
22.7.4.3	Samsung OneNAND Synchronous Mode Configuration.....	1014
22.7.4.4	Samsung OneNAND Utility.....	1014
22.7.5	Access to Samsung UtRAM .....	1015
22.7.5.1	Samsung UtRAM Asynchronous Mode Configuration.....	1015
22.7.5.2	Samsung UtRAM Synchronous Mode Configuration.....	1015
22.7.6	Access to Spansion Flash .....	1015
22.7.6.1	Spansion Flash Asynchronous Mode Configuration.....	1015
22.7.6.2	Spansion Flash Synchronous Mode Configuration.....	1016
22.7.6.3	Spansion Flash Utility.....	1016
22.7.7	8 bit support.....	1017
22.8	External Bus Timing Diagrams.....	1018
22.8.1	Asynchronous Read Memory Accesses Timing Diagram.....	1018
22.8.2	Asynchronous Write Memory Accesses Timing Diagram.....	1019
22.8.3	Asynchronous Read/Write Memory Accesses Timing Diagram.....	1020
22.8.4	Asynchronous Read/Write Using RAL, WAL and CSREC.....	1022

## Chapter 23 10/100/1000-Mbps Ethernet MAC (ENET)

23.1	Introduction.....	1059
23.2	Overview.....	1059
23.2.1	Features.....	1060
23.2.1.1	Ethernet MAC features.....	1060
23.2.1.2	IP protocol performance optimization features.....	1061
23.2.1.3	IEEE 1588 features.....	1062
23.2.2	Block diagram.....	1062
23.3	External Signals.....	1063
23.4	Clocks.....	1068

Section number	Title	Page
23.5	Memory map/register definition.....	1069
23.5.1	Interrupt Event Register (ENET_EIR).....	1074
23.5.2	Interrupt Mask Register (ENET_EIMR).....	1077
23.5.3	Receive Descriptor Active Register (ENET_RDAR).....	1080
23.5.4	Transmit Descriptor Active Register (ENET_TDAR).....	1080
23.5.5	Ethernet Control Register (ENET_ECR).....	1082
23.5.6	MII Management Frame Register (ENET_MMFR).....	1084
23.5.7	MII Speed Control Register (ENET_MSCR).....	1084
23.5.8	MIB Control Register (ENET_MIBC).....	1087
23.5.9	Receive Control Register (ENET_RCR).....	1089
23.5.10	Transmit Control Register (ENET_TCR).....	1092
23.5.11	Physical Address Lower Register (ENET_PALR).....	1094
23.5.12	Physical Address Upper Register (ENET_PAUR).....	1094
23.5.13	Opcode/Pause Duration Register (ENET_OPD).....	1095
23.5.14	Descriptor Individual Upper Address Register (ENET_IAUR).....	1095
23.5.15	Descriptor Individual Lower Address Register (ENET_IALR).....	1096
23.5.16	Descriptor Group Upper Address Register (ENET_GAUR).....	1096
23.5.17	Descriptor Group Lower Address Register (ENET_GALR).....	1097
23.5.18	Transmit FIFO Watermark Register (ENET_TFWR).....	1097
23.5.19	Receive Descriptor Ring Start Register (ENET_RDSR).....	1098
23.5.20	Transmit Buffer Descriptor Ring Start Register (ENET_TDSR).....	1099
23.5.21	Maximum Receive Buffer Size Register (ENET_MRBR).....	1100
23.5.22	Receive FIFO Section Full Threshold (ENET_RSFL).....	1101
23.5.23	Receive FIFO Section Empty Threshold (ENET_RSEM).....	1101
23.5.24	Receive FIFO Almost Empty Threshold (ENET_RAEM).....	1102
23.5.25	Receive FIFO Almost Full Threshold (ENET_RAFL).....	1102
23.5.26	Transmit FIFO Section Empty Threshold (ENET_TSEM).....	1103
23.5.27	Transmit FIFO Almost Empty Threshold (ENET_TAEM).....	1103
23.5.28	Transmit FIFO Almost Full Threshold (ENET_TAFL).....	1104

Section number	Title	Page
23.5.29	Transmit Inter-Packet Gap (ENET_TIPG).....	1104
23.5.30	Frame Truncation Length (ENET_FTRL).....	1105
23.5.31	Transmit Accelerator Function Configuration (ENET_TACC).....	1105
23.5.32	Receive Accelerator Function Configuration (ENET_RACC).....	1106
23.5.33	Reserved Statistic Register (ENET_RMON_T_DROP).....	1107
23.5.34	Tx Packet Count Statistic Register (ENET_RMON_T_PACKETS).....	1108
23.5.35	Tx Broadcast Packets Statistic Register (ENET_RMON_T_BC_PKT).....	1108
23.5.36	Tx Multicast Packets Statistic Register (ENET_RMON_T_MC_PKT).....	1109
23.5.37	Tx Packets with CRC/Align Error Statistic Register (ENET_RMON_T_CRC_ALIGN).....	1109
23.5.38	Tx Packets Less Than Bytes and Good CRC Statistic Register (ENET_RMON_T_UNDERSIZE).....	1110
23.5.39	Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENET_RMON_T_OVERSIZE).....	1110
23.5.40	Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET_RMON_T_FRAG).....	1111
23.5.41	Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENET_RMON_T_JAB)....	1111
23.5.42	Tx Collision Count Statistic Register (ENET_RMON_T_COL).....	1112
23.5.43	Tx 64-Byte Packets Statistic Register (ENET_RMON_T_P64).....	1112
23.5.44	Tx 65- to 127-byte Packets Statistic Register (ENET_RMON_T_P65TO127).....	1113
23.5.45	Tx 128- to 255-byte Packets Statistic Register (ENET_RMON_T_P128TO255).....	1113
23.5.46	Tx 256- to 511-byte Packets Statistic Register (ENET_RMON_T_P256TO511).....	1114
23.5.47	Tx 512- to 1023-byte Packets Statistic Register (ENET_RMON_T_P512TO1023).....	1114
23.5.48	Tx 1024- to 2047-byte Packets Statistic Register (ENET_RMON_T_P1024TO2047).....	1115
23.5.49	Tx Packets Greater Than 2048 Bytes Statistic Register (ENET_RMON_T_P_GTE2048).....	1115
23.5.50	Tx Octets Statistic Register (ENET_RMON_T_OCTETS).....	1115
23.5.51	IEEE_T_DROP Reserved Statistic Register (ENET_IEEE_T_DROP).....	1116
23.5.52	Frames Transmitted OK Statistic Register (ENET_IEEE_T_FRAME_OK).....	1116
23.5.53	Frames Transmitted with Single Collision Statistic Register (ENET_IEEE_T_1COL).....	1117
23.5.54	Frames Transmitted with Multiple Collisions Statistic Register (ENET_IEEE_T_MCOL).....	1117
23.5.55	Frames Transmitted after Deferral Delay Statistic Register (ENET_IEEE_T_DEF).....	1118
23.5.56	Frames Transmitted with Late Collision Statistic Register (ENET_IEEE_T_LCOL).....	1118
23.5.57	Frames Transmitted with Excessive Collisions Statistic Register (ENET_IEEE_T_EXCOL).....	1119

Section number	Title	Page
23.5.58	Frames Transmitted with Tx FIFO Underrun Statistic Register (ENET_IEEE_T_MACERR).....	1119
23.5.59	Frames Transmitted with Carrier Sense Error Statistic Register (ENET_IEEE_T_CSERR).....	1120
23.5.60	ENET_IEEE_T_SQE.....	1120
23.5.61	Flow Control Pause Frames Transmitted Statistic Register (ENET_IEEE_T_FDXFC).....	1121
23.5.62	Octet Count for Frames Transmitted w/o Error Statistic Register (ENET_IEEE_T_OCTETS_OK).....	1121
23.5.63	Rx Packet Count Statistic Register (ENET_RMON_R_PACKETS).....	1122
23.5.64	Rx Broadcast Packets Statistic Register (ENET_RMON_R_BC_PKT).....	1122
23.5.65	Rx Multicast Packets Statistic Register (ENET_RMON_R_MC_PKT).....	1123
23.5.66	Rx Packets with CRC/Align Error Statistic Register (ENET_RMON_R_CRC_ALIGN).....	1123
23.5.67	Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENET_RMON_R_UNDERSIZE).....	1124
23.5.68	Rx Packets Greater Than MAX_FL and Good CRC Statistic Register (ENET_RMON_R_OVERSIZE).....	1124
23.5.69	Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET_RMON_R_FRAG).....	1125
23.5.70	Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENET_RMON_R_JAB)...	1125
23.5.71	Reserved Statistic Register (ENET_RMON_R_RESVD_0).....	1125
23.5.72	Rx 64-Byte Packets Statistic Register (ENET_RMON_R_P64).....	1126
23.5.73	Rx 65- to 127-Byte Packets Statistic Register (ENET_RMON_R_P65TO127).....	1126
23.5.74	Rx 128- to 255-Byte Packets Statistic Register (ENET_RMON_R_P128TO255).....	1127
23.5.75	Rx 256- to 511-Byte Packets Statistic Register (ENET_RMON_R_P256TO511).....	1127
23.5.76	Rx 512- to 1023-Byte Packets Statistic Register (ENET_RMON_R_P512TO1023).....	1128
23.5.77	Rx 1024- to 2047-Byte Packets Statistic Register (ENET_RMON_R_P1024TO2047).....	1128
23.5.78	Rx Packets Greater than 2048 Bytes Statistic Register (ENET_RMON_R_P_GTE2048).....	1129
23.5.79	Rx Octets Statistic Register (ENET_RMON_R_OCTETS).....	1129
23.5.80	Frames not Counted Correctly Statistic Register (ENET_IEEE_R_DROP).....	1130
23.5.81	Frames Received OK Statistic Register (ENET_IEEE_R_FRAME_OK).....	1130
23.5.82	Frames Received with CRC Error Statistic Register (ENET_IEEE_R_CRC).....	1131
23.5.83	Frames Received with Alignment Error Statistic Register (ENET_IEEE_R_ALIGN).....	1131
23.5.84	Receive FIFO Overflow Count Statistic Register (ENET_IEEE_R_MACERR).....	1132

Section number	Title	Page
23.5.85	Flow Control Pause Frames Received Statistic Register (ENET_IEEE_R_FDXFC).....	1132
23.5.86	Octet Count for Frames Received without Error Statistic Register (ENET_IEEE_R_OCTETS_OK).....	1133
23.5.87	Adjustable Timer Control Register (ENET_ATCR).....	1133
23.5.88	Timer Value Register (ENET_ATVR).....	1135
23.5.89	Timer Offset Register (ENET_ATOFF).....	1135
23.5.90	Timer Period Register (ENET_ATPER).....	1136
23.5.91	Timer Correction Register (ENET_ATCOR).....	1136
23.5.92	Time-Stamping Clock Period Register (ENET_ATINC).....	1137
23.5.93	Timestamp of Last Transmitted Frame (ENET_ATSTMP).....	1137
23.5.94	Timer Global Status Register (ENET_TGSR).....	1138
23.5.95	Timer Control Status Register (ENET_TCSR $n$ ).....	1139
23.5.96	Timer Compare Capture Register (ENET_TCCR $n$ ).....	1140
23.6	Functional description.....	1140
23.6.1	Ethernet MAC frame formats.....	1141
23.6.1.1	Pause Frames.....	1142
23.6.1.2	Magic packets.....	1143
23.6.2	IP and higher layers frame format.....	1143
23.6.2.1	Ethernet types.....	1144
23.6.2.2	IPv4 datagram format.....	1144
23.6.2.3	IPv6 datagram format.....	1145
23.6.2.4	Internet Control Message Protocol (ICMP) datagram format.....	1146
23.6.2.5	User Datagram Protocol (UDP) datagram format.....	1146
23.6.2.6	TCP datagram format.....	1147
23.6.3	IEEE 1588 message formats.....	1148
23.6.3.1	Transport encapsulation.....	1148
23.6.3.1.1	UDP/IP.....	1148
23.6.3.1.2	Native Ethernet (PTPv2).....	1149
23.6.3.2	PTP header.....	1149
23.6.3.2.1	PTPv1 header.....	1149

Section number	Title	Page
	23.6.3.2.2 PTPv2 header.....	1150
23.6.4	MAC receive.....	1151
	23.6.4.1 Collision detection in half-duplex mode.....	1152
	23.6.4.2 Preamble processing.....	1153
	23.6.4.3 MAC address check.....	1153
	23.6.4.3.1 Unicast address check.....	1153
	23.6.4.3.2 Multicast and unicast address resolution.....	1153
	23.6.4.3.3 Broadcast address reject.....	1154
	23.6.4.3.4 Miss-bit implementation.....	1154
	23.6.4.4 Frame length/type verification: payload length check.....	1155
	23.6.4.5 Frame length/type verification: frame length check.....	1155
	23.6.4.6 VLAN frames processing.....	1156
	23.6.4.7 Pause frame termination.....	1156
	23.6.4.8 CRC check.....	1156
	23.6.4.9 Frame padding removal.....	1157
23.6.5	MAC transmit.....	1157
	23.6.5.1 Frame payload padding.....	1158
	23.6.5.2 MAC address insertion.....	1158
	23.6.5.3 CRC-32 generation.....	1159
	23.6.5.4 Inter-packet gap (IPG).....	1159
	23.6.5.5 Collision detection and handling — half-duplex operation only.....	1159
23.6.6	Full-duplex flow control operation.....	1161
	23.6.6.1 Remote device congestion.....	1161
	23.6.6.2 Local device/FIFO congestion.....	1162
23.6.7	Magic packet detection.....	1163
	23.6.7.1 Sleep mode.....	1163
	23.6.7.2 Magic packet detection.....	1163
	23.6.7.3 Wakeup.....	1164

Section number	Title	Page
23.6.8	IP accelerator functions.....	1164
23.6.8.1	Checksum calculation.....	1164
23.6.8.2	Additional padding processing.....	1165
23.6.8.3	32-bit Ethernet payload alignment.....	1165
	23.6.8.3.1 Receive processing.....	1166
	23.6.8.3.2 Transmit processing.....	1166
23.6.8.4	Received frame discard.....	1166
23.6.8.5	IPv4 fragments.....	1167
23.6.8.6	IPv6 support.....	1167
	23.6.8.6.1 Receive processing.....	1167
	23.6.8.6.2 Transmit processing.....	1168
23.6.9	Resets and stop controls.....	1168
23.6.9.1	Hardware reset.....	1168
23.6.9.2	Soft reset.....	1168
23.6.9.3	Hardware freeze.....	1169
23.6.9.4	Graceful stop.....	1169
	23.6.9.4.1 Graceful transmit stop (GTS).....	1170
	23.6.9.4.2 Graceful receive stop (GRS).....	1170
	23.6.9.4.3 Graceful stop interrupt (GRA).....	1171
23.6.10	IEEE 1588 functions.....	1171
23.6.10.1	Adjustable timer module.....	1172
	23.6.10.1.1 Adjustable timer implementation.....	1172
23.6.10.2	Transmit timestamping.....	1174
23.6.10.3	Receive timestamping.....	1174
23.6.10.4	Time synchronization.....	1174
23.6.10.5	Input Capture and Output Compare.....	1175
	23.6.10.5.1 Input capture.....	1175
	23.6.10.5.2 Output compare.....	1175

<b>Chapter 24</b>		
<b>Electrophoretic Display Controller (EPDC)</b>		
24.1	Overview .....	1195
24.1.1	EPDC Block Diagram.....	1196
24.2	External Signals.....	1197
24.3	Programming Model.....	1199
24.3.1	Assumptions.....	1199
24.3.2	Register Space (Write/Set/Clear/Toggle).....	1200
24.3.3	Interrupts.....	1201
24.3.3.1	Interrupt Sources.....	1201
24.3.3.2	Enabling/Masking Interrupts.....	1201
24.3.3.3	Handling/Clearing Interrupts.....	1201
24.3.4	Controller Setup.....	1202
24.3.4.1	Memory Requirements.....	1202
24.3.4.2	Panel Architecture Configuration.....	1203
24.3.4.3	TFT Panel Timing Configuration .....	1206
24.3.4.4	Source Driver and Pixel Clock Configuration.....	1211
24.3.4.5	Initializing the Display.....	1212
24.3.4.5.1	Reset/Clocks and Buffer Preparation.....	1213
24.3.4.5.2	Performing an Initialization Display Update.....	1213
24.3.5	Dual-Scan Configuration.....	1214
24.3.6	Update Buffer Analysis Functions.....	1217
24.3.7	Waveform Mode Selection (AUTOWV).....	1218
24.3.8	Panel Interface Generator (Pigeon Mode).....	1218
24.3.9	Display Update Programming.....	1222
24.3.9.1	Initiating a Display Update.....	1222
24.3.9.2	Update Processing and Collisions.....	1223
24.3.9.3	Multiple Update Flow.....	1227
24.3.10	Architectural Clock Gating (Low Power Mode).....	1230

Section number	Title	Page
24.3.11	Performance Tuning and Considerations.....	1232
24.3.11.1	Memory and Bus Bandwidth Requirements.....	1232
24.3.11.2	Pixel Latency FIFOs.....	1233
24.3.11.3	Basic Watermarking Control.....	1233
24.3.11.4	Update/Refresh Tuning (VSCAN_HOLDOFF).....	1234
24.3.11.5	System-Level Arbitration Control.....	1234

24.4.7	EPDC Update Region Address (EPDC_UPD_ADDR).....	1251
24.4.8	EPDC Update Region Stride (EPDC_UPD_STRIDE).....	1252
24.4.9	EPDC Update Command Co-ordinate (EPDC_UPD_CORD).....	1253
24.4.10	EPDC Update Command Size (EPDC_UPD_SIZE).....	1253
24.4.11	EPDC Update Command Control (EPDC_UPD_CTRL <i>n</i> ).....	1254
24.4.12	EPDC Update Fixed Pixel Control (EPDC_UPD_FIXED <i>n</i> ).....	1255
24.4.13	EPDC Temperature Register (EPDC_TEMP).....	1256
24.4.14	Waveform Mode Lookup Table Control Register. (EPDC_AUTOWV_LUT).....	1257
24.4.15	EPDC Timing Control Engine Control Register (EPDC_TCE_CTRL <i>n</i> ).....	1257
24.4.16	EPDC Timing Control Engine Source-Driver Config Register (EPDC_TCE_SDCFG <i>n</i> ).....	1259
24.4.17	EPDC Timing Control Engine Gate-Driver Config Register (EPDC_TCE_GDCFG <i>n</i> ).....	1261
24.4.18	EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC_TCE_HSCAN1 <i>n</i> ).....	1262
24.4.19	EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC_TCE_HSCAN2 <i>n</i> ).....	1262
24.4.20	EPDC Timing Control Engine Vertical Timing Register (EPDC_TCE_VSCAN <i>n</i> ).....	1263
24.4.21	EPDC Timing Control Engine OE timing control Register (EPDC_TCE_OE <i>n</i> ).....	1264
24.4.22	EPDC Timing Control Engine Driver Polarity Register (EPDC_TCE_POLARITY).....	1264

Section number	Title	Page
24.4.23	EPDC Timing Control Engine Timing Register 1 (EPDC_TCE_TIMING1n).....	1265
24.4.24	EPDC Timing Control Engine Timing Register 2 (EPDC_TCE_TIMING2n).....	1267
24.4.25	EPDC Timing Control Engine Timing Register 3 (EPDC_TCE_TIMING3n).....	1267
24.4.26	EPDC Pigeon Mode Control Register 0 (EPDC_PIGEON_CTRL0n).....	1268
24.4.27	EPDC Pigeon Mode Control Register 1 (EPDC_PIGEON_CTRL1n).....	1268
24.4.28	EPDC IRQ Mask Register for LUT 0~31 (EPDC_IRQ_MASK1n).....	1269
24.4.29	EPDC IRQ Mask Register for LUT 32~63 (EPDC_IRQ_MASK2n).....	1269
24.4.30	EPDC Interrupt Register for LUT 0~31 (EPDC_IRQ1n).....	1270
24.4.31	EPDC Interrupt Register for LUT 32~63 (EPDC_IRQ2n).....	1270
24.4.32	EPDC IRQ Mask Register (EPDC_IRQ_MASKn).....	1271
24.4.33	EPDC Interrupt Register (EPDC_IRQn).....	1272
24.4.34	EPDC Status Register - LUTs (EPDC_STATUS_LUTS1n).....	1274
24.4.35	EPDC Status Register - LUTs (EPDC_STATUS_LUTS2n).....	1274
24.4.36	EPDC Status Register - Next Available LUT (EPDC_STATUS_NEXTLUT).....	1274
24.4.37	EPDC LUT Collision Status (EPDC_STATUS_COL1n).....	1276
24.4.38	EPDC LUT Collision Status (EPDC_STATUS_COL2n).....	1276
24.4.39	EPDC General Status Register (EPDC_STATUSn).....	1277
24.4.40	EPDC Collision Region Co-ordinate (EPDC_UPD_COL_CORD).....	1279
24.4.41	EPDC Collision Region Size (EPDC_UPD_COL_SIZE).....	1279
24.4.42	1-level Histogram Parameter Register. (EPDC_HIST1_PARAM).....	1280
24.4.43	2-level Histogram Parameter Register. (EPDC_HIST2_PARAM).....	1281
24.4.44	4-level Histogram Parameter Register. (EPDC_HIST4_PARAM).....	1281
24.4.45	8-level Histogram Parameter 0 Register. (EPDC_HIST8_PARAM0).....	1282
24.4.46	8-level Histogram Parameter 1 Register. (EPDC_HIST8_PARAM1).....	1283
24.4.47	16-level Histogram Parameter 0 Register. (EPDC_HIST16_PARAM0).....	1284
24.4.48	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM1).....	1284
24.4.49	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM2).....	1285
24.4.50	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM3).....	1286
24.4.51	EPDC General Purpose I/O Debug register (EPDC_GPIOn).....	1287

Section number	Title	Page
24.4.52	EPDC Version Register (EPDC_VERSION).....	1288
24.4.53	Panel Interface Signal Generator Register 0_0 (EPDC_PIGEON_0_0).....	1288
24.4.54	Panel Interface Signal Generator Register 0_1 (EPDC_PIGEON_0_1).....	1290
24.4.55	Panel Interface Signal Generator Register 0_1 (EPDC_PIGEON_0_2).....	1290
24.4.56	Panel Interface Signal Generator Register 1_0 (EPDC_PIGEON_1_0).....	1291
24.4.57	Panel Interface Signal Generator Register 1_1 (EPDC_PIGEON_1_1).....	1292
24.4.58	Panel Interface Signal Generator Register 1_1 (EPDC_PIGEON_1_2).....	1293
24.4.59	Panel Interface Signal Generator Register 2_0 (EPDC_PIGEON_2_0).....	1293
24.4.60	Panel Interface Signal Generator Register 2_1 (EPDC_PIGEON_2_1).....	1294
24.4.61	Panel Interface Signal Generator Register 2_1 (EPDC_PIGEON_2_2).....	1295
24.4.62	Panel Interface Signal Generator Register 3_0 (EPDC_PIGEON_3_0).....	1296
24.4.63	Panel Interface Signal Generator Register 3_1 (EPDC_PIGEON_3_1).....	1297
24.4.64	Panel Interface Signal Generator Register 3_1 (EPDC_PIGEON_3_2).....	1297
24.4.65	Panel Interface Signal Generator Register 4_0 (EPDC_PIGEON_4_0).....	1298
24.4.66	Panel Interface Signal Generator Register 4_1 (EPDC_PIGEON_4_1).....	1299
24.4.67	Panel Interface Signal Generator Register 4_1 (EPDC_PIGEON_4_2).....	1300
24.4.68	Panel Interface Signal Generator Register 5_0 (EPDC_PIGEON_5_0).....	1300
24.4.69	Panel Interface Signal Generator Register 5_1 (EPDC_PIGEON_5_1).....	1302
24.4.70	Panel Interface Signal Generator Register 5_1 (EPDC_PIGEON_5_2).....	1302
24.4.71	Panel Interface Signal Generator Register 6_0 (EPDC_PIGEON_6_0).....	1303
24.4.72	Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_1).....	1304
24.4.73	Panel Interface Signal Generator Register 6_1 (EPDC_PIGEON_6_2).....	1305
24.4.74	Panel Interface Signal Generator Register 7_0 (EPDC_PIGEON_7_0).....	1305
24.4.75	Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_1).....	1306
24.4.76	Panel Interface Signal Generator Register 7_1 (EPDC_PIGEON_7_2).....	1307
24.4.77	Panel Interface Signal Generator Register 8_0 (EPDC_PIGEON_8_0).....	1308
24.4.78	Panel Interface Signal Generator Register 8_1 (EPDC_PIGEON_8_1).....	1309
24.4.79	Panel Interface Signal Generator Register 8_1 (EPDC_PIGEON_8_2).....	1309
24.4.80	Panel Interface Signal Generator Register 9_0 (EPDC_PIGEON_9_0).....	1310

<b>Section number</b>	<b>Title</b>	<b>Page</b>
24.4.81	Panel Interface Signal Generator Register 9_1 (EPDC_PIGEON_9_1).....	1311
24.4.82	Panel Interface Signal Generator Register 9_1 (EPDC_PIGEON_9_2).....	1312
24.4.83	Panel Interface Signal Generator Register 10_0 (EPDC_PIGEON_10_0).....	1312
24.4.84	Panel Interface Signal Generator Register 10_1 (EPDC_PIGEON_10_1).....	1314
24.4.85	Panel Interface Signal Generator Register 10_1 (EPDC_PIGEON_10_2).....	1314
24.4.86	Panel Interface Signal Generator Register 11_0 (EPDC_PIGEON_11_0).....	1315
24.4.87	Panel Interface Signal Generator Register 11_1 (EPDC_PIGEON_11_1).....	1316
24.4.88	Panel Interface Signal Generator Register 11_1 (EPDC_PIGEON_11_2).....	1317
24.4.89	Panel Interface Signal Generator Register 12_0 (EPDC_PIGEON_12_0).....	1317
24.4.90	Panel Interface Signal Generator Register 12_1 (EPDC_PIGEON_12_1).....	1318
24.4.91	Panel Interface Signal Generator Register 12_1 (EPDC_PIGEON_12_2).....	1319
24.4.92	Panel Interface Signal Generator Register 13_0 (EPDC_PIGEON_13_0).....	1320
24.4.93	Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_1).....	1321
24.4.94	Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_2).....	1321
24.4.95	Panel Interface Signal Generator Register 14_0 (EPDC_PIGEON_14_0).....	1322
24.4.96	Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_1).....	1323
24.4.97	Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_2).....	1324
24.4.98	Panel Interface Signal Generator Register 15_0 (EPDC_PIGEON_15_0).....	1324
24.4.99	Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_1).....	1326
24.4.100	Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_2).....	1326
24.4.101	Panel Interface Signal Generator Register 16_0 (EPDC_PIGEON_16_0).....	1327
24.4.102	Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_1).....	1328
24.4.103	Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_2).....	1329

## **Chapter 25**

### **Enhanced Periodic Interrupt Timer (EPIT)**

25.1	Overview.....	1331
25.1.1	EPIT features.....	1331
25.1.2	EPIT modes and operations.....	1332
25.2	External signals.....	1332

Section number	Title	Page
25.3	Clocks.....	1332
25.4	Functional Description.....	1334
25.4.1	Operating modes.....	1334
25.4.1.1	Operating in set-and-forget mode.....	1334
25.4.1.2	Operating in free-running mode.....	1334
25.4.2	Operations.....	1335
25.4.3	Compare Event.....	1335
25.4.3.1	Counter Value Overwrite.....	1336
25.4.3.2	Low-Power Mode Behavior.....	1337
25.4.3.3	Debug Mode Behavior.....	1337
25.5	Initialization/ Application Information.....	1337
25.5.1	Change of Clock Source.....	1337
25.6	EPIT Memory Map/Register Definition.....	1338
25.6.1	Control register (EPITx_CR).....	1338
25.6.2	Status register (EPITx_SR).....	1341
25.6.3	Load register (EPITx_LR).....	1341
25.6.4	Compare register (EPITx_CMPR).....	1342
25.6.5	Counter register (EPITx_CNR).....	1342

## Chapter 26 Enhanced Serial Audio Interface (ESAI)

26.1	Overview.....	1343
26.1.1	Features.....	1345
26.1.2	Modes of Operation.....	1345
26.1.2.1	Normal/Network/On-Demand Mode Selection.....	1345
26.1.2.2	Synchronous/Asynchronous Operating Modes.....	1346
26.1.2.3	Frame Sync Selection.....	1346
26.1.2.4	Shift Direction Selection.....	1347
26.2	External Signals.....	1348
26.2.1	Serial Transmit 0 Data Pin.....	1349

Section number	Title	Page
26.2.2	Serial Transmit 1 Data Pin.....	1349
26.2.3	Serial Transmit 2/Receive 3 Data Pin.....	1350
26.2.4	Serial Transmit 3/Receive 2 Data Pin.....	1350
26.2.5	Serial Transmit 4/Receive 1 Data Pin.....	1351
26.2.6	Serial Transmit 5/Receive 0 Data Pin.....	1351
26.2.7	Receiver Serial Clock.....	1352
26.2.8	Transmitter Serial Clock.....	1353
26.2.9	Frame Sync for Receiver.....	1354
26.2.10	Frame Sync for Transmitter.....	1355
26.2.11	High Frequency Clock for Transmitter.....	1355
26.2.12	High Frequency Clock for Receiver.....	1356
26.2.13	Serial I/O Flags.....	1356
26.3	Clocks.....	1357
26.4	Functional Description.....	1358
26.4.1	ESAI After Reset.....	1358
26.4.2	ESAI Interrupt Requests.....	1358
26.4.3	ESAI DMA Requests from the FIFOs.....	1359
26.4.4	ESAI Transmit and Receive Shift Registers.....	1360
26.4.4.1	ESAI Transmit Shift Registers.....	1360
26.4.4.2	ESAI Receive Shift Registers.....	1363
26.5	Initialization Information.....	1363
26.5.1	ESAI Initialization.....	1363
26.5.2	ESAI Initialization Examples.....	1364
26.5.2.1	Initializing the ESAI using Personal Reset.....	1364
26.5.2.2	Initializing the ESAI Transmitter Section.....	1365
26.5.2.3	Initializing the ESAI Receiver Section.....	1365
26.6	ESAI Memory Map/Register Definition.....	1366
26.6.1	ESAI Transmit Data Register (ESAI_ETDR).....	1367
26.6.2	ESAI Receive Data Register (ESAI_ERDR).....	1368

Section number	Title	Page
26.6.3	ESAI Control Register (ESAI_ECR).....	1368
26.6.4	ESAI Status Register (ESAI_ESR).....	1369
26.6.5	Transmit FIFO Configuration Register (ESAI_TFCR).....	1371
26.6.6	Transmit FIFO Status Register (ESAI_TFSR).....	1373
26.6.7	Receive FIFO Configuration Register (ESAI_RFCR).....	1374
26.6.8	Receive FIFO Status Register (ESAI_RFSR).....	1375
26.6.9	Transmit Data Register n (ESAI_TXn).....	1376
26.6.10	ESAI Transmit Slot Register (ESAI_TSR).....	1377
26.6.11	Receive Data Register n (ESAI_RXn).....	1377
26.6.12	Serial Audio Interface Status Register (ESAI_SAISR).....	1378
26.6.13	Serial Audio Interface Control Register (ESAI_SAICR).....	1380
26.6.14	Transmit Control Register (ESAI_TCR).....	1383
26.6.15	Transmit Clock Control Register (ESAI_TCCR).....	1390
26.6.16	Receive Control Register (ESAI_RCR).....	1394
26.6.17	Receive Clock Control Register (ESAI_RCCR).....	1398
26.6.18	Transmit Slot Mask Register A (ESAI_TSMA).....	1401
26.6.19	Transmit Slot Mask Register B (ESAI_TSMB).....	1402
26.6.20	Receive Slot Mask Register A (ESAI_RSMA).....	1403
26.6.21	Receive Slot Mask Register B (ESAI_RSMB).....	1404
26.6.22	Port C Direction Register (ESAI_PPRC).....	1405
26.6.23	Port C Control Register (ESAI_PCRC).....	1405

## Chapter 27 Flexible Controller Area Network (FLEXCAN)

27.1	Overview.....	1407
27.1.1	Block Diagram.....	1407
27.1.2	FLEXCAN Module Features.....	1409
27.1.3	Modes of Operation.....	1410
27.2	External Signals.....	1411
27.3	Clocks.....	1411

<b>Section number</b>	<b>Title</b>	<b>Page</b>
27.4	Message Buffer Structure.....	1411
27.5	Rx FIFO Structure.....	1416
27.6	Functional Description.....	1419
27.6.1	Functional Overview.....	1419
27.6.2	Transmit Process.....	1420
27.6.3	Arbitration process.....	1421
27.6.3.1	Lowest Mailbox number first.....	1421
27.6.3.2	Highest Mailbox priority first.....	1421
27.6.3.2.1	Local Priority disabled.....	1422
27.6.3.2.2	Local Priority enabled.....	1422
27.6.4	Receive Process.....	1424
27.6.5	Matching Process.....	1426
27.6.6	Move Process.....	1430
27.6.6.1	Move-in.....	1430
27.6.6.2	Move-out.....	1431
27.6.7	Data Coherence.....	1432
27.6.7.1	Transmission Abort Mechanism.....	1432
27.6.7.2	Message Buffer Inactivation.....	1433
27.6.7.3	Message Buffer Lock Mechanism.....	1434
27.6.8	Rx FIFO.....	1435
27.6.9	CAN Protocol Related Features.....	1436
27.6.9.1	Remote Frames .....	1436
27.6.9.2	Overload Frames.....	1437
27.6.9.3	Time Stamp.....	1438
27.6.9.4	Protocol Timing.....	1438
27.6.9.5	Arbitration and Matching Timing.....	1441
27.6.10	Modes of Operation Details.....	1443
27.6.10.1	Freeze Mode.....	1443
27.6.10.2	Module Disable Mode.....	1444

Section number	Title	Page
27.6.10.3	Stop Mode.....	1444
27.6.11	Interrupts.....	1446
27.7	Initialization/Application Information.....	1446
27.7.1	FLEXCAN Initialization Sequence.....	1446
27.8	FLEXCAN Memory Map/Register Definition.....	1448
27.8.1	Module Configuration Register (FLEXCAN <sub>x</sub> _MCR).....	1450
27.8.2	Control 1 Register (FLEXCAN <sub>x</sub> _CTRL1).....	1455
27.8.3	Free Running Timer Register (FLEXCAN <sub>x</sub> _TIMER).....	1457
27.8.4	Rx Mailboxes Global Mask Register (FLEXCAN <sub>x</sub> _RXMGMASK).....	1458
27.8.5	Rx Buffer 14 Mask Register (FLEXCAN <sub>x</sub> _RX14MASK).....	1459
27.8.6	Rx Buffer 15 Mask Register (FLEXCAN <sub>x</sub> _RX15MASK).....	1460
27.8.7	Error Counter Register (FLEXCAN <sub>x</sub> _ECR).....	1460
27.8.8	Error and Status 1 Register (FLEXCAN <sub>x</sub> _ESR1).....	1462
27.8.9	Interrupt Masks 2 Register (FLEXCAN <sub>x</sub> _IMASK2).....	1465
27.8.10	Interrupt Masks 1 Register (FLEXCAN <sub>x</sub> _IMASK1).....	1466
27.8.11	Interrupt Flags 2 Register (FLEXCAN <sub>x</sub> _IFLAG2).....	1467
27.8.12	Interrupt Flags 1 Register (FLEXCAN <sub>x</sub> _IFLAG1).....	1467
27.8.13	Control 2 Register (FLEXCAN <sub>x</sub> _CTRL2).....	1469
27.8.14	Error and Status 2 Register (FLEXCAN <sub>x</sub> _ESR2).....	1474
27.8.15	CRC Register (FLEXCAN <sub>x</sub> _CRCR).....	1476
27.8.16	Rx FIFO Global Mask Register (FLEXCAN <sub>x</sub> _RXFGMASK).....	1477
27.8.17	Rx FIFO Information Register (FLEXCAN <sub>x</sub> _RXFIR).....	1478
27.8.18	Rx Individual Mask Registers (FLEXCAN <sub>x</sub> _RXIMR0_RXIMR63).....	1479
27.8.19	Glitch Filter Width Registers (FLEXCAN <sub>x</sub> _GFWR).....	1479

## Chapter 28 General Power Controller (GPC)

28.1	Overview.....	1481
28.2	Clocks.....	1482

Section number	Title	Page
28.3	DVFS overview.....	1482
28.3.1	Features.....	1483
28.4	DVFS output event/interrupt configuration.....	1483
28.4.1	Interrupts.....	1483
28.4.2	DVFS Change Request Sequence Diagrams.....	1484
28.5	Power Gating Control (PGC).....	1485
28.5.1	Overview.....	1486
28.5.1.1	Features.....	1487
28.6	GPC Interrupt Controller (INTC).....	1487
28.6.1	Interrupt Controller features.....	1487
28.7	GPC Memory Map/Register Definition.....	1488
28.7.1	GPC Interface control register (GPC_CNTR).....	1488
28.7.2	GPC Power Gating Register (GPC_PGR).....	1491
28.7.3	IRQ masking register 1 (GPC_IMR1).....	1491
28.7.4	IRQ masking register 2 (GPC_IMR2).....	1492
28.7.5	IRQ masking register 3 (GPC_IMR3).....	1492
28.7.6	IRQ masking register 4 (GPC_IMR4).....	1492
28.7.7	IRQ status resister 1 (GPC_ISR1).....	1493
28.7.8	IRQ status resister 2 (GPC_ISR2).....	1493
28.7.9	IRQ status resister 3 (GPC_ISR3).....	1494
28.7.10	IRQ status resister 4 (GPC_ISR4).....	1494
28.8	PGC Memory Map/Register Definition.....	1494
28.8.1	PGC Control Register (PGC_GPU_CTRL).....	1495
28.8.2	Power Up Sequence Control Register (PGC_GPU_PUPSCR).....	1496
28.8.3	Pull Down Sequence Control Register (PGC_GPU_PDNSCR).....	1497
28.8.4	Power Gating Controller Status Register (PGC_GPU_SR).....	1497
28.8.5	PGC Control Register (PGC_CPU_CTRL).....	1498
28.8.6	Power Up Sequence Control Register (PGC_CPU_PUPSCR).....	1499
28.8.7	Pull Down Sequence Control Register (PGC_CPU_PDNSCR).....	1499

<b>Section number</b>	<b>Title</b>	<b>Page</b>
28.8.8	Power Gating Controller Status Register (PGC_CPU_SR).....	1500
28.9	DVFS Memory Map/Register Definition.....	1500
28.9.1	DVFS Thresholds (DVFS_THRS).....	1501
28.9.2	DVFS Counters thresholds (DVFS_COUN).....	1502
28.9.3	DVFS general purpose bits weight (DVFS_SIG1).....	1502
28.9.4	DVFS general purpose bits weight (DVFS_DVFSIG0).....	1503
28.9.5	DVFS general purpose bit 0 weight counter (DVFS_DVFSGPC0).....	1504
28.9.6	DVFS general purpose bit 1 weight counter (DVFS_DVFSGPC1).....	1505
28.9.7	DVFS general purpose bits enables (DVFS_DVFSGPBT).....	1506
28.9.8	DVFS EMAC settings (DVFS_DVFSEMAC).....	1508
28.9.9	DVFS Control (DVFS_CNTR).....	1509
28.9.10	DVFS Load Tracking Register 0, portion 0 (DVFS_DVFSLTR0_0).....	1512
28.9.11	DVFS Load Tracking Register 0, portion 1 (DVFS_DVFSLTR0_1).....	1513
28.9.12	DVFS Load Tracking Register 1, portion 0 (DVFS_DVFSLTR1_0).....	1514
28.9.13	DVFS Load Tracking Register 3, portion 1 (DVFS_DVFSLTR1_1).....	1514
28.9.14	DVFS pattern 0 length (DVFS_DVFSPT0).....	1515
28.9.15	DVFS pattern 1 length (DVFS_DVFSPT1).....	1516
28.9.16	DVFS pattern 2 length (DVFS_DVFSPT2).....	1516
28.9.17	DVFS pattern 3 length (DVFS_DVFSPT3).....	1517

## Chapter 29 General Purpose Input/Output (GPIO)

29.1	Overview.....	1519
29.1.1	Block Diagram.....	1521
29.1.2	Features.....	1522
29.2	External Signals.....	1523
29.3	Clocks.....	1528
29.4	GPIO Functional Description.....	1529
29.4.1	GPIO Function.....	1529

Section number	Title	Page
29.4.2	GPIO pad structure.....	1529
29.4.2.1	Input Driver.....	1530
29.4.2.1.1	Schmitt trigger.....	1530
29.4.2.1.2	Input keeper.....	1531
29.4.2.2	Output Driver.....	1531
29.4.2.2.1	Drive strength.....	1532
29.4.2.2.2	Output keeper.....	1532
29.4.2.2.3	PU / PD / Keeper Logic.....	1533
29.4.2.2.4	Open drain.....	1533
29.4.2.3	Operating Frequency.....	1534
29.4.3	GPIO Programming.....	1536
29.4.3.1	GPIO Read Mode.....	1536
29.4.3.2	GPIO Write Mode.....	1536
29.4.4	Interrupt Control Unit.....	1537
29.5	GPIO Memory Map/Register Definition.....	1537
29.5.1	GPIO data register (GPIOx_DR).....	1539
29.5.2	GPIO direction register (GPIOx_GDIR).....	1540
29.5.3	GPIO pad status register (GPIOx_PSR).....	1541
29.5.4	GPIO interrupt configuration register1 (GPIOx_ICR1).....	1541
29.5.5	GPIO interrupt configuration register2 (GPIOx_ICR2).....	1545
29.5.6	GPIO interrupt mask register (GPIOx_IMR).....	1548
29.5.7	GPIO interrupt status register (GPIOx_ISR).....	1549
29.5.8	GPIO edge select register (GPIOx_EDGE_SEL).....	1550

## Chapter 30 General Purpose Media Interface (GPMI)

30.1	Overview.....	1551
30.2	External Signals.....	1552
30.3	Clocks.....	1553

Section number	Title	Page
30.4	GPMI NAND Mode.....	1554
30.4.1	Multiple NAND Support.....	1554
30.4.2	GPMI NAND Timing and Clocking.....	1555
30.4.3	Basic NAND Timing.....	1555
30.4.3.1	NAND Asynchronous Timing.....	1555
30.4.3.2	NAND Asynchronous EDO Mode Timing.....	1557
30.4.3.3	NAND ONFI Source Synchronous Mode Timing.....	1560
30.4.3.4	NAND Toggle Mode Timing.....	1565
30.4.4	Hardware BCH Interface.....	1573
30.5	Behavior During Reset.....	1574
30.6	GPMI Memory Map/Register Definition.....	1574
30.6.1	GPMI Control Register 0 Description (GPMI_CTRL0n).....	1576
30.6.2	GPMI Compare Register Description (GPMI_COMPARE).....	1578
30.6.3	GPMI Integrated ECC Control Register Description (GPMI_ECCCTRLn).....	1579
30.6.4	GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT).....	1580
30.6.5	GPMI Payload Address Register Description (GPMI_PAYLOAD).....	1580
30.6.6	GPMI Auxiliary Address Register Description (GPMI_AUXILIARY).....	1581
30.6.7	GPMI Control Register 1 Description (GPMI_CTRL1n).....	1582
30.6.8	GPMI Timing Register 0 Description (GPMI_TIMING0).....	1585
30.6.9	GPMI Timing Register 1 Description (GPMI_TIMING1).....	1585
30.6.10	GPMI Timing Register 2 Description (GPMI_TIMING2).....	1586
30.6.11	GPMI DMA Data Transfer Register Description (GPMI_DATA).....	1587
30.6.12	GPMI Status Register Description (GPMI_STAT).....	1587
30.6.13	GPMI Debug Information Register Description (GPMI_DEBUG).....	1590
30.6.14	GPMI Version Register Description (GPMI_VERSION).....	1591
30.6.15	GPMI Debug2 Information Register Description (GPMI_DEBUG2).....	1591
30.6.16	GPMI Debug3 Information Register Description (GPMI_DEBUG3).....	1594
30.6.17	GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL).....	1595
30.6.18	GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL).....	1596

Section number	Title	Page
30.6.19	GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS).....	1598
30.6.20	GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS).....	1599

## Chapter 31 General Purpose Timer (GPT)

31.1	Overview.....	1603
31.1.1	Features.....	1605
31.1.2	Modes and Operation.....	1605
31.2	External Signals.....	1605
31.2.1	External Clock Input .....	1606
31.2.2	Input Capture Trigger Signals .....	1606
31.2.3	Output Compare Signals.....	1607
31.3	Clocks.....	1607
31.4	Functional Description.....	1609
31.4.1	Operating Modes.....	1609
31.4.1.1	Restart Mode.....	1609
31.4.1.2	Free-Run Mode.....	1609
31.4.2	Operation.....	1610
31.4.2.1	Input Capture.....	1610
31.4.2.2	Output Compare.....	1611
31.4.2.3	Interrupts.....	1612
31.4.2.4	Low Power Mode Behavior.....	1613
31.4.2.5	Debug Mode Behavior.....	1613
31.5	Initialization/ Application Information .....	1613
31.5.1	Selecting the Clock Source .....	1613
31.6	GPT Memory Map/Register Definition.....	1614
31.6.1	GPT Control Register (GPT_CR).....	1615
31.6.2	GPT Prescaler Register (GPT_PR).....	1619
31.6.3	GPT Status Register (GPT_SR).....	1620
31.6.4	GPT Interrupt Register (GPT_IR).....	1621

Section number	Title	Page
31.6.5	GPT Output Compare Register 1 (GPT_OCR1).....	1622
31.6.6	GPT Output Compare Register 2 (GPT_OCR2).....	1623
31.6.7	GPT Output Compare Register 3 (GPT_OCR3).....	1623
31.6.8	GPT Input Capture Register 1 (GPT_ICR1).....	1624
31.6.9	GPT Input Capture Register 2 (GPT_ICR2).....	1624
31.6.10	GPT Counter Register (GPT_CNT).....	1625

## Chapter 32 2D Graphics Processing Unit (GPU2D)

32.1	Overview.....	1627
32.2	GPU2D Block Diagram.....	1627
32.2.1	R2D GPU.....	1627
32.2.2	V2D GPU.....	1628
32.3	GPU2D Features.....	1629
32.3.1	Full Featured R2D GPU Pipeline.....	1629
32.3.2	Full Featured V2D GPU Pipeline.....	1630
32.4	GPU2D OPERATIONS.....	1630
32.4.1	R2D GPU Operations.....	1630
32.4.1.1	Line.....	1630
32.4.1.2	Rectangle Fill and Clear.....	1631
32.4.1.3	BitBLT.....	1631
32.4.1.4	Stretch BLT.....	1632
32.4.1.5	Monochrome Expansion and Mask BLT.....	1632
32.4.1.5.1	Monochrome expansion .....	1633
32.4.1.5.2	Mask BLT.....	1633
32.4.1.6	Filter BLT.....	1633
32.4.1.7	R2D Performance of different operations.....	1634
32.4.1.8	Rotation.....	1635
32.4.1.9	Transparency Mode.....	1635
32.4.1.10	Clipping.....	1635

<b>Section number</b>	<b>Title</b>	<b>Page</b>
32.4.1.11	R2D GPU Data Formats.....	1635
32.4.1.12	ARGB Data Conversion of R2D GPU.....	1636
32.4.1.13	YUV to RGB Conversion of R2D GPU.....	1636
32.4.1.14	Color Index Input Conversion Support of R2D GPU.....	1637
32.4.1.15	Source/Destination Pre-multiply and De-Multiply Support.....	1637
32.4.1.16	Alpha Blending.....	1638
32.4.1.17	GPU Cache Management.....	1639
32.4.2	V2D GPU Operations.....	1640
32.4.2.1	OPENVG 1.1-API STANDARD for VECTOR GRAPHICS ACCELERATION.....	1640
32.4.2.2	Advantages of Using OpenVG.....	1640
32.4.2.3	OpenVG Target Applications.....	1640
32.4.2.4	OpenVG Features.....	1640
32.4.2.4.1	Core API .....	1640
32.4.2.4.2	The VGU Utility Library .....	1641
32.4.2.4.3	OpenVG Rendering Pipeline.....	1641

## **Chapter 33**

### **3D Graphics Processing Unit (GPU3D)**

33.1	Overview.....	1643
33.2	GPU3D Block Diagram.....	1643
33.3	GPU3D Hardware Features.....	1645
33.3.1	Rasterization.....	1648
33.3.2	Fragment Processing.....	1648
33.3.3	Dest/Alpha Blending.....	1650
33.3.4	Z/Stencil Buffer.....	1650
33.3.5	Render Target.....	1650
33.4	Usage Mode.....	1651

Section number	Title	Page
<b>Chapter 34</b>		
<b>HDMI Transmitter (HDMI)</b>		
34.1	Overview.....	1653
34.1.1	HDMI Operational Model Overview.....	1653
34.1.1.1	Interfaces.....	1655
34.1.1.2	Features.....	1656
34.2	External Signals.....	1657
34.3	Clocks.....	1657
34.4	Functional Description.....	1658
34.4.1	HDMI TX Functional Overview.....	1658
34.4.2	Video Pixel Sampler.....	1659
34.4.2.1	HDMI Transmitter Controller Databook Functional Description.....	1660
34.4.3	Supported Video Mode.....	1662
34.4.4	Video Packetizer.....	1665
34.4.5	Color Space Conversion.....	1666
34.4.6	Audio Interfaces.....	1667
34.4.6.1	CTS Calculation.....	1668
34.4.6.2	Audio DMA Interface.....	1668
34.4.6.2.1	AHB Master.....	1669
34.4.6.2.2	DMA Engine.....	1671
34.4.6.2.2.1	Functional Behavior.....	1671
34.4.6.2.2.2	DMA Operation.....	1672
34.4.6.2.2.3	Transfer Data, Package, and Word.....	1674
34.4.6.2.3	Audio FIFO.....	1676
34.4.6.2.4	FIFO Occupancy/FIFO Almost Empty Flags.....	1676
34.4.7	Supported Audio Formats.....	1677
34.4.8	Frame Composer.....	1677
34.4.9	HDCP Encryption Engine.....	1679

Section number	Title	Page
34.4.10	EDID/HDCP I2C E-DDC Interface.....	1680
34.4.10.1	I2C Master Interface Normal Mode.....	1681
34.4.10.2	I2C Master Interface Extended Read Mode.....	1681
34.4.11	System Configuration Interfaces.....	1682
34.4.11.1	AMBA AHB Slave Interface.....	1682
34.4.12	CEC Hardware Engine.....	1682
34.5	HDMI Memory Map/Register Definition.....	1684
34.5.1	Design Identification Register (HDMI_DESIGN_ID).....	1700
34.5.2	Revision Identification Register (HDMI_REVISION_ID).....	1701
34.5.3	Product Identification Register 0 (HDMI_PRODUCT_ID0).....	1702
34.5.4	Product Identification Register 1 (HDMI_PRODUCT_ID1).....	1702
34.5.5	Configuration Identification Register 0 (HDMI_CONFIG0_ID).....	1703
34.5.6	Configuration Identification Register 1 (HDMI_CONFIG1_ID).....	1704
34.5.7	Configuration Identification Register 2 (HDMI_CONFIG2_ID).....	1705
34.5.8	Configuration Identification Register 3 (HDMI_CONFIG3_ID).....	1705
34.5.9	Frame Composer Interrupt Status Register 0 (HDMI_IH_FC_STAT0).....	1706
34.5.10	Frame Composer Interrupt Status Register 1 (HDMI_IH_FC_STAT1).....	1707
34.5.11	Frame Composer Interrupt Status Register 2 (HDMI_IH_FC_STAT2).....	1708
34.5.12	Audio Sampler Interrupt Status Register (HDMI_IH_AS_STAT0).....	1709
34.5.13	PHY Interface Interrupt Status Register (HDMI_IH_PHY_STAT0).....	1710
34.5.14	E-DDC I2C Master Interrupt Status Register (HDMI_IH_I2CM_STAT0).....	1711
34.5.15	CEC Interrupt Status Register (HDMI_IH_CEC_STAT0).....	1712
34.5.16	Video Packetizer Interrupt Status Register (HDMI_IH_VP_STAT0).....	1713
34.5.17	PHY GEN2 I2C Master Interrupt Status Register (HDMI_IH_I2CMPHY_STAT0).....	1714
34.5.18	AHB Audio DMA Interrupt Status Register (HDMI_IH_AHBDMAAUD_STAT0).....	1714
34.5.19	Frame Composer Interrupt Mute Control Register 0 (HDMI_IH_MUTE_FC_STAT0).....	1716
34.5.20	Frame Composer Interrupt Mute Control Register 1 (HDMI_IH_MUTE_FC_STAT1).....	1717
34.5.21	Frame Composer Interrupt Mute Control Register 2 (HDMI_IH_MUTE_FC_STAT2).....	1718
34.5.22	Audio Sampler Interrupt Mute Control Register 0 (HDMI_IH_MUTE_AS_STAT0).....	1718

Section number	Title	Page
34.5.23	PHY Interface Interrupt Mute Control Register (HDMI_IH_MUTE_PHY_STAT0).....	1719
34.5.24	E-DDC I2C Master Interrupt Mute Control Register (HDMI_IH_MUTE_I2CM_STAT0).....	1720
34.5.25	CEC Interrupt Mute Control Register (HDMI_IH_MUTE_CEC_STAT0).....	1720
34.5.26	Video Packetizer Interrupt Mute Control Register (HDMI_IH_MUTE_VP_STAT0).....	1721
34.5.27	PHY GEN 2 I2C Master Interrupt Mute Control Register (HDMI_IH_MUTE_I2CMPHY_STAT0).....	1722
34.5.28	AHB Audio DMA Interrupt Mute Control Register (HDMI_IH_MUTE_AHBDMAAUD_STAT0).....	1723
34.5.29	Global Interrupt Mute Control Register (HDMI_IH_MUTE).....	1724
34.5.30	Video Input Mapping and Internal Data Enable Configuration Register (HDMI_TX_INVID0).....	1724
34.5.31	Video Input Stuffing Enable Register (HDMI_TX_INSTUFFING).....	1725
34.5.32	Video Input GY Data Channel Stuffing Register 0 (HDMI_TX_GYDATA0).....	1726
34.5.33	Video Input GY Data Channel Stuffing Register 1 (HDMI_TX_GYDATA1).....	1727
34.5.34	Video Input RCR Data Channel Stuffing Register 0 (HDMI_TX_RCRDATA0).....	1727
34.5.35	Video Input RCR Data Channel Stuffing Register 1 (HDMI_TX_RCRDATA1).....	1728
34.5.36	Video Input RCB Data Channel Stuffing Register 0 (HDMI_TX_BCBDATA0).....	1728
34.5.37	Video Input RCB Data Channel Stuffing Register 1 (HDMI_TX_BCBDATA1).....	1729
34.5.38	Video Packetizer Packing Phase Status Register (HDMI_VP_STATUS).....	1729
34.5.39	Video Packetizer Pixel Repetition and Color Depth Register (HDMI_VP_PR_CD).....	1730
34.5.40	Video Packetizer Stuffing and Default Packing Phase Register (HDMI_VP_STUFF).....	1731
34.5.41	Video Packetizer YCC422 Remapping Register (HDMI_VP_REMAP).....	1732
34.5.42	Video Packetizer Output, Bypass, and Enable Configuration Register (HDMI_VP_CONF).....	1733
34.5.43	Video Packetizer Interrupt Mask Register (HDMI_VP_MASK).....	1733
34.5.44	Frame Composer Input Video Configuration and HDCP Keepout Register (HDMI_FC_INVIDCONF)	1734
34.5.45	Frame Composer Input Video HActive Pixels Register 0 (HDMI_FC_INHACTIV0).....	1736
34.5.46	Frame Composer Input Video HActive Pixels Register 1 (HDMI_FC_INHACTIV1).....	1736
34.5.47	Frame Composer Input Video HBlank Pixels Register 0 (HDMI_FC_INHBLANK0).....	1737
34.5.48	Frame Composer Input Video HBlank Pixels Register 1 (HDMI_FC_INHBLANK1).....	1737
34.5.49	Frame Composer Input Video VActive Pixels Register 0 (HDMI_FC_INVACTIV0).....	1738
34.5.50	Frame Composer Input Video VActive Pixels Register 1 (HDMI_FC_INVACTIV1).....	1739
34.5.51	Frame Composer Input Video VBlank Pixels Register (HDMI_FC_INVBLANK).....	1739

Section number	Title	Page
34.5.52	Frame Composer Input Video HSync Front Porch Register 0 (HDMI_FC_HSYNCINDELAY0).....	1740
34.5.53	Frame Composer Input Video HSync Front Porch Register 1 (HDMI_FC_HSYNCINDELAY1).....	1740
34.5.54	Frame Composer Input Video HSync Width Register 0 (HDMI_FC_HSYNCINWIDTH0).....	1741
34.5.55	Frame Composer Input Video HSync Width Register 1 (HDMI_FC_HSYNCINWIDTH1).....	1742
34.5.56	Frame Composer Input Video VSync Front Porch Register (HDMI_FC_VSYNCINDELAY).....	1742
34.5.57	Frame Composer Input Video VSync Width Register (HDMI_FC_VSYNCINWIDTH).....	1743
34.5.58	Frame Composer Input Video Refresh Rate Register 0 (HDMI_FC_INFREQ0).....	1743
34.5.59	Frame Composer Input Video Refresh Rate Register 1 (HDMI_FC_INFREQ1).....	1744
34.5.60	Frame Composer Input Video Refresh Rate Register 2 (HDMI_FC_INFREQ2).....	1744
34.5.61	Frame Composer Control Period Duration Register (HDMI_FC_CTRLDUR).....	1745
34.5.62	Frame Composer Extended Control Period Duration Register (HDMI_FC_EXCTRLDUR).....	1746
34.5.63	Frame Composer Extended Control Period Maximum Spacing Register (HDMI_FC_EXCTRLSPAC).1746	1746
34.5.64	Frame Composer Channel 0 Non-Preamble Data Register (HDMI_FC_CH0PREAM).....	1747
34.5.65	Frame Composer Channel 1 Non-Preamble Data Register (HDMI_FC_CH1PREAM).....	1747
34.5.66	Frame Composer Channel 2 Non-Preamble Data Register (HDMI_FC_CH2PREAM).....	1748
34.5.67	Frame Composer AVI Configuration Register 3 (HDMI_FC_AVICONF3).....	1748
34.5.68	Frame Composer GCP Packet Configuration Register (HDMI_FC_GCP).....	1749
34.5.69	Frame Composer AVI Packet Configuration Register 0 (HDMI_FC_AVICONF0).....	1749
34.5.70	Frame Composer AVI Packet Configuration Register 1 (HDMI_FC_AVICONF1).....	1751
34.5.71	FC_AVICONFFrame Composer AVI Packet Configuration Register 2 (HDMI_FC_AVICONF2).....	1751
34.5.72	Frame Composer AVI Packet VIC Register (HDMI_FC_AVIVID).....	1752
34.5.73	Frame Composer AVI Packet End of Top Bar Register 0 (HDMI_FC_AVIETB0).....	1752
34.5.74	Frame Composer AVI Packet End of Top Bar Register 1 (HDMI_FC_AVIETB1).....	1753
34.5.75	Frame Composer AVI Packet Start of Bottom Bar Register 0 (HDMI_FC_AVISBB0).....	1753
34.5.76	Frame Composer AVI Packet Start of Bottom Bar Register 1 (HDMI_FC_AVISBB1).....	1754
34.5.77	Frame Composer AVI Packet End of Left Bar Register 0 (HDMI_FC_AVIELB0).....	1754
34.5.78	Frame Composer AVI Packet End of Left Bar Register 1 (HDMI_FC_AVIELB1).....	1755
34.5.79	Frame Composer AVI Packet Start of Right Bar Register 0 (HDMI_FC_AVISRB0).....	1755
34.5.80	Frame Composer AVI Packet Start of Right Bar Register 1 (HDMI_FC_AVISRB1).....	1756

Section number	Title	Page
34.5.81	Frame Composer AUD Packet Configuration Register 0 (HDMI_FC_AUDICONF0).....	1756
34.5.82	Frame Composer AUD Packet Configuration Register 1 (HDMI_FC_AUDICONF1).....	1757
34.5.83	Frame Composer AUD Packet Configuration Register 2 (HDMI_FC_AUDICONF2).....	1758
34.5.84	Frame Composer AUD Packet Configuration Register 3 (HDMI_FC_AUDICONF3).....	1758
34.5.85	Frame Composer VSI Packet Data IEEE Register 0 (HDMI_FC_VSDIEEEID0).....	1758
34.5.86	Frame Composer VSI Packet Data Size Register (HDMI_FC_VSDSIZE).....	1759
34.5.87	Frame Composer VSI Packet Data IEEE Register 1 (HDMI_FC_VSDIEEEID1).....	1760
34.5.88	Frame Composer VSI Packet Data IEEE Register 2 (HDMI_FC_VSDIEEEID2).....	1760
34.5.89	Frame Composer VSI Packet Data IEEE Register 0 (HDMI_FC_VSDPAYLOAD0).....	1761
34.5.90	Frame Composer VSI Packet Data IEEE Register 1 (HDMI_FC_VSDPAYLOAD1).....	1761
34.5.91	Frame Composer VSI Packet Data IEEE Register 2 (HDMI_FC_VSDPAYLOAD2).....	1762
34.5.92	Frame Composer VSI Packet Data IEEE Register 3 (HDMI_FC_VSDPAYLOAD3).....	1762
34.5.93	Frame Composer VSI Packet Data IEEE Register 4 (HDMI_FC_VSDPAYLOAD4).....	1763
34.5.94	Frame Composer VSI Packet Data IEEE Register 5 (HDMI_FC_VSDPAYLOAD5).....	1763
34.5.95	Frame Composer VSI Packet Data IEEE Register 6 (HDMI_FC_VSDPAYLOAD6).....	1764
34.5.96	Frame Composer VSI Packet Data IEEE Register 7 (HDMI_FC_VSDPAYLOAD7).....	1764
34.5.97	Frame Composer VSI Packet Data IEEE Register 8 (HDMI_FC_VSDPAYLOAD8).....	1765
34.5.98	Frame Composer VSI Packet Data IEEE Register 9 (HDMI_FC_VSDPAYLOAD9).....	1765
34.5.99	Frame Composer VSI Packet Data IEEE Register 10 (HDMI_FC_VSDPAYLOAD10).....	1766
34.5.100	Frame Composer VSI Packet Data IEEE Register 11 (HDMI_FC_VSDPAYLOAD11).....	1766
34.5.101	Frame Composer VSI Packet Data IEEE Register 12 (HDMI_FC_VSDPAYLOAD12).....	1767
34.5.102	Frame Composer VSI Packet Data IEEE Register 13 (HDMI_FC_VSDPAYLOAD13).....	1767
34.5.103	Frame Composer VSI Packet Data IEEE Register 14 (HDMI_FC_VSDPAYLOAD14).....	1768
34.5.104	Frame Composer VSI Packet Data IEEE Register 15 (HDMI_FC_VSDPAYLOAD15).....	1768

## Chapter 35 HDMI 3D Tx PHY (HDMI\_PHY)

35.1	Overview.....	1899
35.1.1	General Description.....	1899
35.1.2	Applications.....	1899
35.1.3	Standards Compliance.....	1900
35.1.4	Features.....	1900

Section number	Title	Page
35.1.5	HDMI 3D Tx PHY System-Level Overview.....	1901
35.1.5.1	System-Level Block Diagram.....	1901
35.1.5.2	HDMI 3D Tx PHY.....	1901
35.1.5.2.1	Interfaces.....	1902
35.1.5.3	HDMI 1.4 I/O Pads.....	1902
35.1.5.3.1	I/O Pads Description.....	1902
35.2	External Signals.....	1903
35.2.1	Top-Level I/O Diagram.....	1904
35.2.2	Top -Level Signal Descriptions.....	1905
35.2.2.1	TMDS Interface.....	1906
35.2.2.2	Reset Signals.....	1906
35.2.2.3	External Component.....	1907
35.3	Functional Description.....	1907
35.3.1	Functional Overview.....	1907
35.3.2	Operating Modes.....	1909
35.3.2.1	Power-Down Mode.....	1910
35.3.2.2	Active Mode.....	1911
35.3.2.2.1	Wide Interface Mode.....	1913
35.3.2.3	Power Sequence.....	1913
35.3.2.3.1	PLL/MPLL.....	1916
35.3.2.3.2	Resistor, ADC Calibration.....	1918
35.3.2.3.3	Clock Alignment.....	1920
35.3.2.4	Color Depth and Color Mode Selection.....	1921
35.3.2.4.1	Pixel Repetition Clock Generation Selection.....	1921
35.3.3	Configuration and Test Mode.....	1921
35.3.3.1	Power-Up Configuration.....	1922
35.4	System-Level Implementation.....	1925
35.4.1	System Operation.....	1925
35.4.1.1	Powering Up and Powering Down.....	1925

Section number	Title	Page
35.4.1.2	Active Mode Requirements.....	1927
35.4.1.3	Power-Up Requirements.....	1927
35.4.1.4	Power Supply Sequence When the HDMI 3D Tx PHY is Not Used.....	1927
35.4.1.5	Power-Down Requirements.....	1927
35.5	Reference Clock.....	1927
35.6	Control Registers.....	1928
35.6.1	Control Registers Module Design Architecture.....	1928
35.7	HDMI_PHY Memory Map/Register Definition.....	1928

## Chapter 38 Image Processing Unit (IPU)

38.1	Overview.....	2813
38.1.1	Architecture.....	2814
38.1.2	Features And Functionality.....	2815
38.1.2.1	External Ports.....	2815
38.1.2.1.1	Camera Ports.....	2815
38.1.2.1.2	Display Ports.....	2819
38.1.2.1.2.1	Access Modes.....	2819
38.1.2.1.2.2	Display Interface.....	2821
38.1.2.1.3	Memory Port.....	2824
38.1.2.1.4	Processing.....	2826
38.1.2.1.4.1	Processing flows.....	2826
38.1.2.1.4.2	Display Processor (DP).....	2827

Section number	Title	Page
38.1.2.1.5	Video De-Interlacer or Combiner (VDIC).....	2828
38.1.2.1.5.1	De-interlacing in the VDIC.....	2828
38.1.2.1.5.2	Combining in the VDIC.....	2829
38.1.2.1.5.3	Image Converter (IC).....	2829
38.1.2.1.5.4	Image Rotator (IRT).....	2830
38.1.2.1.6	Automatic Procedures.....	2831
38.1.2.1.6.1	Screen Refresh.....	2831
38.1.2.1.6.2	Update Of The Display Buffer.....	2832
38.1.2.1.6.3	Camera Preview.....	2832
38.2	External Signals.....	2832
38.3	Clocks.....	2837
38.4	Functional Description.....	2837
38.4.1	IPU detailed block diagram.....	2837
38.4.2	Image DMA Controller (IDMAC).....	2839
38.4.2.1	IDMAC's channels .....	2841
38.4.2.2	IBIW & IBIR - Internal bus interface for write and read.....	2843
38.4.2.3	FCW & FCR - Format converter write and read.....	2843
38.4.2.4	Buffering units.....	2846
38.4.2.4.1	Handling real time channels.....	2847
38.4.2.5	AXIW - AXI Write and AXIR - AXI Read.....	2847
38.4.2.6	CC_W & CC_R - Channel Control Write and Read.....	2847
38.4.2.6.1	Locking the arbitration and reordering the AXI bursts.....	2848
38.4.2.7	AAU_W & AAU_R- Address Arithmetic Unit for Write and Read.....	2849
38.4.2.7.1	Scrolling support.....	2851
38.4.2.8	ATC - Alpha Transparency Controller.....	2851
38.4.2.8.1	Conditional read.....	2853
38.4.2.9	LUT- Look Up Table.....	2853
38.4.2.10	CPMEM - Channel Parameter Memory.....	2854
38.4.2.10.1	CPMEM's words' structure for non interleaved mode.....	2855

Section number	Title	Page
38.4.2.10.2	CPMEM's words' structure for interleaved mode.....	2860
38.4.2.10.3	Accessing the CPMEM for programming.....	2868
38.4.2.10.4	Alternate IDMAC settings.....	2869
38.4.2.11	IDMAC's modes of operation.....	2869
38.4.2.11.1	Rotation modes.....	2869
38.4.2.11.2	Frame size.....	2870
38.4.2.12	IDMAC's restriction.....	2872
38.4.2.13	IDMAC's Endianness support.....	2872
38.4.2.14	IDMAC's internal events.....	2873
38.4.3	Camera Sensor Interface (CSI) .....	2873
38.4.3.1	CSI Block Diagram .....	2873
38.4.3.2	CSI Interface .....	2874
38.4.3.2.1	Parallel Interface .....	2874
38.4.3.2.2	High-speed serial interface - MIPI (Mobile Industry Processor Interface). ..	2875
38.4.3.3	Test Mode .....	2875
38.4.3.4	Sensor Image Frame Relations .....	2876
38.4.3.5	Companding .....	2877
38.4.3.6	Timing/Data mode protocols .....	2878
38.4.3.6.1	Gated Mode .....	2878
38.4.3.6.2	Non-Gated Mode .....	2878
38.4.3.6.3	BT.656 mode .....	2879
38.4.3.6.4	BT.1120 mode .....	2879
38.4.3.7	Packing to memory .....	2880
38.4.3.8	Skipping frames .....	2881
38.4.3.9	16 bit camera support.....	2881
38.4.3.10	CSI Restrictions .....	2882
38.4.4	Sensor Multi FIFO Controller (SMFC).....	2882
38.4.4.1	SMFC's Features.....	2883

Section number	Title	Page
38.4.4.2	SMFC's Functional description.....	2883
38.4.4.2.1	SMFC Master interface.....	2886
38.4.4.2.2	Restrictions.....	2887
38.4.5	Image Converter .....	2887
38.4.5.1	IC Block Diagram.....	2887
38.4.5.2	Processing tasks.....	2888
38.4.5.3	Downsizing Section.....	2889
38.4.5.4	Main Processing Section.....	2891
38.4.5.5	Rotation Section.....	2894
38.4.5.6	IC Task Parameter Memory.....	2896
38.4.5.7	IC's DMA channels.....	2900
38.4.5.8	IC restrictions.....	2901
38.4.5.9	IC bridge.....	2901
38.4.6	Display port.....	2901
38.4.6.1	Display ports channels.....	2902
38.4.6.2	Supported display interfaces.....	2903
38.4.6.2.1	Synchronous Interfaces.....	2904
38.4.6.2.2	Asynchronous Parallel Interfaces.....	2904
38.4.6.3	Display port's bandwidth.....	2904
38.4.6.4	Display Dual Mode.....	2905
38.4.6.5	Display Errors .....	2905
38.4.6.5.1	Data starvation errors.....	2905
38.4.6.5.2	Anti tearing errors.....	2906
38.4.6.6	Display port's restrictions.....	2906
38.4.7	DC - Display Controller.....	2907
38.4.7.1	Channels flow control.....	2909
38.4.7.1.1	New Frame control.....	2909
38.4.7.1.2	Antitearing control.....	2909
38.4.7.1.3	User command mode control.....	2909

Section number	Title	Page
38.4.7.2	Arbitration Unit.....	2910
38.4.7.2.1	Access request generator.....	2910
38.4.7.2.2	DI arbiter.....	2910
38.4.7.2.3	Source arbiter.....	2910
38.4.7.3	Microcode processing unit.....	2911
38.4.7.3.1	Channels address control.....	2911
38.4.7.3.2	General purpose Data oriented events counters.....	2911
38.4.7.3.3	Microcode address generator.....	2911
38.4.7.3.4	Template's Memory Access Arbiter.....	2912
38.4.7.4	DC's Template structure.....	2912
38.4.7.4.1	DC template's memory map.....	2912
38.4.7.5	Display controls' generator.....	2920
38.4.7.5.1	Bus Mapping Unit.....	2921
38.4.8	DMFC - Display Multi FIFO Controller.....	2926
38.4.8.1	DP and DC read channels.....	2927
38.4.8.1.1	FIFO allocation to channels.....	2927
38.4.8.1.2	Arbitration between channels.....	2928
38.4.8.1.3	Watermark.....	2928
38.4.8.2	IC interface.....	2929
38.4.8.3	DC write channel and AHB accesses.....	2929
38.4.9	DP - Display Processor.....	2929
38.4.9.1	The DP programming model.....	2930
38.4.9.2	Displayed Planes.....	2930
38.4.9.3	Combining Unit.....	2931
38.4.9.4	Cursor Generator.....	2932
38.4.9.5	Color Space Conversion unit - CSC.....	2932
38.4.9.5.1	Gamut mapping.....	2934
38.4.9.6	Gamma correction.....	2935
38.4.9.7	DC interface.....	2936

Section number	Title	Page
38.4.9.8	DP's flows management.....	2936
38.4.9.9	DP debug unit.....	2938
38.4.9.10	Restriction.....	2939
38.4.10	Display Interface (DI).....	2939
38.4.10.1	DC interface, data accumulator and clock domain synchronizer.....	2941
38.4.10.2	Parallel interface data synchronizer and data oriented interface.....	2941
38.4.10.3	Timing generator.....	2941
38.4.10.3.1	Waveform concatenation.....	2943
38.4.10.3.2	The basic counter.....	2944
38.4.10.3.3	Counter number 9.....	2947
38.4.10.3.4	DI's active window.....	2947
38.4.10.4	Waveform settings for asynchronous interface pins.....	2948
38.4.10.5	Low Level Access - LLA.....	2950
38.4.10.6	Using a mask channel.....	2950
38.4.11	Video De Interlacing or Combining Block (VDIC).....	2950
38.4.11.1	VDIC Features.....	2953
38.4.11.2	De interlacer (DI) sub-block .....	2953
38.4.11.2.1	Vertical Filter Block (di_vfilt) .....	2953
38.4.11.2.2	Motion Calculator Block (di_mcalc) .....	2954
38.4.11.2.3	Spatial Motion Filter (di_sfilt) .....	2955
38.4.11.2.4	Interpolated Pixel Calculator Block (di_interp) .....	2955
38.4.11.2.5	Median Filter Block (di_med) .....	2955
38.4.11.2.6	Soft Switch Block (di_sswitch) .....	2955
38.4.11.3	DMA only Mode .....	2956
38.4.11.4	Real Time Mode .....	2956
38.4.11.5	CSI only Mode .....	2956
38.4.11.6	Using Combining in the VDIC .....	2956
38.4.11.7	VDIC Restrictions .....	2957

Section number	Title	Page
38.4.12	Control Module (CM).....	2957
38.4.12.1	Block Diagram.....	2958
38.4.12.2	Frame Synchronization Unit.....	2959
38.4.12.2.1	General Description.....	2959
38.4.12.2.2	Frame Synchronization Flow .....	2959
38.4.12.2.3	FSU's fundamentals.....	2960
38.4.12.2.4	IPU main flows.....	2963
38.4.12.2.5	Sub-Frame Double-Buffering (Band Mode).....	2971
38.4.12.2.6	Automatic Window Refresh.....	2972
38.4.12.2.7	VPU Sub Frame Synchronization.....	2972
38.4.12.2.8	IPU VDOA synchronization.....	2972
38.4.12.3	Interrupt Generator.....	2973
38.4.12.4	SDMA event generator.....	2979
38.4.12.5	General Configuration Registers.....	2980
38.4.12.6	Shadow Registers Module (SRM).....	2980
38.4.12.6.1	Switching between 2 flows.....	2980
38.4.12.6.2	Updating parameters between frames.....	2981
38.4.12.6.3	Updating the memory.....	2981
38.4.12.6.4	SRM priority.....	2982
38.4.12.6.5	SRM entries mapping.....	2982
38.4.12.7	Memory Access Unit.....	2999
38.4.12.8	SISG - Still Image Synchronization Generator.....	3000
38.4.12.9	Clock Change procedure.....	3002
38.4.12.10	Low Power Modes.....	3003
38.4.12.10.1	STOP Mode.....	3004
38.4.12.10.2	Low Power Screen Refresh mode - LPSR.....	3005
38.5	IPU Memory Map/Register Definition.....	3007
38.5.1	Configuration Register (IPU_CONF).....	3026
38.5.2	SISG Control 0 Register (IPU_SISG_CTRL0).....	3029

Section number	Title	Page
38.5.3	SISG Control 1 Register (IPU_SISG_CTRL1).....	3030
38.5.4	SISG Set<i> Register (IPU_SISG_SET_i).....	3030
38.5.5	SISG Clear <i> Register (IPU_SISG_CLR_i).....	3031
38.5.6	Interrupt Control Register 1 (IPU_INT_CTRL_1).....	3032
38.5.7	Interrupt Control Register 2 (IPU_INT_CTRL_2).....	3036
38.5.8	Interrupt Control Register 3 (IPU_INT_CTRL_3).....	3038
38.5.9	Interrupt Control Register 4 (IPU_INT_CTRL_4).....	3042
38.5.10	Interrupt Control Register 5 (IPU_INT_CTRL_5).....	3045
38.5.11	Interrupt Control Register 6 (IPU_INT_CTRL_6).....	3050
38.5.12	Interrupt Control Register 7 (IPU_INT_CTRL_7).....	3053
38.5.13	Interrupt Control Register 8 (IPU_INT_CTRL_8).....	3055
38.5.14	Interrupt Control Register 9 (IPU_INT_CTRL_9).....	3057
38.5.15	Interrupt Control Register 10 (IPU_INT_CTRL_10).....	3059
38.5.16	Interrupt Control Register 11 (IPU_INT_CTRL_11).....	3061
38.5.17	Interrupt Control Register 12 (IPU_INT_CTRL_12).....	3064
38.5.18	Interrupt Control Register 13 (IPU_INT_CTRL_13).....	3066
38.5.19	Interrupt Control Register 14 (IPU_INT_CTRL_14).....	3070
38.5.20	Interrupt Control Register15 (IPU_INT_CTRL_15).....	3073
38.5.21	SDMA Event Control Register 1 (IPU_SDMA_EVENT_1).....	3077
38.5.22	SDMA Event Control Register 2 (IPU_SDMA_EVENT_2).....	3081
38.5.23	SDMA Event Control Register 3 (IPU_SDMA_EVENT_3).....	3084
38.5.24	SDMA Event Control Register 4 (IPU_SDMA_EVENT_4).....	3089
38.5.25	SDMA Event Control Register 7 (IPU_SDMA_EVENT_7).....	3092
38.5.26	SDMA Event Control Register 8 (IPU_SDMA_EVENT_8).....	3094
38.5.27	SDMA Event Control Register 11 (IPU_SDMA_EVENT_11).....	3095
38.5.28	SDMA Event Control Register 12 (IPU_SDMA_EVENT_12).....	3098
38.5.29	SDMA Event Control Register 13 (IPU_SDMA_EVENT_13).....	3100
38.5.30	SDMA Event Control Register 14 (IPU_SDMA_EVENT_14).....	3104
38.5.31	Shadow Registers Memory Priority 1 Register (IPU_SRM_PRI1).....	3107

Section number	Title	Page
38.5.32	Shadow Registers Memory Priority 2 Register (IPU_SRM_PRI2).....	3108
38.5.33	FSU Processing Flow 1 Register (IPU_FS_PROC_FLOW1).....	3110
38.5.34	FSU Processing Flow 2 Register (IPU_FS_PROC_FLOW2).....	3114
38.5.35	FSU Processing Flow 3 Register (IPU_FS_PROC_FLOW3).....	3117
38.5.36	FSU Displaying Flow 1 Register (IPU_FS_DISP_FLOW1).....	3120
38.5.37	FSU Displaying Flow 2 Register (IPU_FS_DISP_FLOW2).....	3123
38.5.38	SKIP Register (IPU_SKIP).....	3125
38.5.39	Display General Control Register (IPU_DISP_GEN).....	3127
38.5.40	Display Alternate Flow Control Register 1 (IPU_DISP_ALT1).....	3130
38.5.41	Display Alternate Flow Control Register 2 (IPU_DISP_ALT2).....	3131
38.5.42	Display Alternate Flow Control Register 3 (IPU_DISP_ALT3).....	3132
38.5.43	Display Alternate Flow Control Register 4 (IPU_DISP_ALT4).....	3134
38.5.44	Memory Reset Control Register (IPU_MEM_RST).....	3135
38.5.45	Power Modes Control Register (IPU_PM).....	3137
38.5.46	General Purpose Register (IPU_GPR).....	3140
38.5.47	Channel Double Buffer Mode Select 0 Register (IPU_CH_DB_MODE_SEL0).....	3142
38.5.48	Channel Double Buffer Mode Select 1 Register (IPU_CH_DB_MODE_SEL1).....	3146
38.5.49	Alternate Channel Double Buffer Mode Select 0 Register (IPU_ALT_CH_DB_MODE_SEL0).....	3149
38.5.50	Alternate Channel Double Buffer Mode Select1 Register (IPU_ALT_CH_DB_MODE_SEL1).....	3151
38.5.51	Alternate Channel Triple Buffer Mode Select 0 Register (IPU_ALT_CH_TRB_MODE_SEL0).....	3152
38.5.52	Interrupt Status Register 1 (IPU_INT_STAT_1).....	3155
38.5.53	Interrupt Status Register2 (IPU_INT_STAT_2).....	3160
38.5.54	Interrupt Status Register 3 (IPU_INT_STAT_3).....	3163
38.5.55	Interrupt Status Register 4 (IPU_INT_STAT_4).....	3167
38.5.56	Interrupt Status Register 5 (IPU_INT_STAT_5).....	3170
38.5.57	Interrupt Status Register 6 (IPU_INT_STAT_6).....	3176
38.5.58	Interrupt Status Register7 1 (IPU_INT_STAT_7).....	3180
38.5.59	Interrupt Status Register 8 (IPU_INT_STAT_8).....	3183
38.5.60	Interrupt Status Register 9 (IPU_INT_STAT_9).....	3186

Section number	Title	Page
38.5.61	Interrupt Status Register 10 (IPU_INT_STAT_10).....	3188
38.5.62	Interrupt Status Register 11 (IPU_INT_STAT_11).....	3191
38.5.63	Interrupt Status Register 12 (IPU_INT_STAT_12).....	3195
38.5.64	Interrupt Status Register 13 (IPU_INT_STAT_13).....	3197
38.5.65	Interrupt Status Register 14 (IPU_INT_STAT_14).....	3202
38.5.66	Interrupt Status Register 15 (IPU_INT_STAT_15).....	3205
38.5.67	Current Buffer Register 0 (IPU_CUR_BUF_0).....	3209
38.5.68	Current Buffer Register 1 (IPU_CUR_BUF_1).....	3214
38.5.69	Alternate Current Buffer Register 0 (IPU_ALT_CUR_0).....	3218
38.5.70	Alternate Current Buffer Register 1 (IPU_ALT_CUR_1).....	3220
38.5.71	Shadow Registers Memory Status Register (IPU_SRM_STAT).....	3223
38.5.72	Processing Status Tasks Register (IPU_PROC_TASKS_STAT).....	3225
38.5.73	Display Tasks Status Register (IPU_DISP_TASKS_STAT).....	3227
38.5.74	Triple Current Buffer Register 0 (IPU_TRIPLE_CUR_BUF_0).....	3229
38.5.75	Triple Current Buffer Register 1 (IPU_TRIPLE_CUR_BUF_1).....	3231
38.5.76	IPU Channels Buffer 0 Ready 0 Register (IPU_CH_BUF0_RDY0).....	3232
38.5.77	IPU Channels Buffer 0 Ready 1 Register (IPU_CH_BUF0_RDY1).....	3236
38.5.78	IPU Channels Buffer 1 Ready 0 Register (IPU_CH_BUF1_RDY0).....	3238
38.5.79	IPU Channels Buffer 1 Ready 1 Register (IPU_CH_BUF1_RDY1).....	3241
38.5.80	IPU Alternate Channels Buffer 0 Ready 0 Register (IPU_ALT_CH_BUF0_RDY0).....	3244
38.5.81	IPU Alternate Channels Buffer 0 Ready 1 Register (IPU_ALT_CH_BUF0_RDY1).....	3245
38.5.82	IPU Alternate Channels Buffer 1 Ready 0 Register (IPU_ALT_CH_BUF1_RDY0).....	3246
38.5.83	IPU Alternate Channels Buffer 1 Ready 1 Register (IPU_ALT_CH_BUF1_RDY1).....	3247
38.5.84	IPU Channels Buffer 2 Ready 0 Register (IPU_CH_BUF2_RDY0).....	3248
38.5.85	IPU Channels Buffer 2 Ready 1 Register (IPU_CH_BUF2_RDY1).....	3250
38.5.86	IDMAC Configuration Register (IPU_IDMAC_CONF).....	3251

42.6	MIPI_DSI Memory Map/Register Definition.....	3712
42.6.1	Version of the DSI host ctrl (MIPI_DSI_VERSION).....	3714
42.6.2	Core power up (MIPI_DSI_PWR_UP).....	3714
42.6.3	Number of active data lanes (MIPI_DSI_CLKMGR_CFG).....	3715
42.6.4	DPI interface configuration (MIPI_DSI_DPI_CFG).....	3715
42.6.5	DBI interface configuration (MIPI_DSI_DBI_CFG).....	3717
42.6.6	DBI command size configuration (MIPI_DSI_DBIS_CMDSIZE).....	3718
42.6.7	Packet handler configuration (MIPI_DSI_PCKHDL_CFG).....	3719
42.6.8	Video Mode Configuration (MIPI_DSI_VID_MODE_CFG).....	3720
42.6.9	Video packet configuration (MIPI_DSI_VID_PKT_CFG).....	3721
42.6.10	Command mode configuration (MIPI_DSI_CMD_MODE_CFG).....	3722
42.6.11	Line timer configuration (MIPI_DSI_TMR_LINE_CFG).....	3724
42.6.12	Vertical timing configuration (MIPI_DSI_VTIMING_CFG).....	3724
42.6.13	D-PHY timing configuration (MIPI_DSI_PHY_TMR_CFG).....	3725
42.6.14	Generic packet Header configuration (MIPI_DSI_GEN_HDR).....	3725

Section number	Title	Page
42.6.15	Generic payload data in/out (MIPI_DSI_GEN_PLD_DATA).....	3726
42.6.16	Command packet status (MIPI_DSI_CMD_PKT_STATUS).....	3726
42.6.17	Time Out timers configuration (MIPI_DSI_TO_CNT_CFG0).....	3728
42.6.18	Interrupt status register 0 (MIPI_DSI_ERROR_ST0).....	3728
42.6.19	Interrupt status register 1 (MIPI_DSI_ERROR_ST1).....	3730
42.6.20	Masks Interrupt generation triggered by ERROR_ST0 register (MIPI_DSI_ERROR_MSK0).....	3731
42.6.21	Masks Interrupt generation triggered by ERROR_ST1 register (MIPI_DSI_ERROR_MSK1).....	3733
42.6.22	D-PHY reset control (MIPI_DSI_PHY_RSTZ).....	3735
42.6.23	D-PHY interface configuration (MIPI_DSI_PHY_IF_CFG_).....	3736
42.6.24	D-PHY PPI interface control (MIPI_DSI_PHY_IF_CTRL).....	3736
42.6.25	D-PHY PPI status interface (MIPI_DSI_PHY_STATUS).....	3737
42.6.26	D-PHY Test interface control 0 (MIPI_DSI_PHY_TST_CTRL0).....	3739
42.6.27	D-PHY Test interface control 1 (MIPI_DSI_PHY_TST_CTRL1).....	3739

## Chapter 43

### MIPI HSI Host Controller (MIPI\_HSI)

43.1	Overview.....	3741
43.1.1	Features.....	3741
43.2	External Signals.....	3742
43.2.1	External Signals Overview.....	3742
43.2.2	Ports Table.....	3743
43.3	Clocks.....	3743
43.4	Functional Description.....	3743
43.4.1	DMA AHB /PIO AHB slave and Data Channel Buffer.....	3744
43.4.1.1	AHB Slave Interface.....	3745
43.4.1.2	AHB Master Interface.....	3746
43.4.1.3	Control Registers.....	3746
43.4.1.4	DMA Engine.....	3746
43.4.1.5	Rx/Tx FIFO controller.....	3746
43.4.1.6	Arbiter.....	3746

Section number	Title	Page
43.4.1.7	4K Bytes Dual Port RAM.....	3746
43.4.1.8	Typical Software Operation Flow for DMA.....	3746
43.4.1.9	Typical Software Operation Flow 1 for Data Port.....	3747
43.4.1.10	Typical Software Operation Flow 2 for Data Port.....	3747
43.4.2	HSI Reset.....	3747
43.5	HSI Memory Map/Register Definition.....	3747
43.5.1	HSI Control Register (MIPI_HSI_CTRL).....	3754
43.5.2	HSI Tx Config Register (MIPI_HSI_TX_CONF).....	3756

## Chapter 44 MediaLB (MLB)

44.1	Overview.....	3841
44.1.1	Block Diagram.....	3841
44.1.1.1	Bus Interfaces.....	3842
44.2	External Signals.....	3843
44.3	Clocks.....	3843
44.4	Functional Description.....	3844
44.4.1	MediaLB Block.....	3844
44.4.1.1	MediaLB Channel Address to Logical Channel Mapping.....	3845

Section number	Title	Page
44.4.2	Host Bus Interface Block.....	3845
44.4.2.1	HBI Physical Addresses.....	3845
44.4.3	Routing Fabric Block.....	3846
44.4.3.1	Data Buffer RAM.....	3846
44.4.3.1.1	Synchronous Channels.....	3846
44.4.3.1.2	Isochronous Channels.....	3847
44.4.3.1.3	Asynchronous and Control Channels.....	3847
44.4.3.2	Channel Table RAM.....	3847
44.4.3.2.1	Address Mapping.....	3847
44.4.3.2.2	Channel Allocation Table.....	3848
44.4.3.2.2.1	Channel Setup.....	3849
44.4.3.2.3	Channel Descriptor Table.....	3850
44.4.3.2.3.1	Synchronous Channel Operation.....	3850
44.4.3.2.3.2	Synchronous Channel Descriptors.....	3851
44.4.3.2.3.3	Isochronous Channel Descriptors.....	3853
44.4.3.2.3.4	Asynchronous and Control Channel Descriptors.....	3854
44.4.4	Memory Interface Block.....	3856
44.4.4.1	CTR Access.....	3856
44.4.4.1.1	Direct CTR Writes.....	3857
44.4.4.1.2	Direct CTR Reads.....	3857
44.4.4.1.3	CTR Addressing.....	3858
44.4.4.2	DBR Access.....	3858
44.4.4.2.1	Direct DBR Writes.....	3859
44.4.4.2.2	Direct DBR Reads.....	3859
44.4.5	Interrupt Interface Block.....	3859
44.4.6	AMBA AHB Block.....	3860
44.4.6.1	AHB Descriptor Table.....	3860
44.4.6.2	AHB Synchronous Channel Descriptors.....	3862
44.4.6.3	AHB Isochronous Channel Descriptors.....	3862

Section number	Title	Page
44.4.6.4	AHB Asynchronous and Control Channel Descriptors.....	3863
44.4.6.4.1	Single-packet Mode.....	3863
44.4.6.4.2	Multiple-packet Mode.....	3865
44.5	Software Flow.....	3866
44.5.1	Channel Initialization.....	3867
44.5.1.1	Configure the Hardware.....	3867
44.5.1.2	Program the Routing Fabric Block.....	3867
44.5.1.3	Program the AMBA AHB Block DMAs.....	3868
44.5.1.4	Synchronize and Unmute Synchronous Channel.....	3870
44.5.2	Channel Servicing.....	3870
44.5.2.1	Servicing the AMBA AHB Block (DMA) Interrupts.....	3870
44.5.2.2	Servicing the MediaLB Interrupts.....	3871
44.5.2.3	Polling for MediaLB System Commands.....	3871
44.5.3	Low Power Mode.....	3872
44.6	MLB150 Memory Map/Register Definition.....	3872
44.6.1	MediaLB Control 0 Register (MLB_MLBC0).....	3875
44.6.2	MediaLB 6-pin Control 0 Register (MLB_MLBPC0).....	3878
44.6.3	MediaLB Channel Status 0 Register (MLB_MS0).....	3878
44.6.4	MediaLB 6-pin Control 2 Register (MLB_MLBPC2).....	3879
44.6.5	MediaLB Channel Status 1 Register (MLB_MS1).....	3880
44.6.6	MediaLB System Status Register (MLB_MSS).....	3881
44.6.7	MediaLB System Data Register (MLB_MSD).....	3882
44.6.8	MediaLB Interrupt Enable Register (MLB_MIEN).....	3883
44.6.9	MediaLB 6-pin Control 1 Register (MLB_MLBPC1).....	3884
44.6.10	MediaLB Control 1 Register (MLB_MLBC1).....	3885
44.6.11	HBI Control Register (MLB_HCTL).....	3886
44.6.12	HBI Channel Mask 0 Register (MLB_HCMR0).....	3887
44.6.13	HBI Channel Mask 1 Register (MLB_HCMR1).....	3887
44.6.14	HBI Channel Error 0 Register (MLB_HCER0).....	3888

Section number	Title	Page
44.6.15	HBI Channel Error 1 Register (MLB_HCER1).....	3888
44.6.16	HBI Channel Busy 0 Register (MLB_HCBR0).....	3889
44.6.17	HBI Channel Busy 1 Register (MLB_HCBR1).....	3889
44.6.18	MIF Data 0 Register (MLB_MDAT0).....	3890
44.6.19	MIF Data 1 Register (MLB_MDAT1).....	3890
44.6.20	MIF Data 2 Register (MLB_MDAT2).....	3890
44.6.21	MIF Data 3 Register (MLB_MDAT3).....	3891
44.6.22	MIF Data Write Enable 0 Register (MLB_MDWE0).....	3891
44.6.23	MIF Data Write Enable 1 Register (MLB_MDWE1).....	3891
44.6.24	MIF Data Write Enable 2 Register (MLB_MDWE2).....	3892
44.6.25	MIF Data Write Enable 3 Register (MLB_MDWE3).....	3892
44.6.26	MIF Control Register (MLB_MCTL).....	3893
44.6.27	MIF Address Register (MLB_MADR).....	3893
44.6.28	AHB Control Register (MLB_ACTL).....	3894
44.6.29	AHB Channel Status 0 Register (MLB_ACSR0).....	3895
44.6.30	AHB Channel Status 1 Register (MLB_ACSR1).....	3896
44.6.31	AHB Channel Mask 0 Register (MLB_ACMR0).....	3896
44.6.32	AHB Channel Mask 1 Register (MLB_ACMR1).....	3897

## Chapter 45 Multi Mode DDR Controller (MMDC)

45.1	Overview.....	3899
45.1.1	MMDC feature summary.....	3901
45.2	External Signals.....	3904
45.3	Clocks.....	3904
45.4	Functional Description.....	3905
45.4.1	Write/Read data flow.....	3905
45.4.1.1	Write data flow.....	3905
45.4.1.2	Read data flow.....	3906
45.4.2	MMDC initialization .....	3906

Section number	Title	Page
45.4.3	Configuring the MMDC registers.....	3908
45.4.4	MMDC Address Space.....	3908
45.4.4.1	Address decoding .....	3908
45.4.4.2	Chip select settings.....	3911
45.4.4.2.1	Creating 4 Gbyte address space with 2 Gbyte CS density.....	3911
45.4.4.2.2	Creating 2 Gbyte address spaces with 1 Gbyte CS density.....	3911
45.4.4.3	Translation of AXI accesses to DDR accesses.....	3912
45.4.4.3.1	Example 1.....	3912
45.4.4.3.2	Example 2.....	3913
45.4.4.3.3	Example 3.....	3914
45.4.4.3.4	Example 4.....	3914
45.4.4.3.5	Example 5 .....	3915
45.4.4.4	Address mirroring .....	3916
45.4.5	LPDDR2 and DDR3 pin mux mapping.....	3916
45.4.6	Power Saving and Clock Frequency Change modes.....	3917
45.4.6.1	Power saving general.....	3918
45.4.6.2	Self refresh and Frequency change entry/exit.....	3919
45.4.7	Reset .....	3920
45.4.7.1	Hard reset.....	3920
45.4.7.2	Warm reset.....	3921
45.4.7.3	Software reset .....	3921
45.4.8	Refresh Scheme.....	3922
45.4.9	Burst Length options towards DDR .....	3922
45.4.10	Exclusive accesses handling.....	3923
45.4.11	AXI Error Handling.....	3924
45.5	Performance.....	3924
45.5.1	Arbitration and reordering mechanism.....	3924
45.5.1.1	Arbitration General.....	3925
45.5.1.2	Real time channel mode.....	3925

Section number	Title	Page
45.5.1.3	Dynamic scoring mode (Arbitration Winning Conditions).....	3926
45.5.1.4	Guarding (aging) mechanism.....	3926
45.5.2	Prediction mechanism.....	3927
45.5.3	Special Optimization for accesses towards DDR3.....	3927
45.6	MMDC Debug .....	3928
45.6.1	Hardware debug monitor.....	3928
45.6.2	Step By Step (SBS) software monitor.....	3929
45.7	MMDC Profiling.....	3929
45.8	LPDDR2 Refresh Rate Update and Timing Derating.....	3931
45.9	DLL Off mode.....	3931
45.10	ODT Configuration .....	3933
45.11	Calibration Process.....	3934
45.11.1	Delay-line.....	3935
45.11.2	ZQ calibration .....	3936
45.11.2.1	ZQ automatic (hardware) calibration process.....	3937
45.11.2.1.1	ZQ automatic Pull-up calibration.....	3937
45.11.2.1.2	ZQ automatic Pull-down calibration.....	3938
45.11.2.2	ZQ software calibration process.....	3938
45.11.2.3	ZQ calibration commands .....	3938
45.11.3	Read DQS Gating Calibration.....	3939
45.11.3.1	Hardware DQS Gating Calibration.....	3939
45.11.3.1.1	Hardware DQS Calibration with MPR.....	3939
45.11.3.1.2	Hardware DQS Calibration with pre-defined value.....	3939
45.11.3.2	SW read DQS gating Calibration.....	3942
45.11.3.2.1	SW read Calibration with MPR.....	3942
45.11.3.2.2	SW read Calibration with pre-defined value.....	3942

Section number	Title	Page
45.11.4	Read Calibration.....	3945
45.11.4.1	Hardware (automatic) Read Calibration.....	3945
45.11.4.1.1	Hardware (automatic) Calibration with MPR (DDR3) /DQ Calibration (LPDDR2).....	3945
45.11.4.1.2	Hardware (automatic) Calibration with pre-defined value.....	3946
45.11.4.2	SW Read Calibration.....	3948
45.11.4.2.1	Calibration with MPR(DDR3)/DQ calibration(LPDDR2).....	3948
45.11.4.2.2	Calibration with pre-defined value.....	3948
45.11.5	Write Calibration.....	3950
45.11.5.1	HW (automatic) Write Calibration.....	3950
45.11.5.2	SW Write Calibration.....	3952
45.11.6	Write leveling Calibration.....	3953
45.11.6.1	Hardware Write Leveling Calibration.....	3954
45.11.6.2	SW Write Leveling Calibration.....	3955
45.11.7	Write fine tuning.....	3956
45.11.8	Read fine tuning.....	3957
45.12	MMDC Memory Map/Register Definition.....	3957
45.12.1	MMDC Core Control Register (MMDCx_MDCTL).....	3968
45.12.2	MMDC Core Power Down Control Register (MMDCx_MDPDC).....	3970
45.12.3	MMDC Core ODT Timing Control Register (MMDCx_MDOTC).....	3972
45.12.4	MMDC Core Timing Configuration Register 0 (MMDCx_MDCFG0).....	3974
45.12.5	MMDC Core Timing Configuration Register 1 (MMDCx_MDCFG1).....	3976
45.12.6	MMDC Core Timing Configuration Register 2 (MMDCx_MDCFG2).....	3979
45.12.7	MMDC Core Miscellaneous Register (MMDCx_MDMISC).....	3981
45.12.8	MMDC Core Special Command Register (MMDCx_MDSCR).....	3984
45.12.9	MMDC Core Refresh Control Register (MMDCx_MDREF).....	3987
45.12.10	MMDC Core Read/Write Command Delay Register (MMDCx_MDRWD).....	3990
45.12.11	MMDC Core Out of Reset Delays Register (MMDCx_MDOR).....	3992
45.12.12	MMDC Core MRR Data Register (MMDCx_MDMRR).....	3993

Section number	Title	Page
45.12.13	MMDC Core Timing Configuration Register 3 (MMDCx_MDCFG3LP).....	3994
45.12.14	MMDC Core MR4 Derating Register (MMDCx_MDMR4).....	3995
45.12.15	MMDC Core Address Space Partition Register (MMDCx_MDASP).....	3997
45.12.16	MMDC Core AXI Reordering Control Register (MMDCx_MAARCR).....	3998
45.12.17	MMDC Core Power Saving Control and Status Register (MMDCx_MAPSR).....	4000
45.12.18	MMDC Core Exclusive ID Monitor Register0 (MMDCx_MAEXIDR0).....	4003
45.12.19	MMDC Core Exclusive ID Monitor Register1 (MMDCx_MAEXIDR1).....	4003
45.12.20	MMDC Core Debug and Profiling Control Register 0 (MMDCx_MADPCR0).....	4004
45.12.21	MMDC Core Debug and Profiling Control Register 1 (MMDCx_MADPCR1).....	4005
45.12.22	MMDC Core Debug and Profiling Status Register 0 (MMDCx_MADPSR0).....	4006
45.12.23	MMDC Core Debug and Profiling Status Register 1 (MMDCx_MADPSR1).....	4006
45.12.24	MMDC Core Debug and Profiling Status Register 2 (MMDCx_MADPSR2).....	4007
45.12.25	MMDC Core Debug and Profiling Status Register 3 (MMDCx_MADPSR3).....	4007
45.12.26	MMDC Core Debug and Profiling Status Register 4 (MMDCx_MADPSR4).....	4008
45.12.27	MMDC Core Debug and Profiling Status Register 5 (MMDCx_MADPSR5).....	4009
45.12.28	MMDC Core Step By Step Address Register (MMDCx_MASBS0).....	4009
45.12.29	MMDC Core Step By Step Address Attributes Register (MMDCx_MASBS1).....	4010
45.12.30	MMDC Core General Purpose Register (MMDCx_MAGENP).....	4011
45.12.31	MMDC PHY ZQ HW control register (MMDCx_MPZQHWCTRL).....	4011
45.12.32	MMDC PHY ZQ SW control register (MMDCx_MPZQSWCTRL).....	4014
45.12.33	MMDC PHY Write Leveling Configuration and Error Status Register (MMDCx_MPWLGCR).....	4016
45.12.34	MMDC PHY Write Leveling Delay Control Register 0 (MMDCx_MPWLDECTRL0).....	4019
45.12.35	MMDC PHY Write Leveling Delay Control Register 1 (MMDCx_MPWLDECTRL1).....	4021
45.12.36	MMDC PHY Write Leveling delay-line Status Register (MMDCx_MPWLDLST).....	4023
45.12.37	MMDC PHY ODT control register (MMDCx_MPODTCTRL).....	4025
45.12.38	MMDC PHY Read DQ Byte0 Delay Register (MMDCx_MPRDDQBY0DL).....	4027
45.12.39	MMDC PHY Read DQ Byte1 Delay Register (MMDCx_MPRDDQBY1DL).....	4030
45.12.40	MMDC PHY Read DQ Byte2 Delay Register (MMDCx_MPRDDQBY2DL).....	4033
45.12.41	MMDC PHY Read DQ Byte3 Delay Register (MMDCx_MPRDDQBY3DL).....	4036

Section number	Title	Page
45.12.42	MMDC PHY Write DQ Byte0 Delay Register (MMDCx_MPWRDQBY0DL).....	4038
45.12.43	MMDC PHY Write DQ Byte1 Delay Register (MMDCx_MPWRDQBY1DL).....	4040
45.12.44	MMDC PHY Write DQ Byte2 Delay Register (MMDCx_MPWRDQBY2DL).....	4043
45.12.45	MMDC PHY Write DQ Byte3 Delay Register (MMDCx_MPWRDQBY3DL).....	4045
45.12.46	MMDC PHY Read DQS Gating Control Register 0 (MMDCx_MPDGCTRL0).....	4047
45.12.47	MMDC PHY Read DQS Gating Control Register 1 (MMDCx_MPDGCTRL1).....	4050
45.12.48	MMDC PHY Read DQS Gating delay-line Status Register (MMDCx_MPDGDLST0).....	4051
45.12.49	MMDC PHY Read delay-lines Configuration Register (MMDCx_MPRDDLCTL).....	4053
45.12.50	MMDC PHY Read delay-lines Status Register (MMDCx_MPRDDLST).....	4054
45.12.51	MMDC PHY Write delay-lines Configuration Register (MMDCx_MPWRDLCTL).....	4055
45.12.52	MMDC PHY Write delay-lines Status Register (MMDCx_MPWRDLST).....	4057
45.12.53	MMDC PHY CK Control Register (MMDCx_MPSDCTRL).....	4058
45.12.54	MMDC ZQ LPDDR2 HW Control Register (MMDCx_MPZQLP2CTL).....	4059
45.12.55	MMDC PHY Read Delay HW Calibration Control Register (MMDCx_MPRDDLHWCTL).....	4060
45.12.56	MMDC PHY Write Delay HW Calibration Control Register (MMDCx_MPWRDLHWCTL).....	4062
45.12.57	MMDC PHY Read Delay HW Calibration Status Register 0 (MMDCx_MPRDDLHWST0).....	4064
45.12.58	MMDC PHY Read Delay HW Calibration Status Register 1 (MMDCx_MPRDDLHWST1).....	4065
45.12.59	MMDC PHY Write Delay HW Calibration Status Register 0 (MMDCx_MPWRDLHWST0).....	4066
45.12.60	MMDC PHY Write Delay HW Calibration Status Register 1 (MMDCx_MPWRDLHWST1).....	4067
45.12.61	MMDC PHY Write Leveling HW Error Register (MMDCx_MPWLHWERR).....	4068
45.12.62	MMDC PHY Read DQS Gating HW Status Register 0 (MMDCx_MPDGHWST0).....	4068
45.12.63	MMDC PHY Read DQS Gating HW Status Register 1 (MMDCx_MPDGHWST1).....	4069
45.12.64	MMDC PHY Read DQS Gating HW Status Register 2 (MMDCx_MPDGHWST2).....	4070
45.12.65	MMDC PHY Read DQS Gating HW Status Register 3 (MMDCx_MPDGHWST3).....	4070
45.12.66	MMDC PHY Pre-defined Compare Register 1 (MMDCx_MPPDCMPR1).....	4071
45.12.67	MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDCx_MPPDCMPR2).....	4072
45.12.68	MMDC PHY SW Dummy Access Register (MMDCx_MPSWDAR0).....	4073
45.12.69	MMDC PHY SW Dummy Read Data Register 0 (MMDCx_MPSWDRDR0).....	4075

Section number	Title	Page
45.12.70	MMDC PHY SW Dummy Read Data Register 1 (MMDCx_MPSWDRDR1).....	4076
45.12.71	MMDC PHY SW Dummy Read Data Register 2 (MMDCx_MPSWDRDR2).....	4076
45.12.72	MMDC PHY SW Dummy Read Data Register 3 (MMDCx_MPSWDRDR3).....	4077
45.12.73	MMDC PHY SW Dummy Read Data Register 4 (MMDCx_MPSWDRDR4).....	4077
45.12.74	MMDC PHY SW Dummy Read Data Register 5 (MMDCx_MPSWDRDR5).....	4078
45.12.75	MMDC PHY SW Dummy Read Data Register 6 (MMDCx_MPSWDRDR6).....	4078
45.12.76	MMDC PHY SW Dummy Read Data Register 7 (MMDCx_MPSWDRDR7).....	4079
45.12.77	MMDC PHY Measure Unit Register (MMDCx_MPMUR0).....	4079
45.12.78	MMDC Write CA delay-line controller (MMDCx_MPWRCADL).....	4080
45.12.79	MMDC Duty Cycle Control Register (MMDCx_MPDCCR).....	4082

## Chapter 46 Network Interconnect Bus System (NIC-301)

46.1	Overview .....	4087
46.1.1	Block diagram.....	4087
46.1.2	NIC-301 Main Features.....	4088
46.1.3	Modes and Operations.....	4089
46.2	External Signals.....	4089
46.3	Memory Map and Register Definition.....	4089
46.3.1	Memory Map.....	4089
46.3.2	Configuration programmers model.....	4090
46.3.2.1	Address control and ID registers.....	4091
46.3.2.2	AMBA master interface block (AMIB) configuration registers.....	4091
46.3.2.3	ASIB (AMBA slave interface block) configuration registers.....	4091
46.3.3	Register Descriptions.....	4091
46.3.3.1	QoS registers' address look-up example.....	4092
46.3.4	NIC-specific parameters.....	4092

Section number	Title	Page
<b>Chapter 47</b>		
<b>On-Chip OTP Controller (OCOTP_CTRL)</b>		
47.1	Overview.....	4095
47.1.1	Features.....	4095
47.2	Clocks.....	4095
47.3	Top-Level Symbol and Functional Overview.....	4096
47.3.1	Operation.....	4096
47.3.1.1	Shadow Register Reload.....	4097
47.3.1.2	Fuse and Shadow register read.....	4097
47.3.1.3	Fuse and Shadow Register Writes.....	4098
47.3.1.4	Write Postamble.....	4099
47.3.2	Fuse Shadow Memory Footprint.....	4100
47.3.3	OTP Read/Write Timing Parameters.....	4102
47.3.4	Hardware Visible Fuses.....	4103
47.3.5	Behavior During Reset.....	4103
47.3.6	Secure JTAG control.....	4103
47.4	Fuse Map.....	4104
47.5	OCOTP Memory Map/Register Definition.....	4104
47.5.1	OTP Controller Control Register (OCOTP_CTRL $n$ ).....	4106
47.5.2	OTP Controller Timing Register (OCOTP_TIMING).....	4108
47.5.3	OTP Controller Write Data Register (OCOTP_DATA).....	4109
47.5.4	OTP Controller Write Data Register (OCOTP_READ_CTRL).....	4109
47.5.5	OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA).....	4110
47.5.6	Sticky bit Register (OCOTP_SW_STICKY).....	4111
47.5.7	Software Controllable Signals Register (OCOTP_SCS $n$ ).....	4112
47.5.8	OTP Controller Version Register (OCOTP_VERSION).....	4113
47.5.9	Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK).....	4113
47.5.10	Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0).....	4116
47.5.11	Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1).....	4117

Section number	Title	Page
47.5.12	Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2).....	4117
47.5.13	Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3).....	4118
47.5.14	Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4).....	4118
47.5.15	Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5).....	4119
47.5.16	Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6).....	4119
47.5.17	Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0).....	4120
47.5.18	Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1).....	4120
47.5.19	Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2).....	4121
47.5.20	Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3).....	4121
47.5.21	Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4).....	4122
47.5.22	Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0).....	4122
47.5.23	Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1).....	4123
47.5.24	Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2).....	4123
47.5.25	Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0).....	4124
47.5.26	Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1).....	4124
47.5.27	Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2).....	4125
47.5.28	Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3).....	4125
47.5.29	Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4).....	4126
47.5.30	Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5).....	4126
47.5.31	Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6).....	4127
47.5.32	Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7).....	4127
47.5.33	Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_RESP0).....	4128
47.5.34	Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_HSJC_RESP1).....	4128
47.5.35	Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0).....	4129
47.5.36	Value of OTP Bank4 Word3 (MAC Address) (OCOTP_MAC1).....	4129
47.5.37	Value of OTP Bank4 Word6 (HW Capabilities) (OCOTP_GP1).....	4130
47.5.38	Value of OTP Bank4 Word7 (HW Capabilities) (OCOTP_GP2).....	4130
47.5.39	Value of OTP Bank5 Word5 (HW Capabilities) (OCOTP_MISC_CONF).....	4131
47.5.40	Value of OTP Bank5 Word6 (HW Capabilities) (OCOTP_FIELD_RETURN).....	4131

Section number	Title	Page
47.5.41	Value of OTP Bank5 Word7 (HW Capabilities) (OCOTP_SRK_REVOKE).....	4132

## Chapter 48 On-Chip RAM Memory Controller (OCRAM)

48.1	Overview.....	4133
48.2	Basic Functions.....	4134
48.2.1	Memory Map.....	4134
48.2.2	Read/Write Arbitration.....	4135
48.3	Advanced Features.....	4135
48.3.1	Read Data Wait State.....	4135
48.3.2	Read Address Pipeline.....	4136
48.3.3	Write Data Pipeline.....	4136
48.3.4	Write Address Pipeline.....	4136
48.4	Programmable Registers.....	4137

## Chapter 49 PCI Express (PCIe)

49.1	Overview.....	4139
49.1.1	Terms and Abbreviations.....	4139
49.2	Architecture.....	4141
49.2.1	Common Xpress Port Logic (CXPL).....	4143
49.2.2	Transmit Application-Dependent Module (XADM).....	4144
49.2.2.1	Arbitration.....	4145
49.2.2.2	Credit Checking.....	4146
49.2.3	Receive Application-Dependent Module (RADM).....	4146
49.2.3.1	Posted and Non-Posted Request and Completion TLP Processing.....	4147
49.2.3.1.1	TLP Routing.....	4148
49.2.3.2	Received Completion TLP Processing.....	4148
49.2.3.3	Message Processing.....	4149
49.2.4	Configuration-Dependent Module (CDM).....	4149

Section number	Title	Page
49.2.5	Local Bus Controller (LBC) and Data bus Interface (DBI).....	4150
49.2.5.1	Overview (LBC).....	4150
49.2.5.1.1	Simultaneous Transactions.....	4152
49.2.5.2	ELBI.....	4152
49.2.5.3	CDM Register Space Layout.....	4152
49.2.5.3.1	PCI Configuration Header and Capability Registers (in CDM).....	4154
49.2.5.3.2	Port Logic (PL) Registers (in CDM).....	4154
49.2.5.3.3	Memory Mapping PL Registers.....	4154
49.2.5.4	PCIe Wire Access (EP mode).....	4155
49.2.5.5	PCIe Wire Access (RC mode).....	4156
49.3	Core Operations.....	4157
49.3.1	Initialization.....	4157
49.3.2	Link Establishment.....	4159
49.3.3	Transmit TLP Processing.....	4160
49.3.3.1	Transmit Overview.....	4161
49.3.3.2	Transmit TLP Arbitration.....	4161
49.3.3.2.1	Client-Based Arbitration.....	4162
49.3.3.3	Transmit Retry.....	4162
49.3.3.4	Transmit DLLP Priorities.....	4163
49.3.4	Receive TLP Processing.....	4163
49.3.4.1	Receive Overview.....	4163
49.3.4.2	Receive Filtering.....	4164
49.3.4.2.1	Filtering Rules Applicable for all TLPs Received.....	4165
49.3.4.2.2	Filtering Rules Based on TLP Type Defined in PCIe Specification.....	4166
49.3.4.2.2.1	EP MODE FILTERING RULES.....	4167
49.3.4.2.2.2	RC MODE FILTERING RULES.....	4168
49.3.4.2.3	Filtering Rules Not Defined in PCIe Specification.....	4169
49.3.4.3	Receive Routing.....	4170
49.3.4.3.1	EP Mode.....	4170

Section number	Title	Page
49.3.4.3.2	RC mode.....	4172
49.3.4.3.3	ECRC Handling.....	4173
49.3.4.3.4	Request TLP Routing Rules.....	4173
49.3.4.3.5	Completion TLP Routing Rules.....	4175
49.3.4.4	Receive Queuing.....	4176
49.3.4.4.1	Queuing Architecture.....	4177
49.3.4.4.1.1	SEGMENTED-BUFFER RECEIVE QUEUE CONFIGURATION (CX_RADMQ_MODE=2).....	4177
49.3.4.4.2	Queue Modes.....	4178
49.3.4.4.3	Order Enforcement.....	4179
49.3.4.4.4	Queue to Port Mapping.....	4179
49.3.5	Error Handling.....	4180
49.3.5.1	Error Handling Overview.....	4180
49.3.5.2	PCIe Baseline Capability.....	4181
49.3.5.3	Advanced Error Reporting (AER).....	4182
49.3.5.3.1	Advisory Non-Fatal Error Messages.....	4182
49.3.5.4	Error Source Classification.....	4183
49.3.5.5	Error Detection.....	4184
49.3.5.6	Application Error Reporting Interface.....	4186
49.3.5.7	Handling of General Errors with the AXI Bridge.....	4187
49.3.5.8	AXI.....	4187
49.3.5.9	Handling of ECRC/LCRC Errors for IO/MEM with the AXI Bridge.....	4187
49.3.5.9.1	Link CRC (LCRC) - a correctable Error.....	4187
49.3.5.9.2	End-to-end CRC (ECRC) - an Uncorrectable Non-Fatal Error.....	4188
49.3.6	Messages.....	4188
49.3.6.1	Message Generation.....	4189
49.3.6.1.1	Vendor Defined Message (VDM) Generation.....	4192
49.3.6.1.1.1	Application Msg/MsgD Programming Examples.....	4192
49.3.6.1.2	AHB/AXI Message Address and Size Limitations.....	4193

Section number	Title	Page
49.3.6.2	Message Reception.....	4194
49.3.6.2.1	Message Reception IO Interfaces.....	4196
49.3.6.2.2	Routing of Received Messages to SII and optionally to Application.....	4197
49.3.6.2.3	Accessing Header and Payload Fields of Received Messages.....	4198
49.3.7	Interrupts.....	4199
49.3.7.1	Interrupts Overview.....	4199
49.3.7.1.1	PCI Legacy Interrupt.....	4200
49.3.7.1.2	MSI.....	4201
49.3.7.1.3	MSI-X.....	4203
49.3.7.2	Interrupts (EP Mode).....	4205
49.3.7.3	Interrupts (RC Mode).....	4206
49.3.7.4	MSI Generation in the AXI Bridge.....	4207
49.3.7.5	MSI Reception in the AHB/AXI Bridge.....	4207
49.3.7.5.1	AHB/AXI MSI Controller (Optional in RC mode).....	4207
49.3.7.5.2	Programming and Usage Model.....	4209
49.3.8	Flow Control.....	4212
49.3.9	Address Translation.....	4213
49.3.9.1	Internal Address Translation (iATU).....	4215
49.3.9.1.1	Outbound (TX) Features.....	4215
49.3.9.1.2	Inbound (RX) Features.....	4216
49.3.9.1.3	Programming (iATU).....	4216
49.3.9.2	Outbound iATU Operation.....	4217
49.3.9.2.1	Inbound iATU Operation.....	4222
49.3.9.3	Overview (iATU).....	4223
49.3.10	Gen2 5.0 GT/s Operation.....	4229
49.3.10.1	Overview (Gen2 5.0 GT/s).....	4229
49.3.10.2	Speed Changing.....	4229
49.3.11	Power Management.....	4230
49.3.11.1	L0s Power Down.....	4232

Section number	Title	Page
49.3.11.2	L1 Power Down.....	4233
49.3.12	Completion Timeout Ranges.....	4235
49.4	AXI Bridge Module.....	4235
49.4.1	Product Overview.....	4236
49.4.1.1	Overview.....	4236
49.4.1.2	Interfaces.....	4237
49.4.1.3	Features List.....	4238
49.4.1.4	Limitations.....	4239
49.4.2	Bridge Architecture.....	4240
49.4.2.1	Bridge Architecture Overview.....	4240
49.4.2.1.1	Inbound Processing Module Chain.....	4241
49.4.2.1.2	Outbound Processing Module Chain.....	4242
49.4.2.2	Decomposition.....	4243
49.4.2.3	Bridge Buffering.....	4244
49.4.2.4	Outbound Bridge Tag Management.....	4245
49.4.2.5	Inbound Bridge Tag Management.....	4247
49.4.2.6	Inbound Order Enforcement for AXI Bridge.....	4249
49.4.2.6.1	Ordering Enforcement Hardware Lock Feature.....	4250
49.4.2.6.2	Re-Ordering Effects of AXI Fabric.....	4251
49.4.2.6.2.1	Inbound Ordering Limitation.....	4252
49.4.2.6.3	Additional Information (ordering).....	4252
49.4.2.6.4	PCIe Completion Reordering.....	4253
49.4.2.6.5	Outbound Ordering Limitation #1.....	4253
49.4.2.6.6	Outbound Ordering Limitation #2.....	4254
49.4.2.6.7	Additional Information (AXI bridge bandwidth).....	4254
49.4.3	PCIe AXI Core Operations.....	4254
49.4.3.1	AXI Sideband (Misc. Bus) Signals.....	4254
49.4.3.2	Supported AXI Transfer Type.....	4255
49.4.3.3	Supported AXI Burst Operations.....	4255

Section number	Title	Page
49.4.3.4	I/O and CFG Transaction Handling over AXI Bridge.....	4255
49.4.3.4.1	Outbound I/O and CFG Transaction Handling.....	4256
49.4.3.4.1.1	Method I: Address Translation Method of Sending an Outbound IO or CFG Transfer.....	4256
49.4.3.4.2	Inbound I/O and CFG Transaction Handling.....	4256
49.4.4	Additional AXI Reference Material.....	4257
49.4.4.1	AXI Decomposition Rules.....	4257
49.4.4.1.1	Outbound Decomposition.....	4257
49.4.4.1.1.1	Decomposition Side-Effects.....	4259
49.4.4.1.1.2	Reducing Outbound Decomposition.....	4259
49.4.4.1.2	Inbound Decomposition.....	4259
49.4.4.1.2.1	Reducing Inbound Decomposition.....	4260
49.5	App Note: Order Enforcement Using the PCIe Core.....	4261
49.5.1	PCIe Ordering Rule Overview.....	4261
49.5.2	PCIe Core Inbound Order Enforcement.....	4262
49.5.2.1	Single queue.....	4262
49.5.2.2	Multiple queue.....	4263
49.5.2.3	Segmented buffer queue.....	4264
49.5.3	PCIe Core Outbound Order Enforcement.....	4265
49.5.4	PCIe AHB/AXI Bridge Order Enforcement.....	4267
49.5.5	Additional Information.....	4267
49.6	App Note: Calculating Gen1 PCI Express and AXI Bridge Throughput.....	4267
49.6.1	PCI Express Throughput.....	4268
49.6.2	Effective Throughput.....	4268
49.6.2.1	Effective Throughput Calculation.....	4268
49.6.2.1.1	Packet Level: (Start and End, Link CRC, Header).....	4268
49.6.2.1.2	Link Layer: (Flow Control and ACK/NAK DLLPs).....	4269
49.6.2.2	Other Factors Impacting Throughput.....	4270

Section number	Title	Page
49.7	PCIe Registers (EP mode).....	4271
49.7.1	Register Space Layout (EP mode).....	4271
49.7.2	PF Register Maps.....	4272
49.7.2.1	PF PCI Configuration Space Header - Type 0.....	4273
49.7.2.2	PF PCI Standard Capability Structures Register Maps.....	4273
49.7.2.3	PF PCI Express Extended Capability Register Maps.....	4275
49.7.3	VF Register Maps.....	4277
49.7.3.1	VF PCI Configuration Space Header - Type 0.....	4277
49.7.3.2	VF PCI Standard Capability Structures Register Maps.....	4278
49.7.4	Accessing Configuration Registers.....	4279
49.8	PCIe Registers (RC mode).....	4280
49.8.1	Register Space Layout.....	4281
49.8.2	Register Maps.....	4282
49.8.2.1	PCI Standard Capability Structures Register Maps.....	4283
49.8.2.2	PCI Express Extended Capability Register Maps.....	4285
49.8.3	Accessing Configuration Registers (Configuration).....	4287
49.9	PCIe Registers: Port Logic.....	4288
49.9.1	Overview (Port Logic).....	4289
49.9.2	Non-Standard Addressing of the iATU Port Logic Registers.....	4289
49.9.3	Accessing Configuration Registers (Port Logic Registers).....	4289
49.10	PCIe CTRL EP Mode Memory Map/Register Definition.....	4291
49.10.1	Device ID and Vendor ID Register (PCIE_EP_DeviceID).....	4292
49.10.2	Command and Status Register (PCIE_EP_Command).....	4293
49.10.3	BIST Register (PCIE_EP_BIST).....	4295
49.10.4	Base Address 0 (PCIE_EP_BAR0).....	4296
49.10.5	BAR 0 Mask Register (PCIE_EP_MASK0).....	4299
49.10.6	BAR 1 Mask Register (PCIE_EP_MASK1).....	4301
49.10.7	BAR 2 Mask Register (PCIE_EP_MASK2).....	4302
49.10.8	BAR 3 Mask Register (PCIE_EP_MASK3).....	4303

Section number	Title	Page
49.10.9	CardBus CIS Pointer Register (PCIE_EP_CISP).....	4304
49.10.10	Subsystem ID and Subsystem Vendor ID Register (PCIE_EP_SSID).....	4304
49.10.11	Expansion ROM Base Address Register (PCIE_EP_EROMBAR).....	4305
49.10.12	Expansion ROM BAR Mask Register (PCIE_EP_EROMMASK).....	4306
49.10.13	Capability Pointer Register (PCIE_EP_CAPPR).....	4307
49.10.14	Interrupt Line and Pin Register (PCIE_EP_ILR).....	4307
49.10.15	AER Capability Header (PCIE_EP_AER).....	4308
49.10.16	Uncorrectable Error Status Register (PCIE_EP_UESR).....	4309
49.10.17	Uncorrectable Error Mask Register (PCIE_EP_UEMR).....	4311
49.10.18	Uncorrectable Error Severity Register (PCIE_EP_UESevR).....	4313
49.10.19	Correctable Error Status Register (PCIE_EP_CESR).....	4315
49.10.20	Correctable Error Mask Register (PCIE_EP_CEMR).....	4316
49.10.21	Advanced Capabilities and Control Register (PCIE_EP_ACCR).....	4318
49.10.22	Header Log Register (PCIE_EP_HLR).....	4319
49.10.23	VC Extended Capability Header (PCIE_EP_VCECHR).....	4319
49.10.24	Port VC Capability Register 1 (PCIE_EP_PVCCR1).....	4320
49.10.25	Port VC Capability Register 2 (PCIE_EP_PVCCR2).....	4321
49.10.26	Port VC Control and Status Register (PCIE_EP_PVCCSR).....	4322
49.10.27	VC Resource Capability Register n (PCIE_EP_VCRCR).....	4324
49.10.28	VC Resource Control Register n (PCIE_EP_VCRConR).....	4326
49.10.29	VC Resource Status Register n (PCIE_EP_VCRSR).....	4328
49.11	PCIe CTRL RC Mode Memory Map/Register Definition.....	4329
49.11.1	Device ID and Vendor ID Register (PCIE_RC_DeviceID).....	4332
49.11.2	Command and Status Register (PCIE_RC_Command).....	4332
49.11.3	Revision ID and Class Code Register (PCIE_RC_RevID).....	4335
49.11.4	BIST Register (PCIE_RC_BIST).....	4335
49.11.5	Base Address 0 (PCIE_RC_BAR0).....	4336
49.11.6	Base Address 1 (PCIE_RC_BAR1).....	4339
49.11.7	Bus Number Registers (PCIE_RC_BNR).....	4339

Section number	Title	Page
49.11.8	I/O Base Limit Secondary Status Register (PCIE_RC_IOBLSSR).....	4341
49.11.9	Memory Base and Memory Limit Register (PCIE_RC_MEM_BLR).....	4343
49.11.10	Prefetchable Memory Base and Limit Register (PCIE_RC_PREF_MEM_BLR).....	4344
49.11.11	Prefetchable Base Upper 32 Bits Register (PCIE_RC_PREF_BASE_U32).....	4344
49.11.12	Prefetchable Limit Upper 32 Bits Register (PCIE_RC_PREF_LIM_U32).....	4345
49.11.13	I/O Base and Limit Upper 16 Bits Register (PCIE_RC_IO_BASE_LIM_U16).....	4345
49.11.14	Capability Pointer Register (PCIE_RC_CAPPR).....	4346
49.11.15	Expansion ROM Base Address Register (PCIE_RC_EROMBAR).....	4346
49.11.16	Expansion ROM BAR Mask Register (PCIE_RC_EROMMASK).....	4347
49.11.17	Power Management Capability Register (PCIE_RC_PMCR).....	4348
49.11.18	Power Management Control and Status Register (PCIE_RC_PMCSR).....	4351
49.11.19	PCI Express Capability ID Register (PCIE_RC_CIDR).....	4352
49.11.20	Device Capabilities Register (PCIE_RC_DCR).....	4355
49.11.21	Device Control Register (PCIE_RC_DConR).....	4357
49.11.22	Link Capabilities Register (PCIE_RC_LCR).....	4359
49.11.23	Link Control and Status Register (PCIE_RC_LCSR).....	4362
49.11.24	Slot Capabilities Register (PCIE_RC_SCR).....	4364
49.11.25	Slot Control and Status Register (PCIE_RC_SCSR).....	4367
49.11.26	Root Control and Capabilities Register (PCIE_RC_RCCR).....	4370
49.11.27	Root Status Register (PCIE_RC_RSR).....	4372
49.11.28	Device Capabilities 2 Register (PCIE_RC_DCR2).....	4373
49.11.29	Device Control and Status 2 Register (PCIE_RC_DCSR2).....	4375
49.11.30	Link Capabilities 2 Register (PCIE_RC_LCR2).....	4377
49.11.31	Link Control and Status 2 Register (PCIE_RC_LCSR2).....	4379
49.11.32	AER Capability Header (PCIE_RC_AER).....	4381
49.11.33	Uncorrectable Error Status Register (PCIE_RC_UESR).....	4382
49.11.34	Uncorrectable Error Mask Register (PCIE_RC_UEMR).....	4384
49.11.35	Uncorrectable Error Severity Register (PCIE_RC_UESevR).....	4386
49.11.36	Correctable Error Status Register (PCIE_RC_CESR).....	4388

Section number	Title	Page
49.11.37	Correctable Error Mask Register (PCIE_RC_CEMR).....	4389
49.11.38	Advanced Capabilities and Control Register (PCIE_RC_ACCR).....	4391
49.11.39	Header Log Register (PCIE_RC_HLR).....	4392

## Chapter 50 PCI Express PHY (PCIE\_PHY)

50.1	Overview.....	4465
50.2	Applications.....	4465
50.3	PCIe2 PHY Features.....	4465
50.3.1	Standards Compliance.....	4465
50.3.2	PHY Features.....	4466
50.4	External Signals.....	4466
50.5	Functional Description.....	4466
50.5.1	Clocks and Resets.....	4467
50.5.1.1	Reference Clock Enables.....	4467
50.5.1.2	Reference Clock Frequency Selection.....	4467
50.5.1.3	Spread Spectrum Clocking.....	4467
50.5.2	Termination Resistance Tuning.....	4468
50.5.3	Control Register Access.....	4468
50.6	Control Memory Map/Register Definition.....	4470
50.6.1	Register ID Low 16 bits (PCIE_PHY_IDCODE_LO).....	4473
50.6.2	Register ID High 16 bits (PCIE_PHY_IDCODE_HI).....	4474
50.6.3	Debug Register (PCIE_PHY_DEBUG).....	4474
50.6.4	Debug Register (PCIE_PHY_RTUNE_DEBUG).....	4475
50.6.5	PCIE_PHY_RTUNE_STAT.....	4475
50.6.6	PCIE_PHY_SS_PHASE.....	4476
50.6.7	PCIE_PHY_SS_FREQ.....	4476

Section number	Title	Page
50.6.8	PCIE_PHY_ATEOVRD.....	4477
50.6.9	PCIE_PHY_MPLL_OVRD_IN_LO.....	4477
50.6.10	PCIE_PHY_MPLL_OVRD_IN_HI.....	4478
50.6.11	PCIE_PHY_SSC_OVRD_IN.....	4479
50.6.12	PCIE_PHY_BS_OVRD_IN.....	4480
50.6.13	PCIE_PHY_LEVEL_OVRD_IN.....	4481
50.6.14	PCIE_PHY_SUP_OVRD_OUT.....	4481
50.6.15	PCIE_PHY_MPLL_ASIC_IN.....	4482
50.6.16	PCIE_PHY_BS_ASIC_IN.....	4483
50.6.17	PCIE_PHY_LEVEL_ASIC_IN.....	4484
50.6.18	PCIE_PHY_SSC_ASIC_IN.....	4485
50.6.19	PCIE_PHY_SUP_ASIC_OUT.....	4485
50.6.20	PCIE_PHY_ATEOVRD_STATUS.....	4486
50.6.21	PCIE_PHY_SCOPE_ENABLES.....	4487
50.6.22	PCIE_PHY_SCOPE_SAMPLES.....	4488
50.6.23	PCIE_PHY_SCOPE_COUNT.....	4488
50.6.24	PCIE_PHY_SCOPE_CTL.....	4489
50.6.25	PCIE_PHY_SCOPE_MASK <sub>n</sub> .....	4489
50.6.26	PCIE_PHY_MPLL_LOOP_CTL.....	4490
50.6.27	PCIE_PHY_MPLL_ATB_MEAS2.....	4490
50.6.28	PCIE_PHY_MPLL_OVR.....	4491
50.6.29	PCIE_PHY_RTUNE_RTUNE_CTRL.....	4492
50.6.30	PCIE_PHY_TX_OVRD_IN_LO.....	4493
50.6.31	PCIE_PHY_TX_OVRD_IN_HI.....	4495
50.6.32	PCIE_PHY_TX_OVRD_DRV_LO.....	4496
50.6.33	PCIE_PHY_TX_OVRD_OUT.....	4496
50.6.34	PCIE_PHY_RX_OVRD_IN_LO.....	4497
50.6.35	PCIE_PHY_RX_OVRD_IN_HI.....	4498
50.6.36	PCIE_PHY_RX_OVRD_OUT.....	4499

Section number	Title	Page
50.6.37	PCIE_PHY_TX_ASIC_IN.....	4500
50.6.38	PCIE_PHY_TX_ASIC_DRV_LO.....	4501
50.6.39	PCIE_PHY_TX_ASIC_DRV_HI.....	4502
50.6.40	PCIE_PHY_TX_ASIC_OUT.....	4502
50.6.41	PCIE_PHY_RX_ASIC_IN.....	4503
50.6.42	PCIE_PHY_RX_ASIC_OUT.....	4504
50.6.43	PCIE_PHY_TX_VMD_FSM_TX_VCM_0.....	4505
50.6.44	PCIE_PHY_TX_VMD_FSM_TX_VCM_1.....	4505
50.6.45	PCIE_PHY_TX_VMD_FSM_TX_VCM_DEBUG_IN.....	4506
50.6.46	PCIE_PHY_TX_VMD_FSM_TX_VCM_DEBUG_OUT.....	4507
50.6.47	PCIE_PHY_TX_LBERT_CTL.....	4507
50.6.48	PCIE_PHY_RX_LBERT_CTL.....	4508
50.6.49	PCIE_PHY_RX_LBERT_ERR.....	4509
50.6.50	PCIE_PHY_RX_SCOPE_CTL.....	4509
50.6.51	PCIE_PHY_RX_SCOPE_PHASE.....	4510
50.6.52	PCIE_PHY_RX_DPLL_FREQ.....	4510
50.6.53	PCIE_PHY_RX_CDR_CTL.....	4511
50.6.54	PCIE_PHY_RX_CDR_CDR_FSM_DEBUG.....	4512
50.6.55	PCIE_PHY_RX_CDR_LOCK_VEC_OVRD.....	4513
50.6.56	PCIE_PHY_RX_CDR_LOCK_VEC.....	4514
50.6.57	PCIE_PHY_RX_CDR_ADAP_FSM.....	4514
50.6.58	PCIE_PHY_RX_ATB0.....	4515
50.6.59	PCIE_PHY_RX_ATB1.....	4516
50.6.60	PCIE_PHY_RX_ENPWR0.....	4516
50.6.61	PCIE_PHY_RX_PMI_X_PHASE.....	4517
50.6.62	PCIE_PHY_RX_ENPWR1.....	4518
50.6.63	PCIE_PHY_RX_ENPWR2.....	4519
50.6.64	PCIE_PHY_RX_SCOPE.....	4520
50.6.65	PCIE_PHY_TX_TXDRV_CNTRL.....	4521

Section number	Title	Page
50.6.66	PCIE_PHY_TX_POWER_CTL.....	4522
50.6.67	PCIE_PHY_TX_ALT_BLOCK.....	4523
50.6.68	PCIE_PHY_TX_ALT_AND_LOOPBACK.....	4524
50.6.69	PCIE_PHY_TX_TX_ATB_REG.....	4525

## Chapter 51 Power Management Unit (PMU)

51.1	Overview.....	4527
51.2	Digital LDO Regulators.....	4529
51.3	Analog LDO Regulators.....	4530
51.3.1	LDO 1P1.....	4530
51.3.2	LDO 2P5.....	4531
51.3.3	Low Power Operation.....	4531
51.4	USB LDO Regulator.....	4532
51.5	SNVS Regulator.....	4532
51.6	Power Modes.....	4532
51.6.1	Reverse Well Biasing.....	4533
51.7	PMU Memory Map/Register Definition.....	4533
51.7.1	Regulator 1P1 Register (PMU_REG_1P1).....	4535
51.7.2	Regulator 3P0 Register (PMU_REG_3P0).....	4538
51.7.3	Regulator 2P5 Register (PMU_REG_2P5).....	4540
51.7.4	Digital Regulator Core Register (PMU_REG_CORE).....	4542
51.7.5	Miscellaneous Register 0 (PMU_MISC0).....	4545
51.7.6	Miscellaneous Register 1 (PMU_MISC1 $n$ ).....	4548
51.7.7	Miscellaneous Control Register (PMU_MISC2 $n$ ).....	4551

## Chapter 52 Pulse Width Modulation (PWM)

52.1	Overview.....	4555
52.2	External Signals.....	4556
52.3	Clocks.....	4557

<b>Section number</b>	<b>Title</b>	<b>Page</b>
52.4	Functional Description.....	4558
52.4.1	Operation.....	4559
52.4.1.1	FIFO.....	4559
52.4.1.2	Rollover and Compare Event.....	4560
52.4.1.3	Low Power Mode Behavior.....	4560
52.4.1.4	Debug Mode Behavior.....	4560
52.5	Enable Sequence for the PWM.....	4560
52.6	Disable Sequence for the PWM.....	4561
52.7	PWM Memory Map/Register Definition.....	4561
52.7.1	PWM Control Register (PWMx_PWMCR).....	4563
52.7.2	PWM Status Register (PWMx_PWMSR).....	4565
52.7.3	PWM Interrupt Register (PWMx_PWMIR).....	4566
52.7.4	PWM Sample Register (PWMx_PWMSAR).....	4567
52.7.5	PWM Period Register (PWMx_PWMPR).....	4568
52.7.6	PWM Counter Register (PWMx_PWMCNR).....	4569

## **Chapter 53 Pixel Pipeline (PXP)**

53.1	Overview.....	4571
53.2	Clocks.....	4572
53.3	Top-level architecture.....	4572
53.3.1	Processing Details.....	4574
53.3.2	Scaling Operation.....	4575
53.3.3	Decimation Image Scaling.....	4576
53.3.4	Bilinear Image Scaling Filter .....	4578
53.3.5	YUV 4:2:2 Image Scaling.....	4580
53.3.6	YUV 4:2:0 Image Scaling.....	4581
53.3.7	RGB/YUV444 Image Scaling.....	4583
53.3.8	Color Space Conversion (CSC).....	4583
53.3.9	CSC1 Operation.....	4584

Section number	Title	Page
53.3.10	YUV versus YCbCr Support.....	4585
53.3.11	CSC2 operation.....	4585
53.3.12	Alpha Blending/Color Key .....	4585
53.3.13	Alpha Blend.....	4586
53.3.14	Color Key.....	4587
53.3.15	LUT.....	4587
53.3.16	Lookup Modes.....	4588
53.3.17	DIRECT_Y8.....	4588
53.3.18	DIRECT_RGB444.....	4588
53.3.19	DIRECT_RGB454.....	4588
53.3.20	CACHE_RGB565.....	4589
53.3.21	Output Modes.....	4590
53.3.22	Y8 .....	4590
53.3.23	RGBW4444CFA.....	4591
	53.3.23.1 CFA Correction.....	4591
53.3.24	RGB888.....	4592
53.3.25	Rotation.....	4592
53.3.26	Output Buffer.....	4595
53.3.27	Address calculator.....	4595
53.3.28	Block size selection.....	4595
53.3.29	Interlaced Video Support.....	4595
53.3.30	Theory of Operation.....	4596
53.3.31	Pixel Handling.....	4596
53.3.32	Output Buffer Composition.....	4597
53.3.33	PS Image Processing.....	4598
53.3.34	Letterboxing.....	4599
53.3.35	Clipping source images.....	4599
53.3.36	Color Key Processing.....	4601
53.3.37	In Place Processing (PS buffer is destination buffer).....	4603

Section number	Title	Page
53.3.38	Alpha Surface (AS) Processing.....	4603
53.3.39	Alpha Handling.....	4603
53.3.40	Color Key Processing (AS_CTRL).....	4603
53.4	Output Image Processing.....	4604
53.4.1	Output Image Size.....	4604
53.4.2	Output Format.....	4604
53.4.3	Rotation/Flip operations.....	4604
53.5	Queuing PXP transactions.....	4605
53.6	Error Handling.....	4605
53.6.1	Known PXP Limitations/Issues.....	4606
53.7	PXP Memory Map/Register Definition.....	4606
53.7.1	Control Register 0 (PXP_CTRL).....	4609
53.7.2	Status Register (PXP_STAT).....	4611
53.7.3	Output Buffer Control Register (PXP_OUT_CTRL).....	4613
53.7.4	Output Frame Buffer Pointer (PXP_OUT_BUF).....	4615
53.7.5	Output Frame Buffer Pointer #2 (PXP_OUT_BUF2).....	4616
53.7.6	Output Buffer Pitch (PXP_OUT_PITCH).....	4616
53.7.7	Output Surface Lower Right Coordinate (PXP_OUT_LRC).....	4617
53.7.8	Processed Surface Upper Left Coordinate (PXP_OUT_PS_ULC).....	4618
53.7.9	Processed Surface Lower Right Coordinate (PXP_OUT_PS_LRC).....	4619
53.7.10	Alpha Surface Upper Left Coordinate (PXP_OUT_AS_ULC).....	4620
53.7.11	Alpha Surface Lower Right Coordinate (PXP_OUT_AS_LRC).....	4621
53.7.12	Processed Surface (PS) Control Register (PXP_PS_CTRL).....	4622
53.7.13	PS Input Buffer Address (PXP_PS_BUF).....	4623
53.7.14	PS U/Cb or 2 Plane UV Input Buffer Address (PXP_PS_UBUF).....	4624
53.7.15	PS V/Cr Input Buffer Address (PXP_PS_VBUF).....	4625
53.7.16	Processed Surface Pitch (PXP_PS_PITCH).....	4625
53.7.17	PS Background Color (PXP_PS_BACKGROUND).....	4626
53.7.18	PS Scale Factor Register (PXP_PS_SCALE).....	4627

Section number	Title	Page
53.7.19	PS Scale Offset Register (PXP_PS_OFFSET).....	4628
53.7.20	PS Color Key Low (PXP_PS_CLRKEYLOW).....	4629
53.7.21	PS Color Key High (PXP_PS_CLRKEYHIGH).....	4630
53.7.22	Alpha Surface Control (PXP_AS_CTRL).....	4630
53.7.23	Alpha Surface Buffer Pointer (PXP_AS_BUF).....	4633
53.7.24	Alpha Surface Pitch (PXP_AS_PITCH).....	4633
53.7.25	Overlay Color Key Low (PXP_AS_CLRKEYLOW).....	4634
53.7.26	Overlay Color Key High (PXP_AS_CLRKEYHIGH).....	4634
53.7.27	Color Space Conversion Coefficient Register 0 (PXP_CSC1_COEF0).....	4635
53.7.28	Color Space Conversion Coefficient Register 1 (PXP_CSC1_COEF1).....	4637
53.7.29	Color Space Conversion Coefficient Register 2 (PXP_CSC1_COEF2).....	4637
53.7.30	Color Space Conversion Control Register. (PXP_CSC2_CTRL).....	4638
53.7.31	Color Space Conversion Coefficient Register 0 (PXP_CSC2_COEF0).....	4640
53.7.32	Color Space Conversion Coefficient Register 1 (PXP_CSC2_COEF1).....	4640
53.7.33	Color Space Conversion Coefficient Register 2 (PXP_CSC2_COEF2).....	4641
53.7.34	Color Space Conversion Coefficient Register 3 (PXP_CSC2_COEF3).....	4641
53.7.35	Color Space Conversion Coefficient Register 4 (PXP_CSC2_COEF4).....	4642
53.7.36	Color Space Conversion Coefficient Register 5 (PXP_CSC2_COEF5).....	4643
53.7.37	Lookup Table Control Register. (PXP_LUT_CTRL).....	4643
53.7.38	Lookup Table Control Register. (PXP_LUT_ADDR).....	4645
53.7.39	Lookup Table Data Register. (PXP_LUT_DATA).....	4647
53.7.40	Lookup Table External Memory Address Register. (PXP_LUT_EXTMEM).....	4647
53.7.41	Color Filter Array Register. (PXP_CFA).....	4648
53.7.42	Histogram Control Register. (PXP_HIST_CTRL).....	4648
53.7.43	2-level Histogram Parameter Register. (PXP_HIST2_PARAM).....	4649
53.7.44	4-level Histogram Parameter Register. (PXP_HIST4_PARAM).....	4650
53.7.45	8-level Histogram Parameter 0 Register. (PXP_HIST8_PARAM0).....	4651
53.7.46	8-level Histogram Parameter 1 Register. (PXP_HIST8_PARAM1).....	4652
53.7.47	16-level Histogram Parameter 0 Register. (PXP_HIST16_PARAM0).....	4653

Section number	Title	Page
53.7.48	16-level Histogram Parameter 1 Register. (PXP_HIST16_PARAM1).....	4654
53.7.49	16-level Histogram Parameter 2 Register. (PXP_HIST16_PARAM2).....	4655
53.7.50	16-level Histogram Parameter 3 Register. (PXP_HIST16_PARAM3).....	4656
53.7.51	PXP Power Control Register. (PXP_POWER).....	4656
53.7.52	Next Frame Pointer (PXP_NEXT).....	4657

## Chapter 54 ROM Controller with Patch (ROMC)

54.1	Overview.....	4661
54.1.1	Features.....	4662
54.1.2	Modes of Operation.....	4662
54.1.2.1	Low Power Mode.....	4663
54.2	Clocks.....	4663
54.3	Memory Map.....	4663
54.3.1	ROM Memory Map in detail.....	4663
54.4	Functional Description.....	4664
54.4.1	ROM Controller (ROMC) Functional Description.....	4664
54.4.1.1	Functionality overview.....	4664
54.4.2	ROMC Functional Description.....	4664
54.4.2.1	ROMC Disabling.....	4665
54.4.2.2	ROMC Event Priority.....	4665
54.4.2.3	Data Fixing.....	4665
54.4.2.4	Opcode Patching.....	4666
54.4.2.4.1	Typical Software Response to Opcode Patch.....	4667
54.4.2.5	External Boot Feature.....	4668
54.4.2.6	Alternate Masters and ROMC.....	4669
54.5	ROMCP Memory Map/Register Definition.....	4669
54.5.1	ROMC Data Registers (ROMC_ROMPATCHnD).....	4670
54.5.2	ROMC Control Register (ROMC_ROMPATCHCNTL).....	4671
54.5.3	ROMC Enable Register High (ROMC_ROMPATCHENH).....	4672

Section number	Title	Page
54.5.4	ROMC Enable Register Low (ROMC_ROMPATCHENL).....	4672
54.5.5	ROMC Address Registers (ROMC_ROMPATCHnA).....	4673
54.5.6	ROMC Status Register (ROMC_ROMPATCHSR).....	4674

## Chapter 55 Smart Direct Memory Access Controller (SDMA)

55.1	Overview.....	4677
55.1.1	Block Diagram.....	4677
55.1.2	Features.....	4679
55.2	External Signals.....	4681
55.3	Clocks.....	4681
55.4	Functional Description.....	4681
55.4.1	SDMA Core.....	4683
55.4.1.1	SDMA Core Structure.....	4683
55.4.1.2	Program Control Unit (PCU).....	4686
55.4.1.2.1	Instruction Types.....	4686
55.4.1.2.2	PCU States.....	4687
55.4.1.3	SDMA Core Memory.....	4690
55.4.2	Scheduler.....	4690
55.4.2.1	Primary Functions.....	4690
55.4.2.2	Channels and DMA Requests.....	4691
55.4.2.2.1	Channels.....	4691
55.4.2.2.2	DMA Requests.....	4691
55.4.2.2.3	Mapping from DMA Requests to Channels and Priorities.....	4691
55.4.2.3	Scheduler Functional Description.....	4691
55.4.2.3.1	Scheduler Overview.....	4691
55.4.2.3.2	DMA Requests Scanning.....	4692
55.4.2.3.3	Mapping DMA Requests to Pending Channels.....	4693
55.4.2.3.4	Channel Overflow.....	4696
55.4.2.3.5	Runnable Channels Evaluation.....	4696

Section number	Title	Page
55.4.2.3.6	Next Channel Decision Tree.....	4698
55.4.2.3.7	Scheduler State Diagram.....	4700
55.4.2.3.8	Scheduler Pipeline Timing Diagram.....	4702
55.4.2.3.9	Channel-DMA Request Mapping.....	4702
55.4.2.3.10	Examples: How to Start a Channel.....	4702
55.4.2.4	Context Switching.....	4703
55.4.2.4.1	Context Switch Modes.....	4704
55.4.2.4.2	Context Switch Procedure.....	4704
55.4.2.4.3	Context Map in Memory.....	4706
55.4.3	Functional Units.....	4706
55.4.3.1	Burst DMA Unit.....	4706
55.4.3.1.1	Burst DMA Structure.....	4707
55.4.3.1.2	Burst DMA Registers.....	4708
55.4.3.1.3	Burst DMA Data Transfers.....	4709
55.4.3.1.3.1	Data Retrieval from the ARM platform Memory.....	4709
55.4.3.1.3.2	Storing Data Into the ARM platform Memory.....	4709
55.4.3.1.3.3	Transferring Data Between Two ARM platform Memory Locations-Burst DMA Unit.....	4710
55.4.3.2	Peripheral DMA Unit.....	4710
55.4.3.2.1	Peripheral DMA Structure.....	4711
55.4.3.2.2	Peripheral DMA Registers.....	4712
55.4.3.2.3	Peripheral DMA Data Transfers.....	4713
55.4.3.2.3.1	Data Retrieval from the ARM platform Memory or Peripheral.....	4713
55.4.3.2.3.2	Storing Data into the ARM platform Memory or Peripheral.	4713
55.4.3.2.3.3	Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit.....	4714
55.4.4	SDMA Security Support.....	4714
55.4.4.1	Locked Mode.....	4714
55.4.5	OnCE and PCU Debug States.....	4715

Section number	Title	Page
55.4.6	SDMA Clocks and Low Power Modes.....	4717
55.4.6.1	Clock Gating and Low Power Modes.....	4718
55.4.6.1.1	Coarse Clock Gating.....	4718
55.4.6.1.2	Refined Clock Gating.....	4719
55.4.6.1.3	Low Power Modes and User Control.....	4719
55.4.6.1.3.1	SLEEP Mode.....	4720
55.4.6.1.3.2	RUN Mode.....	4720
55.4.6.1.3.3	DEBUG Mode.....	4721
55.4.6.1.4	Stop Mode Response.....	4721
55.4.6.2	Reset.....	4721
55.4.7	Software Interface.....	4721
55.4.8	Initialization Information.....	4722
55.4.8.1	Hardware Reset.....	4722
55.4.8.2	Channel Script Execution.....	4723
55.4.8.3	Initialization and Script Execution Setup Sequence.....	4723
55.4.9	SDMA Programming Model.....	4724
55.4.9.1	State and Registers Per Channel.....	4724
55.4.9.2	General Purpose Registers.....	4725
55.4.9.3	Functional Unit State.....	4725
55.4.9.3.1	Program Counter Register (PC).....	4725
55.4.9.3.2	Flags.....	4725
55.4.9.3.3	Return Program Counter (RPC).....	4726
55.4.9.3.4	Loop Mode Start Program Counter (SPC).....	4726
55.4.9.3.5	Loop Mode End Program Counter (EPC).....	4726
55.4.9.4	Context Switching-Programming.....	4727
55.4.9.5	Address Space.....	4728
55.4.9.5.1	Instruction Memory Map.....	4729
55.4.9.5.2	Data Memory Map.....	4729

Section number	Title	Page
55.4.10	SDMA Initialization.....	4731
55.4.10.1	Hardware Reset-SDMA.....	4731
55.4.10.2	Standard Boot Sequence.....	4731
55.4.10.3	User-Defined Boot Sequence.....	4732
55.4.10.4	Script Loading and Context Initialization.....	4732
55.4.11	Instruction Description.....	4733
55.4.11.1	Scheduling Instructions.....	4733
55.4.11.2	Conditional Branch Instructions.....	4733
55.4.11.3	Unconditional Jump Instructions.....	4734
55.4.11.4	Subroutine Return Instructions.....	4734
55.4.11.5	Loop Instruction.....	4734
55.4.11.6	Miscellaneous Instructions.....	4735
55.4.11.7	Logic Instructions.....	4735
55.4.11.8	Arithmetic Instructions.....	4735
55.4.11.9	Compare Instructions.....	4736
55.4.11.10	Test Instructions.....	4736
55.4.11.11	Byte Permutation Instructions.....	4736
55.4.11.12	Bit Shift Instructions.....	4737
55.4.11.13	Bit Manipulation Instructions.....	4737
55.4.11.14	SDMA Memory Access Instructions.....	4737
55.4.11.15	Functional Unit Instructions.....	4738
55.4.11.16	Illegal Instructions.....	4738
55.4.11.17	Debug Instructions.....	4738
55.4.12	Functional Units Programming Model.....	4739
55.4.12.1	Burst DMA Unit Programming.....	4740
55.4.12.1.1	Memory Source Address Register (MSA).....	4740
55.4.12.1.2	Memory Destination Address Register (MDA).....	4741
55.4.12.1.3	Memory Data Buffer Register (MD).....	4741
55.4.12.1.4	State Register (MS).....	4742

Section number	Title	Page
55.4.12.1.5	Burst DMA Write (stf).....	4743
55.4.12.1.6	Burst DMA Read (ldf).....	4746
55.4.12.1.7	Prefetch/Flush and Auto-Flush Management-Burst DMA Unit.....	4747
55.4.12.1.8	Data Alignment and Endianness-Burst DMA Unit.....	4749
55.4.12.1.8.1	Burst DMA in Read Mode.....	4749
55.4.12.1.8.2	Burst DMA in Write Mode.....	4750
55.4.12.1.8.3	Endianness-Burst DMA Unit.....	4751
55.4.12.1.9	Burst DMA Unit Copy Mode.....	4752
55.4.12.1.10	Burst DMA Unit Error Management.....	4753
55.4.12.1.11	Conditional Yielding-Burst DMA Unit.....	4754
55.4.12.2	Peripheral DMA Unit Programming.....	4755
55.4.12.2.1	Peripheral Source Address Register (PSA).....	4756
55.4.12.2.2	Peripheral Destination Address Register (PDA).....	4757
55.4.12.2.3	Peripheral Data Register (PD).....	4757
55.4.12.2.4	Peripheral State Register (PS).....	4758
55.4.12.2.5	Peripheral DMA Write (stf)-Write Mode.....	4759
55.4.12.2.6	Peripheral DMA Read (ldf)-Read Mode.....	4762
55.4.12.2.7	Peripheral DMA Unit Copy Mode.....	4763
55.4.12.2.8	Error Management.....	4764
55.4.12.2.8.1	Immediate Errors.....	4764
55.4.12.2.8.2	Data Transfer Errors.....	4764
55.4.12.2.8.3	Read Error (First Phase).....	4765
55.4.12.2.8.4	Write Error and Read Error (Second Phase).....	4765
55.4.12.2.8.5	Copy Mode Errors.....	4766
55.4.12.2.8.6	Error Check Example.....	4766
55.4.12.2.9	Peripheral DMA Unit Prefetch/Flush Management.....	4767
55.4.12.3	OnCE and Real-Time Debug.....	4767
55.4.12.3.1	Memory and Register Access.....	4767
55.4.12.3.2	Hardware Breakpoints.....	4768

Section number	Title	Page
55.4.12.3.3	Watchpoints.....	4768
55.4.12.3.4	Software Breakpoints.....	4768
55.4.12.3.5	Core Control.....	4768
55.4.13	The OnCE Controller.....	4768
55.4.13.1	OnCE Commands.....	4769
55.4.13.2	Sending Commands to the OnCE Controller.....	4770
55.4.13.2.1	Using the JTAG Interface.....	4770
55.4.13.2.2	Using the ARM platform.....	4770
55.4.13.2.3	Conflicts Between the JTAG and the ARM platform Accesses.....	4772
55.4.13.3	Executing a Command from the OnCE.....	4772
55.4.13.3.1	Nature of the Commands.....	4772
55.4.13.3.2	Execution Request.....	4773
55.4.13.3.3	Command Execution.....	4773
55.4.13.4	Registers Descriptions.....	4775
55.4.13.4.1	Event Cell Counter Register (ECOUNT).....	4775
55.4.13.4.2	Event Cell Address Registers (EAA or EAB).....	4776
55.4.13.4.3	Event Cell Address Mask Register (EAM).....	4776
55.4.13.4.4	Event Cell Data Register (ED).....	4776
55.4.13.4.5	Event Cell Data Mask Register (EDM).....	4776
55.4.13.4.6	Real Time Buffer Register (RTB).....	4776
55.4.13.4.7	Event Control Register (ECTL).....	4777
55.4.13.4.8	Trace Buffer (TB).....	4777
55.4.13.4.9	OnCE Status Register (OSTAT).....	4777
55.4.13.5	JTAG Interface Requirements.....	4778
55.4.13.5.1	TCK Speed Limitation.....	4778
55.4.13.5.2	Synchronization Implementation.....	4778
55.4.13.5.3	JTAG Controller Start-Up Recommended Procedure.....	4780
55.4.14	Using the OnCE.....	4780
55.4.14.1	Activating Clocks in Debug Mode.....	4780

Section number	Title	Page
55.4.14.2	Getting the Current Status.....	4781
55.4.14.3	Methods of Entering Debug Mode.....	4781
55.4.14.3.1	External Debug Request During Reset.....	4781
55.4.14.3.2	Debug Request During Normal Activity.....	4782
55.4.14.3.3	Software Breakpoint Instruction.....	4782
55.4.14.3.4	Event Detection Unit Matching Condition.....	4782
55.4.14.4	Executing Instructions in Debug Mode.....	4782
55.4.14.5	Command Sequences Examples.....	4782
55.4.14.5.1	Getting the SDMA Status.....	4783
55.4.14.5.2	Saving the Context.....	4783
55.4.14.5.3	Restoring the Context.....	4784
55.4.14.5.4	Accessing the Memory.....	4785
55.4.14.5.5	Resuming Program Execution.....	4786
55.4.14.5.6	Single Stepping in RAM.....	4787
55.4.14.5.7	Single Stepping in ROM.....	4787
55.4.14.6	OnCE Event Detection Unit.....	4787
55.4.14.7	Clock Gating and Reset.....	4789
55.4.14.7.1	Clocks.....	4789
55.4.14.7.2	Resets.....	4790
55.4.14.8	Real Time Features.....	4790
55.4.14.8.1	Trace Buffer.....	4790
55.4.14.8.2	Real Time Buffer.....	4792
55.4.14.8.3	Emulation Pin.....	4792
55.4.14.8.4	Real-Time Debug Outputs.....	4792
55.5	Instruction Set.....	4796
55.5.1	Instruction Encoding.....	4796
55.5.2	SDMA Instruction Set.....	4798
55.5.2.1	ADD (Addition).....	4799
55.5.2.2	ADDI (Add with Immediate Value).....	4800

Section number	Title	Page
55.5.2.3	AND (Logical AND).....	4801
55.5.2.4	ANDI (Logical AND with Immediate Value).....	4802
55.5.2.5	ANDN (Logical AND NOT).....	4803
55.5.2.6	ANDNI (Logical AND with Negated Immediate Value).....	4804
55.5.2.7	ASRI (Arithmetic Shift Right by 1 Bit).....	4805
55.5.2.8	BCLR1 (Bit Clear Immediate).....	4806
55.5.2.9	BDF (Conditional Branch if Destination Fault).....	4807
55.5.2.10	BF (Conditional Branch if False).....	4808
55.5.2.11	BSETI (Bit Set Immediate).....	4809
55.5.2.12	BSF (Conditional Branch if Source Fault).....	4810
55.5.2.13	BT (Conditional Branch if True).....	4811
55.5.2.14	BTSTI (Bit Test immediate).....	4812
55.5.2.15	CLRF (Clear ARM platform flags).....	4813
55.5.2.16	CMPEQ (Compare for Equal).....	4814
55.5.2.17	CMPEQI (Compare with Immediate for Equal).....	4815
55.5.2.18	CMPHS (Compare for Higher or Same).....	4816
55.5.2.19	CMPLT (Compare for Less Than).....	4817
55.5.2.20	cpShReg (Update Context of PCU Registers and Flag).....	4818
55.5.2.21	DONE (DONE, Yield) .....	4818
55.5.2.22	ILLEGAL (ILLEGAL Instruction).....	4820
55.5.2.23	JMP (Unconditional Jump Immediate).....	4821
55.5.2.24	JMPR (Unconditional Jump).....	4821
55.5.2.25	JSR (Unconditional Jump to Subroutine Immediate).....	4822
55.5.2.26	JSRR (Unconditional Jump to Subroutine).....	4823
55.5.2.27	LD (Load Register).....	4824
55.5.2.28	LDF (Load Register from Functional Unit).....	4825
55.5.2.29	LDI (Load Register with Immediate Value).....	4827
55.5.2.30	LDRPC (Load from RPC to Register).....	4828
55.5.2.31	LOOP (Hardware Loop).....	4829

Section number	Title	Page
55.5.2.32	LSL1 (Logical Shift Left by 1 Bit).....	4831
55.5.2.33	LSR1 (Logical Shift Right by 1 Bit).....	4832
55.5.2.34	MOV (Logical Move).....	4833
55.5.2.35	NOTIFY (Notify to ARM platform).....	4834
55.5.2.36	OR (Logical OR).....	4835
55.5.2.37	ORI (Logical OR with Immediate Value).....	4836
55.5.2.38	RET (Return from Subroutine).....	4837
55.5.2.39	REVB (Reverse Byte Order).....	4838
55.5.2.40	Reverse Low Order Bytes(REVBLO).....	4838
55.5.2.41	ROR1 (Rotate Right by 1 Bit).....	4839
55.5.2.42	RORB (Rotate Right by 1 Byte).....	4840
55.5.2.43	SOFTBKPT (Software Breakpoint).....	4841
55.5.2.44	ST (Store Register).....	4841
55.5.2.45	STF (Store Register in Functional Unit).....	4843
55.5.2.46	SUB (Subtract).....	4846
55.5.2.47	SUBI (Subtract with Immediate).....	4847
55.5.2.48	TST (Test with Zero).....	4848
55.5.2.49	TSTI (Test Immediate).....	4849
55.5.2.50	XOR (Logical Exclusive OR).....	4850
55.5.2.51	XORI (Exclusive OR with Immediate).....	4851
55.5.2.52	YIELD, YIELDGE (DONE, Yield).....	4852
55.6	Software Restrictions.....	4852
55.6.1	Unsupported Burst DMA Access Sequence.....	4852
55.7	Application Notes.....	4853
55.7.1	Data Structures for Boot Code and Channel Scripts.....	4853
55.7.1.1	Buffer Descriptor Format.....	4854
55.7.1.2	Buffer Descriptor Commands for Bootload scripts.....	4857
55.7.1.3	Example of Buffer Descriptors for Channel 0.....	4858
55.7.1.4	Channel Context.....	4861

Section number	Title	Page
55.7.2	Typical Data Transfer Supported by SDMA DMA Units.....	4861
55.7.2.1	External Memory to External Memory.....	4862
55.7.2.2	Peripheral to Peripheral Transfer.....	4863
55.7.2.2.1	Source and Destination Target Have the Same Data Path Width.....	4863
55.7.2.2.2	Source and Destination Target Have a Different Data Path Width.....	4864
55.7.2.3	Transfer Between Peripheral and External Memory.....	4865
55.7.2.3.1	Peripheral to External Memory Transfer.....	4865
55.7.2.3.2	External Memory to Peripheral Transfer.....	4867
55.7.2.4	Transfer Between External Memory and Internal Memory.....	4868
55.7.2.4.1	Internal Memory to Internal Memory.....	4868
55.7.2.4.2	Transfer Between Peripheral and Internal Memory.....	4868
55.8	ARM Platform Memory Map and Control Register Definitions.....	4868
55.8.1	ARM platform Channel 0 Pointer (SDMAARM_MC0PTR).....	4874
55.8.2	Channel Interrupts (SDMAARM_INTR).....	4874
55.8.3	Channel Stop/Channel Status (SDMAARM_STOP_STAT).....	4874
55.8.4	Channel Start (SDMAARM_HSTART).....	4875
55.8.5	Channel Event Override (SDMAARM_EVTOVR).....	4875
55.8.6	Channel BP Override (SDMAARM_DSPOVR).....	4876
55.8.7	Channel ARM platform Override (SDMAARM_HOSTOVR).....	4876
55.8.8	Channel Event Pending (SDMAARM_EVTPEND).....	4876
55.8.9	Reset Register (SDMAARM_RESET).....	4877
55.8.10	DMA Request Error Register (SDMAARM_EVTERR).....	4878
55.8.11	Channel ARM platform Interrupt Mask (SDMAARM_INTRMASK).....	4878
55.8.12	Schedule Status (SDMAARM_PSW).....	4879
55.8.13	DMA Request Error Register (SDMAARM_EVTERRDBG).....	4879
55.8.14	Configuration Register (SDMAARM_CONFIG).....	4880
55.8.15	SDMA LOCK (SDMAARM_SDMA_LOCK).....	4881
55.8.16	OnCE Enable (SDMAARM_ONCE_ENB).....	4882
55.8.17	OnCE Data Register (SDMAARM_ONCE_DATA).....	4883

## Chapter 56 System JTAG Controller (SJC)

56.1	Overview.....	4913
56.1.1	Features.....	4914
56.1.2	Modes of Operation.....	4915
56.2	External Signals.....	4917
56.2.1	External Signal Overview.....	4918
56.2.2	TAP Controller.....	4918
56.2.3	Accessing ExtraDebug Registers .....	4920
56.3	TAP Selection Block (TSB).....	4923
56.3.1	Select Mode Using Software.....	4923
56.4	Boundary Scan Register (BSR).....	4924
56.5	SoC JTAG Instruction Register (SJIR).....	4924
56.5.1	ID_CODE Instruction (IDCODE).....	4925
56.5.2	SAMPLE/PRELOAD Instruction.....	4926
56.5.3	EXTEST Instruction.....	4927

Section number	Title	Page
56.5.4	HIGHZ Instruction.....	4927
56.5.5	BYPASS Instruction.....	4927
56.5.6	ENABLE_ExtraDebug Instruction.....	4928
56.5.7	ENTER_DEBUG instruction.....	4928
56.5.8	TAP Select Instruction.....	4929
56.6	Security.....	4929
56.6.1	JTAG Security Modes.....	4930
56.6.1.1	Mode 1: No Debug - Maximum Security.....	4930
56.6.1.2	Mode 2: Secure JTAG - High Security.....	4930
56.6.1.2.1	Challenge/Response Mechanism in System JTAG Mode.....	4931
56.6.1.3	Mode 3: JTAG Enabled - Low Security.....	4932
56.6.2	Software Enabled JTAG.....	4932
56.6.3	Kill Trace.....	4933
56.6.4	SJC Disable Fuse.....	4934
56.7	Functional Description.....	4935
56.7.1	Static Core Debug.....	4935
56.7.2	Reset Mechanism.....	4935
56.8	Initialization/Application Information.....	4936
56.9	SJC Memory Map/Register Definition.....	4937
56.9.1	General Purpose Unsecured Status Register 1 (SJC_GPUSR1).....	4938
56.9.2	General Purpose Unsecured Status Register 2 (SJC_GPUSR2).....	4940
56.9.3	General Purpose Unsecured Status Register 3 (SJC_GPUSR3).....	4940
56.9.4	General Purpose Secured Status Register (SJC_GPSSR).....	4941
56.9.5	Debug Control Register (SJC_DCR).....	4942
56.9.6	Security Status Register (SJC_SSR).....	4944
56.9.7	General Purpose Clocks Control Register (SJC_GPCCR).....	4947

## Chapter 58 Shared Peripheral Bus Arbiter (SPBA)

58.1	Overview.....	5015
58.1.1	Features.....	5016
58.1.2	Modes of operation.....	5017
58.2	Clocks.....	5017
58.3	Functional description.....	5018
58.3.1	Masters arbitration.....	5018
58.4	Resource ownership control.....	5021
58.4.1	Access control .....	5021
58.4.1.1	Peripheral access.....	5021
58.4.1.2	Peripheral Right Register access.....	5022
58.4.2	Owner election.....	5023
58.4.3	Ending ownership.....	5023
58.4.3.1	Software Controlled Ownership Ending.....	5023
58.4.4	The Un-owned State.....	5024
58.5	SPBA Memory Map/Register Definition.....	5024
58.5.1	Peripheral Rights Register (SPBA_PRR <sub>n</sub> ).....	5026

## Chapter 59 Sony/Philips Digital Interface (SPDIF)

59.1	Introduction .....	5029
59.1.1	Overview.....	5031

Section number	Title	Page
59.2	External Signals.....	5032
59.3	Clocks.....	5033
59.4	Functional Description.....	5033
59.4.1	SPDIF Receiver.....	5033
59.4.1.1	Audio Data Reception.....	5034
59.4.1.1.1	Application Note.....	5035
59.4.1.2	Channel Status Reception.....	5037
59.4.1.2.1	Channel Status Interrupt.....	5037
59.4.1.3	User Bit Reception.....	5037
59.4.1.4	Validity Flag Reception.....	5039
59.4.1.5	SPDIF Receiver Interrupt Exception Definition.....	5040
59.4.1.6	Standards Compliance.....	5040
59.4.1.7	SPDIF PLOCK Detection and Rxclk Output.....	5041
59.4.1.8	Measuring Frequency of SPDIF_RxClk.....	5041
59.4.2	SPDIF Transmitter.....	5042
59.4.2.1	Audio Data Transmission.....	5042
59.4.2.2	Channel Status Transmission.....	5043
59.4.2.3	Validity Flag Transmission.....	5043
59.5	SPDIF Memory Map/Register Definition.....	5043
59.5.1	SPDIF Configuration Register (SPDIF_SCR).....	5045
59.5.2	CDText Control Register (SPDIF_SRCD).....	5047
59.5.3	PhaseConfig Register (SPDIF_SRPC).....	5048
59.5.4	InterruptEn Register (SPDIF_SIE).....	5049
59.5.5	InterruptStat Register (SPDIF_SIS).....	5051
59.5.6	InterruptClear Register (SPDIF_SIC).....	5053
59.5.7	SPDIFRxLeft Register (SPDIF_SRL).....	5054
59.5.8	SPDIFRxRight Register (SPDIF_SRR).....	5055
59.5.9	SPDIFRxCChannel_h Register (SPDIF_SRCSH).....	5055
59.5.10	SPDIFRxCChannel_l Register (SPDIF_SRCSL).....	5056

Section number	Title	Page
59.5.11	UchannelRx Register (SPDIF_SRU).....	5056
59.5.12	QchannelRx Register (SPDIF_SRQ).....	5057
59.5.13	SPDIFTxLeft Register (SPDIF_STL).....	5057
59.5.14	SPDIFTxRight Register (SPDIF_STR).....	5058
59.5.15	SPDIFTxCChannelCons_h Register (SPDIF_STCSCH).....	5058
59.5.16	SPDIFTxCChannelCons_l Register (SPDIF_STCSCL).....	5059
59.5.17	FreqMeas Register (SPDIF_SRFM).....	5059
59.5.18	SPDIFTxCk Register (SPDIF_STC).....	5060

## Chapter 60 System Reset Controller (SRC)

60.1	SRC Overview.....	5063
60.1.1	Features.....	5063
60.2	External Signals.....	5063
60.3	Clocks.....	5064
60.4	Top-level resets, power-up sequence and external supply integration.....	5065
60.4.1	Reset and Power-up Flow.....	5065
60.4.2	Finite-State Machine (FSM).....	5068
60.4.3	Power mode transitions.....	5069
60.5	Power-On Reset and power sequencing.....	5070
60.5.1	External POR using SRC_POR_B.....	5070
60.5.2	Internal POR.....	5071
60.6	Functional Description.....	5071
60.6.1	Reset Control.....	5071
60.6.1.1	Reset inputs and outputs.....	5071
60.6.1.2	Reset Handling.....	5073
60.6.1.2.1	Reset Qualification.....	5073
60.6.1.2.2	Reset Sequence and De-Assertion.....	5074
60.6.1.2.3	POR (SRC_POR_B).....	5074
60.6.1.2.4	COLD RESET.....	5075

Section number	Title	Page
60.6.1.2.5	WARM RESET.....	5076
60.6.2	Parallel Reset Requests.....	5077
60.6.3	Boot Mode Control.....	5078
60.6.3.1	BOOT_MODE Pin Latching.....	5078
60.7	SRC Memory Map/Register Definition.....	5079
60.7.1	SRC Control Register (SRC_SCR).....	5081
60.7.2	SRC Boot Mode Register 1 (SRC_SBMR1).....	5084
60.7.3	SRC Reset Status Register (SRC_SRSR).....	5085
60.7.4	SRC Interrupt Status Register (SRC_SISR).....	5087
60.7.5	SRC Interrupt Mask Register (SRC_SIMR).....	5089
60.7.6	SRC Boot Mode Register 2 (SRC_SBMR2).....	5091
60.7.7	SRC General Purpose Register 1 (SRC_GPR1).....	5092
60.7.8	SRC General Purpose Register 2 (SRC_GPR2).....	5092
60.7.9	SRC General Purpose Register 3 (SRC_GPR3).....	5093
60.7.10	SRC General Purpose Register 4 (SRC_GPR4).....	5093
60.7.11	SRC General Purpose Register 5 (SRC_GPR5).....	5093
60.7.12	SRC General Purpose Register 6 (SRC_GPR6).....	5094
60.7.13	SRC General Purpose Register 7 (SRC_GPR7).....	5094
60.7.14	SRC General Purpose Register 8 (SRC_GPR8).....	5094
60.7.15	SRC General Purpose Register 9 (SRC_GPR9).....	5095
60.7.16	SRC General Purpose Register 10 (SRC_GPR10).....	5096

## Chapter 61 Synchronous Serial Interface (SSI)

61.1	Overview.....	5099
61.1.1	Features.....	5100
61.1.2	Modes of Operation.....	5101
61.2	External Signal Description.....	5101
61.2.1	Signals Overview.....	5101
61.3	Clocks.....	5105

Section number	Title	Page
61.4	SSI Transmit FIFO 0 & 1 Registers.....	5105
61.5	SSI Transmit Shift Register (TXSR).....	5106
61.6	SSI Receive FIFO 0 and 1 Registers.....	5108
61.7	SSI Receive Shift Register (RXSR).....	5109
61.8	Functional Description.....	5111
61.8.1	Operating Modes.....	5111
61.8.1.1	Normal Mode.....	5113
61.8.1.1.1	Normal Mode Transmit.....	5113
61.8.1.1.2	Normal Mode Receive.....	5114
61.8.1.2	Network Mode.....	5116
61.8.1.2.1	Network Mode Transmit.....	5117
61.8.1.2.2	Network Mode Receive.....	5118
61.8.1.3	Gated Clock Mode.....	5120
61.8.1.4	I2S Mode.....	5123
61.8.1.5	AC97 Mode.....	5125
61.8.1.5.1	AC97 Fixed Mode (SSI.SACNT[1]=0).....	5127
61.8.1.5.2	AC97 Variable Mode (SSI.SACNT[1]=1).....	5127
61.8.2	External Frame and Clock Operation.....	5128
61.8.2.1	Data Alignment Formats Supported.....	5128
61.8.3	SSI Architecture.....	5129
61.8.4	SSI Clocking.....	5130
61.8.4.1	SSI Clock and Frame Sync Generation.....	5131
61.8.4.2	DIV2, PSR and PM Bit Description.....	5132
61.8.5	Receive Interrupt Enable Bit Description.....	5134
61.8.6	Transmit Interrupt Enable Bit Description.....	5135
61.8.7	Internal Frame and Clock Shutdown.....	5136
61.8.8	Peripheral Bus Interface.....	5138
61.8.8.1	Transfer Lengths Supported.....	5138
61.8.8.2	Transfer Bus Errors.....	5138

Section number	Title	Page
61.8.8.3	Clock Rate.....	5139
61.8.9	Reset.....	5139
61.9	SSI Memory Map/Register Definition.....	5139
61.9.1	SSI Transmit Data Register n (SSIx_STXn).....	5142
61.9.2	SSI Receive Data Register n (SSIx_SRXn).....	5142
61.9.3	SSI Control Register (SSIx_SCR).....	5143
61.9.4	SSI Interrupt Status Register (SSIx_SISR).....	5145
61.9.5	SSI Interrupt Enable Register (SSIx_SIER).....	5151
61.9.6	SSI Transmit Configuration Register (SSIx_STCR).....	5155
61.9.7	SSI Receive Configuration Register (SSIx_SRCR).....	5157
61.9.8	SSI Transmit Clock Control Register (SSIx_STCCR).....	5159
61.9.9	SSI Receive Clock Control Register (SSIx_SRCCR).....	5161
61.9.10	SSI FIFO Control/Status Register (SSIx_SFCSR).....	5162
61.9.11	SSI AC97 Control Register (SSIx_SACNT).....	5166
61.9.12	SSI AC97 Command Address Register (SSIx_SACADD).....	5167
61.9.13	SSI AC97 Command Data Register (SSIx_SACDAT).....	5167
61.9.14	SSI AC97 Tag Register (SSIx_SATAG).....	5168
61.9.15	SSI Transmit Time Slot Mask Register (SSIx_STMSK).....	5168
61.9.16	SSI Receive Time Slot Mask Register (SSIx_SRMSK).....	5169
61.9.17	SSI AC97 Channel Status Register (SSIx_SACCST).....	5169
61.9.18	SSI AC97 Channel Enable Register (SSIx_SACCEN).....	5170
61.9.19	SSI AC97 Channel Disable Register (SSIx_SACCDIS).....	5170

## Chapter 62 Temperature Monitor (TEMPMON)

62.1	Overview.....	5171
62.2	Software Usage Guidelines.....	5172
62.3	TEMPMON Memory Map/Register Definition.....	5173
62.3.1	Tempsensor Control Register 0 (TEMPMON_TEMPSENSE0n).....	5174
62.3.2	Tempsensor Control Register 1 (TEMPMON_TEMPSENSE1n).....	5176

Section number	Title	Page
<b>Chapter 63</b>		
<b>TrustZone Address Space Controller (TZASC)</b>		
63.1	Overview.....	5177
63.2	Clocks.....	5178
63.3	i.MX 6Solo/6DualLite Specific Configuration .....	5178
63.4	Address Mapping in various memory mapping modes.....	5179
<b>Chapter 64</b>		
<b>Universal Asynchronous Receiver/Transmitter (UART)</b>		
64.1	Overview.....	5181
64.1.1	Features.....	5182
64.1.2	Modes of operation.....	5183
64.2	External Signals.....	5183
64.2.1	Detailed Signal Descriptions.....	5187
64.2.1.1	Interrupt Signals.....	5187
64.2.1.1.1	interrupt_uart - UART Interrupt.....	5187
64.2.1.2	DMA Request Signals.....	5187
64.2.1.2.1	dma_req_rx - Receiver DMA Request.....	5187
64.2.1.2.2	dma_req_tx - Transmitter DMA Request.....	5188
64.2.1.3	Special Signals.....	5188
64.2.1.3.1	stop_req - Stop Mode.....	5188
64.2.1.3.2	doze_req - Doze Mode.....	5188
64.2.1.3.3	debug_req - Debug Mode.....	5188
64.3	Clocks.....	5188
64.4	Functional Description.....	5189
64.4.1	Interrupts and DMA Requests.....	5189
64.4.2	Clocks.....	5190
64.4.2.1	Clock requirements.....	5190
64.4.2.2	Maximum Baud Rate.....	5190
64.4.2.3	Clocking in Low-Power Modes.....	5191

Section number	Title	Page
64.4.3	General UART Definitions.....	5191
64.4.3.1	RTS_B - UART Request To Send.....	5192
64.4.3.2	RTS Edge Triggered Interrupt.....	5193
64.4.3.3	DTR_B - Data Terminal Ready .....	5194
64.4.3.4	DSR_B - Data Set Ready.....	5194
64.4.3.5	DTR_B/DSR_B Edge Triggered Interrupt.....	5194
64.4.3.6	DCD_B - Data Carrier Detect.....	5195
64.4.3.7	RI_B - Ring Indicator.....	5195
64.4.3.8	CTS_B - Clear To Send.....	5195
64.4.3.9	Programmable CTS_B Deassertion.....	5196
64.4.3.10	TX_DATA - UART Transmit.....	5196
64.4.3.11	RX_DATA - UART Receive.....	5196
64.4.4	Transmitter.....	5198
64.4.4.1	Transmitter FIFO Empty Interrupt Suppression.....	5198
64.4.4.2	Transmitting a Break Condition.....	5200
64.4.5	Receiver.....	5200
64.4.5.1	Idle Line Detect.....	5201
64.4.5.2	Aging Character Detect.....	5202
64.4.5.3	Receiver Wake.....	5203
64.4.5.4	Receiving a BREAK Condition.....	5204
64.4.5.5	Vote Logic.....	5204
64.4.5.6	Baud Rate Automatic Detection Logic.....	5206
64.4.5.6.1	Baud Rate Automatic Detection Protocol.....	5207
64.4.5.6.2	New Baud Rate Determination.....	5207
64.4.5.6.2.1	New Autobaud Counter Stopped bit and Interrupt.....	5208
64.4.6	Escape Sequence Detection.....	5208
64.5	Binary Rate Multiplier (BRM).....	5210
64.6	Infrared Interface.....	5212
64.6.1	Generalities-Infrared.....	5212

Section number	Title	Page
64.6.2	Inverted Transmission and Reception bits (INVT & INVR).....	5213
64.6.3	InfraRed Special Case (IRSC) Bit.....	5213
64.6.4	IrDA interrupt.....	5214
64.6.5	Conclusion about IrDA.....	5215
64.6.6	Programming IrDA Interface.....	5216
64.6.6.1	High Speed.....	5216
64.6.6.2	Low Speed.....	5216
64.7	9-bit RS-485 Mode.....	5217
64.7.1	Generalities.....	5217
64.7.2	Transmit 9-bit RS-485 frames.....	5218
64.7.3	Receive 9-bit RS-485 frames.....	5218
64.7.3.1	RS-485 Slave Address Normal Detect Mode.....	5218
64.7.3.2	RS-485 Slave Address Automatic Detect Mode.....	5219
64.8	Low Power Modes.....	5219
64.8.1	UART Operation in System Doze Mode.....	5220
64.8.2	UART Operation in System Stop Mode.....	5220
64.8.3	Power Saving Method in UART.....	5221
64.9	UART Operation in System Debug State.....	5221
64.10	Reset.....	5222
64.10.1	Hardware reset.....	5222
64.10.2	Software reset.....	5222
64.11	Transfer Error.....	5222
64.12	Functional Timing.....	5223
64.12.1	IrDA Mode.....	5223
64.13	Initialization.....	5223
64.13.1	Programming the UART in RS-232 mode.....	5223
64.13.2	Programming the UART in 9-bit RS-485 mode.....	5225
64.14	References.....	5226

64.15.12	UART BRM Incremental Register (UARTx_UBIR).....	5252
64.15.13	UART BRM Modulator Register (UARTx_UBMR).....	5253
64.15.14	UART Baud Rate Count Register (UARTx_UBRC).....	5253
64.15.15	UART One Millisecond Register (UARTx_ONEMS).....	5254
64.15.16	UART Test Register (UARTx_UTS).....	5255
64.15.17	UART RS-485 Mode Control Register (UARTx_UMCR).....	5256

## **Chapter 65**

### **Universal Serial Bus Controller (USB)**

65.1	Overview.....	5259
65.1.1	Features.....	5260
65.1.2	Modes of Operation.....	5261
65.1.2.1	Normal Mode.....	5262
65.1.2.2	Low-Power Mode.....	5262
65.2	External Signals.....	5263
65.3	Functional Description.....	5263
65.3.1	USB 2.0 Controller Core 0.....	5264
65.3.1.1	Host Mode.....	5264

Section number	Title	Page
65.3.1.2	Peripheral (Device) Mode.....	5264
65.3.1.3	Pins Used for OTG Controller.....	5264
65.3.2	USB 2.0 Controller Core 1.....	5265
65.3.2.1	Pins Used for Host Controller 1.....	5265
65.3.3	USB 2.0 Controller Core 2.....	5265
65.3.4	USB 2.0 Controller Core 3.....	5265
65.3.5	USB Power Control.....	5266
65.3.5.1	Entering Low Power Suspend Mode.....	5266
65.3.5.2	Wake-Up Events.....	5266
65.3.5.2.1	Host Mode Events.....	5267
65.3.6	Interrupts.....	5267
65.3.6.1	USB Core Interrupts.....	5267
65.3.6.2	USB Wake-Up Interrupts.....	5268
65.4	USB Operation Model.....	5268
65.4.1	Register Interface.....	5268
65.4.1.1	Configuration, Control and Status Register Set.....	5269
65.4.1.2	Identification Registers.....	5271
65.4.1.3	OTG Operations.....	5271
65.4.1.3.1	Register Bits.....	5271
65.4.2	Host Data Structures.....	5273
65.4.2.1	Periodic Frame List.....	5273
65.4.2.2	Asynchronous List Queue Head Pointer.....	5275
65.4.2.3	Isochronous (High-Speed) Transfer Descriptor (iTDD).....	5276
65.4.2.3.1	Next Link Pointer.....	5277
65.4.2.3.2	iTDD Transaction Status and Control List.....	5278
65.4.2.3.3	iTDD Buffer Page Pointer List (Plus).....	5279
65.4.2.4	Split Transaction Isochronous Transfer Descriptor (siTDD).....	5281
65.4.2.4.1	Next Link Pointer.....	5281
65.4.2.4.2	siTDD Endpoint Capabilities/Characteristics.....	5282

Section number	Title	Page
65.4.2.4.3	siTD Transfer State.....	5283
65.4.2.4.4	siTD Buffer Pointer List (plus).....	5284
65.4.2.4.5	siTD Back Link Pointer.....	5285
65.4.2.5	Queue element transfer descriptor (qTD).....	5285
65.4.2.5.1	Next qTD Pointer.....	5286
65.4.2.5.2	Alternate Next qTD Pointer.....	5287
65.4.2.5.3	qTD Token.....	5287
65.4.2.5.4	qTD Buffer Page Pointer List.....	5290
65.4.2.6	Queue Head.....	5291
65.4.2.6.1	Queue Head Horizontal Link Pointer.....	5291
65.4.2.6.2	Queue Head Endpoint Capabilities/Characteristics.....	5292
65.4.2.6.3	Transfer Overlay-Queue Head.....	5294
65.4.2.7	Periodic Frame Span Traversal Node (FSTN).....	5295
65.4.2.7.1	FSTN Normal Path Pointer .....	5296
65.4.2.7.2	FSTN Back Path Link Pointer .....	5296
65.4.3	Host Operational Model .....	5297
65.4.3.1	Host Controller Initialization .....	5297
65.4.3.2	Port Routing and Control .....	5299
65.4.3.2.1	Port Routing Control through EHCI Configured (CF) Bit .....	5301
65.4.3.2.2	Port Routing Control through PortOwner and Disconnect Event .....	5302
65.4.3.2.3	Example Port Routing State Machine .....	5304
65.4.3.2.3.1	EHCI HC Owner .....	5304
65.4.3.2.3.2	Companion HC Owner .....	5305
65.4.3.2.4	Port Power .....	5305
65.4.3.2.5	Port Reporting Over-Current .....	5306
65.4.3.3	Suspend/Resume-Host Operational Model .....	5307
65.4.3.3.1	Port Suspend/Resume .....	5307

Section number	Title	Page
65.4.3.4	Schedule Traversal Rules .....	5310
65.4.3.4.1	Example - Preserving Micro-Frame Integrity .....	5312
65.4.3.4.1.1	Transaction Fit - A Best-Fit Approximation Algorithm .....	5312
65.4.3.5	Periodic Schedule Frame Boundaries vs Bus Frame Boundaries .....	5314
65.4.3.6	Periodic Schedule .....	5317
65.4.3.7	Managing Isochronous Transfers Using iTDs .....	5319
65.4.3.7.1	Host Controller Operational Model for iTDs .....	5319
65.4.3.7.2	Software Operational Model for iTDs .....	5321
65.4.3.7.2.1	Periodic scheduling threshold.....	5323
65.4.3.8	Asynchronous Schedule .....	5324
65.4.3.8.1	Adding Queue Heads to Asynchronous Schedule.....	5325
65.4.3.8.2	Removing Queue Heads from Asynchronous Schedule .....	5326
65.4.3.8.3	Empty Asynchronous Schedule Detection .....	5328
65.4.3.8.4	Restarting Asynchronous Schedule Before EOF .....	5329
65.4.3.8.4.1	Example Method for Restarting Asynchronous Schedule Traversal .....	5330
65.4.3.8.4.2	Async Sched Not Active .....	5331
65.4.3.8.4.3	Async Sched Active .....	5331
65.4.3.8.4.4	Async Sched Sleeping .....	5332
65.4.3.8.4.5	Example Derivation for AsyncSchedSleepTime.....	5332
65.4.3.8.5	Asynchronous schedule traversal: Start Event.....	5332
65.4.3.8.6	Reclamation Status Bit (USBSTS Register) .....	5333
65.4.3.9	Operational Model for Nak Counter.....	5333
65.4.3.9.1	Nak Count Reload Control .....	5335
65.4.3.9.1.1	Wait for List Head .....	5336
65.4.3.9.1.2	Do Reload .....	5336
65.4.3.9.1.3	Wait for Start Event .....	5336
65.4.3.10	Managing Control/Bulk/Interrupt Transfers through Queue Heads.....	5337
65.4.3.10.1	Fetch Queue Head .....	5339

Section number	Title	Page
65.4.3.10.2	Advance Queue .....	5339
65.4.3.10.3	Execute Transaction .....	5340
65.4.3.10.3.1	Interrupt Transfer Pre-condition Criteria .....	5341
65.4.3.10.3.2	Asynchronous Transfer Pre-operations and Pre-condition Criteria .....	5341
65.4.3.10.3.3	Transfer Type Independent Pre-operations.....	5341
65.4.3.10.3.4	Halting a Queue Head .....	5344
65.4.3.10.3.5	Asynchronous Schedule Park Mode .....	5345
65.4.3.10.4	Write Back qTD .....	5347
65.4.3.10.5	Follow Queue Head Horizontal Pointer .....	5347
65.4.3.10.6	Buffer Pointer List Use for Data Streaming with qTDs .....	5348
65.4.3.10.7	Adding Interrupt Queue Heads to the Periodic Schedule .....	5350
65.4.3.10.8	Managing Transfer Complete Interrupts from Queue Heads .....	5350
65.4.3.11	Ping Control.....	5351
65.4.3.12	Split Transactions .....	5352
65.4.3.12.1	Split Transactions for Asynchronous Transfers .....	5353
65.4.3.12.1.1	Asynchronous - Do Start Split.....	5354
65.4.3.12.1.2	Asynchronous - Do Complete Split .....	5354
65.4.3.12.2	Split Transaction Interrupt .....	5355
65.4.3.12.2.1	Split Transaction Scheduling Mechanisms for Interrupt .....	5356
65.4.3.12.2.2	Host Controller Operational Model for FSTNs.....	5359
65.4.3.12.2.3	Software Operational Model for FSTNs.....	5362
65.4.3.12.2.4	Tracking Split Transaction Progress for Interrupt Transfers .	5363
65.4.3.12.2.5	Split Transaction Execution State Machine for Interrupt .....	5364
65.4.3.12.2.6	Rebalancing the periodic schedule .....	5370
65.4.3.12.3	Split Transaction Isochronous .....	5371
65.4.3.12.3.1	Split Transaction Scheduling Mechanisms for Isochronous .	5371
65.4.3.12.3.2	Tracking Split Transaction Progress for Isochronous Transfers.....	5376

Section number	Title	Page
65.4.3.12.3.3	Split Transaction Execution State Machine for Isochronous	5378
65.4.3.12.3.4	Periodic Isochronous - Do Start Split .....	5379
65.4.3.12.3.5	Periodic Isochronous - Do Complete Split .....	5381
65.4.3.12.3.6	Complete-Split for Scheduling Boundary Cases 2a, 2b .....	5384
65.4.3.12.3.7	Split Transaction for Isochronous - Processing Examples ....	5386
65.4.3.13	Host Controller Pause.....	5388
65.4.3.14	Port Test Modes -Host Operational Model.....	5389
65.4.3.15	Interrupts-Host Operational Model.....	5389
65.4.3.15.1	Transfer/Transaction Based Interrupts .....	5391
65.4.3.15.1.1	Transaction Error .....	5391
65.4.3.15.1.2	Serial Bus Babble.....	5391
65.4.3.15.1.3	Data Buffer Error .....	5392
65.4.3.15.1.4	USB Interrupt (Interrupt on Completion (IOC)) .....	5393
65.4.3.15.1.5	Short Packet.....	5393
65.4.3.15.2	Host Controller Event Interrupts .....	5393
65.4.3.15.2.1	Port Change Events .....	5394
65.4.3.15.2.2	Frame List Rollover .....	5394
65.4.3.15.2.3	Interrupt on Async Advance .....	5394
65.4.3.15.2.4	Host System Error .....	5394
65.4.4	EHCI Deviation.....	5395
65.4.4.1	Embedded Transaction Translator Function.....	5396
65.4.4.1.1	Capability Registers.....	5396
65.4.4.1.2	Operational Registers.....	5397
65.4.4.1.3	Discovery-EHCI Deviation.....	5397
65.4.4.1.4	Data Structures.....	5397
65.4.4.1.5	Operational Model.....	5398
65.4.4.1.5.1	Micro- frame Pipeline.....	5398
65.4.4.1.5.2	Split State Machines.....	5399

Section number	Title	Page
	65.4.4.1.5.3 Asynchronous Transaction Scheduling and Buffer Management.....	5400
	65.4.4.1.5.4 Periodic Transaction Scheduling and Buffer Management....	5400
	65.4.4.1.5.5 Multiple Transaction Translators.....	5400
65.4.4.2	Device Operation.....	5401
	65.4.4.2.1 USB_USBMODE Register.....	5401
	65.4.4.2.2 Non-Zero Fields the Register File.....	5401
	65.4.4.2.3 SOF Interrupt.....	5401
65.4.4.3	Embedded Design Interface.....	5401
	65.4.4.3.1 Frame Adjust Register.....	5402
65.4.4.4	Miscellaneous variations from EHCI.....	5402
	65.4.4.4.1 Programmable Physical Interface Behaviour.....	5402
	65.4.4.4.2 Discovery.....	5402
	65.4.4.4.2.1 Port Reset.....	5402
	65.4.4.4.2.2 Port Speed Detection.....	5403
	65.4.4.4.3 Port Test Mode.....	5403
65.4.5	Device Data Structures.....	5403
	65.4.5.1 Endpoint Queue Head (dQH).....	5404
	65.4.5.1.1 Endpoint Capabilities/Characteristics.....	5405
	65.4.5.1.2 Transfer Overlay-Endpoint Queue Head.....	5406
	65.4.5.1.3 Current dTD Pointer.....	5406
	65.4.5.1.4 Set-up Buffer.....	5407
	65.4.5.2 Endpoint Transfer Descriptor (dTD).....	5407
65.4.6	Device Operational Model.....	5409
	65.4.6.1 Device Controller Initialization.....	5410
	65.4.6.2 Port State and Control.....	5411
	65.4.6.2.1 Bus Reset.....	5413
	65.4.6.2.2 Suspend/Resume.....	5414
	65.4.6.2.2.1 Suspend.....	5414

Section number	Title	Page
	65.4.6.2.2 Resume.....	5415
65.4.6.3	Managing Endpoints.....	5415
	65.4.6.3.1 Endpoint Initialization.....	5416
	65.4.6.3.2 Stalling.....	5417
	65.4.6.3.3 Data Toggle .....	5418
	65.4.6.3.3.1 Data Toggle Reset.....	5418
	65.4.6.3.3.2 Data Toggle Inhibit.....	5418
	65.4.6.3.3.3 Priming Transmit Endpoints.....	5418
	65.4.6.3.3.4 Priming Receive Endpoints.....	5419
65.4.6.4	Operational Model For Packet Transfers.....	5419
	65.4.6.4.1 Interrupt/Bulk Endpoint Operational Model.....	5420
	65.4.6.4.1.1 Interrupt/Bulk Endpoint Bus Response Matrix.....	5422
	65.4.6.4.2 Control Endpoint Operation Model.....	5422
	65.4.6.4.2.1 Setup Phase.....	5422
	65.4.6.4.2.2 Data Phase.....	5423
	65.4.6.4.2.3 Status Phase.....	5424
	65.4.6.4.2.4 Control Endpoint Bus Response Matrix.....	5424
	65.4.6.4.3 Isochronous Endpoint Operational Model.....	5425
	65.4.6.4.3.1 Isochronous Pipe Synchronization.....	5427
	65.4.6.4.3.2 Isochronous Endpoint Bus Response Matrix.....	5427
65.4.6.5	Managing Queue Heads.....	5427
	65.4.6.5.1 Queue Head Initialization.....	5428
	65.4.6.5.2 Operational Model For Setup Transfers.....	5429
65.4.6.6	Managing Transfers with Transfer Descriptors.....	5430
	65.4.6.6.1 Software Link Pointers.....	5430
	65.4.6.6.2 Building a Transfer Descriptor.....	5430
	65.4.6.6.3 Executing A Transfer Descriptor.....	5431
	65.4.6.6.4 Transfer Completion.....	5432
	65.4.6.6.5 Flushing/De-priming an Endpoint.....	5432

Section number	Title	Page
	65.4.6.6.6 Device Error Matrix.....	5433
	65.4.6.7 Servicing Interrupts.....	5434
	65.4.6.7.1 High-Frequency Interrupts.....	5434
	65.4.6.7.2 Low-Frequency Interrupts.....	5434
	65.4.6.7.3 Error Interrupts.....	5434
65.5	USB Non-Core Memory Map/Register Definition.....	5435
65.5.1	USB OTG Control Register (USBNC_USB_OTG_CTRL).....	5437
65.5.2	USB Host1 Control Register (USBNC_USB_UH1_CTRL).....	5440
65.5.3	USB Host2 Control Register (USBNC_USB_UH2_CTRL).....	5443
65.5.4	USB Host3 Control Register (USBNC_USB_UH3_CTRL).....	5445
65.5.5	USB Host2 HSIC Control Register (USBNC_USB_UH2_HSIC_CTRL).....	5447
65.5.6	USB Host3 HSIC Control Register (USBNC_USB_UH3_HSIC_CTRL).....	5449
65.5.7	OTG UTMI PHY Control 0 Register (USBNC_USB_OTG_PHY_CTRL_0).....	5450
65.5.8	Host1 UTMI PHY Control 0 Register (USBNC_USB_UH1_PHY_CTRL_0).....	5451
65.6	USB Core Memory Map/Register Definition.....	5452
65.6.1	Identification register (USB_nID).....	5457
65.6.2	Hardware General (USB_nHWGENERAL).....	5458
65.6.3	Host Hardware Parameters (USB_nHWHOST).....	5459
65.6.4	Device Hardware Parameters (USB_nHWDEVICE).....	5460
65.6.5	TX Buffer Hardware Parameters (USB_nHWTXBUF).....	5460
65.6.6	RX Buffer Hardware Parameters (USB_nHWRXBUF).....	5461
65.6.7	General Purpose Timer #0 Load (USB_nGPTIMER0LD).....	5462
65.6.8	General Purpose Timer #0 Controller (USB_nGPTIMER0CTRL).....	5462
65.6.9	General Purpose Timer #1 Load (USB_nGPTIMER1LD).....	5464
65.6.10	General Purpose Timer #1 Controller (USB_nGPTIMER1CTRL).....	5464
65.6.11	System Bus Config (USB_nSBUSCFG).....	5465
65.6.12	Capability Registers Length (USB_nCAPLENGTH).....	5466
65.6.13	Host Controller Interface Version (USB_nHCVERSION).....	5467
65.6.14	Host Controller Structural Parameters (USB_nHCSPARAMS).....	5467

Section number	Title	Page
65.6.15	Host Controller Capability Parameters (USB_nHCCPARAMS).....	5469
65.6.16	Device Controller Interface Version (USB_nDCIVERSION).....	5471
65.6.17	Device Controller Capability Parameters (USB_nDCCPARAMS).....	5471
65.6.18	USB Command Register (USB_nUSBCMD).....	5473
65.6.19	USB Status Register (USB_nUSBSTS).....	5477
65.6.20	Interrupt Enable Register (USB_nUSBINTR).....	5481
65.6.21	USB Frame Index (USB_nFRINDEX).....	5483
65.6.22	Frame List Base Address (USB_nPERIODICLISTBASE).....	5484
65.6.23	Device Address (USB_nDEVICEADDR).....	5484
65.6.24	Next Asynch. Address (USB_nASYNCLISTADDR).....	5485
65.6.25	Endpoint List Address (USB_nENDPTLISTADDR).....	5486
65.6.26	Programmable Burst Size (USB_nBURSTSIZE).....	5486
65.6.27	TX FIFO Fill Tuning (USB_nTXFILLTUNING).....	5487
65.6.28	Endpoint NAK (USB_nENDPTNAK).....	5489
65.6.29	Endpoint NAK Enable (USB_nENDPTNAKEN).....	5489
65.6.30	Configure Flag Register (USB_nCONFIGFLAG).....	5490
65.6.31	Port Status & Control (USB_nPORTSC1).....	5490
65.6.32	On-The-Go Status & control (USB_nOTGSC).....	5497
65.6.33	USB Device Mode (USB_nUSBMODE).....	5501
65.6.34	Endpoint Setup Status (USB_nENDPTSETUPSTAT).....	5502
65.6.35	Endpoint Prime (USB_nENDPTPRIME).....	5503
65.6.36	Endpoint Flush (USB_nENDPTFLUSH).....	5504
65.6.37	Endpoint Status (USB_nENDPTSTAT).....	5504
65.6.38	Endpoint Complete (USB_nENDPTCOMPLETE).....	5505
65.6.39	Endpoint Control0 (USB_nENDPTCTRL0).....	5506
65.6.40	Endpoint Control 1 (USB_nENDPTCTRL1).....	5508
65.6.41	Endpoint Control 2 (USB_nENDPTCTRL2).....	5511
65.6.42	Endpoint Control 3 (USB_nENDPTCTRL3).....	5513
65.6.43	Endpoint Control 4 (USB_nENDPTCTRL4).....	5516

Section number	Title	Page
65.6.44	Endpoint Control 5 (USB_nENDPTCTRL5).....	5519
65.6.45	Endpoint Control 6 (USB_nENDPTCTRL6).....	5522
65.6.46	Endpoint Control 7 (USB_nENDPTCTRL7).....	5525

## Chapter 66 Universal Serial Bus 2.0 Integrated PHY (USB-PHY)

66.1	USB PHY Overview.....	5529
66.2	Operation.....	5530
66.2.1	UTMI.....	5531
66.2.2	Digital Transmitter.....	5531
66.2.3	Digital Receiver.....	5531
66.2.4	Analog Receiver.....	5531
66.2.4.1	HS Differential Receiver.....	5532
66.2.4.2	Squelch Detector.....	5533
66.2.4.3	LS/FS Differential Receiver.....	5533
66.2.4.4	HS Disconnect Detector.....	5533
66.2.4.5	USB Plugged-In Detector.....	5533
66.2.4.6	Single-Ended USB_DP Receiver.....	5534
66.2.4.7	Single-Ended USB_DN Receiver.....	5534
66.2.4.8	9X Oversample Module.....	5534
66.2.5	Analog Transmitter.....	5534
66.2.5.1	Switchable High-Speed 45Ω Termination Resistors.....	5534
66.2.5.2	Low-Speed/Full-Speed Differential Driver.....	5535
66.2.5.3	High-Speed Differential Driver.....	5535
66.2.5.4	Switchable 1.5KΩ USB_DP Pullup Resistor.....	5535
66.2.5.5	Switchable 15KΩ USB_DP Pulldown Resistor.....	5535
66.2.6	Recommended Register Configuration for USB Certification.....	5537
66.2.7	Charger detection.....	5537
66.2.7.1	Charger detect control table.....	5537
66.2.7.2	Data pin contact detector.....	5537

Section number	Title	Page
66.2.7.3	Charger detector.....	5538
66.2.7.4	Charger detection software flow.....	5538
66.2.7.5	Dead Battery Protect.....	5540
66.3	USB PHY Memory Map/Register Definition.....	5540
66.3.1	USB PHY Power-Down Register (USBPHY <sub>x</sub> _PWD <sub>n</sub> ).....	5543
66.3.2	USB PHY Transmitter Control Register (USBPHY <sub>x</sub> _TX <sub>n</sub> ).....	5545
66.3.3	USB PHY Receiver Control Register (USBPHY <sub>x</sub> _RX <sub>n</sub> ).....	5546
66.3.4	USB PHY General Control Register (USBPHY <sub>x</sub> _CTRL <sub>n</sub> ).....	5548
66.3.5	USB PHY Status Register (USBPHY <sub>x</sub> _STATUS).....	5551
66.3.6	USB PHY Debug Register (USBPHY <sub>x</sub> _DEBUG <sub>n</sub> ).....	5553
66.3.7	UTMI Debug Status Register 0 (USBPHY <sub>x</sub> _DEBUG0_STATUS).....	5555
66.3.8	UTMI Debug Status Register 1 (USBPHY <sub>x</sub> _DEBUG1 <sub>n</sub> ).....	5556
66.3.9	UTMI RTL Version (USBPHY <sub>x</sub> _VERSION).....	5557
66.4	USB Analog Memory Map/Register Definition.....	5557
66.4.1	USB VBUS Detect Register (USB_ANALOG_USB1_VBUS_DETECT <sub>n</sub> ).....	5559
66.4.2	USB Charger Detect Register (USB_ANALOG_USB1_CHRG_DETECT <sub>n</sub> ).....	5560
66.4.3	USB VBUS Detect Status Register (USB_ANALOG_USB1_VBUS_DETECT_STAT).....	5562
66.4.4	USB Charger Detect Status Register (USB_ANALOG_USB1_CHRG_DETECT_STAT).....	5564
66.4.5	USB Misc Register (USB_ANALOG_USB1_MISC <sub>n</sub> ).....	5565
66.4.6	USB VBUS Detect Register (USB_ANALOG_USB2_VBUS_DETECT <sub>n</sub> ).....	5566
66.4.7	USB Charger Detect Register (USB_ANALOG_USB2_CHRG_DETECT <sub>n</sub> ).....	5568
66.4.8	USB VBUS Detect Status Register (USB_ANALOG_USB2_VBUS_DETECT_STAT).....	5570
66.4.9	USB Charger Detect Status Register (USB_ANALOG_USB2_CHRG_DETECT_STAT).....	5572
66.4.10	USB Misc Register (USB_ANALOG_USB2_MISC <sub>n</sub> ).....	5573
66.4.11	Chip Silicon Version (USB_ANALOG_DIGPROG).....	5574

## Chapter 67 Ultra Secured Digital Host Controller (uSDHC)

67.1	Overview.....	5577
67.1.1	Features.....	5580

Section number	Title	Page
67.1.2	Modes and Operations.....	5581
67.1.2.1	Data transfer Modes.....	5581
67.2	External Signals.....	5581
67.2.1	Signals Overview.....	5584
67.3	Clocks.....	5585
67.4	Functional Description.....	5585
67.4.1	Data Buffer.....	5585
67.4.1.1	Write Operation Sequence.....	5588
67.4.1.2	Read Operation Sequence.....	5588
67.4.1.3	Data Buffer and Block Size.....	5589
67.4.1.4	Dividing Large Data Transfer.....	5590
67.4.1.5	External DMA Request.....	5591
67.4.2	DMA AHB Interface.....	5592
67.4.2.1	Internal DMA Request.....	5593
67.4.2.2	DMA Burst Length.....	5594
67.4.2.3	AHB Master Interface.....	5594
67.4.2.4	ADMA Engine.....	5594
67.4.2.4.1	ADMA Concept and Descriptor Format.....	5595
67.4.2.4.2	ADMA Interrupt.....	5599
67.4.2.4.3	ADMA Error.....	5600
67.4.3	Register Bank with IP Bus Interface.....	5600
67.4.3.1	SD Protocol Unit.....	5601
67.4.3.2	SD control misc.....	5602
67.4.3.3	SD Clock control.....	5602
67.4.3.4	Command control.....	5602
67.4.3.5	Data control.....	5603
67.4.4	Clock & Reset Manager.....	5603
67.4.5	Clock Generator.....	5604

Section number	Title	Page
67.4.6	SDIO Card Interrupt.....	5604
67.4.6.1	Interrupts in 1-bit Mode.....	5604
67.4.6.2	Interrupt in 4-bit Mode.....	5604
67.4.6.3	Card Interrupt Handling.....	5605
67.4.7	Card Insertion and Removal Detection.....	5606
67.4.8	Power Management and Wake Up Events.....	5607
67.4.8.1	Setting Wake Up Events.....	5608
67.4.9	MMC fast boot.....	5608
67.4.9.1	Boot operation.....	5608
67.4.9.2	Alternative boot operation.....	5609
67.5	Initialization/Application of uSDHC.....	5610
67.5.1	Command Send & Response Receive Basic Operation.....	5610
67.5.2	Card Identification Mode.....	5611
67.5.2.1	Card Detect.....	5611
67.5.2.2	Reset.....	5612
67.5.2.3	Voltage Validation.....	5613
67.5.2.4	Card Registry.....	5615
67.5.3	Card Access.....	5616
67.5.3.1	Block Write.....	5616
67.5.3.1.1	Normal Write.....	5616
67.5.3.1.2	DDR Write.....	5618
67.5.3.1.3	Write with Pause.....	5618
67.5.3.2	Block Read.....	5620
67.5.3.2.1	Normal Read.....	5620
67.5.3.2.2	DDR Read.....	5620
67.5.3.2.3	Read with Pause.....	5621
67.5.3.2.4	DLL (Delay Line) in Read Path.....	5622
67.5.3.3	Suspend Resume.....	5624
67.5.3.3.1	Suspend.....	5624

Section number	Title	Page
	67.5.3.3.2 Resume.....	5625
67.5.3.4	ADMA Usage.....	5625
67.5.3.5	Transfer Error.....	5626
	67.5.3.5.1 CRC Error.....	5626
	67.5.3.5.2 Internal DMA Error.....	5626
	67.5.3.5.3 Transfer ADMA Error.....	5627
	67.5.3.5.4 Auto CMD12 Error.....	5627
67.5.3.6	Card Interrupt.....	5628
67.5.4	Switch Function.....	5628
67.5.4.1	Query, Enable and Disable SDIO High Speed Mode.....	5629
67.5.4.2	Query, Enable and Disable SD High Speed Mode/SDR50/SDR104/DDR50.....	5629
67.5.4.3	Query, Enable and Disable MMC High Speed Mode.....	5630
67.5.4.4	Set MMC Bus Width.....	5630
67.5.5	ADMA Operation.....	5630
67.5.5.1	ADMA1 Operation.....	5630
67.5.5.2	ADMA2 Operation.....	5631
67.5.6	Fast Boot Operation.....	5631
67.5.6.1	Normal fast boot flow .....	5632
67.5.6.2	Alternative fast boot flow.....	5632
67.5.6.3	Fast boot application case (in DMA mode).....	5633
67.6	Commands for MMC/SD/SDIO.....	5635
67.7	Software Restrictions.....	5640
67.7.1	Initialization Active.....	5640
67.7.2	Software Polling Procedure.....	5641
67.7.3	Suspend Operation.....	5641
67.7.4	Data Length Setting.....	5641
67.7.5	(A)DMA Address Setting.....	5641
67.7.6	Data Port Access.....	5642
67.7.7	Change Clock Frequency.....	5642

Section number	Title	Page
67.7.8	Multi-block Read.....	5642
67.8	uSDHC Memory Map/Register Definition.....	5642
67.8.1	DMA System Address (uSDHCx_DS_ADDR).....	5648
67.8.2	Block Attributes (uSDHCx_BLK_ATT).....	5648
67.8.3	Command Argument (uSDHCx_CMD_ARG).....	5649
67.8.4	Command Transfer Type (uSDHCx_CMD_XFR_TYP).....	5650
67.8.5	Command Response0 (uSDHCx_CMD_RSP0).....	5653
67.8.6	Command Response1 (uSDHCx_CMD_RSP1).....	5654
67.8.7	Command Response2 (uSDHCx_CMD_RSP2).....	5654
67.8.8	Command Response3 (uSDHCx_CMD_RSP3).....	5655
67.8.9	Data Buffer Access Port (uSDHCx_DATA_BUFF_ACC_PORT).....	5656
67.8.10	Present State (uSDHCx_PRES_STATE).....	5657
67.8.11	Protocol Control (uSDHCx_PROT_CTRL).....	5662
67.8.12	System Control (uSDHCx_SYS_CTRL).....	5667
67.8.13	Interrupt Status (uSDHCx_INT_STATUS).....	5670
67.8.14	Interrupt Status Enable (uSDHCx_INT_STATUS_EN).....	5676
67.8.15	Interrupt Signal Enable (uSDHCx_INT_SIGNAL_EN).....	5679
67.8.16	Auto CMD12 Error Status (uSDHCx_AUTOCMD12_ERR_STATUS).....	5681
67.8.17	Host Controller Capabilities (uSDHCx_HOST_CTRL_CAP).....	5685
67.8.18	Watermark Level (uSDHCx_WTMK_LVL).....	5687
67.8.19	Mixer Control (uSDHCx_MIX_CTRL).....	5688
67.8.20	Force Event (uSDHCx_FORCE_EVENT).....	5690
67.8.21	ADMA Error Status Register (uSDHCx_ADMA_ERR_STATUS).....	5693
67.8.22	ADMA System Address (uSDHCx_ADMA_SYS_ADDR).....	5695
67.8.23	DLL (Delay Line) Control (uSDHCx_DLL_CTRL).....	5696
67.8.24	DLL Status (uSDHCx_DLL_STATUS).....	5698
67.8.25	CLK Tuning Control and Status (uSDHCx_CLK_TUNE_CTRL_STATUS).....	5699
67.8.26	Vendor Specific Register (uSDHCx_VEND_SPEC).....	5701
67.8.27	MMC Boot Register (uSDHCx_MMC_BOOT).....	5704

Section number	Title	Page
67.8.28	Vendor Specific 2 Register (uSDHCx_VEND_SPEC2).....	5705

## Chapter 68 Video Data Order Adapter (VDOA)

68.1	Overview.....	5707
68.1.1	Block Diagram.....	5707
68.1.2	Features.....	5708
68.2	Clocks.....	5708
68.3	Functional Description.....	5709
68.3.1	Memory organization .....	5709
68.3.1.1	Frame organization - VPU .....	5709
68.3.1.2	Frame organization - IPU.....	5710
68.3.2	Conversion types.....	5710
68.3.3	IPU synchronization.....	5710
68.3.4	Double buffering.....	5710
68.4	VDOA Memory Map/Register Definition.....	5711
68.4.1	VDOA Control Register (VDOA_VDOAC).....	5712
68.4.2	VDOA Start and Reset (VDOA_VDOASRR).....	5713
68.4.3	VDOA Interrupt Enable Register (VDOA_VDOAIE).....	5714
68.4.4	VDOA Interrupt Status Register (VDOA_VDOAIST).....	5714
68.4.5	VDOA Frame Parameters Register (VDOA_VDOAFP).....	5715
68.4.6	VDOA IPU External Buffer 0 Frame 0 Address Register (VDOA_VDOAIEBA00).....	5715
68.4.7	VDOA IPU External Buffer 0 Frame 1 Address Register (VDOA_VDOAIEBA01).....	5716
68.4.8	VDOA IPU External Buffer 0 Frame 2 Address Register (VDOA_VDOAIEBA02).....	5716
68.4.9	VDOA IPU External Buffer 1 Frame 0 Address Register (VDOA_VDOAIEBA10).....	5716
68.4.10	VDOA IPU External Buffer 1 Frame 1 Address Register (VDOA_VDOAIEBA11).....	5717
68.4.11	VDOA IPU External Buffer 1 Frame 2 Address Register (VDOA_VDOAIEBA12).....	5717
68.4.12	VDOA IPU Stride Line Register (VDOA_VDOASL).....	5718
68.4.13	VDOA IPU U (Chroma) Buffer Offset Register (VDOA_VDOAIUBO).....	5718
68.4.14	VDOA VPU External Buffer 0 Address Register (VDOA_VDOAVEBA0).....	5719

Section number	Title	Page
68.4.15	VDOA VPU External Buffer 1 Address Register (VDOA_VDOAVEBA1).....	5719
68.4.16	VDOA VPU External Buffer 2 Address Register (VDOA_VDOAVEBA2).....	5719
68.4.17	VDOA VPU U (Chroma) Buffer Offset Register (VDOA_VDOAVUBO).....	5720
68.4.18	VDOA Status Register (VDOA_VDOASR).....	5721

## Chapter 69 Video Processing Unit (VPU)

69.1	Overview.....	5723
69.1.1	Features.....	5724
69.2	Modes of Operation.....	5726
69.2.1	Normal Operating Mode.....	5726
69.2.2	Low Power Mode.....	5726
69.3	Clocks.....	5726
69.4	Functional Description.....	5727
69.4.1	VPU Architecture.....	5727
69.4.1.1	Embedded BIT processor.....	5728
69.4.1.2	Video CODEC Hardware.....	5728
69.4.1.2.1	Inter-Predictor.....	5728
69.4.1.2.2	AC/DC and Intra-Predictor.....	5729
69.4.1.2.3	Inverse transform/Inverse quantization.....	5729
69.4.1.2.4	De-blocking/Overlap-smoothing filter.....	5729
69.4.1.2.5	Coefficient buffer interface.....	5729
69.4.1.2.6	Macroblock controller.....	5729
69.4.1.2.7	Rotation/Mirroring .....	5730
69.4.2	Reset.....	5731
69.4.3	Interrupts.....	5732
69.4.4	Endianness.....	5732
69.5	Initialization Information.....	5733

Section number	Title	Page
69.6	Application Information.....	5734
69.6.1	Video Decoding Processing Control.....	5734
69.6.1.1	Video Decoding Process Flow.....	5734
69.6.1.2	Video Decoding Process Command.....	5736
69.6.1.3	Video Decoding Process Finish Detection.....	5737
69.6.1.4	Video Decoding Process Flow Example.....	5738
69.6.2	Video Encoding Processing Control.....	5740
69.6.2.1	The Pipeline for Encoding.....	5740
69.6.3	Video Codec Processing Buffer Requirement.....	5744
69.6.3.1	Memory Map Types of Frame Buffer.....	5745
69.6.3.2	Frame Buffer.....	5746
69.6.3.3	BIT Processor Program Buffer.....	5748
69.6.3.4	Working Buffer.....	5749
69.6.3.5	Bitstream Buffer.....	5749
69.6.3.6	Parameter Buffer.....	5750
69.6.3.7	Search RAM.....	5750
69.6.3.8	Buffer Requirement Summary.....	5750
69.7	VPU Memory Map/Register Definition.....	5750
69.7.1	BIT Processor run start (VPU_CodeRun).....	5752
69.7.2	BIT Boot Code Download Data register (VPU_CodeDown).....	5752
69.7.3	Host Interrupt Request to BIT (VPU_HostIntReq).....	5753
69.7.4	BIT Interrupt Clear (VPU_BitIntClear).....	5754
69.7.5	BIT Interrupt Status (VPU_BitIntSts).....	5755
69.7.6	BIT Current PC (VPU_BitCurPc).....	5756
69.7.7	BIT CODEC Busy (VPU_BitCodecBusy).....	5757

## Chapter 70 Watchdog Timer (WDOG)

70.1	Overview.....	5759
70.1.1	Features.....	5760

Section number	Title	Page
70.2	External signals.....	5761
70.3	Clocks.....	5761
70.4	Watchdog mechanism and system integration.....	5761
70.5	Functional description.....	5763
70.5.1	Timeout event.....	5763
70.5.1.1	Servicing WDOG to reload the counter.....	5764
70.5.2	Interrupt event .....	5764
70.5.3	Power-down counter event.....	5764
70.5.4	Low power modes.....	5765
70.5.4.1	STOP and DOZE mode.....	5765
70.5.4.2	WAIT mode.....	5765
70.5.5	Debug mode.....	5766
70.5.6	Operations.....	5766
70.5.6.1	Watchdog reset generation.....	5766
70.5.6.2	WDOG_B generation.....	5766
70.5.7	Reset.....	5768
70.5.8	Interrupt.....	5769
70.5.9	Flow Diagrams.....	5769
70.6	Initialization.....	5771
70.7	WDOG Memory Map/Register Definition.....	5772
70.7.1	Watchdog Control Register (WDOGx_WCR).....	5772
70.7.2	Watchdog Service Register (WDOGx_WSR).....	5774
70.7.3	Watchdog Reset Status Register (WDOGx_WRSR).....	5775
70.7.4	Watchdog Interrupt Control Register (WDOGx_WICR).....	5776
70.7.5	Watchdog Miscellaneous Control Register (WDOGx_WMCR).....	5777

## Chapter 71 Crystal Oscillator (XTALOSC)

71.1	Overview.....	5779
71.2	External Signals.....	5779

<b>Section number</b>	<b>Title</b>	<b>Page</b>
71.3	Crystal Oscillator 24 MHz.....	5780
71.3.1	Oscillator Configuration (24 MHz).....	5780
71.3.2	Bypass Configuration (24 MHz).....	5781
71.3.3	Crystal Frequency Detection(24 MHz).....	5782
71.4	Crystal Oscillator 32 kHz.....	5782
71.4.1	Oscillator Configuration (32 kHz).....	5782
71.4.2	Bypass Configuration (32 kHz).....	5783
71.5	XTALOSC 24MHz Memory Map/Register Definition.....	5784
71.5.1	Miscellaneous Register 0 (XTALOSC24M_MISC0).....	5785

# Chapter 1

## Introduction

### 1.1 About This Document

The i.MX 6Solo/6DualLite application processors are Freescale Semiconductor's latest additions to a growing family of multimedia-focused products offering high performance processing optimized for lowest power consumption.

The i.MX 6Solo/6DualLite processors feature Freescale's advanced implementation of the ARM<sup>®</sup>Cortex<sup>®</sup>-A9 core, which can be interfaced with DDR3- 800 , LV-DDR3- 800 and LPDDR2- 800(single and dual channel) DRAM memory devices.

These products are suitable for applications such as:

- Automotive navigation and entertainment
- High-end Mobile Internet Devices and high-end PDAs
- Netbooks
- Nettops
- High-end portable media players with HD video capability
- Portable navigation devices
- Gaming Consoles

#### 1.1.1 Audience

This manual is intended to be used by board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands concepts of digital system design, microprocessor architecture, Input / Output (I/O) devices, industry standard communication and device interface protocols.

## 1.1.2 Organization

This document covers the i.MX 6Solo/6DualLite at a system level and provides an architectural overview. Also covered are system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

## 1.1.3 Suggested Reading

This section lists additional reading materials that provide background for the information in this manual, as well as general information about the architecture.

### 1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex-A9 processor.

For information about the ARM Cortex-A9 processor see:

- <http://infocenter.arm.com>

### 1.1.3.2 Related Documentation

Freescale documentation is available from the sources listed on the back cover of this manual; the document order numbers are included in parentheses for ease in ordering.

For a current list of documentation, refer to <http://www.freescale.com>.

## 1.1.4 Conventions

This document uses the following notational conventions:

### cleared / set

When a bit takes the value zero, it is said to be cleared; when it takes a value of one, it is said to be set.

### mnemonics

Instruction mnemonics are shown in lowercase bold

### italics

Italics indicate variable command parameters, for example, *bcctrx*

Book titles in text are set in italics

15

An integer in decimal

0x

Prefix to denote hexadecimal number

0b

Prefix to denote binary number. Binary 0 and 1 are written without the prefix.

**n'H4000CA00**

n-bit Hexadecimal number

**BLK\_REG\_NAME**

Register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (\_).

**BLK\_REG[FIELD]**

Fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

**BLK\_REG[ *n* ]**Bit number *n* within register BLK.REG.**BLK\_REG[ *l:r* ]**Register bit ranges. Ranges are indicated by the left-most bit number *l* and the right-most bit number *r* separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.**x, U**

In some contexts, such as signal encodings, an unitalicized x indicates a don't care or uninitialized. The binary value could be 1 or 0.

***x***An italicized *x* indicates an alphanumeric variable***n, m***Italicized *n* or *m* represent integer variables**!**

Binary logic operator NOT

**&&**

Binary logic operator AND

**||**

Binary logic operator OR

**^ or <O+>**

Binary logic operator XOR

**|**

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value 0b1001.

**&**

Bit-wise AND. For example, 0b0001 &amp; 0b1000 yields the value 0b0000.

**{A,B}**

Concatenation, where the  $n$ -bit value  $A$  is prepended to the  $m$ -bit value  $B$  to form an  $(n + m)$ -bit value. For example,  $\{0, \text{REG}m [14:0]\}$  yields a 16-bit value with 0 in the most significant bit.

- or grey fill

Indicates a reserved bit field in an register. Although these bits can be written to as ones or zeros, they are always read as zeros.

>>

Shift right logical one position

<<

Shift left logical one position

= <left arrow>

Assignment

==

Compare equal

!=

Compare not equal

>

Greater than

<

Less than

## 1.1.5 Register Access

### 1.1.5.1 Register Diagram Field Access Type Legend

The following figure provides the interpretation of the notation used in register diagrams for a number of common field access types.

Figure 1-1. Register Field Conventions

#### NOTE

For reserved register fields, software should mask off the data in the field after read (software can not rely on the contents of data read from a reserved field) and always write all zeros.

### 1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all bits set to 1 perform the associated operation on the primary register, while all bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read/modify/write operations. When atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

### 1.1.6 Signal Conventions

**\_b, \_B**

When appended to a signal name, indicates that a signal is active-low

**NEG\_ACTIVE**

Overbar also denotes a negative active signal

**UPPERCASE**

## About This Document

Package pin names, Block I/O signals

### lowercase

Lowercase is used to indicate internal signals

## 1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

### Acronyms and Abbreviated Terms

Term	Meaning
AHB	Advanced High-performance Bus
ALU	Arithmetic Logic Unit
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
AXI	Advanced eXtensible Interface
BIST	Built-in self test
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
EPROM	Erasable programmable read-only memory
FIFO	First-in-first-out
GPIO	General-purpose I/O
GPR	General-purpose register
GPS	Global Positioning System
GPU	Graphics Processing Unit
HAB	High Assurance Boot
I2C or I <sup>2</sup> C	Inter-integrated circuit
IEEE	Institute of Electrical and Electronics Engineers
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LCD	Liquid Crystal Display
LDO	Low-Dropout
LIFO	Last-in-first-out
LRU	Least recently used
LSB	Least-significant byte
LUT	Lookup Table
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MMC	MultiMedia Card

*Table continues on the next page...*

Term	Meaning
MSB	Most-significant byte
MT/s	Mega transfers per second
OCRAM	On-Chip Random Access Memory
PCI	Peripheral Component Interconnect
PCIe	PCI enhanced
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable interrupt controller
POR	Power-on reset
PSRAM	Pseudo-Static Random Access Memory
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced instruction set computing
ROM	Read-Only Memory
RTOS	Real-time operating system
Rx	Receive
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous data link control
SDMA	Smart DMA
SoC	System-On-Chip
SPDIF	Sony Phillips Digital Interface
SPI	Serial peripheral interface
SRAM	Static random access memory
TFT	Thin Film Transistor
Tx	Transmit
UART	Universal asynchronous receiver/transmitter
USB	Universal serial bus
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

## 1.2 Introduction

This chapter introduces the architecture of the i.MX 6Solo/6DualLite Multimedia Applications Processor.

The i.MX 6Solo/6DualLite processor represents Freescale Semiconductor's latest achievement in integrated multimedia applications processors .

It is part of a growing family of multimedia-focused products, offering high performance processing optimized for the lowest power consumption.

### 1.3 Target Applications

The i.MX 6Solo/6DualLite applications processor is tailored for use in multimedia-centric smart mobile devices, driver information systems including infotainment and graphical instrument clusters, and portable medical devices.

The architecture's flexibility also allows for use in a wide variety of general embedded applications. The heart of the application chipset, the i.MX 6Solo/6DualLite processor provides all of the interfaces necessary for connecting peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

### 1.4 Features

The i.MX 6Solo/6DualLite processors are based on ARM Cortex-A9 MPCore™ Platform, which has the following features:

- The i.MX 6Solo supports single ARM Cortex-A9 MPCore (with TrustZone)
- The i.MX 6DualLite supports dual ARM Cortex-A9 MPCore (with TrustZone)

The core configuration is symmetric, where each core includes:

- 32 KByte L1 Instruction Cache
- 32 KByte L1 Data Cache
- Private Timer and Watchdog
- Cortex-A9 NEON MPE (Media Processing Engine) Co-processor

The ARM Cortex-A9 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 512 KB unified I/D L2 cache:
  - Used by one core in i.MX 6Solo
  - Shared by two cores in i.MX 6DualLite
- Two Master AXI (32-bit) bus interfaces output of L2 cache

Target frequency of the core (including Neon and L1 cache) is 800 MHz non-overdrive over the specified temperature range:

- 1 GHz overdrive over the specified temperature range
- 800 MHz non-overdrive over the specified temperature range

- NEON MPE coprocessor
- SIMD Media Processing Architecture
- NEON register file with 32x64-bit general-purpose registers
- NEON Integer execute pipeline (ALU, Shift, MAC)
- NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
- NEON load/store and permute pipeline
- Supports single and double-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations as described in the ARM VFPv3 architecture.
- Provides conversions between 16-bit, 32-bit, and 64-bit floating-point formats and ARM integer word formats

The memory system consists of the following components:

- Level 1 Cache—32 KB Instruction, 32 KB Data cache per core
- Level 2 Cache—Unified instruction and data (256 KB)

On-Chip Memory:

- Boot ROM, including HAB (96 KB)
- Internal multimedia / shared, fast access RAM (OCRAM, 128 KB)
- Secure/non-secure RAM (16 KB)

External memory interfaces:

The i.MX 6Solo/6DualLite processors support latest, high volume, cost effective handheld DRAM, NOR, and NAND Flash memory standards.

- In i.MX 6Solo, 16/32-bit LP-DDR2-800, 16/32-bit DDR3-800, and LV-DDR3-800
- In i.MX 6DualLite, 16/32/64-bit LP-DDR2-800, 16/32/64-bit DDR3-800, and LV-DDR3-800
- 8-bit NAND-Flash, including support for Raw MLC/SLC, 2 KB, 4 KB, and 8 KB page size, BA-NAND, PBA-NAND, LBA-NAND, OneNAND™ and others.
- BCH ECC up to 40 bit.
- 16/32-bit NOR Flash. All EIMv2 pins are muxed on other interfaces.
- 16/32-bit PSRAM, Cellular RAM

Each i.MX 6Solo/6DualLite processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

- Displays—Total four interfaces available. Total raw pixel rate of all interfaces is up to 266 Mpixels/sec, 24 bpp. Up to three interfaces may be active in parallel (excluding EPDC).
- One Parallel 24-bit display port, up to 225 Mpixels/sec (for example, WUXGA at 60 Hz or dual HD1080 and WXGA at 60 Hz)
- LVDS serial ports—One port up to 165 Mpixels/sec or two ports up to 85 MP/sec (for example, WUXGA at 60 Hz) each
- HDMI 1.4 port

## Features

- MIPI/DSI, two lanes at 1 Gbps
- EPDC, Color, and monochrome E-INK, up to 1650x2332 resolution and 5-bit grayscale

### Camera sensors:

- Up to two interfaces may be active at once
- Parallel Camera port (up to 20 bit and up to 240 MHz peak)
- MIPI CSI-2 / Parallel port, supporting from 80 Mbps to 800 Mbps speed per data lane. The CSI-2 Receiver core can manage one clock lane and up to two data lanes. Each i.MX 6Solo/6DualLite processor has two lanes.

### Expansion cards:

Four MMC/SD/SDIO card ports all supporting:

- 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
- 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)
- Compatible with SD Memory, miniSD Memory, SDIO, miniSDIO, SD Combo, MMC and MMC RS, embedded MMC and embedded SD cards
- Host clock frequency variable between 32kHz to 52 MHz
- Up to 200 Mbps data transfer for SD/SDIO cards using 4 parallel data lines
- Up to 416 Mbps data transfer for MMC cards using 8 parallel data lines
- Up to 832 Mbps data transfer for MMC/SD cards using 8 parallel data lines in DDR mode
- Supports Single Block, Multi Block and Byte
- Dual internal 32x32-bit FIFOs

### USB:

- One High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy
- Three USB 2.0 (480 Mbps) hosts:
- One HS host with integrated High Speed Phy
- Two HS hosts with integrated HS-IC USB (High Speed Inter-Chip USB) Phy

Expansion PCI Express port (PCIe) v2.0 one lane:

- PCI Express (Gen 2.0) dual mode complex, supporting Root complex operations and Endpoint operations. Uses x1 PHY configuration.

### Miscellaneous IPs and interfaces:

- Three I2S/SSI/AC97, up to 1.4 Mbps each
- Enhanced Serial Audio Interface (ESAI), up to 1.4 Mbps per channel

- Five UARTs, up to 4.0 Mbps each:
  - Providing RS232 interface
  - Supporting 9-bit RS485 multidrop mode
  - One of the five UARTs (UART1) supports 8-wire while others four supports 4-wire. This is due to the SoC IOMUX limitation, since all UART IPs are identical.
- Four eCSPI (Enhanced CSPI). Using chip selects to support multiple peripherals
- Four I2C, supporting 400 kbps
- Gigabit Ethernet Controller (IEEE1588 compliant), 10/100/1000 Mbps
- Four Pulse Width Modulators (PWM)
- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)
- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Controller Area Network (FlexCAN), 1 Mbps each
- Two Watchdog timers (WDOG)
- Audio MUX (AUDMUX)
- MLB (MediaLB) provides interface to MOST Networks (MOST25, MOST50, MOST150) with the option of DTCP cipher accelerator

The i.MX 6Solo/6DualLite processors integrate advanced power management unit and controllers:

- Provide PMU, including DCDC and LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use SW State Retention and Power Gating for ARM and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6Solo/6DualLite processors use dedicated HW accelerators to meet the targeted multimedia performance. The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6Solo/6DualLite processors incorporate the following hardware accelerators:

- VPU—Video Processing Unit
- IPUv3H—Image Processing Unit version 3H
- GPU3Dv5—3D Graphics Processing Unit (OpenGL ES 2.0) version 5
- GPU2Dv2—2D Graphics Processing Unit (BitBlit)
- PXP—PiXel Processing Pipeline. Off loading key pixel processing operations are required to support the EPD display applications.
- ASRC—Asynchronous Sample Rate Converter

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- CAAM—Cryptographic Acceleration and Assurance Module, containing cryptographic and hash engines, 16 KB secure RAM, and True and Pseudo Random Number Generator (NIST certified).
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock
- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSES and will determine the security level operation mode as well as the TZ policy.
- A-HAB—Advanced High Assurance Boot—HABv4 with the new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.

### NOTE

The actual feature set depends on the part number. Functions, such as video hardware acceleration, and 2D and 3D hardware graphics acceleration may not be enabled for specific part numbers.

## 1.5 Architectural Overview

This section contains i.MX 6Solo/6DualLite architectural details.

### 1.5.1 Block Diagram

A simplified block diagram is provided in the following section.

#### 1.5.1.1 Simplified Block Diagram

A high level block diagram is shown in the figure below. This diagram provides a view of the i.MX 6Solo/6DualLite major sub-systems (processor domains, shared peripherals domain, memories, and so on) and logical connectivity.

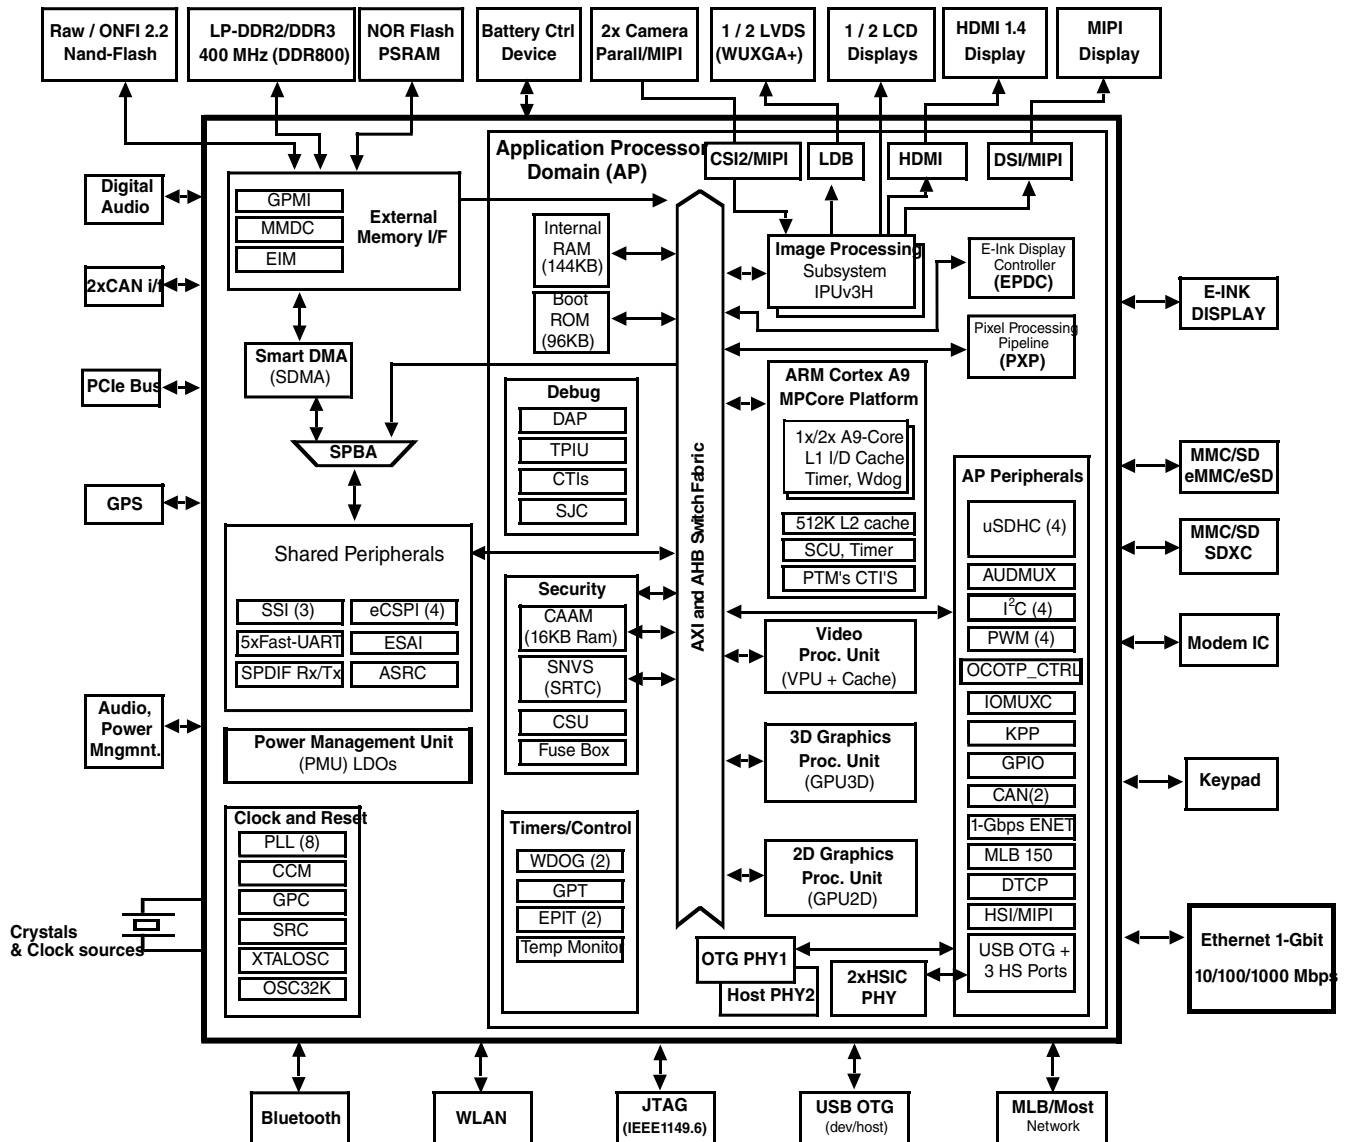

Figure 1-2. Simplified Block Diagram

## 1.5.2 Architectural Partitioning

Architecture supports processing-intensive tasks in the following ways:

- ARM Cortex A9 MPCore™ Platform is responsible for:
  - Operating System
  - User applications (including control over hardware accelerators and non-accelerated functions)
  - TrustZone applications

- Smart DMA enables data transfer between non-mastering peripherals and external or internal memories
- System Control is supported via:
  - Clock Control Module (CCM)
  - Eight PLLs and two PFDs
  - XTALOSC- 24MHz Crystal oscillator source support
  - OSC32KHz - 32.768Hz Crystal oscillator source support
  - System Reset Controller (SRC)
  - General Power Controller (GPC)
  - Temperature Sensor for monitoring and alarming on high temperature situations.
- Multimedia is supported with:
  - One Image Processing Unit-IPUv3H
    - Connectivity to displays and controllers (Parallel, LVDS, MIPI, HDMI), cameras (parallel, MIPI).
    - Display Processing: video/graphics combining, image enhancement
    - Image conversions: resizing, rotation/inversion, color conversion, de-interlacing
    - Synchronization and control capabilities, allowing autonomous operation
  - Video Processing Unit (VPU), supports various decoding/encoding formats in HW, up to 1080p plus SD 30fps decoding (H.264, VC1, RV10, DivX, etc.), and up to 1080p 30fps encoding (H.264, etc.).
  - Graphics Processing Unit (GPU3Dv5) graphics processing compliant with the following:
    - OpenGL ES 1.1 and 2.0 including extensions.
    - Windows Direct3D
  - Graphics Processing Unit (GPU2Dv2)
  - Audio
    - Audio codecs are provided by SW, which runs on ARM core, supporting (but not limited to) MP3, WMA, AAC, HE-AAC and Pro10
    - 3x SSIs
    - ESHi AI
    - SPDIF Tx/Rx
    - Audmux
    - Audio sample rate conversion accelerator (ASRC)
- Security is supported by:
  - High Assurance Boot (HAB4) System
  - ARM TrustZone (TZ) Trusted Execution environment
  - DDR Memory secure region protection by TrustZone Address Space Controller
  - On-chip RAM (OCRAM) single region TrustZone protection
  - Peripheral access policy control, using Central Security Unit (CSU)

- One-Time Programmable (OTP) electrical fuse array (Total of 3840-bit e-fuses) via the On-chip electrical fuse controller (OCOTP\_CTRL)
- CAAM and SNVS security architecture, providing:
  - 16KB Secure RAM
  - Secure Real Time Counters
  - Security State Controller
  - Encryption and Hashing functions, Random Number Generator (RNG)
  - Security Violation/Tamper Detection & Reporting
- System JTAG controller (SJC)
- Secure Real Time Clock (SRTC)
- TrustZone Watchdog (TZ WDOG)
- Connectivity peripherals, timers and External Memory Interfaces:
  - Embedded DMAs
  - 3.3V IO voltage for seamless integration
  - Four USB 2.0 ports, including four PHYs: 2x HS-USB (OTG) and 2x HS-IC USB integrated PHYs
  - Memory, 800 MT/s per Line, supports LP-DDR2 (2x16, 2x32, 2x32 interleaved mode - x64), DDR3 (x16/x32/x64) and DDR3L (x16/x32/x64)
  - Nand-Flash (MLC up to 40-bit ECC) and NOR Flash memory interface via GPMI Nand-Flash controller
  - Timers: 2xEPIT, GPT and two Watch Dog timers (one of which is used for TZ), in addition to the timers and watchdog timers integrated within the ARM Cortex A9 MPCore™ platform.
  - Miscellaneous connectivity support - PCIe, FLEXCAN, MLB, MMC/SD, I2C, SPI, UART, PWM and Keypad interface

### 1.5.3 Endianness Support

i.MX 6Solo/6DualLite supports Little Endian mode only.

### 1.5.4 Memory Interfaces

i.MX 6Solo/6DualLite Multi-Port DRAM/DDR controller (MMDC) supports the following memory interfaces:

- LP-DDR2-800, 1x32 channel for i.MX 6Solo and 2x32 channels for i.MX 6DualLite, 400MHz clock
- DDR3 / LV-DDR3 32-bit in i.MX 6Solo, DDR3 / LV-DDR3 32/64-bit in i.MX 6DualLite, both 400MHz clock.

NAND Flash controller supports the following:

- x8 NAND Flash bus.
- Configurable page size of 2KB, 4KB, 8KB.
- Configurable spare area per page of up to 512B
- Supports interleaved accesses to up to 8 NAND devices
- Legacy raw SLC, MLC type device
- Supports up to 40-bit ECC by HW BCH ECC accelerator, capable of 200MB/s encode/decode rate.
- ONFI2.2 compliant
  - Timing modes 0-5 for both asynchronous and synchronous I/F. Synchronous clock rate of up to 100MHz with data rate of up to 200MB/s.
- Vendor specific devices: BA-NAND (Micron), PBA-NAND and LBA-NAND (Toshiba), E2-NAND (Hynix), EF-NAND (Samsung), Samsung's "Toggle-mode" NAND (clock rate of up to 66MHZ and 80Mz, with data rate of up to 133MB/s and 160MB/s respectively)

NOR Flash, SRAM and PSRAM, 16/8-bit NOR Flash, interface is supported by the EIM block. All EIM pins are muxed on other interfaces.

# Chapter 2

## Memory Maps

### 2.1 Memory system overview

This chapter introduces the memory architecture of the i.MX 6Solo/6DualLite chip.

### 2.2 ARM Platform Memory Map

The i.MX 6Solo/6DualLite memory map has been provided in the following tables. The mapping of the DDR memory address space can be configured by software or hardware fuses, depending on the memory device type (LPDDR2/DDR3) and the selected interleave/non-interleaving scheme.

A combined memory map (both 2x32 and x64) is shown in the following table.

**Table 2-1. System memory map**

Start address	End address	Size	Description
1000_0000	FFFF_FFFF	3840 MB	MMDC - DDR Controller. See <a href="#">DDR mapping to MMDC controller ports</a>
1000_0000	7FFF_FFFF	1792 MB	
0800_0000	0FFF_FFFF	128 MB	EIM - CSO (NOR/SRAM)
02A0_0000	02DF_FFFF	4 MB	Reserved

**NOTE**

User should not address reserved memory regions. Access to reserved memory regions can cause unpredictable behavior.

### 2.3 DDR mapping to MMDC controller ports

The following table lists the various DDR configuration modes and how each is mapped to the DDR channels.

Memory Mapping Mode	DDR Memory Map Config[1:0] fuse value	Start Address	End Address	Total Size	MMDC channel / ports
X32 / X64 bit, fixed mapping	'00'	1000_0000	FFFF_FFFF	3840MB	MMDC #0
Dual channel (2x 32-bit), Fixed mapping (LPDDR2)	'01'	8000_0000	FFFF_FFFF	2048MB	MMDC #0
		1000_0000	7FFF_FFFF	1792MB	MMDC #1
Dual channel (2x 32-bit), Interleaved mapping (LPDDR2) <sup>1</sup>	'10'	1000_0000	FFFF_FFFF	3840MB	MMDC #0 , MMDC #1 (interleaved data)
Illegal	'11'				

1. In the 4KB interleaving mode the system bus maps each consecutive 4KB region to a 4KB region in the other MMDC port, such that "even" 4KB spaces are mapped to MMDC0, and "odd" 4KB regions mapped to MMDC1.

## 2.4 DMA memory map

The Smart DMA memory map can be found in the following table.

**Table 2-6. SDMA peripheral memory map**

Peripheral	Base address	Size
Reserved for SDMA internal memory	0x0000	4KB
SPDIF	0x1000	4KB
eCSPI1	0x2000	4KB
eCSPI2	0x3000	4KB
eCSPI3	0x4000	4KB
eCSPI4	0x5000	4KB
Reserved	0x6000	4KB
Reserved for SDMA internal registers	0x7000	4KB
UART1	0x8000	4KB
ESAI	0x9000	4KB
SSI1	0xA000	4KB
SSI2	0xB000	4KB
SSI3	0xC000	4KB
ASRC	0xD000	4KB
Reserved	0xE000	4KB
SPBA Registers	0xF000	4KB

### NOTE

User should not address reserved memory regions. Access to reserved memory regions can cause unpredictable behavior.

# Chapter 3

## Interrupts and DMA Events

### 3.1 Overview

This chapter discusses the assignments of interrupts from the ARM domain in [A9 interrupts](#) and from DMA events in [SDMA event mapping](#)

### 3.2 A9 interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all i.MX 6Solo/6DualLite sources and provides an interface to each of the CPU cores.

The first 32 interrupts are used for interrupts that are private to the CPUs interface. These interrupts are not included in the table below. All interrupts besides the private CPU are also hooked up to the GPC in the same order.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. The following table describes the ARM interrupt sources.

**Table 3-1. ARM domain interrupt summary**

IRQ	Interrupt Source	Interrupt Description
32	IOMUXC	General Purpose Register 1 from IOMUXC. Used to notify cores on exception condition while boot.
33	DAP	Debug Access Port interrupt request.
34	SDMA	SDMA interrupt request from all channels.
35	VPU	JPEG codec interrupt request.
36	SNVS	PMIC power off request.
37	IPU	IPU error interrupt request.
38	IPU1	IPU1 sync interrupt request.

*Table continues on the next page...*

**Table 3-1. ARM domain interrupt summary (continued)**

IRQ	Interrupt Source	Interrupt Description
39	Reserved	Reserved
40	Reserved	Reserved
41	GPU3D	GPU3D interrupt request.
42	R2D GPU2D	R2D GPU2D general interrupt request.
43	Reserved	Reserved
44	VPU	VPU interrupt request.
45	APBH DMA	Logical OR of APBH DMA channels 0-3 completion and error interrupts.
46	EIM	EIM interrupt request.
47	BCH	BCH operation complete interrupt.
48	GPMI	GPMI operation timeout error interrupt.
49	DTCP	DTCP interrupt request.
50	VDOA	VDOA interrupt request.
51	SNVS	SRTC consolidated interrupt.
52	SNVS	SRTC security interrupt.
53	CSU	CSU interrupt request 1. Indicates to the processor that one or more alarm inputs were asserted.
54	uSDHC1	uSDHC1 (Enhanced SDHC) interrupt request.
55	uSDHC2	uSDHC2 (Enhanced SDHC) interrupt request.
56	uSDHC3	uSDHC3 (Enhanced SDHC) interrupt request.
57	uSDHC4	uSDHC4 (Enhanced SDHC) interrupt request.
58	UART1	UART1 interrupt request.
59	UART2	UART2 interrupt request.
60	UART3	UART3 interrupt request.
61	UART4	UART4 interrupt request.
62	UART5	UART5 interrupt request.
63	eCSPI1	eCSPI1 interrupt request.
64	eCSPI2	eCSPI2 interrupt request.
65	eCSPI3	eCSPI3 interrupt request.
66	eCSPI4	eCSPI4 interrupt request.
67	I2C4	I2C4 interrupt request.
68	I2C1	I2C1 interrupt request.
69	I2C2	I2C2 interrupt request.
70	I2C3	I2C3 interrupt request.
71	Reserved	Reserved
72	USB	USB Host 1 interrupt request.
73	USB	USB Host 2 interrupt request.
74	USB	USB Host 3 interrupt request.
75	USB	USB OTG interrupt request.
76	USB_PHY	UTMI0 interrupt request.

*Table continues on the next page...*

**Table 3-1. ARM domain interrupt summary (continued)**

IRQ	Interrupt Source	Interrupt Description
77	USB_PHY	UTMI1 interrupt request.
78	SSI1	SSI1 interrupt request.
79	SSI2	SSI2 interrupt request.
80	SSI3	SSI3 interrupt request.
81	Temperature Monitor	Temperature Sensor (temperature greater than threshold) interrupt request.
82	ASRC	ASRC interrupt request.
83	ESAI	ESAI interrupt request.
84	SPDIF	SPDIF interrupt.
85	MLB150	MLB error interrupt request.
86	PMU	PMU analog regulator brownout occurred.
87	GPT	Logical OR of GPT rollover interrupt line, input capture 1 and 2 lines, output compare 1, 2, and 3 interrupt lines.
88	EPIT1	EPIT1 output compare interrupt.
89	EPIT2	EPIT2 output compare interrupt.
90	GPIO1	INT7 interrupt request.
91	GPIO1	INT6 interrupt request.
92	GPIO1	INT5 interrupt request.
93	GPIO1	INT4 interrupt request.
94	GPIO1	INT3 interrupt request.
95	GPIO1	INT2 interrupt request.
96	GPIO1	INT1 interrupt request.
97	GPIO1	INT0 interrupt request.
98	GPIO1	Combined interrupt indication for GPIO1 signals 0 - 15.
99	GPIO1	Combined interrupt indication for GPIO1 signals 16 - 31.
100	GPIO2	Combined interrupt indication for GPIO2 signals 0 - 15.
101	GPIO2	Combined interrupt indication for GPIO2 signals 16 - 31.
102	GPIO3	Combined interrupt indication for GPIO3 signals 0 - 15.
103	GPIO3	Combined interrupt indication for GPIO3 signals 16 - 31.
104	GPIO4	Combined interrupt indication for GPIO4 signals 0 - 15.
105	GPIO4	Combined interrupt indication for GPIO4 signals 16 - 31.
106	GPIO5	Combined interrupt indication for GPIO5 signals 0 - 15.
107	GPIO5	Combined interrupt indication for GPIO5 signals 16 - 31.
108	GPIO6	Combined interrupt indication for GPIO6 signals 0 - 15.
109	GPIO6	Combined interrupt indication for GPIO6 signals 16 - 31.
110	GPIO7	Combined interrupt indication for GPIO7 signals 0 - 15.
111	GPIO7	Combined interrupt indication for GPIO7 signals 16 - 31.
112	WDOG1	WDOG1 timer reset interrupt request.
113	WDOG2	WDOG2 timer reset interrupt request.
114	KPP	Key Pad interrupt request.

*Table continues on the next page...*

**Table 3-1. ARM domain interrupt summary (continued)**

IRQ	Interrupt Source	Interrupt Description
115	PWM1	Cumulative interrupt line for PWM1. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
116	PWM2	Cumulative interrupt line for PWM2. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
117	PWM3	Cumulative interrupt line for PWM3. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
118	PWM4	Cumulative interrupt line for PWM4. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
119	CCM	CCM interrupt request 1.
120	CCM	CCM interrupt request 2.
121	GPC	GPC interrupt request 1.
122	Reserved	Reserved
123	SRC	SRC interrupt request.
124	CPU	L2 interrupt request.
125	CPU	Parity Check error interrupt request.
126	CPU	Performance Unit interrupt.
127	CPU	CTI trigger outputs interrupt.
128	SRC	Combined CPU wdog interrupts out of SRC.
129	EPDC	EPDC interrupt request.
130	PXP	PXP interrupt request.
131	Reserved	Reserved
132	MIPI_CSI	CSI interrupt request 1.
133	MIPI_CSI	CSI interrupt request 2.
134	MIPI_DSI	DSI interrupt request.
135	MIPI_HSI	HSI interrupt request.
136	SJC	SJC interrupt from General Purpose register.
137	CAAM	CAAM job ring 0 interrupt.
138	CAAM	CAAM job ring 1 interrupt.
139	Reserved	Reserved
140	TZASC1	TZASC1 interrupt request.
141	TZASC2	TZASC2 interrupt request.
142	FLEXCAN1	FLEXCAN1 combined interrupt. Logical OR of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein.  Combined interrupt of ini_int_busoff,ini_int_error,ipi_int_mbor,ipi_int_txwarning and ipi_int_waken
143	FLEXCAN2	FLEXCAN2 combined interrupt. Logical OR of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein.
144	Reserved	Reserved
145	Reserved	Reserved
146	Reserved	Reserved

*Table continues on the next page...*

**Table 3-1. ARM domain interrupt summary (continued)**

IRQ	Interrupt Source	Interrupt Description
147	HDMI	HDMI master interrupt request.
148	HDMI	HDMI CEC engine dedicated interrupt signal raised by a wake-up event.
149	MLB150	Interrupt request for channels [31:0]. Interrupt request for channels [63:32] available on IRQ #149 if SMX bit is set in MLB150 AHB control register (ACTL), otherwise interrupt for channels [63:32] interrupt is available on IRQ #158.
150	ENET	ENET Interrupt Request.
151	ENET	ENET 1588 Timer interrupt [synchronous] request.
152	PCIe	PCIe interrupt request 1.
153	PCIe	PCIe interrupt request 2.
154	PCIe	PCIe interrupt request 3.
155	PCIe	PCIe interrupt request 4.
156	DCIC1	DCIC1 interrupt request.
157	DCIC2	DCIC2 interrupt request.
158	MLB150	Interrupt request for channel[63:32]. If SMX bit is not set in MLB150 AHB control register (ACTL), it is the default working mode.
159	PMU	PMU digital regulator brownout occurred.

### 3.3 SDMA event mapping

The following table shows the DMA request signals for peripherals in i.MX 6Solo/6DualLite.

**Table 3-2. SDMA event mapping**

Event Number	DMA Source	Description
0	VPU	VPU DMA request
1	I2C4	I2C4 DMA event
2	IPU / IOMUX	IPU1 DMA Event; Muxed with HDMI audio done event, controlled by GPR0[0], IPU1 event - default.
3	eCSPI1 / I2C3	eCSPI1 Rx request; Muxed with I2C3 controlled by IOMUXC register GPR0[1].
4	eCSPI1 / I2C2	eCSPI1 Tx request; Muxed with I2C2 controlled by IOMUXC register GPR0[2].
5	eCSPI2 / I2C1	eCSPI2 Rx request; Muxed with I2C1 controlled by IOMUXC register GPR0[3].
6	eCSPI2	eCSPI2 Tx request
7	eCSPI3	eCSPI3 Rx request
8	eCSPI3	eCSPI3 Tx request
9	eCSPI4 / EPIT2	eCSPI4 Rx request; Muxed with EPIT2 DMA request controlled by IOMUXC register GPR0[5].

*Table continues on the next page...*

**Table 3-2. SDMA event mapping (continued)**

Event Number	DMA Source	Description
10	eCSPI4/ I2C1	eCSPI4 Tx request; Muxed with I2C1 controlled by IOMUXC register GPR0[4].
11	Reserved	Reserved
12	Reserved	Reserved
13	GPT	GPT counter event
14	SPDIF / IOMUX	SPDIFRX DMA request; Muxed with external DMA pad #2 controlled by IOMUXC register GPR0[7].
15	SPDIF	SPDIF TX DMA request
16	EPIT1	EPIT1 request.
17	ASRC	ASRC DMA1 request (Pair A input Request)
18	ASRC	ASRC DMA2 request (Pair B input Request)
19	ASRC	ASRC DMA3 request (Pair C input Request)
20	ASRC	ASRC DMA4 request (Pair A output Request)
21	ASRC	ASRC DMA5 request (Pair B output Request)
22	ASRC	ASRC DMA6 request (Pair C output Request)
23	ESAI / I2C3	ESAI Rx FIFO DMA request; Muxed with I2C3 controlled by IOMUXC register GPR0[6].
24	ESAI	ESAI Tx FIFO DMA request
25	UART1	UART1 Rx FIFO
26	UART1	UART1 Tx FIFO
27	UART2	UART2 Rx FIFO
28	UART2	UART2 Tx FIFO
29	UART3 / QSPI1	UART3 Rx FIFO; Muxed with QSPI1 DMA Tx request controlled by IOMUXC register GPR0[21]
30	UART3 / QSPI2	UART3 Tx FIFO; Muxed with QSPI2 DMA Tx request controlled by IOMUXC register GPR0[22]
31	UART4	UART4 Rx FIFO
32	UART4	UART4 Tx FIFO
33	UART5	UART5 Rx FIFO
34	UART5	UART5 Tx FIFO
35	SSI1	SSI1 receive 1 DMA request
36	SSI1	SSI1 transmit 1 DMA request
37	SSI1	SSI1 receive 0 DMA request
38	SSI1	SSI1 transmit 0 DMA request
39	SSI2	SSI2 receive 1 DMA request
40	SSI2	SSI2 transmit 1 DMA request
41	SSI2	SSI2 receive 0 DMA request
42	SSI2	SSI2 transmit 0 DMA request
43	SSI3	SSI3 receive 1 DMA request
44	SSI3	SSI3 transmit 1 DMA request
45	SSI3	SSI3 receive 0 DMA request

*Table continues on the next page...*

**Table 3-2. SDMA event mapping (continued)**

Event Number	DMA Source	Description
46	SSI3	SSI3 transmit 0 DMA request
47	DTCP	DTCP DMA request

As shown in the table, some of the events are an output of a mux of two signals or triggers. The select of this mux is controlled by the general purpose registers in IOMUXC.

# Chapter 4

## External Signals and Pin Multiplexing

### 4.1 Overview

The i.MX 6Solo/6DualLite contains a limited number of pins, most of which have multiple signal options. These signal to pin and pin to signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

[Pin Assignments](#) lists the pad names of the chip, the various signals that can be assigned to each of the pads, and the default settings for each pad. [Muxing Options](#) lists the external signals grouped by module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

#### 4.1.1 Pin Assignments

**Table 4-1. Pin Assignments**

Pad Name	Mode	Signal	Pad Settings	Pad/Group Registers
BOOT_MODE0		SRC_BOOT_MODE0		
BOOT_MODE1		SRC_BOOT_MODE1		
CLK1_N		XTALOSC_CLK1_N		
CLK1_P		XTALOSC_CLK1_P		
CLK2_N		XTALOSC_CLK2_N		
CLK2_P		XTALOSC_CLK2_P		
CSI0_DAT4	ALT0	IPU1_CSI0_DATA04	HYS - ENABLED	SW_PAD_CTL_PAD_CSI0_DATA04
	ALT1	EIM_DATA02	PUS - 100K_OHM_PU	
	ALT2	ECSPI1_SCLK	PUE - PULL	
	ALT3	KEY_COL5	PKE - ENABLED	
	ALT4	AUD3_TXC	ODE - DISABLED	
	ALT5	GPIO5_IO22	SPEED - 100MHZ	
	ALT7	ARM_TRACE01	DSE - 40_OHM	

*Table continues on the next page...*

**Table 4-1. Pin Assignments (continued)**

Pad Name	Mode	Signal	Pad Settings	Pad/Group Registers
			SRE - SLOW

# Chapter 5

## Fusemap

### 5.1 Boot Fusemap

The following section details the various modes and selection of the required boot devices. A separate map is given for each and every boot device. The device select is specified by BOOT\_CFG1[7:3] fuses listed in [Table 5-1](#). In [Table 5-2](#), the "Address Offset" means the address offset compared with the OCOTP\_CTRL base address, which is 0x21B\_C000.

**Table 5-1. Boot Device Select**

Boot Device	BOOT_CFG1[7]	BOOT_CFG1[6]	BOOT_CFG1[5]	BOOT_CFG1[4]	BOOT_CFG1[3]
EIM ( <a href="#">Table 5-3</a> )	0	0	0	0	Memory Type: 0 - NOR Flash 1 - OneNAND
Serial ROM ( <a href="#">Table 5-4</a> )	0	0	1	1	X
SD/eSD ( <a href="#">Table 5-5</a> )	0	1	0	X	X
MMC/eMMC ( <a href="#">Table 5-6</a> )	0	1	1	X	X
NAND Flash ( <a href="#">Table 5-7</a> )	1	X	X	X	X

#### NOTE

Fuses marked as “Reserved” are reserved for Freescale internal (and future) use only. Customers should not attempt to burn these, as the IC behavior may be unpredictable. The reserved fuses can be read as either ‘0’ or ‘1’.

**Table 5-2. Lock Fuses**

Address Offset	7	6	5	4	3	2	1	0

0x6D0[5:0]	PAD_SETTINGS	6	Used with conjunction of MMC/SD/Nand "Override Pad Settings" fuse value, as follows:  0 - Use IO default settings for boot device IO pads  1 - Use "Override" value, as set by this register	IO pads settings of selected boot interface, are override with this fuses, as follows: [0] - Slew Rate [3:1] Drive Strength [5:4] - Speed Settings. Refer to IO PAD chapter for "Settings" fields value	MISC_CONF_LOCK
0x6E0[0]	FIELD_RETURN	1	Configure device for field return testing. Fuse burning requires CSF command.	0 - Device is in functional / secure mode.  1 - Device is open for 'field-return' testing	FIELD_RETURN_LOCK

# Chapter 6

## External Memory Controllers

### 6.1 Overview

This chip has the following external memory interfaces and controllers:

- Multi-mode DDR controller (MMDC)
- Raw NAND Flash controller, consisting of GPMI2, BCH40, and APBH\_DMA components including Randomizer module.
- EIM-PSRAM/NOR Flash controller

### 6.2 Multi-mode DDR controller (MMDC) overview and feature summary

The MMDC module is a DDR controller that can support several types of DDR memories and two channel x32 and x64 memory widths.

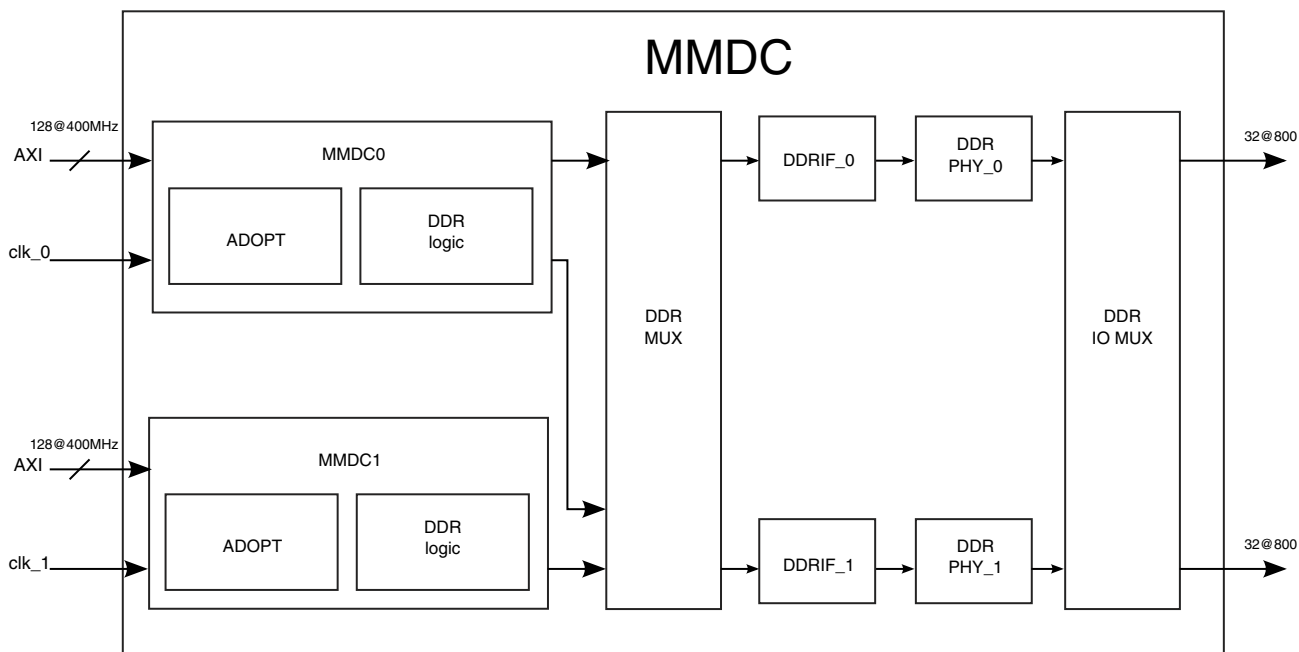

Figure 6-1. MMDC block diagram

Table 6-1. MMDC feature summary

Feature	Description
Supported standards	<ul style="list-style-type: none"> <li>• LV-DDR3, DDR3 x16, x32, x64 (includes SODIMM)</li> <li>• LPDDR2 2ch x32, in either split map or interleaving mode</li> <li>• LPDDR2 1ch x32</li> </ul>
DDR interface	<ul style="list-style-type: none"> <li>• x16, x32, x64 data bus width</li> <li>• Density of 256 Mbytes-8 Gbytes                             <ul style="list-style-type: none"> <li>• Column size of 8-12 bits</li> <li>• Row size of 11-16 bits</li> </ul> </li> <li>• 2 CS per channel, with a separate CS allocation for LPDDR2-DRAM)</li> <li>• Up to 4 Gbyte address space and configurable address space per CS. For LPDDR2 2ch x32 up to 2 Gbytes per channel</li> <li>• Interleaved accesses of LPDDR2-DRAM towards the same DDR channel. This is supported only when using the same clock frequency for LPDDR2-DRAM</li> <li>• Supports burst length of 8 (aligned) for DDR3 and burst lengths of 4 for LPDDR2</li> </ul>
DDR performance	<ul style="list-style-type: none"> <li>• DDR3 and LPDDR2 running at 400 MHz (800MT/s)</li> <li>• Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable different priority levels in the re-ordering mechanism</li> <li>• Page hit/page miss optimizations</li> <li>• Consecutive read/write access optimizations</li> <li>• Supports deep read and write requests queues to enable bank prediction</li> <li>• Drives back the critical word in a read transaction as soon as it is received by the DDR device (doesn't wait until the whole data phase has been completed)</li> </ul>

Table continues on the next page...

**Table 6-1. MMDC feature summary (continued)**

Feature	Description
	<ul style="list-style-type: none"> <li>• Can track open memory pages</li> <li>• Supports bank interleaving</li> <li>• Special optimization for non-aligned wrap accesses in burst length 8</li> </ul>
AXI interface	<ul style="list-style-type: none"> <li>• AXI bus compliant with glueless interface to PL301 AXI network interconnect</li> <li>• Supports bus transfers of 8,16,32, 64 and 128 bits (single accesses and bursts)</li> </ul>
DDR calibration and delay-lines	<ul style="list-style-type: none"> <li>• All calibrations can be done automatically by hardware or manually by software</li> <li>• ZQ calibration for external DDR device (in DDR3 through the ZQ calibration command and in LPDDR2 through the MRW command). <ul style="list-style-type: none"> <li>• Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh).</li> <li>• Can be handled manually at ZQ INIT.</li> </ul> </li> </ul>
DDR general	<ul style="list-style-type: none"> <li>• Configurable timing parameters</li> <li>• Configurable refresh scheme</li> <li>• Supports dynamic voltage, frequency change and low power mode entry through hardware negotiation with the system (req/ack handshake)</li> <li>• Supports automatic self-refresh and power down entry and exit</li> <li>• Supports fast and slow precharge power down in DDR3</li> <li>• Supports various ODT control schemes. <ul style="list-style-type: none"> <li>• Assertion/Deassertion of ODT control per read or write accesses and for active or passive CS</li> </ul> </li> <li>• Supports MRW and MRR commands for LPDDR2.</li> <li>• Software control for moving to derated timing parameters and derated refresh rate according to temperature variation.</li> <li>• Supports various debug and profiling modes</li> </ul>

### 6.3 Raw NAND Flash controller overview

The Raw NAND Flash controller consists of three components: BCH, GPMI, and APBH\_DMA

- BCH is a 40-bit error correction hardware engine with an AXI bus master and a private connection to GPMI.
- GPMI is the NAND controller pin interface.
- APBH\_DMA is the DMA engine that drives the GPMI module.

The following figure shows the modules' connectivity.

Figure 6-2. Raw NAND Flash controller sub-system

### 6.3.1 NAND interface features

- ONFI2.2 compliant
  - Timing modes 0-5 for both asynchronous and synchronous interface
  - Synchronous clock rate of up to 100 MHz with data rate of up to 200 MB/s
- Support for ganged ready/busy inputs
  - Support allows the use of a single package pin for all ready busy/busy input signals.
  - In ganged mode (selectable by a programmable mode bit), GPMI expects that all NAND r/b pins are hard wired to the GPMI RDY\_BUSY0.
- Up to 4 NAND devices supported by 4 chip-selects and 1 ganged ready/busy.
- Legacy raw SLC, MLC type device
- BA-NAND (Micron)
- PBA-NAND and LBA-NAND (Toshiba)
- E2-NAND (Hynix)
- EF-NAND (Samsung)

- Samsung's "Toggle-mode" NAND (clock rate of up to 66 Mhz and 80 Mhz, with data rate of up to 133 MB/s and 160 MB/s respectively).
- Configurable page size of 2 Kbytes, 4 Kbytes, or 8 Kbytes.
- Configurable spare area per page of up to 512 bytes.
- Support for non-identical NAND devices not required

### 6.3.2 NAND control features

The NAND control supports interleaved accesses to as many as four NAND devices while hiding the busy period of each devices. However, fully-independent interleaving cannot be supported in ganged ready/busy mode because that suggests fully independent DMA channel operation on multiple paralleled-accessed chip-enables.

It also features:

- Delay line for adjusting the latching edge in case the frequency is relatively high while the delay is big
- Support for monitoring the external ready/busy signal and read status command polling to compare R/B bit.

### 6.3.3 Internal interface features

- AXI Master interface can access the system's memory space.
- APBH slave port for register configuration through the APBH bridge DMA.

### 6.3.4 APBH-DMA overview

APBH-DMA provides an APB peripheral bus system for GPMI and BCH. APBH-DMA uses a single GPMI interface to support as many as four DMA channels for four NAND devices (4 chip-enables) in interleaved mode.

### 6.3.5 ECC-BCH features

BCH supports:

- A data rate of up to 200 Mbytes/s
- 2 Kbyte codeword (1 Kbyte data + parity)

- Galois Field polynomial GF(2<sup>14</sup>)
- Up to 40-bit ECC for 1 Kbyte of data. (2,4,6,8,10,12,14,16, 18,20,22,24,26,28,30,32,34,36,38,40 configurable)
- 1 Kbyte codeword (1/2 Kbyte data + parity)
  - Galois Field polynomial GF(2<sup>13</sup>)
  - Up to 40-bit ECC for 1/2 Kbyte of data (2,4,6,8,10,12,14,16, 18,20,22,24,26,28,30,32,34,36,38,40 configurable)

## 6.4 EIM-PSRAM/NOR Flash controller overview

EIM, which is an external interface module, handles the interface to devices that are external to the chip, including the generation of chip selects, clocks, and control for external peripherals and memory.

It provides asynchronous and synchronous access to devices with an SRAM-like interface.

### 6.4.1 EIM features

- Up to four (software configurable) chip selects for external devices
  - Flexible address decoding; each chip select memory space is determined separately according to the GPR bits in IOMUXC.
  - 128 MByte maximum supported density by default (AUS bit is cleared). When the AUS bit is set, maximum supported density is 32MBytes.
- Selectable write protection for each chip select
- Support for multiplexed address/data bus operation x16 and x32 port size
- Programmable data port size for each chip select (x8, x16 and x32)
- Programmable wait-state generator for each chip select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Supports asynchronous page mode accesses (x16 and x32 port size)
- Supports a continuous burst clock that can be used as the reference clock for FPGA
- Independent synchronous memory burst read mode support for NOR-Flash and PSRAM memories (x16 and x32 port size)
- Independent synchronous memory burst write mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Supports NAND-Flash devices with NOR-Flash like interface - OneNAND™ (Samsung)

- Independent programmable variable/fix latency support for read and write synchronous (burst) mode
- Support for little endian operation
- ARM AXI slave interface accesses only handled in parallel for single AXI ID transactions
- External interrupt support using the RDY\_INT signal function as an external interrupt pin
- Boot from external device support according to boot signals, using the RDY\_INT signal
  - RDY signal support assertion after reset
  - INT signal support assertion after reset for OneNAND™ (Samsung) device
  - Supports little endian mode only

### 6.4.2 EIM boot scenarios

EIM allows booting from NOR Flash devices. To select NOR Flash as the boot source, use either the boot mode and configuration GPIO pins or the internal boot-related fuses.

See [System Boot](#) for more information.

### 6.4.3 EIM boot configuration

The following table shows the EIM boot configuration.

**Table 6-2. EIM boot configuration**

EIM_BOOT_CFG bus	EIM affected bits	EIM register
12	NUM16_BYP_GRANT	CS0GCR2
11	DZS[2]	CS0GCR1
10	AUS	CS0GCR1
[9:8]	CSREC[2:1]	CS0GCR1
[7:5]	RWSC[4:2] WWSC[4:2]	CS0GCR1 CS0WCR
4	ERRST	WCR
3	RAL WAL	CS0RCR1 CS0WCR
2	MUM OEA[1]	CS0GCR1 CS0RCR1
[1:0]	DSZ[1:0]	CS0GCR1

## 6.4.4 OneNAND requirements

Because Ready/Busy pin is not in use, OneNAND devices require the following actions:

- Poll the device to see whether it is ready; software performs a read from the device.
- Connect the Ready/Busy signal of the device to any GPIO pin and use it as an interrupt that indicates the on ready state.

# Chapter 7

## System Debug

### 7.1 Overview

This chapter describes the hardware and software debug and application development features and resources of the chip. It discusses the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- ARM's CoreSight architecture, adapted to i.MX 6Solo/6DualLite SoC (for 1x and 2x core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with cores under debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the ARM RealView Debugging tools and other third party tools
- TPIU, a trace port interface unit that efficiently accesses program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

### 7.2 Chip and ARM Platform Debug Architecture

ARM Debug architecture is based on CoreSight architecture by ARM Ltd. The CoreSight architecture provides a system wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access debug functionality without software interaction;
- To connect to a running system without performing a reset.

Full access to the processor debug capability is available by the ARM debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit allow which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state and restarts the processor core.

## 7.2.1 Debug Features

- CoreSight Program Trace Macrocell (PTM): trace generator for the ARM Cortex A9™ core
- Support for a TrustZone-related 3-level debug scheme:
  - Debug in Non-Secure privileged and user, and Secure user
  - Debug in Non-Secure only
- EmbeddedICE-RT logic
  - Support for both monitor-mode and halt-mode debugging:
  - Core run/halt control, debug status/control
  - Breakpoint/watchpoint control
  - Core- and memory-mapped resource examination/modification
- Data communication channel between ARM core and host debugger via JTAG, and the Debug Access Port (DAP) module.
- PMU: Performance Metrics Unit used for system profiling and debug.
- CP15 register for debugging the MMU, I & D L1 cache, and TLB
- PL310 L2 Cache: Provides an event monitoring signal routed to pins for visibility to help in system debug.

The chip includes ARM CoreSight components for multicore debug and trace solutions.

See the following figure for the ARM debug architecture scheme.

Figure 7-1. i.MX 6Solo/6DualLite Cortex-A9 Core Platform Debug Architecture

## 7.2.2 Debug System components

CoreSight components include:

- Embedded Trace Buffer (ETB): RAM array to be used for on-chip capture of trace data output from the PTM
- ATB Replicator to connect the trace data to TPIU (Trace Port Interface) and ETB (Embedded Trace Buffer)
- Cross Triggering logic for event routing, including CTIs and CTMs

Other related IPs and functionality:

- ROMPATCH module to support modification of program/data information in the MCU ROM
- Debug Visibility, which selects critical signals routed to the I/O pads as alternate outputs for external visibility

### 7.2.2.1 AMBA trace bus (ATB)

ATB transfers trace data through the CoreSight infrastructure in a chip. Trace sources are ATB masters and sinks are ATB slaves. The ARM (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine sources into a single trace stream.
- Association of the trace data with the generating source using trace source IDs. A CoreSight system can trace up to 111 different items at any one time.
- Capture and transfer of multiple byte bus widths, currently to 32 bits.
- A flushing mechanism to force historic trace to drain from any sources, links, or sinks up to the point that the request was initiated

### 7.2.2.2 ATB replicator

The ATB replicator enables two trace sinks to be wired together and to operate from the same incoming trace stream.

There are no programmable registers. This component is invisible to the user on a particular trace path, from source to sink.

- Incoming ATB Interface—The ATB replicator accepts trace data from the trace source, either directly or through a trace funnel.
- Outgoing ATB Interfaces—The ATB replicator sends identical trace data on outgoing master port interfaces.

### 7.2.2.3 Embedded Cross Triggering

The ECT is a modular component from ARM Limited that supports the interaction and synchronization of multiple triggering events within a chip. The main function of the ECT (CTI and CTM) is to pass debug events from one core to another. For example, the ECT can communicate debug state information from one core to another, so that program execution on both processors can be stopped at the same time if required.

The ECT consists of the following types of modules:

- Cross trigger interfaces (CTI)
- Cross trigger matrix (CTM)

Cross trigger interfaces provide the interface between a component or subsystem and the cross trigger matrix. The system requires a CTI for each subsystem that supports cross triggering. The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

The Cross Trigger Matrix (CTM) combines the trigger request generated from the CTIs and broadcasts them to all CTIs as channel triggers. The CTM controls the distribution of channel events. It provides Channel Interfaces (CIs) to connect to either CTIs or CTMs. This enables multiple CTIs to be linked together. The ECT is composed of three/five CTIs (Cross Trigger Interface) and two CTMs (Cross Trigger Matrix). The ECT is key in the multi-core and multi-IP debug strategy. The outcome is a SWcontrolled debug signal matrix that receives signals from various sources (i.e. cores and peripherals) and propagates/ routes them to the different debug resources of the SoC. Those debug resources can include time stamping capability, profiling capabilities, real-time trace (trace enabled or disabled), triggers, SOC level multiplexing, and debug interrupts.

#### NOTE

As the ECT should only be used during debug sessions, it is off (disabled) by default.

The chip's cross-triggering architecture consists of 2xCTMs and 2 / 3<sup>1</sup> CTIs covering three basic groups of functionality as follows:

- CTI 0,1 - for ARM core 0/1 respectively

#### 7.2.2.3.1 Cross-Trigger Matrix (CTM)

The CTM (Cross Trigger Matrix) is provided by ARM. A brief description is provided below. It is advised to refer to ARM documentation for more details.

1. Depending on specific part: i.MX 6Solo, i.MX 6DualLite.

The CTM is a relatively simple block with no configuration options. There are two CTM instances in i.MX6Solo/6DualLite in ARM Platform.

One of them is used to route 2x Core's CTI's, while the second one, is used for additional CoreSight CTI. Each CTI has 4 channel lines, which CTI events are mapped to. The exact mapping is configured in the CTI logic.

### 7.2.2.3.2 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by ARM. A brief description of the CTI is provided below.

There are 3 CTIs in the chip's ARM platform. Two are of which, dedicated to each Core, while the 3rd is used for various other signals routing.

Each of these CTIs has 8 trigger inputs and 8 trigger outputs that connect to logic in the domain to be debugged or profiled. Each CTI also includes a 4 channel interface to the CTM (4 inputs and 4 outputs).

For more information, see ARM platform chapter.

### 7.2.2.4 Debug Access Port (DAP)

The DAP enables debug access to the chip modules through APB-AP (the APB access port) and APB-Mux (the APB multiplexer).

AHB-AP provides system access. Debug tools can use JTAG to connect to the chip.

DAP has the following features:

- AMBA 3 Peripheral Bus Multiplexor access through AMBA 3 APB Access Port, providing debug peripheral access through the APB interface.
- External JTAG access using the JTAG Debug Port (JTAG-DP).
- Internal chip module access using:
  - AHB Access Port (AHB-AP)
  - APB Access Port (APB-AP)
  - JTAG Access Port (JTAG-AP)

APB-Mux enables system access to CoreSight components connected to the Debug APB.

The ROM table provides a list of memory locations of CoreSight components connected to the Debug APB. This is visible from both tools and system access and one configures it during system implementation.

External read/write access to the internal interface is provided by JTAG-DP. JTAG-DP provides a standard interface for debug access to the chip through DAP. It interfaces to the DAP internal bus.

Internal access to on-chip buses and other interfaces are provided by the access ports (APs). The available APs are:

- AHB-AP which provides an AHB-Lite master for access to a system AHB bus.
- APB-AP which provides an AMBA 3 APB master for access to the Debug APB that configures all CoreSight components.
- JTAG-AP which provides JTAG access to on-chip components and operates as a JTAG master port to drive JTAG chains throughout the chip.

## 7.2.3 i.MX6Solo/6DualLite-Specific SJC Features

### 7.2.3.1 JTAG Disable Mode

In addition to four different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

### 7.2.3.2 JTAG ID

**Table 7-1. i.MX JTAG ID**

Device	Silicon revision	JTAG ID (ID CODE)
i.MX 6Solo	Rev 1.0	0891_B01Dh <sup>1</sup>
i.MX 6DualLite	Rev 1.0	0891_A01Dh <sup>2</sup>

1. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1891\_B01Dh for Rev 1.1, 2891\_B01Dh for Rev 1.2 , etc.
2. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1891\_A01Dh for Rev 1.1, 2891\_A01Dh for Rev 1.2 , etc.

## 7.2.4 System JTAG Controller - SJC

The SJC module is the bridge between external development and test instrumentation and the internal JTAG-accessible debug and test resources.

It implements and manages the daisy-chained topology consisting of its own TAP and those of the SDMA, and the ARM Debug Access Port (DAP).

The DAP itself has a JTAG serial links, which can drive the PCIe PHY JTAG logic, used for testing of the PHYs.

### NOTE

Single Wire Debug (SWD) protocol is not supported.

## 7.2.5 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
  - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
  - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; putting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- Four levels of security, ranging from no security to no JTAG accessibility to the chip

## 7.2.6 SJC TAP Port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

## 7.2.7 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug\_Event pin
- A master TAP controller which implements the standard JTAG state machine
- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
  - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
  - Optional: "ID\_CODE" (SOC JTAG ID register), "HIGHZ"
- Supports the SDMA's DR-path-only JTAG architecture by implementing the controller portion of its TAP (including "BYPASS" as the default state) within the SJC
- The ExtraDebug registers, which implement a variety of control and status features
  - Three 32-bit insecure general purpose status registers
  - Two 32-bit secure status registers - one predefined, one general purpose.
  - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined (SOC integration team) control and status functions are supported by the SJC.

The user-defined functions will be defined and documented by the SOC integration team.

## 7.3 Smart DMA (SDMA) core

SDMA is a dedicated, programmable DMA engine. It is an integration of a 32-bit RISC core and DMA-specific hardware. It includes ports for the AP domain and a peripheral domain, along with a burst-capable port for direct external memory access.

The SDMA and its integration in the chip is unchanged from previous i.MX chips.

The main SDMA debug features are:

- OnCE - On Chip Emulator, provides the following capabilities:
  - SDMA core control - run/halt/single-step
  - SDMA core register/memory-map access
  - Event detection, watchpoints, and hardware breakpoints
  - Real time buffer and PC trace buffer capability
- Trace buffer
  - Contains information to identify the 32 last changes of flow detected during a program execution
- Context dump

- Includes information about all the channel dump activity
- Current contents of SDMA RAM
- ROMPATCH

### 7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary

The SDMA debug features are primarily defined by the OnCE portion of its design.

They are summarized as follows:

- Memory And Register Access - dedicated logic enables user-access to SDMA memory and register locations. These accesses are supported only when the processor is in debug mode.
- Event Detection Unit - watches signals from the data memory bus (DMBus) which is used by the RISC core to access its RAM, ROM, and memory-mapped registers
- Watchpoints - one output signal is available to watch event matching conditions at the chip level. Match conditions are defined by programming memory-mapped registers.
- Hardware Breakpoint - a counter is decremented after an event detection. A debug request is sent to the SDMA core only when the counter reaches the value of zero. It is possible to program the initial value of the counter or to disable the use of the counter if a debug request must be generated after each event detection.
- Real Time Buffer - The Real Time Buffer Register (RTB) is a single 32-bit memory-mapped register which can be accessed as a regular memory location during program execution. It is used to store and retrieve run time information without putting the SDMA in debug mode. Each write to this register causes an event. This register is, in fact, located in the OnCE. Executing through JTAG, a buffer command exports the content of this register through the JTAG port.
- Core Control (Core Status / Single Stepping) - Commands are provided to monitor and control processor activity. The commands can halt the core, rerun the core from another address location, and get processor status.
- Trace Buffer - a 32x32 buffer which records the last 32 changes of flow during program execution. The buffer stores data in a modulo fashion (i.e. the 33rd instruction change replaces the 1st). Captured trace information is retrieved via reads to the Trace Buffer Register.

#### 7.3.1.1 Other SDMA Debug Functionality

- Core Trace - basic core trace capability is available through debug visibility functionality only. PTM trace capability does not exist.

- ROM Patch - can be accomplished by manipulating the CHN0ADDR register through JTAG or via the MCU's ability to write to SDMA OnCE registers. This must be done right after reset and before the SDMA core is enabled to begin processing events.
- Additional debug control/status interaction with the SJC module
  - SJC-controlled Debug Request
  - SJC-readable Debug Acknowledge (in debug mode)
  - Debug clock control - allows SJC to force clocks on for debug purposes
  - Debug core state (SDMA RISC Core State) - 4 bits accessible from the SJC via JTAG

### 7.3.1.2 SDMA ROM Patching

After reset, the SDMA is in its IDLE\_AFTER\_RESET mode. A debug request also puts the SDMA in its DEBUG\_IN\_IDLE\_AFTER\_RESET mode. The new address boot must be stored in CHN0ADDR register (e.g., through the SDMA OnCE via debugger).

The user must then issue the `exec_core <instruction> SDMA OnCE` instruction to return to the IDLE\_AFTER\_RESET mode. The very first instructions of the boot code fetches the contents of this register (which is also mapped in the SDMA memory space) and jumps to the given address.

## 7.4 Miscellaneous

### 7.4.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The Cortex-A9 and VSP cores can receive resets from the following sources:

- Debug Reset (CDBGRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

Conversely, the debug system is capable of generating a system reset via a request bit in the MDM-AP control register. This allows the debugger to hold the system in reset.

## 7.5 Supported tools

DS-5 ARM Debugger is supported.

The debugger is connected to the chip from the host by the DS-5 ICE protocol converter. Other third party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

# Chapter 8

## System Boot

### 8.1 Overview

The boot process begins at Power On Reset (POR) where the hardware reset logic forces the ARM core to begin execution starting from the on-chip boot ROM.

Boot ROM code uses the state of the internal register `BOOT_MODE[1:0]` as well as the state of various eFUSES and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG)
- Device configuration data (DCD) and plugin
- Digital signature and encryption based High Assurance Boot (HAB)
- Wake-up from low power modes
- Wake-up secondary core

The boot ROM supports the following boot devices:

- NOR Flash
- NAND Flash
- OneNAND Flash
- SD/MMC
- Serial (I2C/SPI) NOR Flash and EEPROM

In normal operation, the Boot ROM uses the state of `BOOT_MODE` and eFUSES to determine the boot device. For development purposes, eFUSES used to determine the boot device may be overridden by using GPIO pin inputs.

Boot ROM code also allows the downloading of programs to be run on the device. An example is a provisioning program that can make further use of the serial connection to provision a boot device with a new image. Typically the provisioning program is

downloaded to internal RAM and allows the programming of boot devices, such as an SD/MMC Flash. The ROM Serial Downloader uses high speed USB in a non-stream mode connection.

Boot ROM allows waking up from low-power modes and waking up the secondary core of Cortex-A9. On reset the ROM checks the ARM core ID and power gating status register. On waking from low power mode, the primary core (ID=0) will skip loading an image from the boot device and jump to the address saved in PERSISTENT\_ENTRY0. The secondary cores (ID!=0) jump to the address in PERSISTENT\_ENTRY<X> where 0<X<4 in all power modes.

The device configuration data (DCD) feature allows boot ROM code to obtain SOC configuration data from an external Program Image residing on the boot device. As an example, DCD can be used to program the DDR controller for optimal settings improving the boot performance. DCD is restricted to memory areas and peripheral addresses that are considered essential for boot purposes (see [Write Data Command](#)).

A key feature of the boot ROM is the ability to perform a secure boot or High Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. HAB uses a combination of hardware and software together with a Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows a user's image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as part of the final Program Image. If configured to do so, the ROM verifies the signatures using the public keys included in the Program Image. In addition to supporting digital signature verification to authenticate Program Images, Encrypted boot is also supported. Encrypted boot can be used to prevent cloning of the Program Image directly off the boot device. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the Serial Downloader. The HAB library in the boot ROM also provides API functions, allowing additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for SEC\_CONFIG is the Open configuration in which the ROM/HAB performs image authentication, but all authentication errors are ignored and the image is still allowed to execute.

## 8.2 Boot modes

During reset, the chip checks ARM core ID and Power Gating Controller status register.

On normal boot, the core's behavior is defined by the Boot Mode pins settings as described in [Boot mode pin settings](#). On waking up from low power boot mode, the core skips clock settings. Boot ROM checks that PERSISTENT\_ENTRY0 (see [Persistent Bits](#)) is a pointer to valid address space (OCRAM, DDR, or EIM). If PERSISTENT\_ENTRY0 is a pointer to valid range, it starts execution using entry point from PERSISTENT\_ENTRY0 register. If PERSISTENT\_ENTRY0 is a pointer to invalid range, the core performs system reset.

For secondary cores (with ID!=0) boot ROM checks that PERSISTENT\_ENTRY is a pointer to valid address space (OCRAM, DDR, or EIM). If PERSISTENT\_ENTRY is a pointer to valid range, it starts execution using entry point from PERSISTENT\_ENTRY register. If PERSISTENT\_ENTRY is a pointer to invalid range, it sets error status registers (see [Persistent Bits](#)), sends wakeup error interrupt and performs Wait For Interrupt instruction. The interrupt service routine of the other core must reconfigure the system and reset the secondary core that failed to boot.

### NOTE

Code that enables the secondary cores is not part of ROM, but it must be part of upper level software.

## 8.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for Freescale use). Boot mode is selected based on the binary value stored in the internal BOOT\_MODE register.

BOOT\_MODE is initialized by sampling the BOOT\_MODE0 and BOOT\_MODE1 inputs on the rising edge of POR\_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT\_MODE internal register. The state of the internal BOOT\_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC\_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See the table below for settings.

**Table 8-1. Boot MODE Pin Settings**

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

## 8.2.2 High level boot sequence

The figure found here shows the high-level boot ROM code flow.

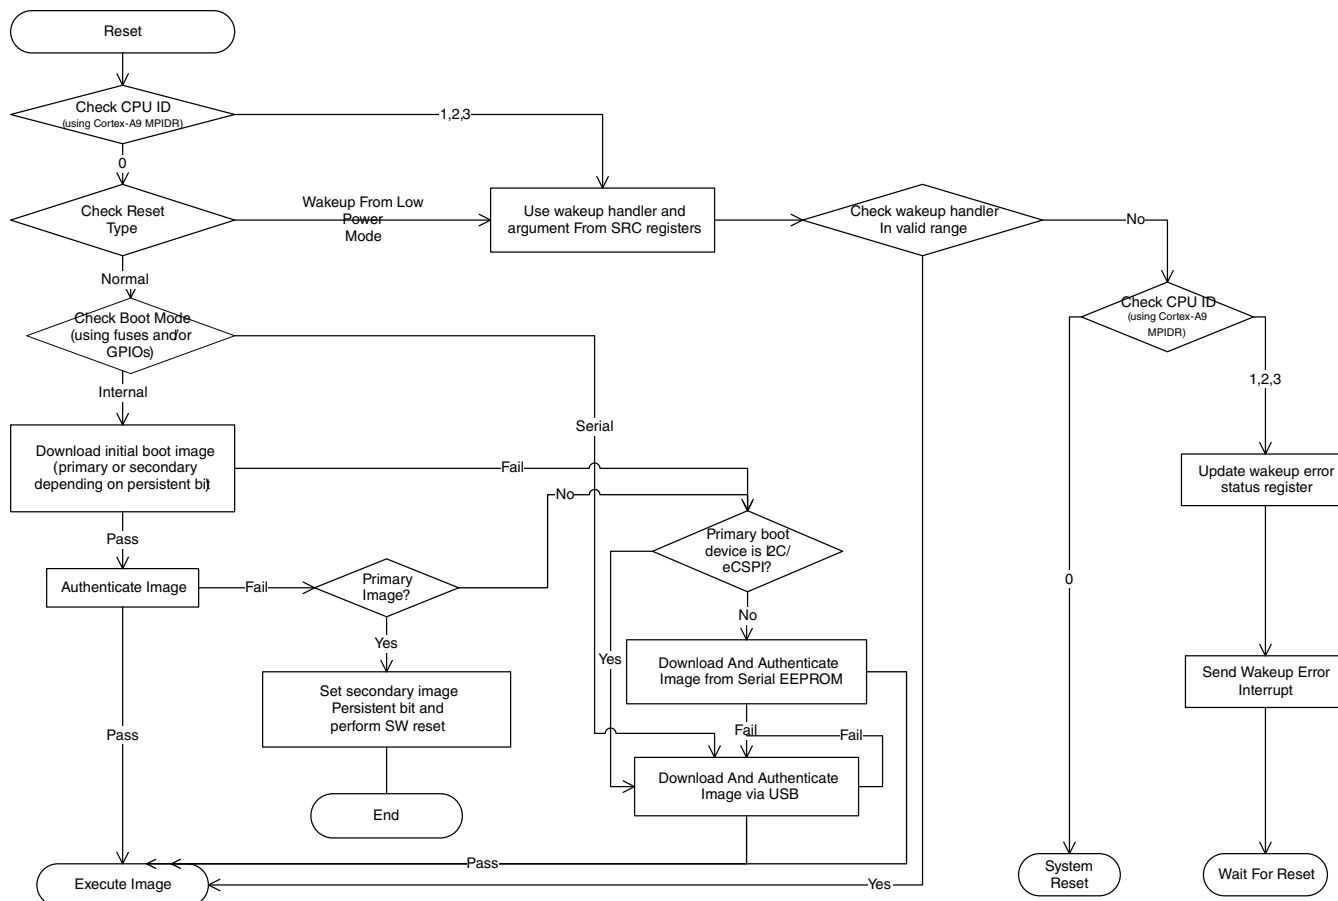

Figure 8-1. Boot Flow

### 8.2.3 Boot From Fuses Mode (BOOT\_MODE[1:0] = 00b)

A value of 00b in the BOOT\_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in [Internal Boot Mode \(BOOT\\_MODE\[1:0\] = 0b10\)](#) with one difference. In this mode the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT\_FUSE\_SEL eFUSE value. If BT\_FUSE\_SEL = 0, indicating that the boot device (for example, Flash, SD/MMC) has not yet been programmed, the boot flow jumps directly to the Serial Downloader. If BT\_FUSE\_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSES may be configured incorrectly for the hardware on the platform. In such a case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using Boot From Fuses mode addresses this problem.

Setting BT\_FUSE\_SEL forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a Program Image and blow the BT\_FUSE\_SEL and the other boot configuration eFUSES. After reset, the Boot ROM code determines that BT\_FUSE\_SEL is blown (BT\_FUSE\_SEL = 1) and the ROM code performs internal boot according to the new eFUSE settings. This allows a user to set BOOT\_MODE[1:0]=00b on a production device and burn fuses on the same device (by forcing entry to the Serial Downloader), without changing the value of BOOT\_MODE[1:0] or pullups/pulldowns on the BOOT\_MODE pins.

## 8.2.4 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG1 for a 90-second time-out if WDOG\_ENABLE eFuse is 1 and continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

### NOTE

The downloaded image must continue to service the watchdog timer to avoid an undesired reset from occurring.

The USB boot flow is shown in the figure below.

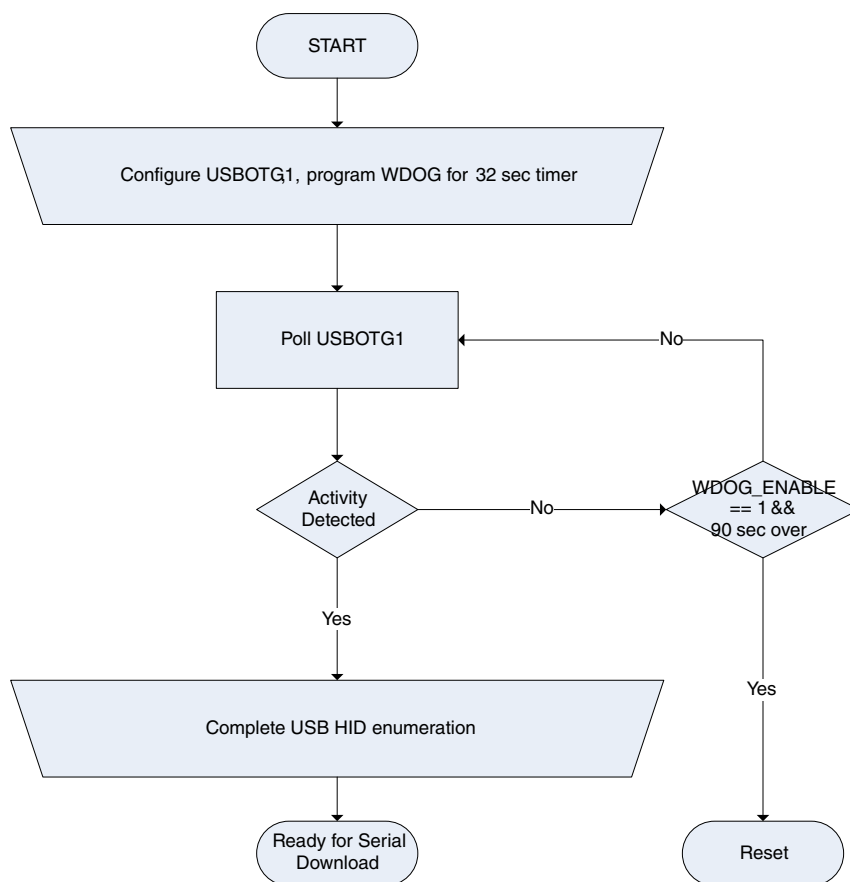

Figure 8-2. Serial Download Boot Flow

### 8.2.5 Internal Boot Mode (BOOT\_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT\_MODE[1:0] register selects the internal boot mode. In this mode, the processor continues to execute boot code from the internal boot ROM.

The boot code performs hardware initialization, loads the Program Image from the chosen boot device, performs image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the Program Image. If any error occurs during internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to internal boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT\_FUSE\_SEL) determines whether the ROM uses GPIO pins for a select number of configuration parameters or eFUSES in this mode. See [Table 8-4](#) for more details.

- If `BT_FUSE_SEL = 1`, all boot options are controlled by the eFUSES described in [Table 8-2](#).
- If `BT_FUSE_SEL = 0`, specific boot configuration parameters may be set using GPIO pins rather than eFUSES. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Table 8-2](#). [Table 8-3](#) provides the details on the GPIO pins.

The use of GPIO overrides is intended for development since these pads are used for other purposes in deployed products. Freescale recommends controlling the boot configuration by eFUSES in deployed products and reserving the use of the GPIO mode for development and testing purposes only.

## 8.2.6 Boot security settings

Internal boot modes use one of three security configurations:

- **Closed:** This level is intended for use with shipping secure products. All HAB functions are executed and security hardware is initialized (the Security Controller, or SNVS, enters Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, and the boot flow aborted with control passing to the serial downloader. At this level, execution does not leave the internal ROM unless the target executable image has been authenticated.
- **Open:** This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. Security hardware is initialized (except the SNVS is left in Non-Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, but have no influence on the boot flow, which continues as if the errors did not occur. This configuration is useful for secure product development, since the Program Image will run even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of authentication failure.
- **Field Return:** This level is intended for parts returned from shipped products.

### NOTE

If the `DIR_BT_DIS` eFuse is not blown, authentication may be bypassed. In this case the system is not secure.

## 8.3 Device Configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes boot device selection (SPI, EIM, NOR, SD, MMC, etc.), boot device configuration (SD bus width, speed, etc), and so on. In general, the source for this configuration comes from eFUSES embedded inside the chip. However, certain configuration parameters can be sourced from GPIO pins allowing further flexibility during the development process.

### 8.3.1 Boot eFUSE Descriptions

The table below is a comprehensive list of the configuration parameters that the ROM uses.

**Table 8-2. Boot eFUSE Descriptions**

Fuse	Configuration	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
DIR_BT_DIS	OEM	Disables Freescale reserved modes. Must be set for secure boot.	NA	0	0 Reserved Freescale modes enabled 1 Reserved Freescale modes disabled
BT_FUSE_SEL	OEM	In internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by GPIO pins or eFUSE settings in the On-Chip OTP Controller (OCOTP).  In Boot From Fuse mode BOOT_MODE[1:0] = 00, BT_FUSE_SEL fuse indicates whether bit configuration eFuses have been programmed.	NA	0	If BOOT_MODE[1:0] = 0b10 0 Bits of SBMR are overridden by GPIO pins. 1 Specific bits of SBMR are controlled by eFUSE settings.  If BOOT_MODE[1:0] = 0b00 0 BOOT configuration eFuses are not yet programmed. Boot flow jumps to serial downloader. 1 BOOT configuration eFuses have been programmed. Regular boot flow is performed.
SEC_CONFIG[1:0]	SEC_CONFIG[0] - Freescale SEC_CONFIG[1] - OEM	Security Configuration as defined in <a href="#">Boot security settings</a>	NA	01	00 Reserved 01 Open (allows any program image, even if authentication fails) 1x Closed (Program image executes only if authenticated)

Table continues on the next page...

**Table 8-2. Boot eFUSE Descriptions  
(continued)**

Fuse	Configuratio n	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
FIELD_RETURN	OEM	Enables Freescale reserved modes			0 - Freescale reserved modes are enabled/ disabled based on DIR_BT_DIS value 1 - Freescale reserved modes are enabled
SRK_HASH[255:0]	OEM	256-bit hash value of super root key (SRK_HASH)	NA	0	Settings vary - used by HAB
DIE-X-CORDINATE[7:0] DIE-Y-CORDINATE[7:0] WAFER_NO[4:0] LOT_NO_ENC[42:40] LOT_NO_ENC[39:32] LOT_NO_ENC[31:24] LOT_NO_ENC[23:16] LOT_NO_ENC[15:8] LOT_NO_ENC[7:0]	Freesc ale	Device Unique ID, 64-bit UID.	NA	Unique ID	Settings vary - used by HAB
BT_MMU_DISABLE (BOOT_CFG3[6])	OEM	MMU/L1 D Cache/PL310 disable bit used by boot ROM for fast HAB processing	Yes	0	0 - MMU/L1 D Cache/PL310 is enabled by ROM during the boot 1 - MMU/L1 D Cache/PL310 is disabled by ROM during the boot
L1 I-Cache DISABLE (BOOT_CFG3[7])	OEM	L1 I Cache disable bit used by boot during entire execution	Yes	0	0 - L1 I Cache is enabled by ROM during the boot 1 - L1 I Cache is disabled by ROM during the boot
BT_FREQ (BOOT_CFG3[2])	OEM	Frequency Selection	Yes	0	0 - ARM - 792 MHz, DDR - 396 MHz, AXI - 264 MHz 1 - ARM - 396 MHz, DDR - 352 MHz, AXI - 176 MHz
BOOT_CFG1[7:0]	OEM	Boot Configuration1	Yes	0	Specific to selected boot mode
BOOT_CFG2[7:0]	OEM	Boot Configuration2	Yes	0	Specific to selected boot mode
BOOT_CFG4[6:0]	OEM	Boot Configuration4		0	Specific to selected boot mode
BOOT_CFG4[7]	OEM	Infinite Loop Enable at start of boot ROM. Used for debugging purposes. Ignored if DIR_BT_DIS is 1 and FIELD_RETURN is 0.	Yes	0	0 - Disabled 1 - Enabled
LPB_BOOT	OEM	USB Low Power Boot	No	0	00 - LPB Disable 01 - 1 GPIO (default frequencies) 10 - Divide by 2 11 - Divide by 4

Table continues on the next page...

**Table 8-2. Boot eFUSE Descriptions  
(continued)**

Fuse	Configuration	Definition	GPIO <sup>1</sup>	Shipped Value	Settings <sup>2</sup>
BT_LPB_POLARITY	OEM	USB Low Power Boot GPIO polarity	No	0	0 - low on GPIO pad indicates low power condition 1 - high on GPIO pad indicates low power condition
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	0 - watchdog reset counter is disabled during serial downloader 1 - watchdog reset counter is enabled during serial downloader
MMC_DLL_DLY[6:0]	OEM	uSDHC Delay Line settings	No	0	uSDHC Delay Line settings
SRK_REVOKE[2:0]	OEM	SRK revocation mask	No	0	SRK revocation mask
DISABLE_SDMMC_MFG	OEM	Disable SDMMC manufacture mode	Yes	0	0: enable SD/MMC MFG mode 1: disable SD/MMC MFG mode
PAD_SETTINGS	OEM	Override values for SD/MMC and NAND boot modes	No	0	Override the following IO PAD settings: PAD_SETTINGS[0] - Slew Rate PAD_SETTINGS[3:1] Drive Strength PAD_SETTINGS[5:4] - Speed Settings .

- Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.
- 0 = intact fuse and 1= blown fuse

### 8.3.2 GPIO Boot Overrides

The table below provides a list of GPIO boot overrides.

**Table 8-3. GPIO Override Contact Assignments**

Package Pin	Direction on reset	eFuse
BOOT_MODE1	Input	Boot Mode Selection
BOOT_MODE0	Input	
EIM_DA0	Input	BOOT_CFG1[0]
EIM_DA1	Input	BOOT_CFG1[1]
EIM_DA2	Input	BOOT_CFG1[2]
EIM_DA3	Input	BOOT_CFG1[3]
EIM_DA4	Input	BOOT_CFG1[4]
EIM_DA5	Input	BOOT_CFG1[5]
EIM_DA6	Input	BOOT_CFG1[6]
EIM_DA7	Input	BOOT_CFG1[7]

*Table continues on the next page...*

**Table 8-3. GPIO Override Contact Assignments (continued)**

Package Pin	Direction on reset	eFuse
EIM_DA8	Input	BOOT_CFG2[0]
EIM_DA9	Input	BOOT_CFG2[1]
EIM_DA10	Input	BOOT_CFG2[2]
EIM_DA11	Input	BOOT_CFG2[3]
EIM_DA12	Input	BOOT_CFG2[4]
EIM_DA13	Input	BOOT_CFG2[5]
EIM_DA14	Input	BOOT_CFG2[6]
EIM_DA15	Input	BOOT_CFG2[7]
EIM_A16	Input	BOOT_CFG3[0]
EIM_A17	Input	BOOT_CFG3[1]
EIM_A18	Input	BOOT_CFG3[2]
EIM_A19	Input	BOOT_CFG3[3]
EIM_A20	Input	BOOT_CFG3[4]
EIM_A21	Input	BOOT_CFG3[5]
EIM_A22	Input	BOOT_CFG3[6]
EIM_A23	Input	BOOT_CFG3[7]
EIM_A24	Input	BOOT_CFG4[0]
EIM_WAIT	Input	BOOT_CFG4[1]
EIM_LBA	Input	BOOT_CFG4[2]
EIM_EB0	Input	BOOT_CFG4[3]
EIM_EB1	Input	BOOT_CFG4[4]
EIM_RW	Input	BOOT_CFG4[5]
EIM_EB2	Input	BOOT_CFG4[6]
EIM_EB3	Input	BOOT_CFG4[7]

The input pins provided are sampled at boot, and can be used to override corresponding eFUSE values, depending on the setting of the BT\_FUSE\_SEL fuse. Table below describes boot options control sampling in different boot modes.

**Table 8-4. Boot Options Control Selection**

BOOT_MODE[1:0]	BT_FUSE_SEL Value	Boot Options Controlled By
00	0	eFUSEs
	1	
01 <sup>1</sup>	0	GPIO pins
	1	eFUSEs
10	0	GPIO pins
	1	eFUSEs

1. BOOT\_MODE[1:0]=01 always selects serial download regardless of the setting or the fuses or GPIO pins.

### 8.3.3 Device Configuration Data

DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on Device Configuration Data.

## 8.4 Device Initialization

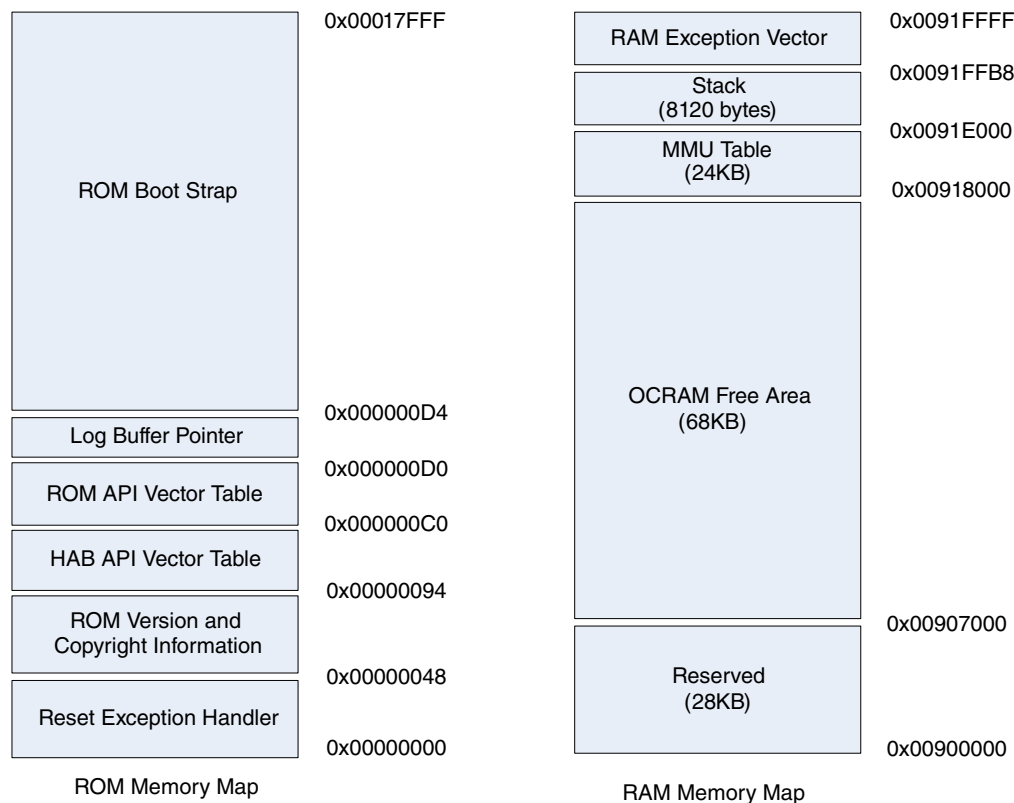

This section describes the details on the ROM and provides initialization details.

This includes details on:

- The ROM Memory Map
- The RAM Memory Map
- On-chip blocks that the ROM should make use of or change POR register default values
- Clock initialization
- Enabling the MMU/L2 cache
- Exception handling and interrupt handling

### 8.4.1 Internal ROM /RAM memory map

The following figure shows the iROM memory map.

**Figure 8-3. Internal ROM and RAM memory map**

### NOTE

The entire OCRAM region can be used freely post boot.

## 8.4.2 Boot Block Activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and boot device selection:

- APBH - DMA engine to drive the GPMI module
- BCH - 40-bit error correction hardware engine with AXI bus master and private connection to GPMI
- CCM - Clock Control Module
- ECSPI - Enhanced Configurable Serial Peripheral Interface
- EIM - External Interface Module. Used for NOR and OneNAND devices

- I2C - I2C Controller
- GPMI - NAND controller pin interface
- OCOTP\_CTRL - On-Chip OTP Controller. The OCOTP contains the eFUSES.
- IOMUXC - I/O Multiplexer Control allows GPIO use to override eFUSE boot settings
- IOMUXC GPR - I/O Multiplexer Control General Purpose registers
- CAAM - Cryptographic Acceleration and Assurance Module
- SNVS - Secure Non-Volatile Storage
- SRC - System Reset Controller
- USB - Used for serial download of a boot device provisioning program
- USDHC - Ultra Secure Digital Host Controller
- WDOG-1 - Watchdog Timer
- DTCP - Digital Transmission Content Protection
- HDCP - High-bandwidth Digital Content Protection

### 8.4.3 Clocks at Boot Time

The table below shows the various clocks and their sources used by ROM.

**Table 8-5. Normal Frequency Clocks Configuration**

Clock	CCM signal	Source	Frequency(MHz)	
			BT_FREQ=0	BT_FREQ=1
System PLL	pll1_sw_clk		792	792
528MHz PLL	pll2_sw_clk		528	528
480MHz PLL	pll3_sw_clk		480	480
ARM core clock	arm_clk_root	System PLL	792	396
EIM	eim_slow_clk_root	528MHz PLL	132	132
AHB	ahb_clk_root	528MHz PLL/PFD307	132	76.6
IPG	ipg_clk_root	528MHz PLL/PFD307	66	38.3
AXI_A	axi_a	528MHz PLL/PFD307	396	306
AXI_B	axi_b	528MHz PLL/PFD352	264	153.3
USB	usboh3_clk_root	480MHz PLL	60	60
USDHC	usdhc1_clk_root usdhc2_clk_root usdhc3_clk_root usdhc4_clk_root	PFD400	198	198
ECSPI	ecspi_clk_root	480MHz PLL	60	60
I2C	per_clk_root	528MHz PLL	66	38.3

Following reset, each ARM core has access to all peripherals. The ROM code will disable the clocks listed in the following table, except for the boot devices listed in the second column.

**Table 8-6. List Of Disabled Clocks**

Clock Name	Enabled For Boot Device
CCGR0_APBHDMA	
CCGR1_ECSP11	ECSP11
CCGR1_ECSP12	ECSP12
CCGR1_ECSP13	ECSP13
CCGR1_ECSP14	ECSP14
CCGR1_FEC	
CCGR1_EPIT1	
CCGR1_EPIT2	
CCGR2_I2C1_SERIAL	I2C1
CCGR2_I2C2_SERIAL	I2C2
CCGR2_I2C3_SERIAL	I2C3
CCGR3_OPENVGAXICLK	
CCGR4_PWM1	
CCGR4_PWM2	
CCGR4_PWM3	
CCGR4_PWM4	
CCGR5_SDMA	
CCGR5_SPDIF	
CCGR5_SSI1	
CCGR5_SSI2	
CCGR5_SSI3	
CCGR5_UART	
CCGR5_UART_SERIAL	
CCGR6_USBOH3	USB
CCGR6_USDHC1	USDHC1
CCGR6_USDHC2	USDHC2
CCGR6_USDHC3	USDHC3
CCGR6_USDHC4	USDHC4
CCGR6_EIM_SLOW	NOR, OneNAND

## 8.4.4 Enabling MMU and Caches

The boot ROM includes a feature of enabling the Memory Management Unit (MMU) and caches to improve boot speed.

L1 instruction cache is enabled at the start of image download. L1 data cache, L2 cache and MMU are enabled during image authentication. Once HAB authentication completes the ROM disables the L1 data cache, L2 cache and MMU.

L1 Instruction cache, L1 data cache, L2 cache and MMU is controlled by eFuse. By default these features are enabled.

Enabling the MMU when booting non-securely with SEC\_CONFIG=Open, and setting the CSF pointer in the Image Vector Table to NULL, has no impact on the boot performance. With this configuration it is recommended to blow BT\_MMU\_DISABLE fuse.

## 8.4.5 Exception Handling

The exception vectors located at the start of ROM are used to map all the ARM exceptions (except the reset exception) to a duplicate exception vector table in internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in ROM.

During the boot phase of a secondary CPU, the internal RAM vectors point to a function that sets the error status registers (see [Persistent Bits](#)), sends a wakeup error interrupt and performs the Wait For Interrupt instruction. The interrupt service routine of primary CPU must reconfigure the system and reset the secondary CPU.

After boot the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate one in RAM.

### Mapping ROM Exception Vector Table

```
;; Define linker area for ROM exception vector table
AREA IROM_VECTORS, CODE, READONLY
LDR    PC, Reset_Addr
LDR    PC, Undefined_Addr
LDR    PC, SWI_Addr
LDR    PC, Prefetch_Addr
LDR    PC, Abort_Addr
NOP
LDR    PC, IRQ_Addr
LDR    PC, FIQ_Addr

;; Define exception vector table
Reset_Addr    DCD    start_address
Undefined_Addr DCD    iRAM_Undefined_Handler
SWI_Addr      DCD    iRAM_SWI_Handler
Prefetch_Addr DCD    iRAM_Prefetch_Handler
Abort_Addr    DCD    iRAM_Abort_Handler
              DCD    0 ; Reserved vector
IRQ_Addr      DCD    iRAM_IRQ_Handler
FIQ_Addr      DCD    iRAM_FIQ_Handler
```

```
start_address DCD start ;reset handler vector
```

## 8.4.6 Interrupt Handling During Boot

No special interrupt handling routines are required during the boot process. Interrupts are disabled during boot ROM execution and may be enabled in a later boot stage.

## 8.4.7 Persistent Bits

Some modes of boot ROM require registers that keep their values after warm reset. SRC General Purpose registers are used for this purpose.

See the table below for persistent bits list and description.

**Table 8-7. Persistent Bits**

Bit Name	Bit Location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used - primary and secondary. Used only for boot modes that support redundant boot.
PERSIST_BLOCK_REWRITE	SRC_GPR10[29]	This bit is used as warning. It identifies that there are errors in NAND blocks that hold the application image.  See <a href="#">NAND Flash</a> for more details.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds entry function for CPU0 for waking-up from low power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds argument of entry function for CPU0 for waking-up from low power mode.
PERSISTENT_ENTRY1[31:0]	SRC_GPR3[31:0]	Holds entry function for CPU1 for wake-up from low-power mode.
PERSISTENT_ARG1[31:0]	SRC_GPR4[31:0]	Holds argument of entry function for CPU1 for wake-up from low-power mode.
CPU1_ERROR_STATUS	SRC_GPR10[25]	CPU1 error status bit

## 8.5 Boot Devices (Internal Boot)

The Chip supports the following boot Flash devices:

- NOR Flash with External Interface Module (EIM), located on CS0, 16-bit bus width
- OneNAND Flash with EIM interface, located on CS0, 16-bits bus width

## Boot Devices (Internal Boot)

- Raw NAND (MLC and SLC), and Toggle-mode NAND flash through GPMI-2 interface. Page sizes of 2 Kbyte, 4 Kbyte and 8 Kbyte. Bus widths of 8-bit with 2 through 40-bit BCH Hardware ECC (Error Correction) are supported.
- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards
- EEPROM boot via SPI (serial flash) and I2C(via ECSPi and I2C blocks respectively)

The selection of external boot device type is controlled by BOOT\_CFG1[7:4] eFUSES. See the table below for more details.

**Table 8-8. Boot Device Selection**

BOOT_CFG1[7:4]	Boot Device
0000	NOR/OneNAND (EIM)
0001	Reserved
0011	Serial ROM (I2C/SPI)
010x	SD/eSD/SDXC
011x	MMC/eMMC
1xxx	Raw NAND

### 8.5.1 NOR Flash/OneNAND using EIM Interface

The External Interface Module (EIM) works in the asynchronous mode, and supports either muxed, Address/Data, or non-muxed schemes based on fuse settings.

**Table 8-9. EIM Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0000	0000 - Boot from EIM Interface
BOOT_CFG1[3]	OEM	NOR/OneNAND Selection	Yes	0	0 - NOR 1 - OneNAND
BOOT_CFG2[7:6]	OEM	Muxing Scheme	Yes	00	00 - Muxed, 16-bit data (low half) interface 01 - Not muxed, 16-bit data (high half) interface 10 - Not muxed, 16-bit data (low half) interface 11 - Reserved
BOOT_CFG2[5:4]	OEM	OneNAND Page Size	Yes	00	00 - 1K 01 - 2K 10 - 4K 11 - Reserved

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.

### 8.5.1.1 NOR Flash Boot Operation

Booting from the NOR Flash is supported via EIM interface. The ROM reads Image Vector Table and Boot Data structures to determine if the image can be executed directly from EIM address space or should be copied to other memory.

The start field of Boot Data Structure specifies the final location of the image (see [Image Vector Table and Boot Data](#)).

### 8.5.1.2 OneNAND Flash Boot Operation

At system power-up, the OneNAND device automatically copies an Initial Load Region of 1 Kbyte from the start of the flash array (sector 0 and sector 1, page 0, block 0) to its Boot RAM (OneNAND's internal RAM).

#### NOTE

The OneNAND boot RAM memory containing the Initial 1K Load Region must contain the IVT, DCD and the Boot Data structures.

Next, the ROM processes the DCD and then proceeds to copy the Program Image contents to the application destination pointer (located in the start entry of Boot Data (see [Image Vector Table and Boot Data](#))). The ROM determines the size of the Program Image by the length specified by size entry in Boot Data structure (see [Image Vector Table and Boot Data](#)). A failure loading data from the OneNAND device for any reason forces the Chip to enter the Serial Downloader, otherwise the booting from the OneNAND device continues.

The figure below illustrates the layout of the Program Image on a OneNAND boot device.

**Figure 8-4. Program Image Layout on a OneNAND Flash Device**

Prior to accessing the OneNAND device, the Chip waits approximately 500  $\mu$ s after Power On Reset. This delay is required for the OneNAND device to become ready. After this initial 500  $\mu$ s delay it can take an addition 70  $\mu$ s for the OneNAND device to load the Initial Load Region of 1 Kbyte into its boot RAM. The Chip polls the OneNAND device Interrupt Status Register to confirm that the first 1 Kbytes has been loaded to the OneNAND boot RAM before continuing with the boot flow.

### 8.5.1.3 IOMUX Configuration for EIM Devices

The EIM interface uses dedicated contacts on the IC.

The contacts assigned to the data signals used by EIM are shown in the table below.

**Table 8-10. EIM IOMUX Pin Configuration**

Signal	A/D16 (Muxed, 16-bit data low half interface)	A+DH (Not muxed, 16-bit data high half interface)	A+DL (Not muxed, 16-bit data low half interface)
DATA0	EIM_DA0.alt0	EIM_D16.alt0	CSI0_DATA_EN.alt1
DATA1	EIM_DA1.alt0	EIM_D17.alt0	CSI0_VSYNC.alt1
DATA2	EIM_DA2.alt0	EIM_D18.alt0	CSI0_DAT4.alt1
DATA3	EIM_DA3.alt0	EIM_D19.alt0	CSI0_DAT5.alt1
DATA4	EIM_DA4.alt0	EIM_D20.alt0	CSI0_DAT6.alt1
DATA5	EIM_DA5.alt0	EIM_D21.alt0	CSI0_DAT7.alt1
DATA6	EIM_DA6.alt0	EIM_D22.alt0	CSI0_DAT8.alt1
DATA7	EIM_DA7.alt0	EIM_D23.alt0	CSI0_DAT9.alt1
DATA8	EIM_DA8.alt0	EIM_D24.alt0	CSI0_DAT12.alt1
DATA9	EIM_DA9.alt0	EIM_D25.alt0	CSI0_DAT13.alt1
DATA10	EIM_DA10.alt0	EIM_D26.alt0	CSI0_DAT14.alt1
DATA11	EIM_DA11.alt0	EIM_D27.alt0	CSI0_DAT15.alt1
DATA12	EIM_DA12.alt0	EIM_D28.alt0	CSI0_DAT16.alt1

*Table continues on the next page...*

**Table 8-10. EIM IOMUX Pin Configuration (continued)**

Signal	A/D16 (Muxed, 16-bit data low half interface)	A+DH (Not muxed, 16-bit data high half interface)	A+DL (Not muxed, 16-bit data low half interface)
DATA13	EIM_DA13.alt0	EIM_D29.alt0	CSI0_DAT17.alt1
DATA14	EIM_DA14.alt0	EIM_D30.alt0	CSI0_DAT18.alt1
DATA15	EIM_DA15.alt0	EIM_D31.alt0	CSI0_DAT19.alt1

ADDR11	EIM_DA11.alt0		
ADDR12	EIM_DA12.alt0		
ADDR13	EIM_DA13.alt0		
ADDR14	EIM_DA14.alt0		
ADDR15	EIM_DA15.alt0		

## 8.5.2 NAND Flash

The boot ROM supports a number of MLC/SLC NAND Flash devices from different vendors and LBA NAND Flash devices. The Error Correction and Control (ECC) subblock (BCH) is used to detect the errors.

### 8.5.2.1 NAND eFUSE Configuration

The boot ROM determines the configuration of external the NAND flash by parameters, either provided by eFUSE, or sampled on GPIO pins, during boot. See the table below for parameters details.

#### NOTE

BOOT\_CFGx sampled on GPIO pins depends on BT\_FUSE\_SEL setting. See Fusemap chapter for details.

**NOTE**

For BOOT\_CFG1[3:2], Although ROM always boots from CS0\_B, for multiple chip selects, such as some NAND chips which consist of multi CS. This fuse must be burned correctly. The number of devices means the number of chip selects.

**Table 8-11. NAND Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG1[7]	OEM	Boot Device Selection	Yes	0	1 - Boot from NAND Interface
BOOT_CFG1[5]	OEM	BT_TOGGLEMODE	Yes	0	0 - raw NAND 1 - toggle mode NAND
BOOT_CFG1[4]	OEM	Override Pad Settings	Yes	0	0 - Use default values 1 - Use PAD_SETTINGS values
BOOT_CFG1[3:2]	OEM	Number of devices	Yes	00	00 - 1 device 01 - 2 device 10 - 4 device 11 - Reserved
BOOT_CFG1[1:0]	OEM	Row Address Cycles	Yes	00	00 - 3 01 - 2 10 - 4 11 - 5
BOOT_CFG2[7:5]	OEM	Toggle Mode 33MHz Preamble Delay, Read Latency	Yes	000	000 - 16 GPMICK cycles. 001 - 1 GPMICK cycles 010 - 2 GPMICK cycles 011 - 3 GPMICK cycles 100 - 4 GPMICK cycles 101 - 5 GPMICK cycles 110 - 6 GPMICK cycles 111 - 7 GPMICK cycles
BOOT_CFG2[4:3]	OEM	Boot Search Count	Yes	00	00 - 2 01 - 2 10 - 4 11 - 8
BOOT_CFG2[2:1]	OEM	Pages In Block	Yes	00	00 - 128 01 - 64 10 - 32 11 - 256
BOOT_CFG2[0]	OEM	Reset time	Yes	0	0 - 12ms 1 - 22ms (LBA NAND)

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [Table 3](#) for corresponding GPIO pin.

### 8.5.2.2 NAND Flash Boot Flow and Boot Control Blocks (BCB)

There are two BCB data structures: FCB and DBBT.

As part of the NAND media initialization, the ROM driver uses safe NAND timings to search for a Firmware Configuration Block (FCB) that contains the optimum NAND timings, page address of Discovered Bad Block Table (DBBT) Search Area and start page address of primary and secondary firmware.

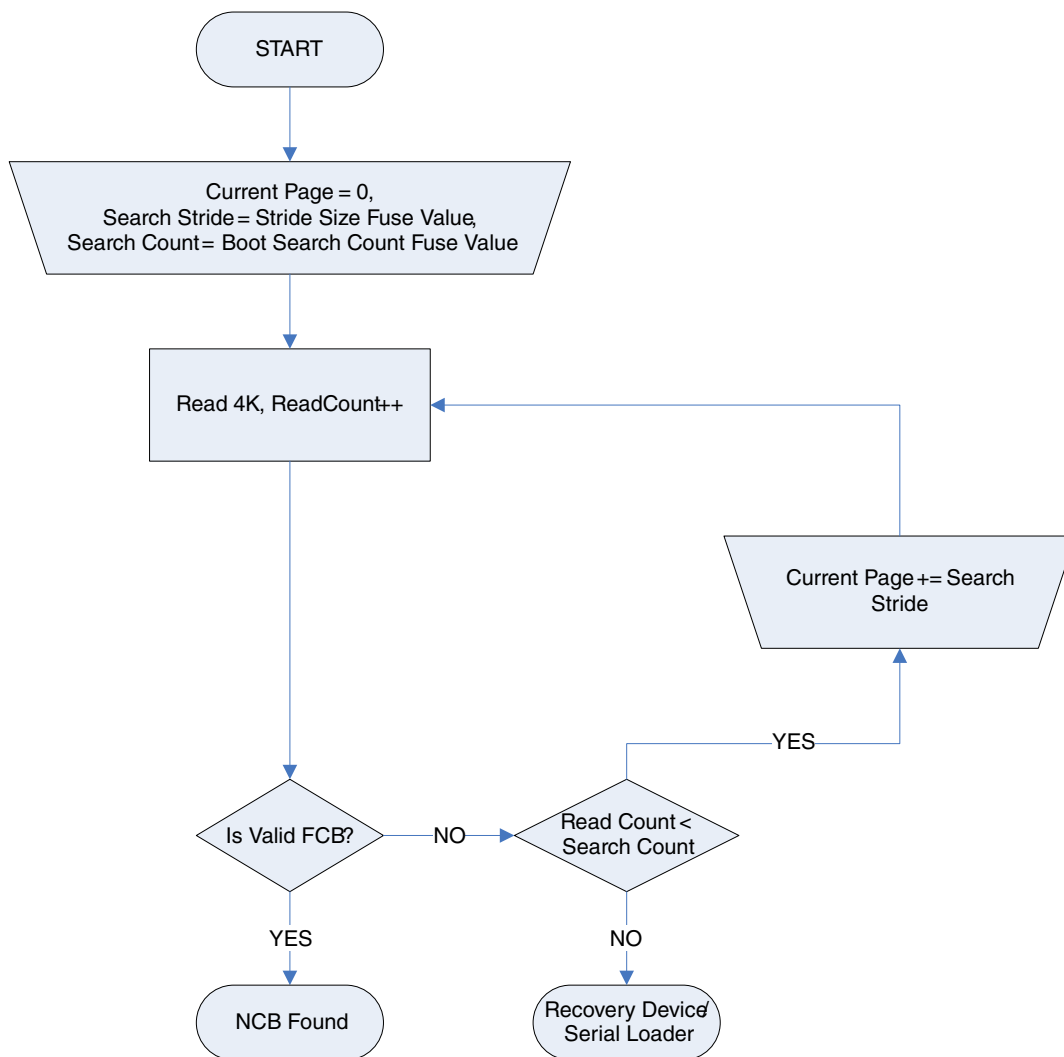

The hardware ECC level to use is embedded inside FCB block. The FCB data structure is also protected using ECC. Driver reads raw 2112 bytes of first sector and runs through software ECC engine that determines whether FCB data is valid or not.

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next BCB until SearchCount pages have been read.

If search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters into serial download mode.

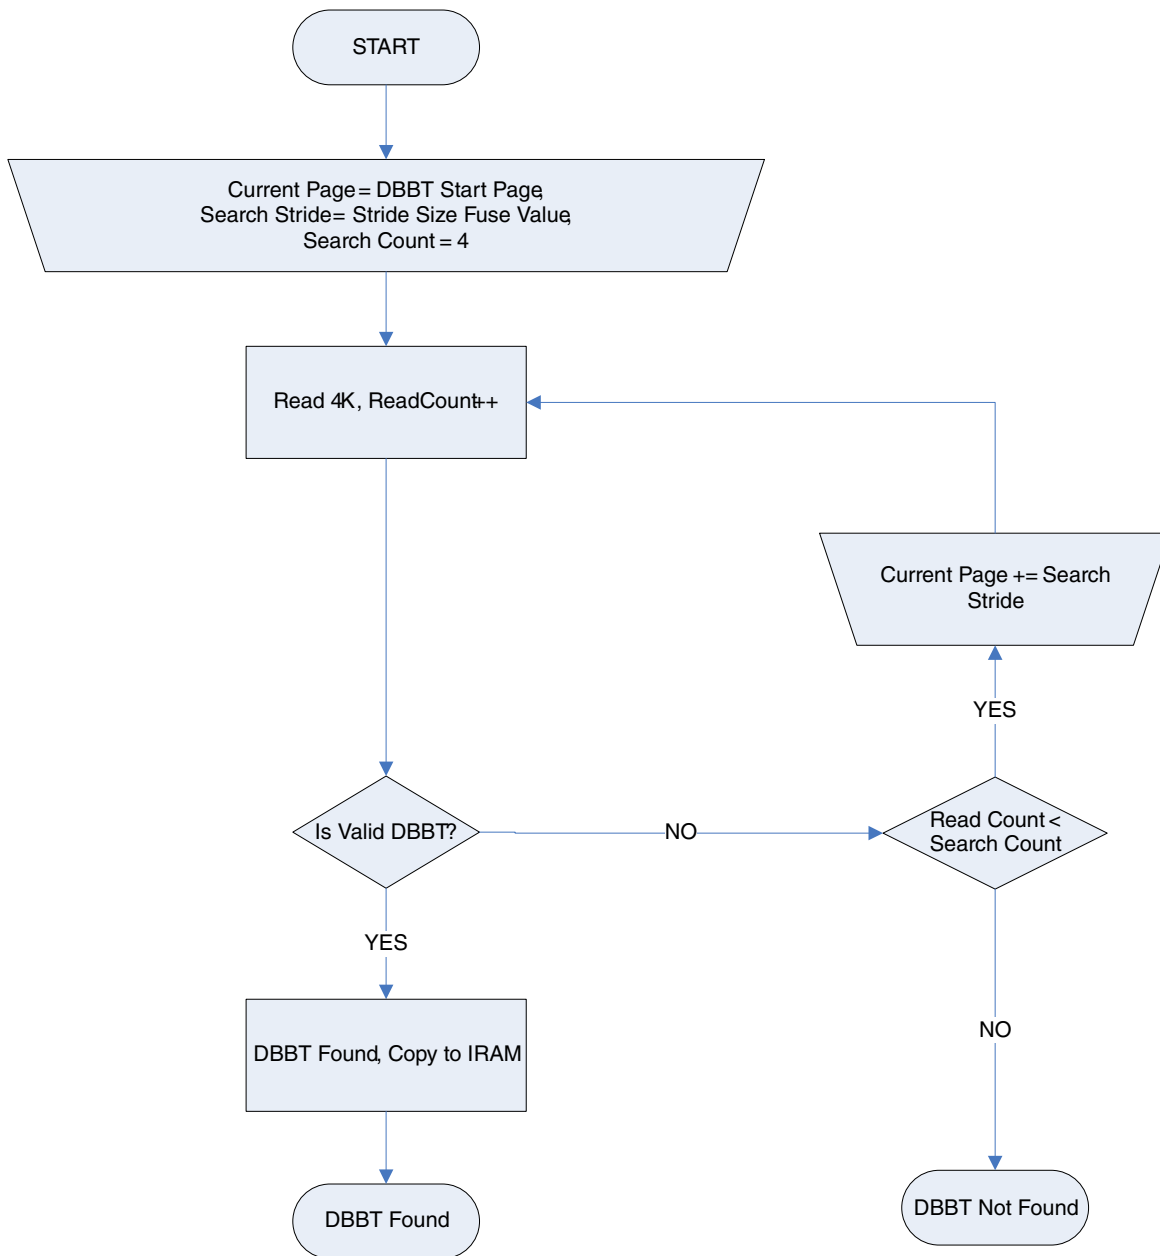

The FCB contains the page address of DBBT Search Area, and the page address for primary and secondary boot images. DBBT is searched in DBBT Search Area just like how FCB is searched. After the FCB is read, the DBBT is loaded, and the primary or secondary boot image is loaded using starting page address from FCB.

The state diagram of FCB search is shown in the following figure.

**Figure 8-5. FCB Search Flow**

Once FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If DBBT Search Area is 0 in FCB, then ROM assumes that there are no bad blocks on NAND device boot area. See the figure below for the DBBT search flow.

**Figure 8-6. DBBT Search Flow**

The BCB search and load function also monitors the ECC correction threshold and sets the `PERSIST_BLOCK_REWRITE` persistent bit if the threshold exceeds the maximum ECC correction ability.

If during primary image read there is a page with a number of errors higher than ECC can correct, the boot ROM will turn on `PERSIST_SECONDARY_BOOT` bit and perform SW reset. (After SW reset, secondary image will be used.)

If during secondary image read there is a page with number of errors higher than ECC can correct, the boot ROM will go to serial loader.

### 8.5.2.3 Firmware Configuration Block

The FCB is the first sector in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, so in case the first NAND block becomes corrupted, the ROM will find its copy in the next NAND block. The search area should span over at least two NAND blocks. The location information for DBBT search area, FW1, and FW2 are all specified in the FCB. Flash Control Block Structure is as shown in the table below.

**Table 8-12. Flash Control Block Structure**

Name	Start Byte	Size in Bytes	Description
Reserved	0	4	Reserved for Fingerprint #1(Checksum)
FingerPrint	4	4	32 bit word with a value of 0x4E434220, in ascii "FCB"
Version	8	4	32-bit version number; this version of FCB is 0x00000001
m_NANDTiming	12	8	8 bytes of data for 8 NAND Timing Parameters from NAND datasheet. The 8 parameters are: m_NandTiming[0]=data_setup, m_NandTiming[1]=data_hold, m_NandTiming[2]=address_setup, m_NandTiming[3]=dsample_time, m_NandTiming[4]=nand_timing_state, m_NandTiming[5]=REA, m_NandTiming[6]=RLOH, m_NandTiming[7]=RHOH.  ROM only uses first 4 parameters but FCB provides space for other 4 parameters to be used by boot-loader or other applications.
PageDataSize	20	4	Number of bytes of data in a page. Typically, this is 2048 bytes for 2112 bytes page size or 4096 bytes for 4314/4224 bytes page size or 8192 for 8568 bytes page size
TotalPageSize	24	4	Total number of bytes in page. Typically, 2112 for 2 KB page or 4224 or 4314 for 4 KB page or 8568 for 8 KB page.
SectorsPerBlock	28	4	Number of pages per block. Typically 64 or 128 or depending on NAND device type.

Table continues on the next page...

**Table 8-12. Flash Control Block Structure  
(continued)**

Name	Start Byte	Size in Bytes	Description
NumberOfNANDs	32	4	Not used by ROM
TotalInternalDie	36	4	Not used by ROM
CellType	40	4	Not used by ROM
EccBlockNEccType	44	4	Value from 0 to 16 used to set BCH Error Correction level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring BCH40 page layout registers
EccBlock0Size	48	4	Size of block B0, used in configuring BCH40 page layout registers
EccBlockNSize	52	4	Size of block BN, used in configuring BCH40 page layout registers
EccBlock0EccType	56	4	Value from 0 to 16 used to set BCH Error Correction level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring BCH40 page layout registers
MetadataBytes	60	4	Size of metadata bytes used in configuring BCH40 page layout registers
NumEccBlocksPerPage	64	4	Number of ECC blocks BN not including B0. This value is used in configuring BCH40 page layout registers

EccBlock0SizeSDK	72	4	Not used by ROM
EccBlockNSizeSDK	76	4	Not used by ROM
EccBlock0EccLevelSDK	80	4	Not used by ROM
NumEccBlocksPerPageSDK	84	4	Not used by ROM
MetadataBytesSDK	88	4	Not used by ROM
EraseThreshold	92	4	Not used by ROM
Firmware1_startingPage	104	4	Page number address where first copy of bootable firmware is located
Firmware2_startingPage	108	4	Page number address where second copy of bootable firmware is located
PagesInFirmware1	112	4	Size of first copy of firmware in pages
PagesInFirmware2	116	4	Size of second copy of firmware in pages
DBBTSearchAreaStartAddress	120	4	Page address for bad block table search area
BadBlockMarkerByte	124	4	This is an input offset in BCH page for ROM to swap with first byte of metadata after reading a page using BCH40. ROM supports restoration of manufacturer marked bad block markers in the page and this offset is the bad block marker offset location
BadBlockMarkerStartBit	128	4	This is an input bit offset in BadBlockMarkerByte for ROM to use when swapping 8 bits with first byte of metadata.
BBMarkerPhysicalOffset	132	4	This is the offset where manufacturer leaves bad block marker on a page

Table continues on the next page...

**Table 8-12. Flash Control Block Structure  
(continued)**

Name	Start Byte	Size in Bytes	Description
BCHType	136	4	0 for BCH20 and 1 for BCH40. The Chip is backward compatible to BCH20 and this field tell ROM to use BCH20 or BCH40 block
TMTiming2_ReadLatency	140	4	Toggle mode NAND timing parameter read latency, ROM use this value to configure timing2 register of GPMI
TMTiming2_PreambleDelay	144	4	Toggle mode NAND timing parameter Preamble Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_CEDelay	148	4	Toggle mode NAND timing parameter CE Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_PostambleDelay	152	4	Toggle mode NAND timing parameter Postamble Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_CmdAddPause	156	4	Toggle mode NAND timing parameter Cmd Add Pause. ROM use this value to configure timing2 register of GPMI
TMTiming2_DataPause	160	4	Toggle mode NAND timing parameter Data Pause. ROM use this value to configure timing2 register of GPMI
TMSpeed	164	4	This is the toggle mode speed for ROM to configure gpmi clock. 0 for 33 MHz, 1 for 40 MHz and 2 for 66 MHz
TMTiming1_BusyTimeout	168	4	Toggle mode NAND timing parameter Busy Timeout. ROM use this value to configure timing1 register of GPMI
DISBBM	172	4	If 0 ROM will swap BadBlockMarkerByte with metadata[0] after reading a page using BCH40. If the value set is 1 then ROM will not do swapping
BBMark_spare_offset	176	4	The offset in mata data place which stores the data in Bad block marker place.
Onfi_sync_enable	180	4	Enable the Onfi nand sync mode support
Onfi_sync_speed	184	4	Speed for onfi nand sync mode: 0 - 24MHZ, 1 - 33MHZ, 2 - 40MHZ, 3 - 50MHZ, 4 - 66MHZ, 5 - 80MHZ, 6 - 100MHZ, 7 - 133MHZ, 8 - 160MHZ, 9 - 200MHZ
Onfi_syncNANDData	188	28	parameters for onfi nand sync mode timing. They are read_latency, ce_delay, preamble_delay, postamble_delay, cmdadd_pause, data_pause, busy_timeout
DISBB_Search	216	4	Disable the badblock search function when reading the firmware, only using DBBT.

### 8.5.2.4 Discovered Bad Block Table

See the table below for DBBT format.

**Table 8-13. DBBT Structure**

Name	Start Byte	Size in Bytes	Description
reserved	0	4	-
FingerPrint	4	4	32-bit word with a value of 0x44424254, in ascii "DBBT"
Version	8	4	32-bit version number; this version of DBBT is 0x00000001
reserved	12	4	-
DBBT_NUM_OF_PAGES	16	4	Size of DBBT in pages
reserved	20	4*PageSize-20	-
reserved	4*PageSize	4	-
Number of Entries	4*PageSize + 4	4	Number of bad blocks
Bad Block Number	4*PageSize + 8	4	First bad block number
Bad Block Number	4*PageSize + 12	4	Second bad block number
...-	-	-	...next bad block number
...-	-	-	...-
Last bad block number	-	-	last bad block number

### 8.5.2.5 Bad Block Handling in the ROM

During firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

If Bad Block table start page is null, check the manufactory made Bad Block marker. The location of Bad Block maker is at the first 3 or last 3 pages in every block of the NAND flash. NAND manufacturers normally use one byte in the spare area of certain pages within a block to mark a block is bad or not. 0xFF means good block, non FF means bad block.

In order to preserve the BI (bad block information), flash updater or gang programmer applications need to swap Bad Block Information (BI) data to byte 0 of metadata area for every page before programming NAND flash. ROM when loading firmware copies back the value at metadata[0] to BI offset in page data. The figure below shows how the factory bad block marker is preserved.

Bad block information at column address 2048

Figure 8-7. Factory Bad Block Marker Preservation

In the FCB structure, there are two elements `m_u32BadBlockMarkerByte` and `m_u32BadBlockMarkerStartBit` to indicate the byte and bit place in the page data, that manufacturer marked the bad block marker.

### 8.5.2.6 Toggle Mode DDR NAND Boot

If `BT_TOGGLEMODE` efuse is blown then ROM does the following to boot from Samsung's toggle mode DDR NAND.

#### 8.5.2.6.1 GPMI and BCH Clocks Configuration

ROM sets the clock source and the dividers in CCM registers.

If `BOOT_CFG1[5]` is set (toggle mode), GPMI/BCH CLK source is PLL2PFD4, and running at 66MHz, otherwise GPMI/ BCH CLK source is PLL3, running at 24 MHz. ROM sets default values to `timing0`, `timing1` and `timing2` gpmi registers for 24 MHz clock speed. It uses fuse `BOOT_CFG2[7:5]` to configure GPMI `timing2` register parameters preamble delay and read latency, the default value for these parameters is 2 when fuses are not blown.

Default timing parameter values used by ROM for toggle-mode device:

- `Timing0.ADDRESS_SETUP = 5`

- Timing0.DATA\_SETUP = 10
- Timing0.DATA\_HOLD = 10
- Timing1.DEVICE\_BUSY\_TIMEOUT = 0 x 500
- Timing2.READ\_LATENCY = BOOT\_CFG2[7:5] if blown, otherwise 2
- Timing2.CE\_DELAY = 2
- Timing2.PREAMBLE\_DELAY = BOOT\_CFG2[7:5] if blown, otherwise 2
- Timing2.POSTAMBLE\_DELAY = 3
- Timing2.CMDADD\_PAUSE = 4
- Timing2.DATA\_PAUSE = 6

Default timing parameters can be overridden by TMTiming2\_ReadLatency, TMTiming2\_PreambleDelay, TMTiming2\_CEDelay, TMTiming2\_PostambleDelay, TMTiming2\_CmdAddPause, TMTiming2\_DataPause parameters of FCB.

#### 8.5.2.6.2 Setup DMA for DDR Transfers

In DMA descriptors GPMI is configured to read page data at double data rate, the word length is set to 16 and transfer count to half of page size.

#### 8.5.2.6.3 Reconfigure Timing and Speed Using Values in FCB

After reading FCB page with GPMI set to default timings and speed 33 MHz, ROM reconfigures CCM dividers to run gpmi/bch clks to desired speed specified in FCB for rest of boot process. The GPMI timing registers are also reconfigured to values specified in FCB.

The GPMI speed can be configured using FCB parameter TMSpeed: 0 - 24MHZ, 1 - 33MHZ, 2 - 40MHZ, 3 - 50MHZ, 4 - 66MHZ, 5 - 80MHZ, 6 - 100MHZ, 7 - 133MHZ, 8 - 160MHZ, 9 - 200MHZ.

The GPMI timing0 register fields data\_setup, data\_hold and address\_setup are set to values specified for data\_setup, data\_hold and address\_setup in FCB member m\_NANDTiming.

The GPMI timing1.DEVICE\_BUSY\_TIMEOUT is set to value specified in FCB member TMTiming1\_BusyTimeout.

The GPMI timing2 register values are set using FCB members TMTiming2.READ\_LATENCY, CE\_DELAY, PREAMBLE\_DELAY, POSTAMBLE\_DELAY, CMDADD\_PAUSE and DATA\_PAUSE.

#### 8.5.2.7 Typical NAND Page Organization

### 8.5.2.7.1 BCH ECC Page Organization

The first data block is called block 0 and the rest of the blocks are called block N. Separate ECC level can be used for block 0 and block N.

The metadata bytes should be located at the beginning of a page, starting at byte 0, followed by data block 0, followed by ECC bytes for data block 0, followed by block 1 and its ECC bytes, and so on until N data blocks. The ECC level for block 0 can be different from the ECC level of rest of the blocks.

For NAND boot, with page size restrictions and data block size restricted to 512 bytes, only few combinations of ECC for block 0 and block N are possible.

The figure below shows the valid layout for 2112 byte sized page.

**Figure 8-8. Valid Layout for 2112 bytes Sized Page**

The example below is for 13 bits of parity(GF13). The number of ECC bits required for a data block is calculated using (ECC\_Correction\_Level \* 13) bits.

In the above layout the ECC size for EccB0 and EccBN should be selected to not exceed a total page size of 2112 bytes. EccB0 and EccBN can be one of 2, 4, 6, 8, 10, 12, 14, 16, 18, 20 bits ECC correction level. The total bytes would then be:

$$[M + (\text{data\_block\_size} \times 4) + ((\text{EccB0} + (\text{EccBN} \times 3)) \times 13) / 8] \leq 2112;$$

M = metadata bytes and data\_block\_size is 512.

There are 4 data blocks of 512 bytes each in a page of 2k page sized NAND. The values of EccB0 and EccBN should be such that the above calculation would not result in a value greater than 2112 bytes.

M	Block0 512 bytes	EccB0	Block1 512 bytes	EccBN	Block2 512 bytes	EccBN	Block3 512 bytes	EccBN
	Block4 512 bytes	EccBN	Block5 512 bytes	EccBN	Block6 512 bytes	EccBN	Block7 512 bytes	EccBN

**Figure 8-9. Valid Layout for 4 Kbytes Sized Page**

Different NAND manufacturers have different sizes for a 4K page; 4314 bytes is typical.

$$[M + (\text{data\_block\_size} \times 8) + ((\text{EccB0} + (\text{EccBN} \times 7)) \times 13) / 8] \leq 4314;$$

M= metadata bytes and data\_block\_size is 512.

There are 8 data blocks of 512 bytes each in a page of a 4k page sized NAND. The values of EccB0 and EccBN should be such that above calculation should not result in a value greater than the size of a page in a 4k page NAND.

### 8.5.2.7.2 Metadata

The number of bytes used for metadata is specified in FCB. Metadata for BCH encoded pages will be placed at the beginning of a page. ROM only cares about the first byte of metadata to swap it with bad block marker byte in page data after each page read; it is important to have at least one byte for the metadata bytes field in FCB data structure.

### 8.5.2.8 IOMUX Configuration for NAND

The table below shows the RawNAND IOMUX pin configuration. NAND boot is only supported on chip select 0.

**Table 8-14. NAND IOMUX Pin Configuration**

Signal	Pad Name
CLE	NANDF_CLE.alt0
ALE	NANDF_ALE.alt0
WPN	NANDF_WP_B.alt0
RD_N	SD4_CMD.alt1
WRN	SD4_CLK.alt1
READY0	NANDF_RB0.alt0
DQS	SD4_DAT0.alt2
CE0N	NANDF_CS0.alt0

*Table continues on the next page...*

**Table 8-14. NAND IOMUX Pin Configuration (continued)**

CE1N	NANDF_CS1.alt0
CE2N	NANDF_CS2.alt0
CE3N	NANDF_CS3.alt0

D3	NANDF_D3.alt0
D4	NANDF_D4.alt0
D5	NANDF_D5.alt0
D6	NANDF_D6.alt0
D7	NANDF_D7.alt0

### 8.5.3 Expansion Device

The ROM supports booting from MMC/eMMC and SD/eSD compliant devices.

#### 8.5.3.1 Expansion Device eFUSE Configuration

SD/MMC/eSD/eMMC/SDXC boot can be performed using either USDHC ports, based on setting of the BOOT\_CFG2[4:3] (Port Select) fuse or it's associated GPIO input value at boot. All USDHC ports support eMMC4.3 and eMMC4.4 fast boot.

See the table below for details.

**Table 8-15. USDHC Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG1[7:6]	OEM	Boot Device Selection	Yes	00	01 - Boot from USDHC Interfaces
BOOT_CFG1[5]	OEM	SD/MMC Selection	Yes	0	0 - SD/eSD/SDXC 1 - MMC/eMMC
BOOT_CFG1[4]	OEM	Fast Boot Support	Yes	0	0 - Normal Boot 1 - Fast Boot
BOOT_CFG1[3:2]	OEM	SD/MMC Speed Mode	Yes	00	MMC 0x - High Speed Mode 1x - Normal Speed Mode x0 - eMMC Fast boot acknowledge enable

*Table continues on the next page...*

**Table 8-15. USDHC Boot eFUSE Descriptions  
(continued)**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
					1 - Apply value per fuse field MMC_DLL_DLY[6:0]
BOOT_CFG2[1]	OEM	Boot Acknowledge Disable/ Pull Down During Power Cycle Enable	Yes	0	MMC 0 - Boot Acknowledge Enabled. 1 - Boot Acknowledge Disabled. SD 0 - Use default SD pad settings during power cycle 1 - Set pull-down on SD pads during power cycle (used only if "SD Power Cycle Enable" enabled)
BOOT_CFG2[0]	OEM	Override Pad Settings	Yes	0	0 - Use default values 1 - Use PAD_SETTINGS values
MMC_DLL_DLY[6:0]	OEM	MMC DLL Value / UHSI Calibration Start Value	No	0000000	MMC DLL Value / UHSI Calibration Start Value

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.

Boot code supports following standards.

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST\_BOOT.
- SDXCv3.0

MMC/SD/eSD/SDXC/eMMC can be connected to any of the USDHC blocks and can be booted by copying 4Kbyte of data from MMC/SD/eSD/eMMC device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

The maximum image size to load in SD/MMC boot is 32MB. This is due to the limited number of uSDHC ADMA Buffer Descriptors allocated by ROM.

**NOTE**

The Initial 4Kbyte of Program Image must contain the IVT, DCD and the Boot Data structures.

**Table 8-16. SD/MMC Frequencies**

	SD	MMC	MMC (DDR Mode)
Identification (KHz)	347.22		
Normal Speed Mode (MHz)	25	20	25
High Speed Mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

**NOTE**

The boot ROM code reads application image length and application destination pointer from image.

**8.5.3.2 MMC and eMMC Boot**

The following table provides MMC and eMMC boot details.

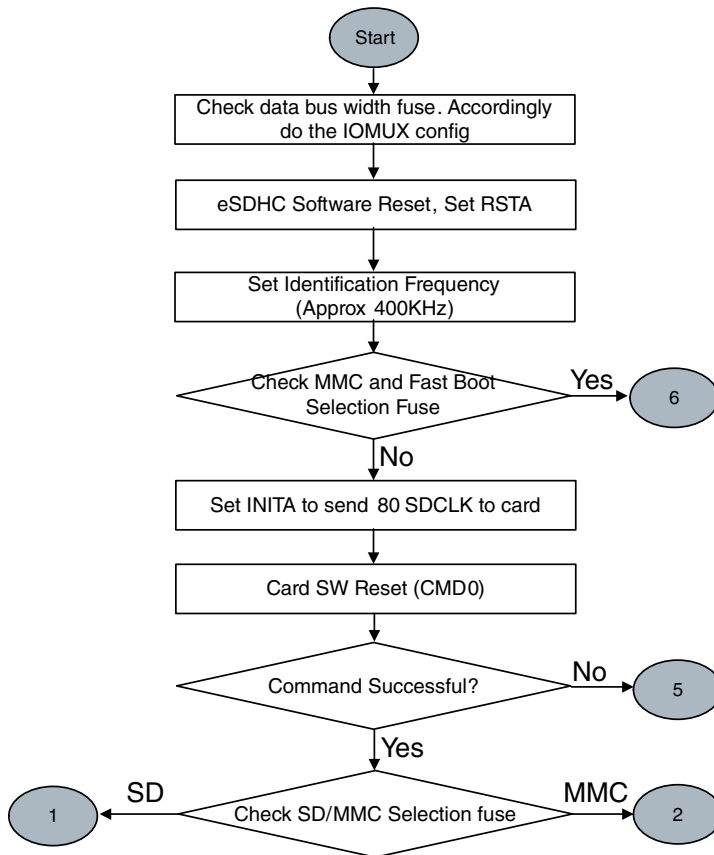

**Table 8-17. MMC and eMMC Boot Details**

Normal Boot Mode	<p>During initialization (normal boot mode) the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, voltage validation is performed and the ROM boot code checks high voltage settings and card capacity. The ROM boot code supports both high capacity and low capacity MMC/eMMC cards. After initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in Normal boot mode or 40MHz in High Speed mode). eMMC is also interfaced via USDHC and follows the same flow as MMC.</p> <p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the <code>BOOT_PARTITION_ENABLE</code> field in the <code>Ext_CSD[179]</code> to get the boot partition to be set. If there is no boot partition mentioned in <code>BOOT_PARTITION_ENABLE</code> field or the user partition has been mentioned, ROM boots from the user partition.</p>
eMMC4.3 or eMMC4.4 Device Supporting Special Boot Mode	<p>If using an eMMC4.3 or eMMC4.4 device supporting special boot mode, it can be initiated by pulling the CMD line low. If <code>BOOT ACK</code> is enabled, the eMMC4.3/eMMC4.4 device sends the <code>BOOT ACK</code> via DATA lines and ROM can read the <code>BOOT ACK [S010E]</code> to identify the eMMC4.3/eMMC4.4 device. eMMC4.3/eMMC4.4 device with "Boot mode" feature can only be supported via ESDHCV3-3 and with or without <code>BOOT ACK</code>. If <code>BOOT ACK</code> is enabled ROM waits 50 ms to get the <code>BOOT ACK</code> and if <code>BOOT ACK</code> is received by ROM. If <code>BOOT ACK</code> is disabled ROM waits 1 second for data. If <code>BOOT ACK</code> or data was received then eMMC4.3/eMMC4.4 is booted in "Boot mode", otherwise eMMC4.3/eMMC4.4 boots as a</p>

*Table continues on the next page...*

**Table 8-17. MMC and eMMC Boot Details (continued)**

	normal MMC card from the selected boot partition. This boot mode can be selected by BOOT_CFG1[4] (Fast Boot) fuse. BOOT ACK is selected by BOOT_CFG2[1].
eMMC4.4 Device	If using eMMC4.4 device, Double Data Rate (DDR) mode can be used. This mode can be selected by BOOT_CFG2[7:5] (Bus Width) fuse.

### 8.5.3.3 SD, eSD and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, SD/eSD/SDXC card voltage validation is performed. During voltage validation, boot code first checks with high voltage settings; if that fails, it checks with low voltage settings.

The capacity of the card is also checked. Boot code supports high capacity and low capacity SD/eSD/SDXC cards after voltage validation card initialization is done.

During card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes the card is a normal SD card or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, boot code switches to a higher frequency (25 MHz in Normal Speed mode or 50 MHz in High Speed Mode). ROM also supports FAST\_BOOT mode booting from eSD card. This mode can be selected by BOOT\_CFG1[4] (Fast Boot) fuse described in [Table 8-15](#).

For UHSI cards, clock speed fuses can be set to SDR50 or SDR104 on USDHC3 and USDHC4 ports. This will enable the voltage switch process to set the signaling voltage to 1.8V during voltage validation. The bus width is fixed at 4 bits wide and a sampling point tuning process is needed to calibrate the number of delay cells. If SD Loopback Clock eFuse is set, the feedback clock will come directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by BOOT\_CFG1[3:2], and the SD Loopback Clock is selected by BOOT\_CFG1[0].

UHSI calibration start value (MMC\_DLL\_DLY[6:0]) and step value (BOOT\_CFG2[7:5]) can be set to optimize the sample point tuning process.

If SD Power Cycle Enable eFuse is 1, ROM will set SD\_RST pad low, wait 5ms and then set SD\_RST pad high. If SD\_RST pad is connected to SD power supply enable logic on board, it enables power cycle of SD card. This may be crucial in case when SD logic is in 1.8V states and must be reset to 3.3V states.

### 8.5.3.4 IOMUX Configuration for SD/MMC

**Table 8-18. SD/MMC IOMUX Pin Configuration**

Signal	USDHC-1	USDHC-2	USDHC-3	USDHC-4

### 8.5.3.5 Redundant Boot Support for Expansion Device

ROM supports redundant boot for expansion device. Primary or Secondary image is selected depending on PERSIST\_SECONDARY\_BOOT setting (see [Table 8-7](#)).

If PERSIST\_SECONDARY\_BOOT is 0, the boot ROM uses address 0x0 for primary image.

If PERSIST\_SECONDARY\_BOOT is 1, the boot ROM will read secondary image table from address 0x200 on boot media and will use address specified in the table.

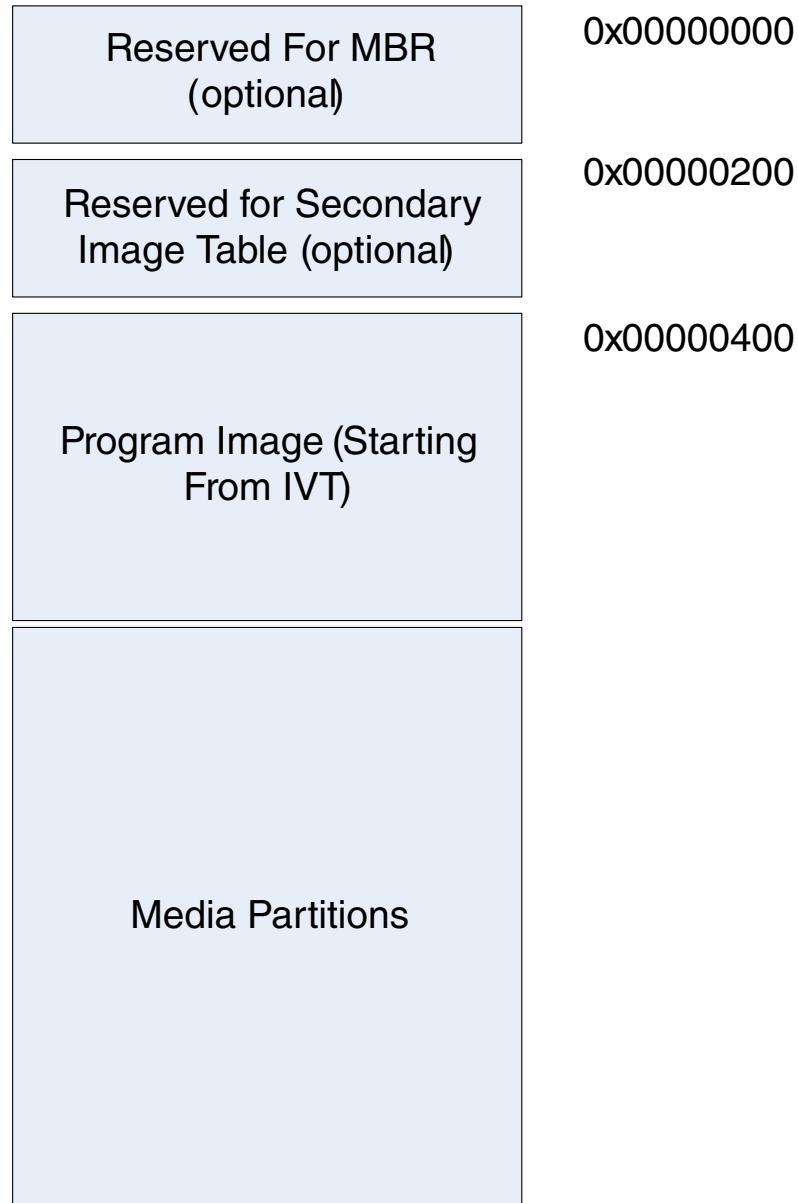

**Table 8-19. Secondary Image Table Format**

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- tag: used as indication of valid secondary image table. Must be 0x00112233.
- firstSectorNumber is the first 512B sector number of the secondary image.

For secondary image support, the primary image must reserve space for secondary image table. See the figure below for typical structures layout on expansion device.

**Figure 8-17. Expansion Device Structures Layout**

For Closed mode, if there are failures during primary image authentication, the boot ROM will turn on PERSIST\_SECONDARY\_BOOT bit (see [Table 8-7](#)) and perform software reset. (After software reset, secondary image will be used.)

## 8.5.4 Serial ROM through SPI

The chip supports boot from serial memory devices, such as EEPROM and Serial Flash using the SPI.

The following ports are available for serial boot: eCSPI (eCSPI1, eCSPI2, eCSPI3, eCSPI4) and I2C Controller (I2C1, I2C2 and I2C3) interfaces.

### 8.5.4.1 Serial ROM eFUSE Configuration

The boot ROM code determines the type of device using the following parameters, either provided by eFUSE settings or sampled on the I/O pins, during boot.

See the table below for details:

**Table 8-20. Serial ROM Boot eFUSE Descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0000	0011 - Boot from Serial ROM
BOOT_CFG4[6]	OEM	EEPROM Recovery Enable	Yes	0	0 - Disabled EEPROM recovery 1 - Enabled EEPROM recovery
BOOT_CFG4[5:4]	OEM	CS select (SPI only)	Yes	00	00 - ECSPi <sub>x</sub> _SS0 01 - ECSPi <sub>x</sub> _SS1 10 - ECSPi <sub>x</sub> _SS2 11 - ECSPi <sub>x</sub> _SS3
BOOT_CFG4[3]	OEM	SPI Addressing (SPI only)	Yes	0	0 - 2-bytes (16-bit) 1 - 3-bytes (24-bit)
BOOT_CFG4[2:0]	OEM	Port Select	Yes	00	000 - ECSPi-1 001 - ECSPi-2 010 - ECSPi-3 011 - ECSPi-4 101- I2C1 110- I2C2 111- I2C3

1. Setting can be overridden by GPIO settings when BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4 block can be used as boot device using ECSPi interface for serial ROM boot. The SPI interface is configured to operate at 15MHz for 3-byte addressing device and 3.75MHz for 2-byte addressing devices.

I2C-1/I2C-2/I2C-3 block can be used as boot device using I2C interface, for serial ROM boot. The I2C interface is configured to operate at 343.75 Kbps.

The boot ROM will copy 4Kbyte of data from Serial ROM device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

### NOTE

The Initial 4K of Program Image must contain the IVT, DCD and the Boot Data structures.

#### 8.5.4.2 I2C Boot

The boot flow when booting from an I2C device is shown in [Figure 8-18](#).

The boot ROM code reads the fuses BOOT\_CFG1[7:4] (Boot Device Selection) and BOOT\_CFG1[7:4] (Port select) to detect EEPROM device type. The ROM program copies 4K data from the EEPROM device to internal RAM. The boot ROM code next copies the initial 4Kbyte of data as well as rest of image directly to application destination extracted from application image.

The chip uses the Device Select Code/Device Address in the table below to boot from an EEPROM.

**Table 8-21. EEPROM via I2C Device Select Code**

Bits	Device Type Identifier				Chip Enable Address <sup>1</sup>			R/W
	7	6	5	4	3	2	1	0
Device Select Code	1	0	1	0	0	0	0	R/W

1. These address bits, should be configured at the memory device, to match this '000' value.

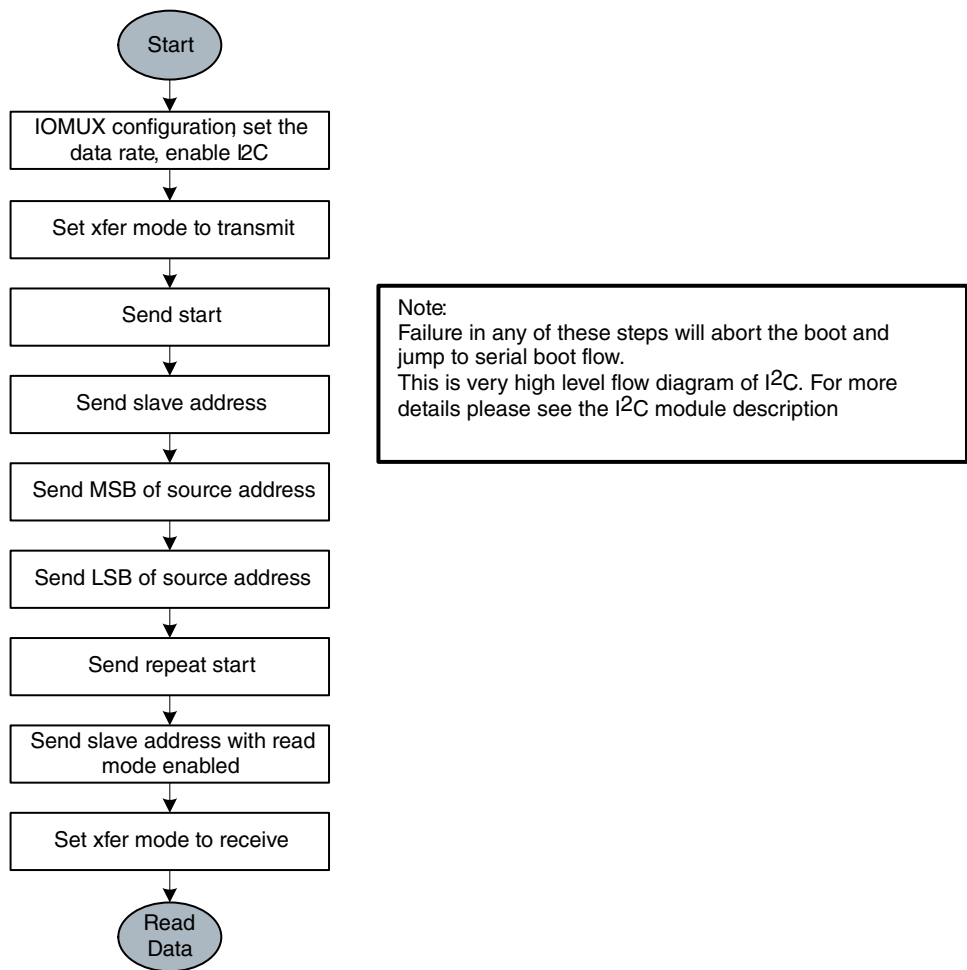

Figure 8-18. I2C Flow Chart

### 8.5.4.2.1 I2C IOMUX Pin Configuration

The contacts assigned to the signals used by the I2C blocks is shown in the table below.

Table 8-22. I2C IOMUX Pin Configuration

Signal	I2C-1	I2C-2	I2c-3
SDA	EIM_D28.alt1	EIM_D16.alt6	EIM_D18.alt6
SCL	EIM_D21.alt6	EIM_EB2.alt6	EIM_D17.alt6

### 8.5.4.3 ECSPI Boot

The Enhanced Configurable SPI (ECSPI) interface is configured in master mode and the EEPROM device is connected to ECSPI interface as a slave.

The boot ROM code copies 4 KB data from EEPROM device to the internal RAM. If DCD verification is successful, the ROM code copies the initial 4 KB data, as well as the rest of the image extracted from application image, directly to the application destination. The ECSPI can read data from EEPROM using 2 or 3 byte addressing. Its burst length is 32 bytes.

#### NOTE

The Serial ROM Chip Select Number is determined by BOOT\_CFG4[5:4] (Chip Select) fuse.

When using the SPI as boot device, the Chip supports booting from both Serial EEPROM and Serial Flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at boot (see [Table 8-20](#) for details).

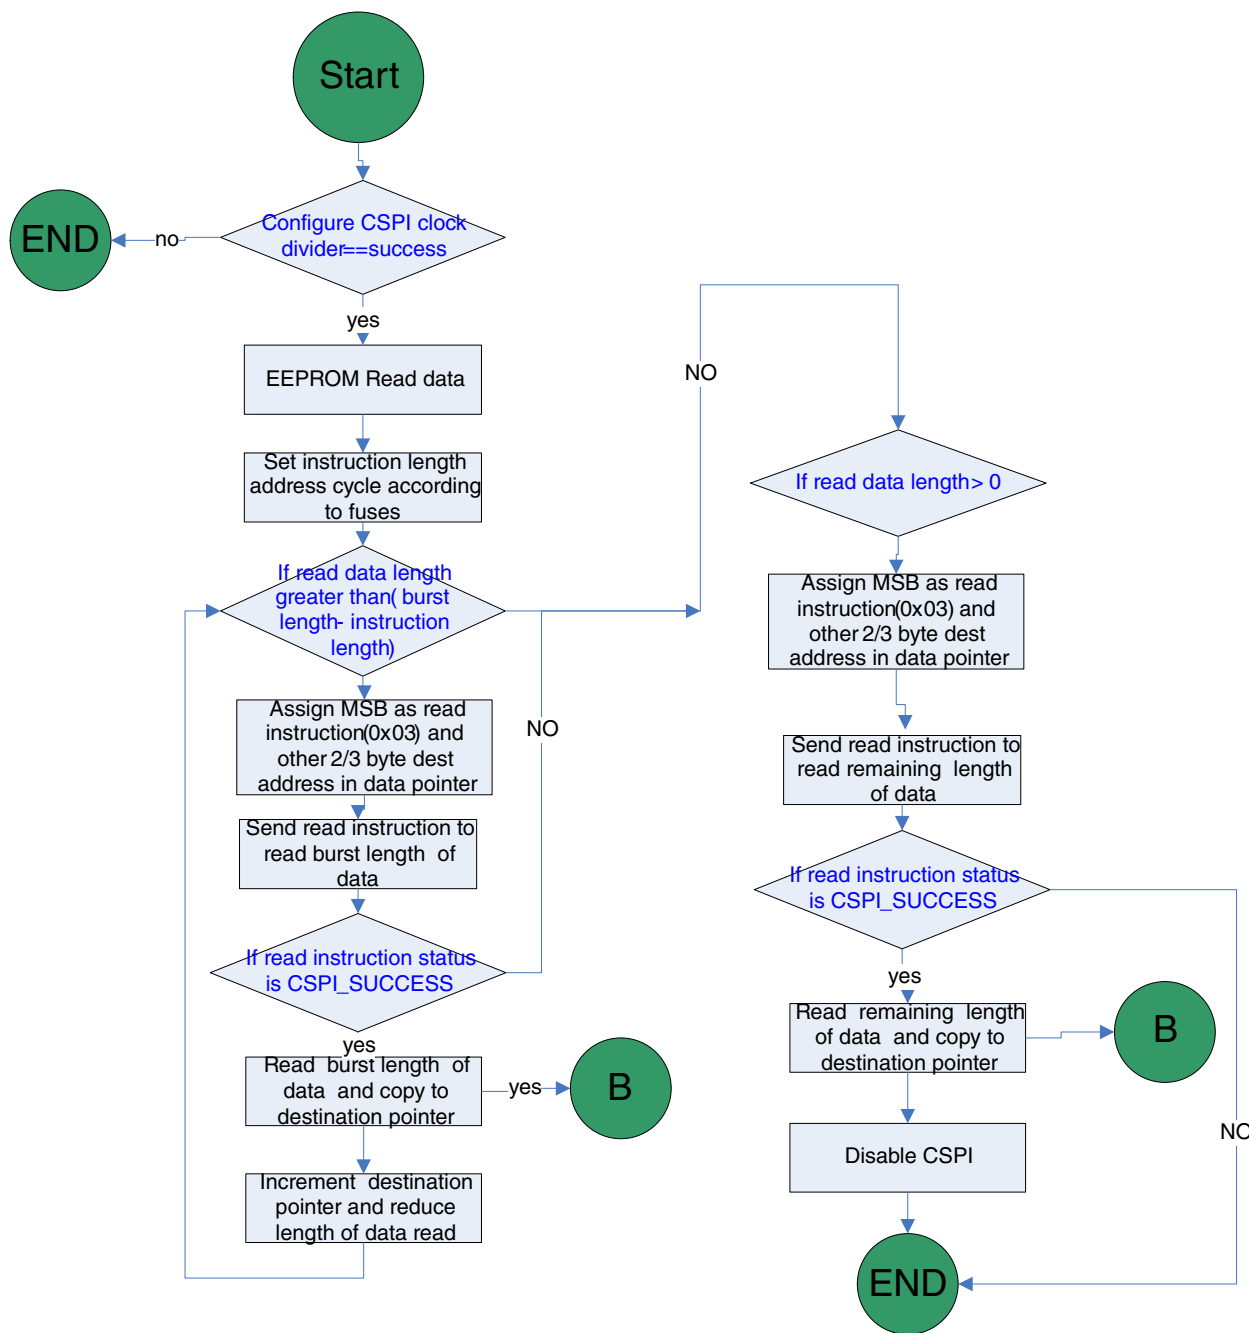

Figure 8-19. CSPI Flow chart

### 8.5.4.3.1 ECSPI IOMUX Pin Configuration

The contacts assigned to the signals used by the three CSPI blocks is shown in the table below.

**Table 8-23. SPI IOMUX Pin Configuration**

Signal	ECSPI-1	ECSPI-2	ECSPI-3	ECSPI4	ECSPI-5
<b>MISO</b>	EIM_D17.alt1	CSI0_DAT10.alt2	DISP0_DAT2.alt2	EIM_D22.alt1	N/A
<b>MOSI</b>	EIM_D18.alt1	CSI0_DAT9.alt2	DISP0_DAT1.alt2	EIM_D28.alt2	N/A
<b>RDY</b>	N/A <sup>1</sup>	N/A	N/A	N/A	N/A
<b>SCLK</b>	EIM_D16.alt1	CSI0_DAT8.alt2	DISP0_DAT0.alt2	EIM_D21.alt1	N/A
<b>SS0</b>	EIM_EB2.alt1	CSI0_DAT11.alt2	DISP0_DAT3.alt2	EIM_D20.alt1	N/A
<b>SS1</b>	EIM_D19.alt1	EIM_LBA.alt1	DISP0_DAT4.alt2	EIM_A25.alt1	N/A
<b>SS2</b>	EIM_D24.alt1	EIM_D24.alt4	DISP0_DAT5.alt2	EIM_D24.alt1	N/A
<b>SS3</b>	EIM_D25.alt1	EIM_D25.alt4	DISP0_DAT6.alt2	EIM_D25.alt1	N/A

1. N/A in the ROM code indicates the pins are not available or not used.

## 8.6 Program image

This section describes the data structures that are required to be included in a user's program image. A program image consists of:

- Image vector table—A list of pointers located at a fixed address that the ROM examines to determine where other components of the program image are located
- Boot data—A table indicating the program image location, program image size in bytes, and the plugin flag
- Device configuration data—IC configuration data
- User code and data

### 8.6.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

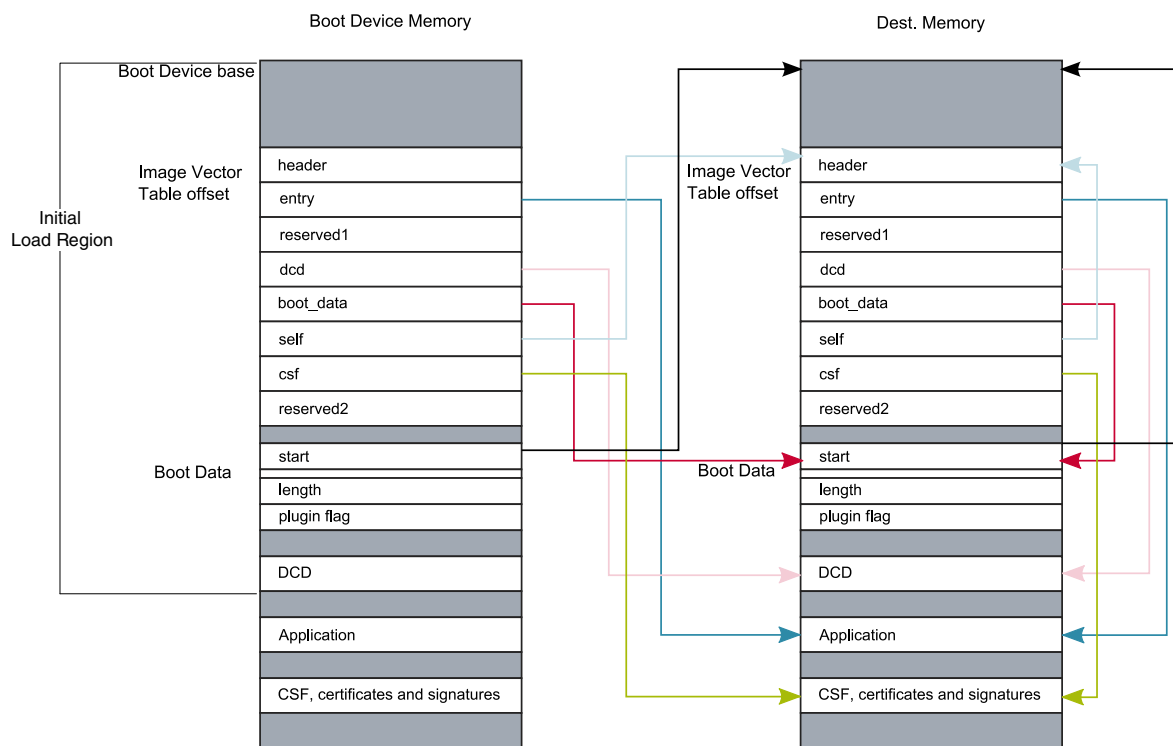

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device

## Program image

type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder of the image memory map is flexible and is determined by the contents of the IVT.

**Table 8-24. Image Vector Table Offset and Initial Load Region Size**

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
NOR	4 Kbyte = 0x1000 bytes	Entire Image Size
NAND	1 Kbyte = 0x400 bytes	4 Kbyte
OneNAND	256 bytes = 0x100 bytes	1 Kbyte
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
I2C/SPI EEPROM	1 Kbyte = 0x400 bytes	4 Kbyte

**Figure 8-20. Image Vector Table**

### 8.6.1.1 Image Vector Table Structure

The IVT has the following format where each entry is a 32 bit word:

**Table 8-25. IVT Format**

header
entry: Absolute address of the first instruction to execute from the image
reserved1: Reserved and should be zero
dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See <a href="#">Device Configuration Data (DCD)</a> for further details on DCD.
boot data: Absolute address of the Boot Data
self: Absolute address of the IVT. Used internally by the ROM
csf: Absolute address of Command Sequence File (CSF) used by the HAB library. See <a href="#">High Assurance Boot (HAB)</a> for details on secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2: Reserved and should be zero

The IVT header has the following format:

**Table 8-26. IVT Header Format**

Tag	Length	version
-----	--------	---------

where:

Tag: A single byte field set to 0xD1

Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)

Version: A single byte field set to 0x40 or 0x41

### 8.6.1.2 Boot Data Structure

The Boot Data must follow the format defined in the table found here, each entry is a 32-bit word.

**Table 8-27. Boot Data Format**

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see <a href="#">Plugin Image</a> )

## 8.6.2 Device Configuration Data (DCD)

Upon reset, the Chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving optimal system performance and there are even some peripherals that must be configured before they can be used.

## Program image

The DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various peripherals on the Chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately out of reset. This allows the Chip to interface with any NOR flash device, but has the cost of slow performance. Additionally, some components such as DDR require some sequence of register programming as part of configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and MMDC registers to the optimal settings.

The ROM determines the location of the DCD table based on information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big endian byte array of the allowable DCD commands. The maximum size of the DCD limited to 1768 bytes.

**Table 8-28. DCD Data format**

Header
[CMD]
[CMD]
...

The DCD header is 4 bytes with the following format:

**Table 8-29. DCD Header**

Tag	Length	Version
-----	--------	---------

where:

Tag: A single byte field set to 0xD2

Length: a two byte field in big endian format containing the overall length of the DCD, in bytes, including the header

Version: A single byte field set to 0x41

### 8.6.2.1 Write Data Command

The Write Data Command is used to write a list of given 1-, 2- or 4-byte values or bitmasks to a corresponding list of target addresses.

The format of Write Data Command, again a big endian byte array, is shown in the table below.

**Table 8-30. Write Data Command Format**

Tag	Length	Parameter
-----	--------	-----------

*Table continues on the next page...*

**Table 8-30. Write Data Command Format (continued)**

Address
Value/Mask
[Address]
[Value/Mask]
...
[Address]
[Value/Mask]

where:

Tag: A single byte field set to 0xCC

Length: A two byte field in big endian format containing the length of the Write Data Command, in bytes, including the header

Address: target address to which data should be written

Value/Mask: data value or bitmask to be written to preceding address

The Parameter field is a single byte divided into bitfields as follows:

**Table 8-31. Write Data Command Parameter field**

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: width of target locations in bytes. Either 1, 2 or 4

flags: control flags for command behavior.

Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes and flags parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

**Table 8-32. Interpretation of Write Data Command Flags**

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address  = val_msk	Set bitmask

**NOTE**

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values is larger or any of the bitmasks is wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within an allowed region, none of the values are written. The list of allowable blocks and target addresses for the Chip are given below.

**Table 8-33. Valid DCD Address Ranges**

Address range	Start address	Last Address
IOMUX Control (IOMUXC) registers	0x020E0000	0x020E3FFF
CCM register set	0x020C4000	0x020C7FFF
ANADIG registers	0x020C8000	0x020C8FFF
MMDC register set	0x021B0000	0x021B7FFF
IRAM free space	0x00907000	0x00937FF0
EIM memory	0x08000000	0x0FFEFFFFF
EIM registers	0x021B8000	0x021BBFFF
DDR	0x10000000	0xFFFFFFFF

**8.6.2.2 Check Data Command**

The Check Data Command is used to test for a given -1, 2- or 4-byte bitmasks from a source address.

The Check Data Command is a big endian byte array with format shown in the table below.

**Table 8-34. Check Data Command Format**

Tag	Length	Parameter
	Address	
	Mask	
	[Count]	

where:

Tag: A single byte field set to 0xCF

Length: A two byte field in big endian format containing the length of the Check Data Command, in bytes, including the header

Address: source address to test

Mask: bit mask to test

Count: optional poll count. If count is not specified this command will poll indefinitely until the exit condition is met. If count = 0, this command behaves as for NOP.

The Parameter field is a single byte divided into bitfields as follows:

**Table 8-35. Check Data Command Parameter field**

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: width of target locations in bytes. Either 1, 2 or 4

flags: control flags for command behavior.

Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

**Table 8-36. Interpretation of Check Data Command Flags**

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask) != mask	Any bit clear
1	1	(*address & mask) != 0	Any bit set

### NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

### 8.6.2.3 NOP Command

This command has no effect.

The format of NOP Command is a big endian four byte array as shown in the table below.

**Table 8-37. NOP Command Format**

Tag	Length	Undefined
-----	--------	-----------

where:

Tag: A single byte field set to 0xC0

Length: A two byte field in big endian containing the length of the NOP Command in bytes. Fixed to a value of 4.

Undefined: This byte is ignored and can be set to any value.

### 8.6.2.4 Unlock Command

The Unlock Command is used to prevent specific engine features being locked when exiting ROM.

The format of Unlock Command, again a big endian byte array, is shown in the table below.

**Table 8-38. Unlock Command Format**

Tag	Length	Eng
	Value	
	Value	
	...	
	Value	

where:

Tag: A single byte field set to 0xB2

Eng: Engine to be left unlocked.

Values: [optional] unlock values required by engine.

**NOTE**

This command may not be used in DCD structure if the SEC\_CONFIG is configured as closed.

## 8.7 Plugin Image

The ROM supports a limited number of boot devices. For using other devices as boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) for firmware with the missing boot drivers. >Additionally plugin can customize supported boot drivers. It is more flexible when doing device initialization, such as condition judging, delay assertion, applying custom settings to boot device and memory system.

>In addition to standard images, the chip also supports plugin images. Plugin images return execution to the ROM whereas a standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot Data Structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end the plugin function must return with the program image parameters. (See [High level boot sequence](#) for details about boot flow).

The boot ROM authenticates the plugin image prior to running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef unsigned char (*) plugin_download_f(void **start, size_t *bytes, UINT32
*ivt_offset)
```

ARGUMENTS PASSED:

- start - Image load address on exit.
- bytes - Image size on exit.
- ivt\_offset - Offset in bytes of the IVT from the image start address on exit.

RETURN VALUE:

- 1 - on success
- 0 - on failure

## 8.8 Serial Downloader

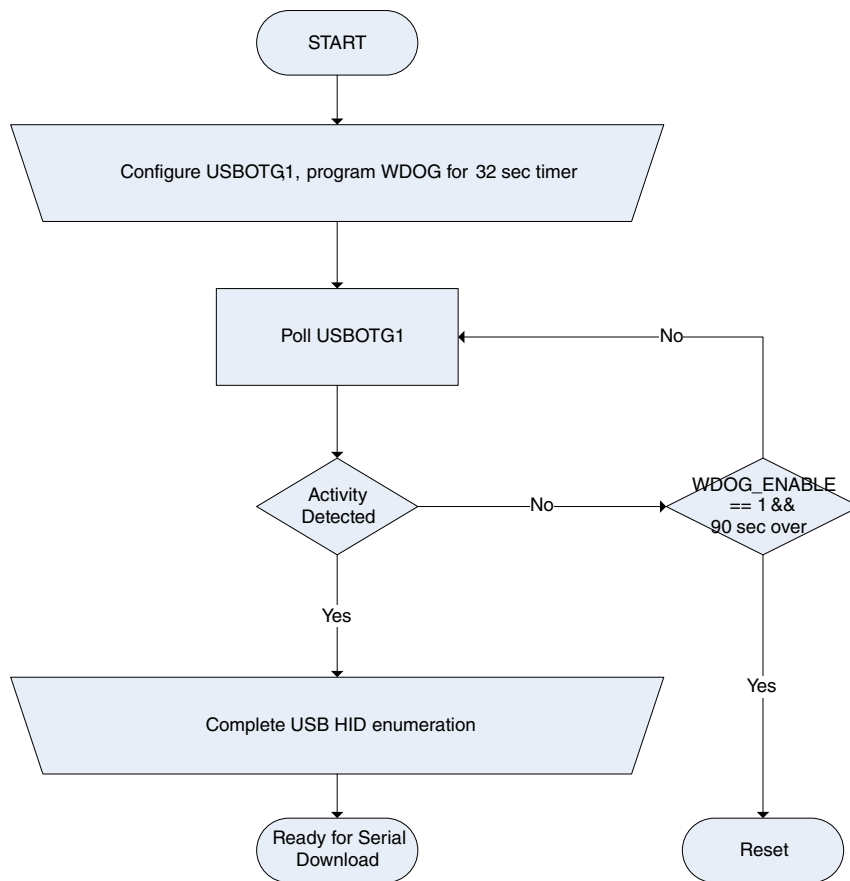

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG1 for a 90-second time-out if WDOG\_ENABLE eFuse is 1 and continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

**NOTE**

The downloaded image must continue to service the watchdog timer to avoid an undesired reset from occurring.

The USB boot flow is shown in the figure below.

**Figure 8-21. Serial Download Boot Flow**

**8.8.1 USB**

USB support is composed of the ( core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of 4 HID reports are used to implement SDP protocol for data transfers as described in [Table 8-39](#).

**Table 8-39. USB HID Reports**

Report ID (first byte)	Transfer Endpoint	Direction	Length	Description
1	control OUT	Host to device	17 bytes	SDP command from host to device
2	control OUT	Host to device	Up to 1025 bytes	Data associated with report 1 SDP command
3	interrupt	Device to host	5 bytes	HAB security configuration. Device sends 0x12343412 in closed mode and 0x56787856 in open mode.
4	interrupt	Device to host	Up to 65 bytes	Data in response to SDP command in report 1

### 8.8.1.1 USB Configuration Details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for USB device driver are listed in the table below.

**Table 8-40. VID/PID and Strings for USB Device Driver**

Descriptor	Value
VID	0x15A2 (Freescale vendor ID)
PID <sup>1</sup>	0x61
String Descriptor1 (manufacturer)	Freescale Semiconductor, Inc.
String Descriptor2 (product)	S Blank RIGEL SE Blank RIGEL NS Blank RIGEL
String Descriptor4	Freescale Flash
String Descriptor5	Freescale Flash

1. Allocation based on BPN (Before Part Number)

### 8.8.1.2 IOMUX Configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses dedicated contacts on the IC. See the Chip data sheet for details.

## 8.8.2 Serial Download protocol

The 16 byte SDP command from host to device is sent using HID report 1.

The table below describes 16 byte SDP command data structure:

**Table 8-41. 16 Byte SDP Command Data Structure**

BYTE Offset	Size	Name	Description
0	2	COMMAND TYPE	The following commands are supported for ROM: <ul style="list-style-type: none"> <li>• 0x0101 READ_REGISTER</li> <li>• 0x0202 WRITE_REGISTER</li> <li>• 0x0404 WRITE_FILE</li> <li>• 0x0505 ERROR_STATUS</li> <li>• 0x0A0A DCD_WRITE</li> <li>• 0x0B0B JUMP_ADDRESS</li> </ul>
2	4	ADDRESS	Only relevant for following commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS.  For READ_REGISTER and WRITE_REGISTER commands, this field is address to a register. For WRITE_FILE and JUMP_ADDRESS commands, this field is an address to internal or external memory address.
6	1	FORMAT	Format of access, 0x8 for 8-bit access, 0x10 for 16-bit and 0x20 for 32-bit access. Only relevant for READ_REGISTER and WRITE_REGISTER commands.
7	4	DATA COUNT	Size of data to read or write. Only relevant for WRITE_FILE, READ_REGISTER, WRITE_REGISTER and DCD_WRITE commands. For WRITE_FILE and DCD_WRITE commands DATA COUNT is in byte units.
11	4	DATA	Value to write. Only relevant for WRITE_REGISTER command.
15	1	RESERVED	Reserved

## 8.8.2.1 SDP Command

SDP commands are described in the following sections.

### 8.8.2.1.1 READ REGISTER

The transaction for command READ\_REGISTER consists of following reports: Report1 for command, Report3 for security configuration and Report4 for response or register value.

The register to read is specified in ADDRESS field of SDP command. First device sends Report3 with security configuration followed by Report4 with bytes read at given address. If count is greater than 64 then multiple reports with report id 4 are sent until entire data requested by host is sent. The STATUS is either 0x12343412 for closed parts and 0x56787856 for open or field return parts.

Report1, Command, Host to Device:

1	Valid values for READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT
---	---

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register Value
---	----------------

ID 4 bytes of data containing register value. If number of bytes requested is less than 4 then remaining bytes should be ignored by host.

Multiple reports of report id 4 are sent until entire data requested is sent

Report4, Response, Device to Host: Last response report

4	Register Value
---	----------------

ID 64 bytes of data containing register value. If number of bytes requested is less than 64 then remaining bytes should be ignored by host.

### 8.8.2.1.2 WRITE REGISTER

The transaction for command WRITE\_REGISTER consists of the following reports: Report1 for command, Report3 for security configuration and Report4 for write status.

Host sends Report1 with WRITE\_REGISTER command. The register to write is specified in ADDRESS field of SDP command of Report1, with FORMAT field set to data type (number of bits to write 8, 16 or 32) and value to write in DATA field of SDP command. Device writes the DATA to register address and returns WRITE\_COMPLETE code using Report4 and security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA
---	---

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes data with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

### 8.8.2.1.3 WRITE\_FILE

The transaction for command WRITE\_FILE consists of following reports: Report1 for command-phase, Report2 for data-phase, Report3 for hab mode and Report4 to indicate data received in full.

The size of each Report2 is limited to 1024 bytes (limitation of USB HID protocol) hence multiple Report2 packets will be sent by host in data phase until entire data is transferred to device. Once entire data (DATA\_COUNT bytes) is received then device sends report 3 with hab mode and report 4 with 0x88888888, indicating file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT
---	--

## ID 16 byte SDP Command

=====Optional Begin=====

Host sends ERROR\_STATUS command to query if HAB rejected the address

===== Optional End=====

Report2, Host to Device:

2	File data
---	-----------

## ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data
---	-----------

## ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration
---	---

## ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status
---	------------------------------

ID 64 bytes data with first 4 bytes to indicate file download has completed with code 0x88888888. On failure device will report HAB error status.

### 8.8.2.1.4 ERROR\_STATUS

The transaction for SDP command ERROR\_STATUS consists of three reports.

Report1 is used by host to send the command; device sends global error status in 4 bytes of Report4 after returning security configuration in Report3. When device receives ERROR\_STATUS command it will return global error status that is updated for each command. This command is useful to find out if last command resulted in device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND
---	----------------------

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	4 bytes Error status
---	----------------------

ID first 4 bytes status in 64 bytes report 4

### 8.8.2.1.5 DCD WRITE

The SDP command DCD\_WRITE is used by host to send multiple register writes in one shot. This command is provided to speed up the process of programming register writes such as to configure external RAM device.

The command goes with Report1 from host with COMMAND TYPE set to DCD\_WRITE, ADDRESS which is used for temporary location of DCD data and DATA\_COUNT to number of bytes sent in data out phase. In data phase host sends data for number of registers using Report2. Device completes the transaction with Report3 indicating security configuration and report 4 with WRITE\_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16 byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data
---	-----------------

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes report with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

See [Device Configuration Data \(DCD\)](#) for DCD format description.

### 8.8.2.1.6 JUMP ADDRESS

The SDP command JUMP\_ADDRESS will be the last command host can send to the device, after this command device will jump to the address specified in the ADDRESS field of SDP command and start executing.

This command should typically follow after WRITE\_FILE command. The command is sent by host in command-phase of transaction using Report1, there is no data phase for this command but device send status report3 to complete the transaction. And if HAB authentication fails then it will also send report 4 with HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS
---	-------------------------------

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

This report is sent by device only in case of an error jumping to the given address, device reports error in Report4, Response, Device to Host:

4	4 bytes HAB error status
---	--------------------------

ID 4 bytes status, 64 bytes report length

## 8.9 Recovery Devices

The Chip supports recovery devices. If primary boot device fails, boot ROM will try to boot from recovery device using one of I2C or ECSPI ports.

For enabling recovery device BOOT\_CFG4[6] fuse must be set. Additionally Serial EEPROM fuses must be set as described in [Serial ROM through SPI](#).

## 8.10 USB Low Power Boot

ROM supports USB Low Power Boot. This feature enables a device with dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter the upstream port is a USB charger or USB host/hub.

If a USB dedicated charger or host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (Max.1.5A) can be supplied by charger. If USB host/hub are connected, the maximal 100mA current is supplied to the device, the device should be able to power up to boot the image with less than 100mA.

If LPB\_BOOT fuses are blown, the Chip will check if there is low power condition via GPIO\_3 pad. If there is low power boot condition USB charger detection will be activated. If there is no USB charger, ROM will initialize USB as device and apply division factors on ARM, DDR, AXI and AHB root clocks based on LPB\_BOOT fuses value (see the table below). Polarity of low power boot condition on GPIO\_3 pad is set by BT\_LPB\_POLARITY fuse (see the figure below).

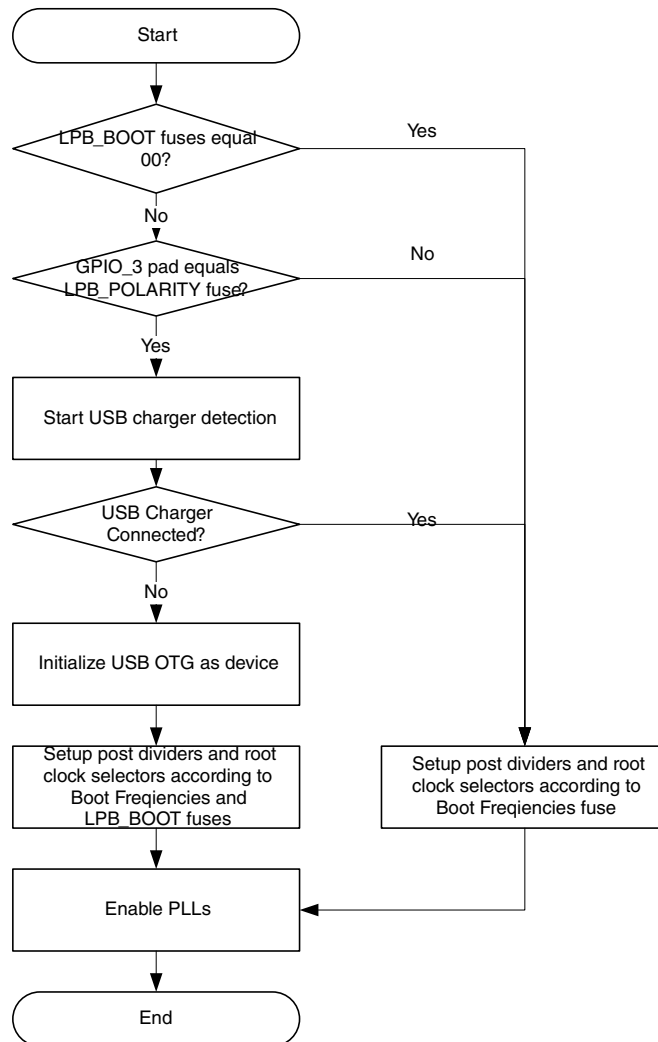

**Table 8-64. USB Low Power Boot Frequencies**

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1

## 8.11 SD/MMC Manufacture Mode

When internal boot and recover boot (if enabled) failed, boot will go to SD/MMC manufacture mode before serial download mode. In manufacture mode, one bit bus width is used despite of the fuse setting.

In manufacture mode, SD or MMC card will be scanned on uSDHC1 and uSDHC2. If card is detected and valid boot image is found in card, then boot image will be loaded then executed. Pad of SD1\_CD and SD2\_CD are used to detect whether card is inserted.

By default, SD/MMC manufacture mode is enabled, blow the fuse of DISABLE\_SDMMC\_MFG to disable it.

### NOTE

Secondary boot is not supported on SD/MMC manufacture mode.

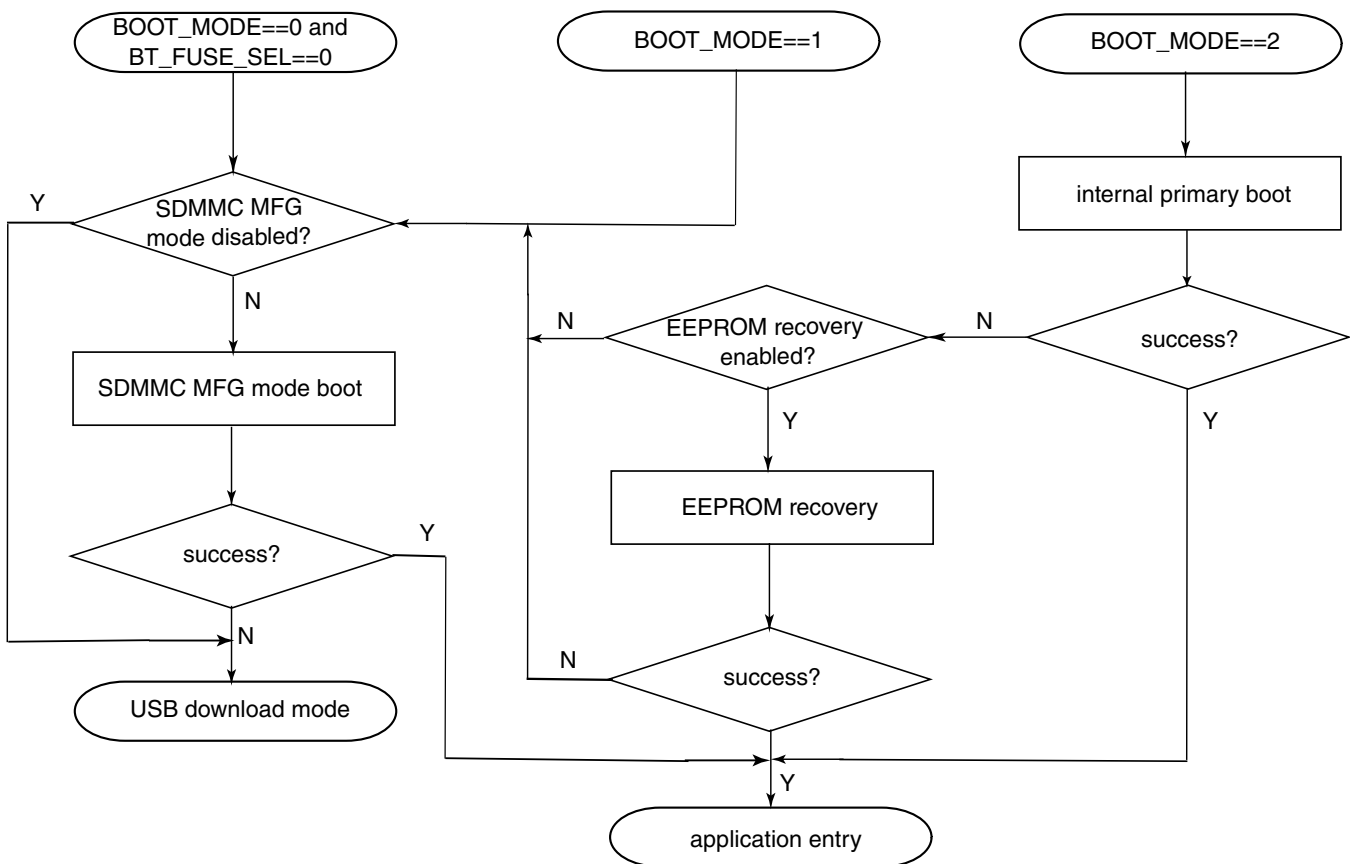

Figure 8-23. SD/MMC Manufacture boot flow

## 8.12 High Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying areas of code or data in programmable memory to make it behave in an incorrect manner. The HAB also prevents attempts to gain access to features which should not be available.

The integration of the HAB feature with the ROM code ensures that Chip does not enter an operational state if the existing hardware security blocks have detected a condition that may be a security threat or areas of memory deemed to be important have been modified. The HAB uses RSA digital signatures to enforce these policies.

**Figure 8-24. Secure Boot Components**

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to ensure the system security state is as expected. The HAB also makes use of CAAM hardware block to accelerate SHA-256 message digest operations performed during signature verifications and AES-128 operations for encrypted boot operations. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator cannot be used. The RSA key sizes supported are 1024, 2048 and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by HAB are:

- X.509 Public key certificate support
- CMS signature format support
- Proprietary encrypted boot support. Note that encrypted boot depends on the CAAM HW module. When CAAM is disabled (i.e. when the EXPORT\_CONTROL fuse is blown) then encrypted boot is not available.

**NOTE**

Freescale provides a reference Code Signing Tool (CST) for key generation, certificate generation and code signing for use with the HAB library. The CST can be found by searching for "IMX\_CST\_TOOL" at <http://www.freescale.com>.

**NOTE**

For further details on making use of the secure boot feature using HAB contact your local Freescale representative.

**8.12.1 HAB API Vector Table Addresses**

For devices that perform a secure boot, the HAB library may be called by boot stages that execute after ROM code.

The RVT table contains the pointers to the HAB API functions. The address of the RTV table is shown in the table below.

**Table 8-65. RVT Table Addresses**

	HAB API vector table address	ROM API vector table address
Silicon revisions prior to 1.2	0x00000094	0x000000C0
Silicon revision 1.2 and later	0x00000098	0x000000C4

**NOTE**

For additional information on secure boot including the HAB API, contact your local Freescale representative.

# Chapter 9

## Multimedia

### 9.1 Video Graphics Sub System

The i.MX 6Solo/6DualLite video graphics subsystem consists of the dedicated modules found here.

- Video Processing Unit (VPU): a multi-standard high performance video/image CODEC
- Two Graphics Processing Units (GPUs):
  - 3D GPU: accelerating the generation of 3D graphics (OpenGL/ES)
  - 2D GPU: acceleration the generation of 2D graphics (BitBLT).
- One Image Processing Unit (IPU): providing connectivity to cameras and displays, related processing, synchronization and control.
- Display interface bridges: providing optional translation from the digital display interface supported by the IPU to other interfaces:
  - LVDS bridge (LDB): providing up to one LVDS interface
  - HDMI transmitter
  - MIPI/DSI transmitter
- MIPI/CSI-2 receiver
- Two (identical) Display Content Integrity Checker (DCIC) are used to authenticate sensitive displayed data.
- A Video Data Order Adapter (VDOA): used to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

High level integration scheme of the i.MX 6Solo/6DualLite video/graphics system is provided by the figure below.

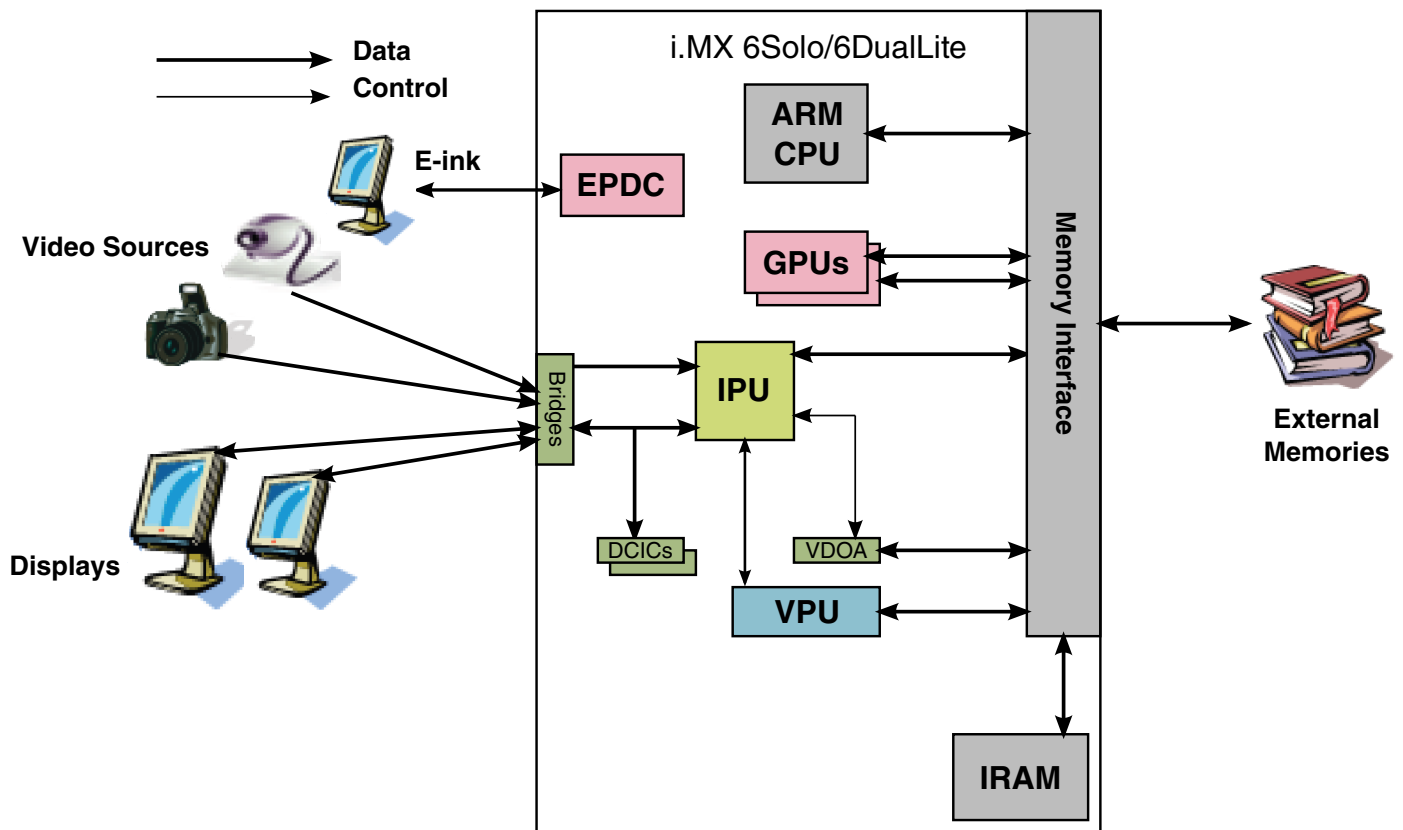

Figure 9-1. i.MX 6Solo/6DualLite Video-Graphics Subsystem

### 9.1.1 Display outputs

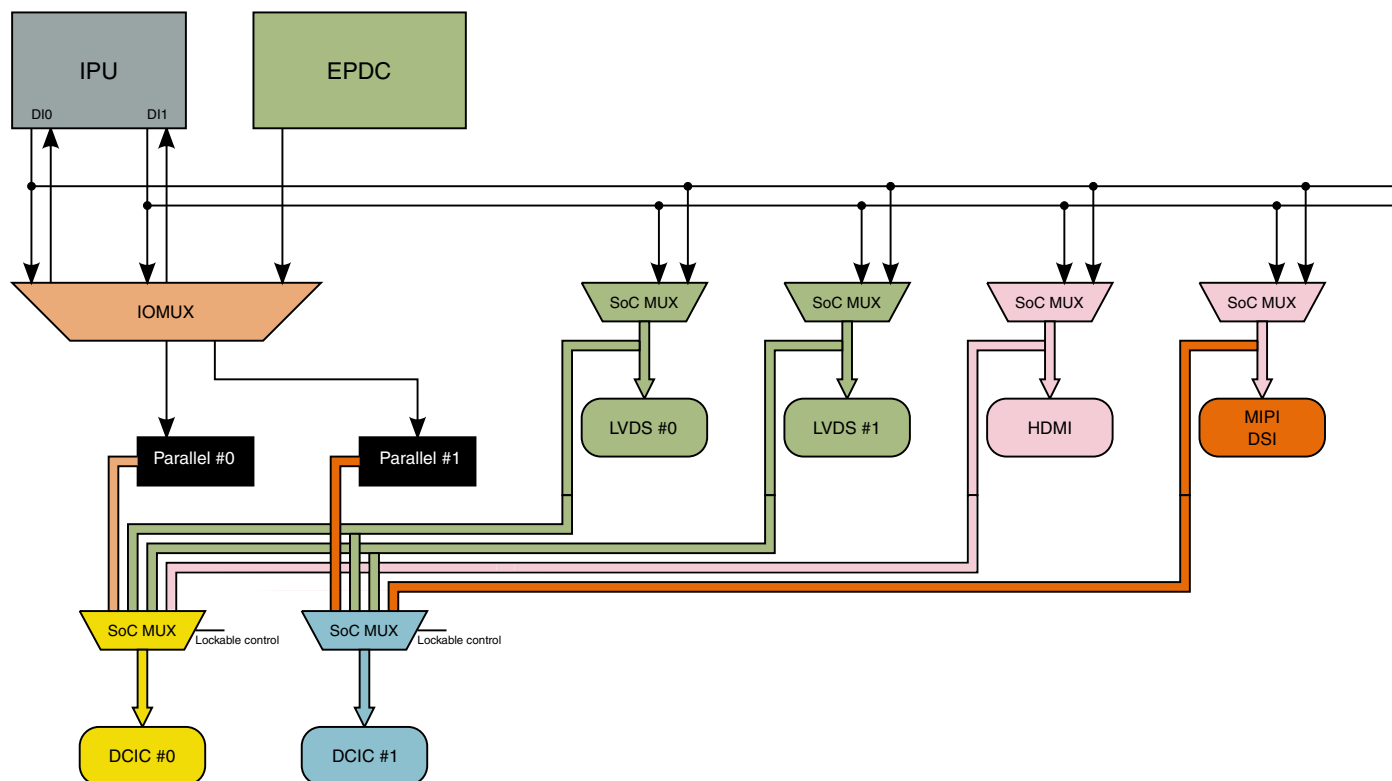

The i.MX 6Solo/6DualLite implements a robust muxing logic on the two display ports (2x per IPU), to the external interfaces, either direct, or via bridges (MIPI, LVDS, HDMI), per description below:

- Two parallel - driven directly by IPU; pixel clock at least up to 200 MHz (for external load of up to 10 pF).
  - Parallel interface works up to 200 MHz
  - HDMI interface works up to 270 MHz
- Two LVDS channels, driven by the LDB; pixel clock up to 170 MHz.
- One HDMI port (ver. 1.4) - driven by the HDMI transmitter: pixel clock up to 270 MHz (gated by the IPU capabilities)
- One MIPI/DSI port - driven by the MIPI/DSI transmitter; 2 data lanes at 1 GHz
- IPU display port (DI) can be connected to each of the above ports

- IPU has 2 display ports, up to two external ports can be active at any given time. (Additional asynchronous data flows can be sent though the parallel ports and the MIPI/DSI port.)
- Read access is supported as follows
  - For the Parallel0 port: through DI0
  - For the Parallel1 port: through DI1
- Inputs to either of the DCICs are taken from one of the following buses
  - For each of the parallel interfaces: probing the I/O loopback (essentially equivalent to probing the external wires).
  - For other integrated interfaces (e.g. LVDS): probing the DI1 output of the IPU (essentially equivalent to the inputs to the serializers)
  - For the data enable signal, two control signals are probed from each of the above buses.

The i.MX 6Solo/6DualLite also implements a EPDC for E-ink display.

For visual view of display signal routing, see the following figure. The chip MUX select signals are driven by configuration bits as specified in the IOMUX controller (IOMUXC) chapter in the IOMUXC\_IOMUXC\_GPR registers description fields.

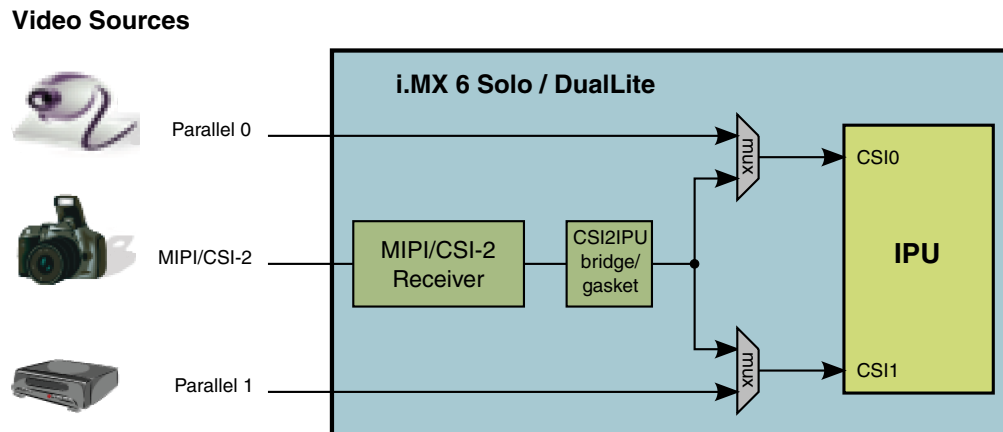

**Figure 9-2. Display port muxing scheme**

## 9.1.2 Video input

There are 2 video input ports (e.g. from image sensors)

See the figure below for details.

### Video Input Ports Connectivity

**Figure 9-3. The Video Input Ports**

One parallel port is connected directly to an IPU input port.

One MIPI/CSI-2 port- IPU receives two components per cycle from the MIPI\_CSI2 interface. The maximum bandwidth of the interface is as follows:

- 250MByte/sec for 2 data lanes configuration (1000Mbps/lane)
- 125Mbyte/sec for 1 data lanes configuration (1000Mbps/lane)

IPU has two input ports, CSI0 and CSI1, which can receive data concurrently and independently. At any given time, an IPU input port may receive data either from a parallel external port or from the MIPI/CSI-2 receiver.

The MIPI/CSI-2 port can receive up to 4 concurrent data channels. Each data channel can be routed by one of the two CSI ports of the IPU. Pixel data can be further processed by the IPU. Other data types can be transferred through a CSI transparently as generic data to the system memory.

The IPU, VPU, VDOA and the GPUs have master AXI ports, providing access to system memory.

The modules are controlled (by the ARM CPU or the SDMA) as follows:

- The LDB is controlled by signals connected to top-level registers.
- All other modules have a host interface. For the VPU, VDOA and the DCIC's, this is a slave IP port and for the MIPI bridges, GPUs, and IPU's, this is a slave AHB port.
- The data flow between VPU, VDOA, GPUs and IPU is through system memory and it is normally controlled by the CPU. For special situations, a direct synchronization interface is provided:
  - An interface between the IPU and VPU, for low-latency video record.
  - An interface between the VDOA and IPU, for tight pipelining of data from the VDOA to the IPU, through the IRAM.

### 9.1.3 Synchronization Mechanisms

The i.MX 6Solo/6DualLite provides HW synchronization mechanism between IPU and VPU and between IPU and VDOA to reduce core intervention and enable lock-step operation.

### 9.1.4 Supported applications

The system described above supports a wide variety of video/graphics applications. The following table describes the main applications.

**Table 9-1. Video/graphics applications**

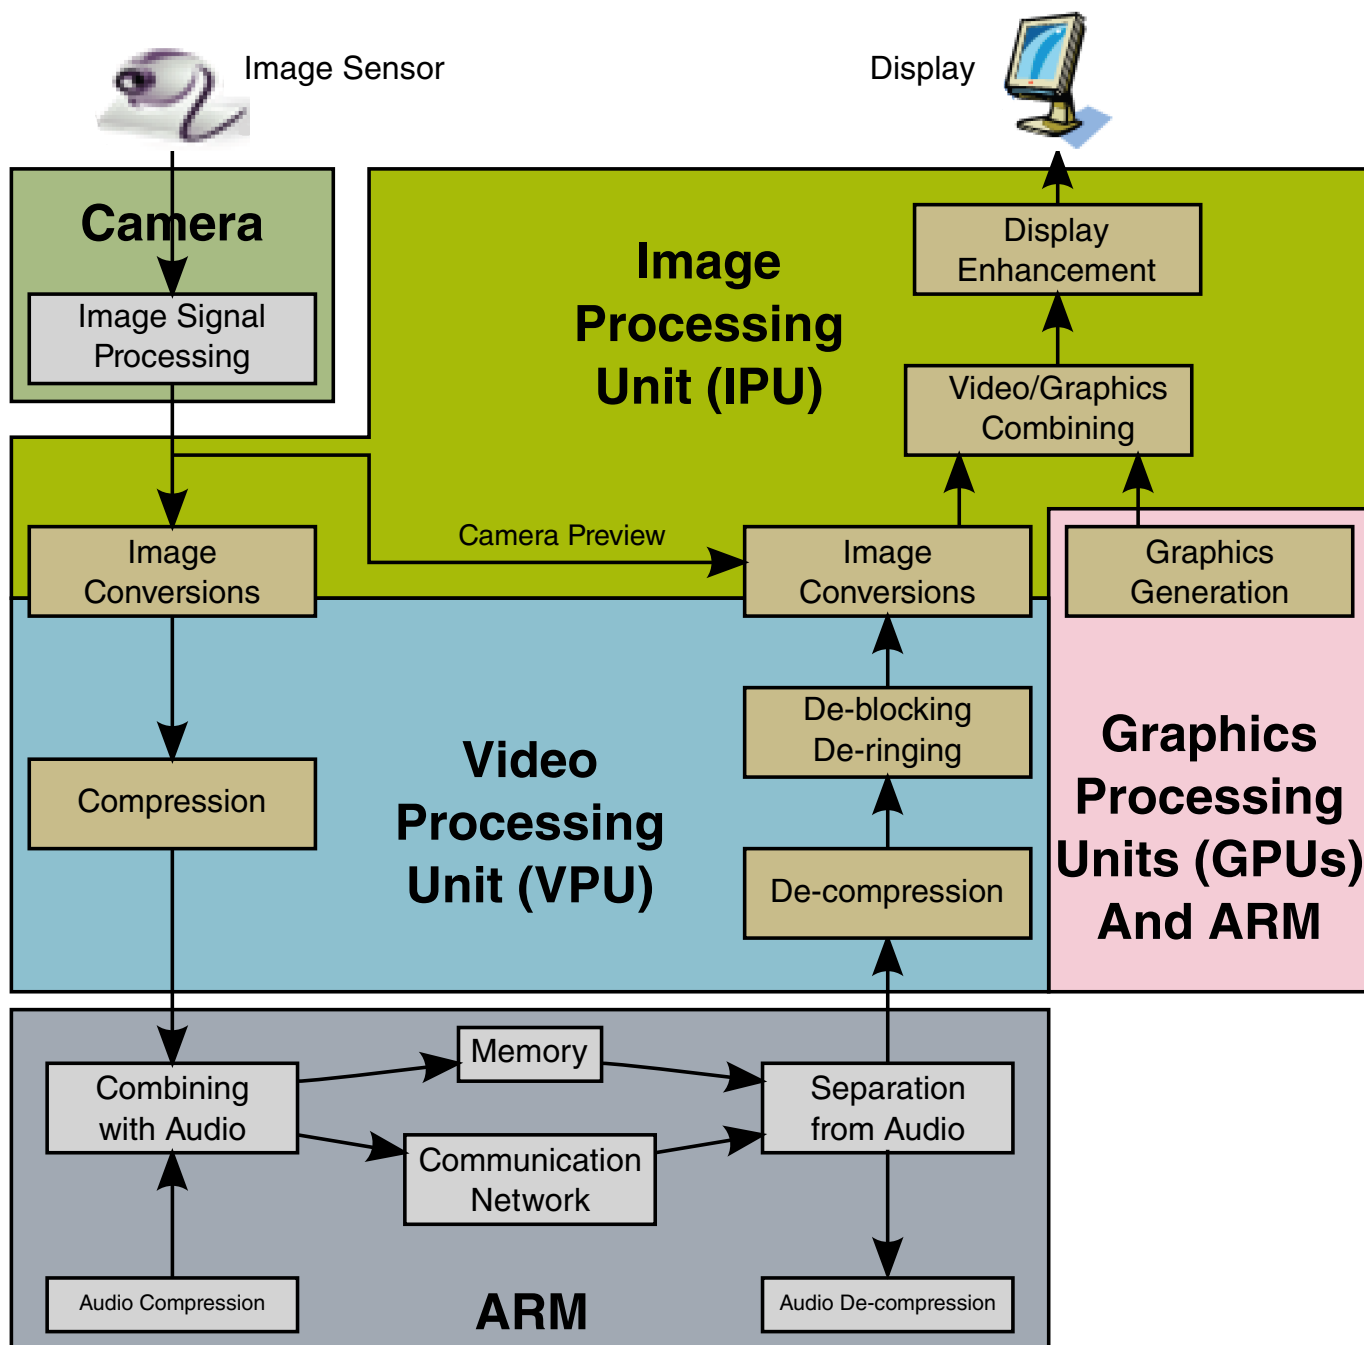

Application	Features
<b>Display management</b>	
Screen refresh	Up to two displays active simultaneously Pixel clock rate: <ul style="list-style-type: none"> <li>• Single display - up to 270 MHz</li> <li>• Two displays (the sum of the two rates) - up to 270 MHz</li> </ul> <p style="text-align: center;"><b>NOTE:</b> The parallel interface works up to 200 MHz, and the HDMI interface works up to 270 MHz.</p> Special features: <ul style="list-style-type: none"> <li>• On-the-fly image conversion: rotation, inversion, resizing, color-space conversion and combining</li> <li>• On-the-fly image quality enhancement: color adjustment (including special effects) and gamut mapping, gamma correction and contrast stretching</li> <li>• Low-light compensation, allowing back-light reduction</li> <li>• Scrolling/panning</li> </ul>
Updating the display buffer (from a background buffer)	Buffer either in system memory or in an external display controller (accessed through the display port) Special features:

*Table continues on the next page...*

**Table 9-1. Video/graphics applications (continued)**

Application	Features
	<ul style="list-style-type: none"> <li>• On-the-fly processing - as for screen refresh</li> <li>• Optimized update - only modified parts are transferred</li> <li>• Synchronization with screen refresh, to prevent tearing</li> <li>• Scrolling (e.g. a running banner or a short animation)</li> </ul>
<b>Video</b>	
Camera preview (displaying a view-finder window)	Input rate (from sensor): up to 270 MHz Additional features: <ul style="list-style-type: none"> <li>• Window-of-interest</li> <li>• On-the-fly image conversion: de-interlacing, resizing, color space conversion, rotation, inversion</li> <li>• Combining with graphics</li> <li>• Synchronization, to prevent tearing</li> </ul>
Still image capture	Rate: <ul style="list-style-type: none"> <li>• Burst mode (off-line processing): up to 180 Mpixels/sec (while still leaving headroom for up to 35% blanking overhead)</li> <li>• Continuous: up to 160 Mpixels/sec</li> </ul> Additional features: <ul style="list-style-type: none"> <li>• Image quality enhancement before compression - as for camera preview</li> <li>• Image conversion before compression - as for camera preview; with independent parameters</li> <li>• Synchronization with a flash, a mechanical shutter and a mechanical iris</li> </ul>
Motion Video Record	Resolution and rate: up to 1080p (1920x1080 at 60 fps in unit test without multimedia framework) Image processing before compression - as for still image capture
Motion Video Playback	Resolution and rate - up to 1080i/p (1920x1080) at 60 fps in unit test (without multimedia framework) Additional features: <ul style="list-style-type: none"> <li>• Post-filtering: de-blocking and de-ringing</li> <li>• Image conversion after decompression: de-interlacing, rotation, inversion, resizing, color-space conversion and combining</li> <li>• Quality enhancement: color adjustment (including special effects) and gamut mapping, gamma correction and contrast stretching</li> </ul>
Two-Way Video	Resolution and rate - up to 1080p (1920x1080) at 30 fps in unit test (without multimedia framework) Record and playback features - as above Various display options, including: <ul style="list-style-type: none"> <li>• Two non-overlapping windows</li> <li>• Picture-in-picture</li> </ul>

The following figure provides the sample processing flow of multimedia application.

**Figure 9-4. Processing flow for multimedia applications**

- The camera preview mode-the upper part
- Video recording-the left part
- Video playback-the right part
- A video call-both sides

## 9.2 Image Processing Unit (IPU)

The following table shows the IPU IP parametric table.

**Table 9-2. IPU IP Parametric Table**

Name	IPU
Function	Connectivity to cameras and displays; related processing; synchronization and control
External I/O Pins Notes: This is the pinout of the IPU module At chip level, some of the pins are muxed and some are omitted. Additional GPIO pins are required to construct the connection. This is not included in this list.	Parallel Display port: 32 bit data, ~18 clocks and controls. Regular CMOS IO type, 198 MHz max. May be also connected to internal connectivity bridges. Slow Serial Display port: 2 bit data, 3 clocks and controls. Regular CMOS IO type, 120 MHz max. Parallel Sensor port: 20 bit data inputs, 5-6 clocks and controls. Regular CMOS IO type, MHz max. Camera strobe port: 6 camera control outputs. Regular CMOS IO type, 120 MHz max.
SoC Buses	AXI master - for accessing the memory AHB slave - for programming, control and direct access of the MCU to the display
Interrupts	Two interrupts: functional and error
DMA Requests	Includes an integral DMA controller with an AXI master port Also one DMA request to the SDMA
Number of instantiations	2
Clock sources and range	HSP_CLK - Internal high-speed processing clock: up to 270 MHz DI_CLK0, DI_CLK1 - Display interface clocks: up to 270 MHz

The goal of the IPU is to provide comprehensive support for the flow of data from an image sensor and/or to a display device. This support covers all aspects of these activities:

- Connectivity to relevant devices - cameras, displays, graphics coprocessors, TV encoders and decoders.

- Related image processing and manipulation: image enhancements and conversions, etc.
- Synchronization and control capabilities (to avoid tearing artifacts, for example)

This integrative approach leads to several significant advantages:

- **Automation:** The involvement of the MCU (Main Control Unit) in image management is minimized. In particular, display refresh/update and a camera preview (displaying the input from an image sensor) can be performed completely autonomously. The resulting benefits are reducing the overhead due to SW-HW synchronization, freeing the MCU to perform other tasks and reduced power consumption (when the MCU is idle and can be powered down).
- **Optimal data path:** Access to system memory is minimized. In particular, significant processing can be performed on-the-fly while receiving data from an image sensor and/or sending data to a display. System memory is used essentially only when a change in pixel order or frame rate is needed. The resulting benefits are reduced load on the system bus and further reduction of power consumption.
- **Resource sharing:** Maximal HW reuse for different applications, resulting with the support of a wide range of requirements with minimal hardware

The hardware reuse mentioned above is enabled by a sophisticated configurability of each hardware block. This configurability also allows the support of a wide range of external devices, data formats and operation modes.

A simplified block diagram of the IPU is given in the figure below. The role of each block is described in the table below.

## Image Processing Unit (IPU)

**Figure 9-5. IPU - Block Diagram**

**Table 9-3. IPU - Block Description**

Block	Description
CSI - Camera Sensor Interface	Controls a camera port; provides interface to an image sensor or a related device. IPUv3 includes 2 such blocks
DI - Display Interface	Provides interface to displays, display controllers and related devices. IPUv3 includes 2 such blocks
DC - Display Controller	Controls the display ports.
VDIC - Video De-Interlacer and Combiner	Performs de-interlacing - converting interlaced video to progressive - or combining
IC - Image Converter	Performs resizing, color conversion/correction, combining with graphics, and horizontal inversion
DP - Display Processor	Performs the processing required for data sent to display
IRT - Image Rotator	Performs rotation (90 or 180 degrees) and inversion (vertical/horizontal)
IDMAC - Image DMA Controller	Controls the memory port; transfers data to/from system memory
SMFC - Sensor Multi FIFO Controller	Controls FIFO's for output from the CSI's to system memory
DMFC - Display Multi FIFO Controller	Controls FIFO's for IDMAC channels related to the display system
CM - Control Module	Provides control and synchronization.

## 9.2.1 IPU External Ports

The IPU has the following ports:

- Two camera ports - controlled by a CSI module - providing a connection to image sensors and related devices.
- Two display ports - each controlled by a DI module - providing a connection to displays and related devices.
- Memory port - AXI (AHB V3.0) master, controlled by the IDMAC - providing connection to the system memory.
- AHB-lite slave port, providing connection to the ARM MCU (and to any other master connected to the ARM's cross-bar switch)

### 9.2.1.1 Camera Ports

The role of these ports is to receive input from video sources (e.g. image sensors) and to provide support for time-sensitive control signals to the camera. (Non-time-sensitive controls - e.g. configuration, reset - are performed by the MCU, through an I2C I/F or GPIO signals).

Each of the camera ports includes the following features:

- Direct connectivity to most relevant external devices.
- Parallel interface - up to 20-bit data bus
- Frame size: up to 8192 x 4096 pixels (including blanking intervals)
- Data formats supported include Raw (Bayer), RGB, YUV 4:4:4, YUV 4:2:2 and grayscale, up to 16 bits per value (component).
- Synchronization - video mode
  - The sensor is the master of the pixel clock (PIXCLK) and synchronization signals
  - Synchronization signals are received using either of the following methods:
    - Dedicated control signals -VSYNC, HSYNC - with programmable pulse width and polarity
    - Controls embedded in the data stream, following loosely the BT.656 protocol, with flexibility in code values and location.
- Synchronization - still image capture
  - The image capture is triggered by the MCU or by an external signal (e.g. a mechanical shutter)
  - Synchronized strobes are generated for up to 6 outputs - the sensor and camera peripherals (flash, mechanical shutter...)
- Additional features
  - Frame rate reduction, by periodic skipping of frames

- Downsizing x2, by skipping rows/columns
- Window-of-interest selection
- Pre-flash - for red-eye reduction and for measurements (e.g. focus) in low-light conditions

Several sensors can be connected to each of the CSI's. Simultaneous functionality (sending data) is supported as follows:

- Two streams can be received independently, each through a different CSI.
- Only one of the streams can be transferred to the VDIC or IC for on-the-fly processing, while the other one sent directly to system memory.

The input rate supported by the camera port is as follows:

- Peak: up to 240 MHz (values/sec)
- Average (assuming 35% blanking overhead), for YUV 4:2:2
  - Pixel in one cycle (e.g. BT.1120): up to 180 MP/sec, e.g. 12M pixels @ 15 fps
  - Pixel on two cycles (e.g. BT.656): up to 90 MP/sec, e.g. 6M pixels @ 15 fps.
- On-the-fly processing may be restricted to a lower input rate - see below.

### 9.2.1.2 Display Ports

The role of these ports is to communicate with display devices, either directly or through a controller (e.g. graphics accelerator) or a bridge (e.g. TV encoder or an LVDS interface bridge).

#### 9.2.1.2.1 Access Modes

Two access modes are supported:

- Synchronous Access
- Asynchronous Access

#### 9.2.1.2.2 Synchronous Access

In this mode, the IPU transfers a two-dimensional block of pixels to the display device, in synchronization with the screen refresh cycle.

This mode has a dual role:

- For a RAM-less display or a TV screen, this mode is used to perform the screen refresh process from a display buffer in system memory.
- For a "smart" display, this mode is used to transfer a rectangular block of pixels to the display's screen and, in some cases, also to the display buffer

In both cases, the IPU sends to the display all the synchronization signals controlling the screen refresh and the block transfer is synchronized with these signals. This synchronization means that tearing effects are avoided when using this mode.

### 9.2.1.2.3 Asynchronous Access

This is the main mode used for communicating with an external display controller (possibly in a smart display or a graphics accelerator). In this mode, the IPU performs random access - read/write - to the memory and registers of the controller.

The following access types are provided:

- Data transfer to the external device, after on-the-fly processing in the IPU.
- Data transfer (DMA) - read/write - between the host's system memory and the external device, through the IPU's memory port (controlled by the IDMAC); e.g. transfer of a rectangular block of pixels (possibly full screen).
- Host access - read/write - to an external device, through the AHB-slave port

### 9.2.1.2.4 Interface details

The display interface is very flexible and supports a wide variety of devices from major manufacturers.

The following interface types are provided (in each of the two display ports):

- A parallel video interface (for synchronous access) - up to 24-bit data bus.
  - Supports BT.656 (8-bit) and BT.1120 (16-bit) protocols
  - Supports HDTV standards SMPTE274 (1080i/p) and SMPTE296 (720p)
- A parallel bidirectional bus interface (for asynchronous access) - up to 32-bit data bus.
- A serial interface - 3-wire, 4-wire and 5-wire (two flavors) (for asynchronous access)

The supported formats for pixel data are: RGB and YUV 4:2:2.

For the interface clock, there are the following options (independently for each port)

- Derived from the IPU internal clock (master mode)
- Provided by an external source (slave mode)

The transfer rate supported

- When a single port is active, the pixel clock rate is up to 198 MHz
- The both ports are active
  - Each pixel clock rate may be up to MHz<sup>1</sup>
  - The sum of pixel clock rates is up to MHz

### 9.2.1.2.5 Connecting To Display Devices

IPU allows the connectivity to multiple display devices.

In particular, it supports the following setup:

- Primary LCD display.
- Second LCD display.
- External display; e.g. TV.

Simultaneous functionality of the above devices is possible in each of the following ways:

- Two devices can be accessed (synchronously or asynchronously) independently, each through a different port: each using any of the available interfaces.
- Two devices can time-share asynchronous accesses through the legacy serial and parallel interfaces, using the CS signals.

## 9.2.2 Processing

The IPU processes rectangular blocks of pixels. The processing is performed in four modules - VDIC, IC, DP and IRT.

(see [Figure 9-5](#) and [Table 9-3](#)). Several time-shared data flows are supported, as described in the following table.

**Table 9-4. Time-Shared Data Flows Through The IPU**

Name	Number	Type	Flow	Target	Restrictions
Display Refresh/Update	5 flows (at most two of them of type DS1)	DS1	Fmem -> DP -> Display	Synchronous Access (e.g. display refresh; controlled by the DI)	
		DS2	Fmem -> DP -> Display	Asynchronous Access (e.g. display update)	
		DS3	Fmem <-> Display	Generic Data Transfer	
	1 flow	DS4	MCU <-> Display	Direct Access	
Video Playback	1 flow	PL1	Bmem -> VDIC -> IC -> Bmem -> IRT -> Fmem + DSx	Main option	
		PL2	Fmem -> IRT -> Bmem -> IC -> DP	Low power	Progressive source Large enough window

*Table continues on the next page...*

1. Specified pixel clocks frequencies are applicable for internal clocks, but may be limited by IO buffers speed capability. Final numbers are subjected to AC characterization.

**Table 9-4. Time-Shared Data Flows Through The IPU (continued)**

Name	Number	Type	Flow	Target	Restrictions
				(branching to DSx, as a video plane)	No other video flows
		PL3	Fmem -> VDIC -> IC -> DP	Low power (branching to DSx, as a video plane)	Interlaced source Large enough window No other video flows
Camera Preview	2 flows (VF2 may be used also as a playback flow)	VF1	Sensor -> IC -> Bmem -> IRT -> Fmem + DSx	main option	Single progressive input
		VF2	Sensor -> Fmem -> VDIC -> IC -> Bmem -> IRT -> Fmem + DSx	two inputs and/or interlaced input	When the VDIC is used for de-interlacing, one of the three input fields can go directly from the sensor to the VDIC
		VF4	Sensor -> IC -> Fmem + DS1	Low power RAM-less Display Single Display Buffer (in internal memory) Tearing-less	Single progressive input Refresh rate = 2x sensor frame rate Large enough window No other video flows
Video Record	2 flows	RCx	IC -> Bmem -> IRT -> Fmem	(branching from VFx)	
Graphic Overlays	2 flows	GF1	Fmem -> IC	(combining with the main flow)	
	2 flows	GF2	Fmem -> DP		

### 9.2.2.1 Display Processor (DP)

The Display Processor performs all the processing required for data sent to a display.

- Combining 2 video/graphics planes
- Overlaying a simple HW cursor 32 x 32 pixels, uniform color; may be combined logically with the background.
- Color conversion/correction - linear (multiplicative and additive) Programmable; including:
  - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
  - Adjustments: brightness, contrast, color saturation...
  - Special effects: gray-scale, color inversion, sephia, blue-tone...
  - Hue-preserving gamut mapping - for minimal color distortion
  - Applied to the output of combining or to one of the inputs
- Gamma correction and contrast stretching - programmable piecewise-linear map

The DP processes a single data flow at any given time, but it supports up to three data flows, by time sharing, one of them may be synchronous.

The data rate is up to 198M pixels/sec

### 9.2.2.2 Video de-interlacer (VDIC)

VDIC, the video de-interlacer and combiner module, has two operation modes

- De-interlacing: converts an interlaced video stream to progressive order.
- Combining: combines two video/graphics planes and a background color

The input and output to/from the VDIC is as follows:

- Input for de-interlacing: three consecutive fields
  - Source
    - The most recent field may come from the CSI or from system memory
    - The other two fields are read from memory
  - Field size: Supports up to 1080p
  - Pixel format: YUV 4:2:2/4:2:0, 8 bits/value
  - Typical video sources - SDTV: 480i30 (720x480 at 30 fps) or 576i25 (720x576 at 25 fps) and HDTV: 1080i30 (1920x1080 at 30 fps)
- Input for combining: two progressive video/graphics planes
  - Source: system memory
  - Plane size: up to 1920x1200 pixels.
  - Pixel format: RGB/YUV 4:2:2, 8 bits/value
- Output: progressive frame
  - Destination: to system memory or to the Image Converter.
  - Frame size: up to 1920x1200 pixels.
  - Rate: up to pixels/sec.
  - Format: same as input format.

De-interlacing is performed using a high-quality 3-field filter, which is motion adaptive:

- For slow motion - retains the full resolution (of both top and bottom fields)
- For fast motion - prevents motion artifacts

VDIC supports a single video stream at any given time.

### 9.2.2.3 Image Converter (IC)

The Image Converter performs various operations on a video stream.

The operations performed are:

- Resizing:
  - Fully flexible resizing ratio Maximal downsizing ratio: 8:1. Subject to this limitation, any N->M resizing can be performed
  - Independent horizontal and vertical resizing ratios.
- Color conversion/correction - linear (multiplicative and additive) Programmable; including:
  - YUV <-> RGB, YUV<->YUV conversions where YUV stands for any one of the color formats defined in the MPEG-4 standard
  - Adjustments: brightness, contrast, color saturation...
  - Special effects: gray-scale, color inversion, sephia, blue-tone
- Combining with a graphics plane (e.g. application-specific overlay)
- Horizontal inversion

The IC supports three time-shared data flows: record, camera preview and playback (the first two share a common input).

The frame resolution supported is up to 4096x4096 for input and up to 1024x1024 for output. Wider frames can be processed by the IC by splitting them to vertical stripes.

Data throughput:

- For a single active task: up to pixels/sec for input and up to pixels/sec for output.
- For several active tasks: up to pixels/sec for input and up to pixels/sec for output.

#### 9.2.2.4 Image Rotator (IRT)

The Image Rotator performs any combination of the following:

- 90-degree rotation
- Horizontal inversion
- Vertical inversion

The data throughput

- When a single task is active: up to pixels/sec.
- When more tasks are active: up to pixels/sec.

### 9.2.3 Automatic Procedures

The IPU is equipped with powerful control and synchronization capabilities to perform its tasks with minimal involvement of ARM and minimal use of memory.

In particular, it includes:

- An integrated DMA controller with an AXI master port, allowing autonomous access to the system memory.
- An integrated display controller, performing screen refresh of a RAM-less display.
- A page-flip double buffering mechanism, synchronizing read and write access to system memory, to prevent tearing effects.
- A double/triple buffer synchronization mechanism with a video/graphics source.
- Internal synchronization, e.g., between input from sensor and output to display.

As a result, in most cases, the MCU is involved only when it also performs part of the processing (e.g. video coding). In particular, the following procedures are performed by the IPU completely autonomously:

- Screen refresh for RAM-less displays
- Camera preview (displaying a view finder - a video-stream from the image sensor to the display).

### NOTE

Direct camera to display flow is possible when the frame rate of the source and the destination is the same (typically the target display will be asynchronous display, where the display is updated at the rate of the source).

Typically, there are extended periods of time in which there is no other activity in the system. The MCU - being idle - can be put to a low-power mode, reducing the power consumption and extending significantly the battery life.

The IPU supports several techniques to reduce further the power consumption of the display system:

- Dynamic backlight control, with low-light compensation by image enhancement

Further features and capabilities of the automatic procedures include:

- Automatic display of a changing image (animation) or moving image (scrolling).
- The timing of the display update can be adjusted to avoid tearing.
- The video stream from an image sensor can be sent directly to the display buffer used for screen refresh, while avoiding tearing.

The clock sources received by the IPU are listed in the following table.

**Table 9-5. IPU Clock Sources**

Name	Symbol	Source	Rate	Comments
High-Speed Processing Clock	HSP_CLK	Clock control Module	Up to 270 MHz	
Display Interface Clocks	DI_CLK0 DI_CLK1	Clock control Module or an external PLL	Up to 220 MHz	Optional; needed for synchronization with interface bridges

## 9.3 LVDS Display Bridge (LDB)

LVDS Display Bridge (LDB) will be used to connect the IPU (Image Processing Unit) to the External LVDS Display Interface.

### 9.3.1 LDB Overview

**Table 9-6. IP Parametric Table**

Name	Description
Function	Connectivity to displays with LVDS interface
External I/O Pins Notes: Those are LVDS IO pads	LVDS Display port: 2 channels. Each channel consists of: <ul style="list-style-type: none"> <li>• 1 clock pair</li> <li>• 4 data pairs</li> </ul> Each pair contains - LVDS special differential pad (PadP, PadM). total of 20 IO pads.
SoC Buses	None. Only configuration signals.
Interrupts	None
DMA Requests	None
Number of instantiations	1
Clock sources and range	DI0_CLK, DI1_CLK - Display interface clock: 20-170 MHz DI0_SER_CLK, DI1_SER_CLK - Serializer clock: 140-595 MHz

The purpose of the LDB is to support flow of synchronous RGB data from the IPU to external display devices through the LVDS interface. This support covers all aspects of these activities:

- Connectivity to relevant devices - Displays with LVDS receivers.
- Arranging the data as required by the external display receiver and by LVDS display standards.
- Synchronization and control capabilities.

## 9.3.2 LDB External Ports

The LDB has the following ports:

- Two input parallel display ports.
- Two Output LVDS channels - Each channel consisting of 4 data pair, and 1 clock pair (pair=LVDS pad contains PadP, PadM).
- Control signals - to configure LDB parameters and operations.
- Clocks from SOC PLLs.

## 9.3.3 Input Parallel Display Ports

One or Two (DI0, DI1) parallel RGB input ports are supported (configurable). Only synchronous access mode is supported.

Each RGB data interface contains the following:

- RGB Data of 18 or 24 bits
- Pixel clock
- Control signals: HSYNC, VSYNC, DE, and 1 additional optional general purpose control.

Total of up to 28 bits per data interface are transferred per pixel clock cycle.

Rates supported:

- For dual-channel output: Up to 170 MHz pixel clock (e.g. UXGA - 1600x1200 @ 60 Hz + 35% blanking)
- For single-channel output: Up to 85 MHz per interface. (e.g. WXGA - 1366x768 @ 60 Hz + 35% blanking).

### 9.3.3.1 Output LVDS Ports

There are 2 LVDS channels. These inputs are used to communicate RGB data and controls to external LCD displays with LVDS interface, or through LVDS receivers.

The LVDS ports may be used as follows:

- One single-channel output
- One dual channel output: single input, split to two output channels
- Two identical outputs: single input sent to both output channels
- Two independent outputs: two inputs sent, each, to a different output channel

### 9.3.3.2 Control signals

Control signals are used to configure LDB operation.

## 9.4 Video Data Order Adapter (VDOA)

The goal of the VDOA is to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

## 9.5 Display Content Integrity Checker (DCIC)

The goal of the DCIC is to verify that a safety-critical information sent to a display is not corrupted.

Such a verification is mandatory for warning icons in the instrument cluster of a car, to comply with the ASIL B (Automotive Safety Integrity Level B) specification. It is also required in other safety-sensitive systems.

## 9.6 Video Processing Unit (VPUv6)

The VPU is a multi-standard video codec (encoder/decoder) capable of handling multiple streams simultaneously by time multiplexing.

It is a very flexible block consisting of hardware accelerators surrounding a programmable core. The VPU presents to the system a register mapped interface that is controlled by the embedded processor. End users should only interface with the VPU using the API that is provided with each BSP Programmers User Guide. This API isolates the user from possible changes in the register level interface.

In the following table we can see a summary of the VPU specs. The VPU has its own DMA driven AXI masters that allow it to retrieve the required data directly from system memory (DDR and iRAM). The load in the host ARM platform is negligible because it only needs to interact with the VPU at the frame level.

**Table 9-7. VPU Spec Summary**

Name	VPU
Function	Decode video streams including optional video processing such as rotation, deringing and mirroring.
Supported encoders	MPEG-4 SP H.263 V2 + Annex J, K (RS=0 and ASO=0), and T H.264 BP, CBP MJPEG Baseline
Supported decoders	MPEG-2 MP, HP VC-1 SP, MP, AP MPEG-4 SP, ASP H.263 V2 + Annex J, K (RS=0 and ASO=0), and T H.264 BP, MP, HP H.264-MVC BP, MP, HP DivX v3,4,5 Real Video 8, 9, 10 MJPEG Baseline On2 VP8 AVS Jizhun
External I/O Pins (List, Type, Schmidt Trigger, Speed)	No external I/O pins are needed
SoC Buses (List, Type, Bandwidth)	64 bit AXI master for accessing the system memory and the optional secondary AXI but to iRAM IPBus slave for host control
Interrupts	Two interrupts
DMA Requests	Integrated DMA controller on the AXI master port
Endianness	64 and 32 bit BE/LE
Number of instantiations	1
Clock sources and range	Core clock: up to 328 MHz AXI bus clock: up to 328 MHz IP bus clock: up to 66 MHz

**NOTE**

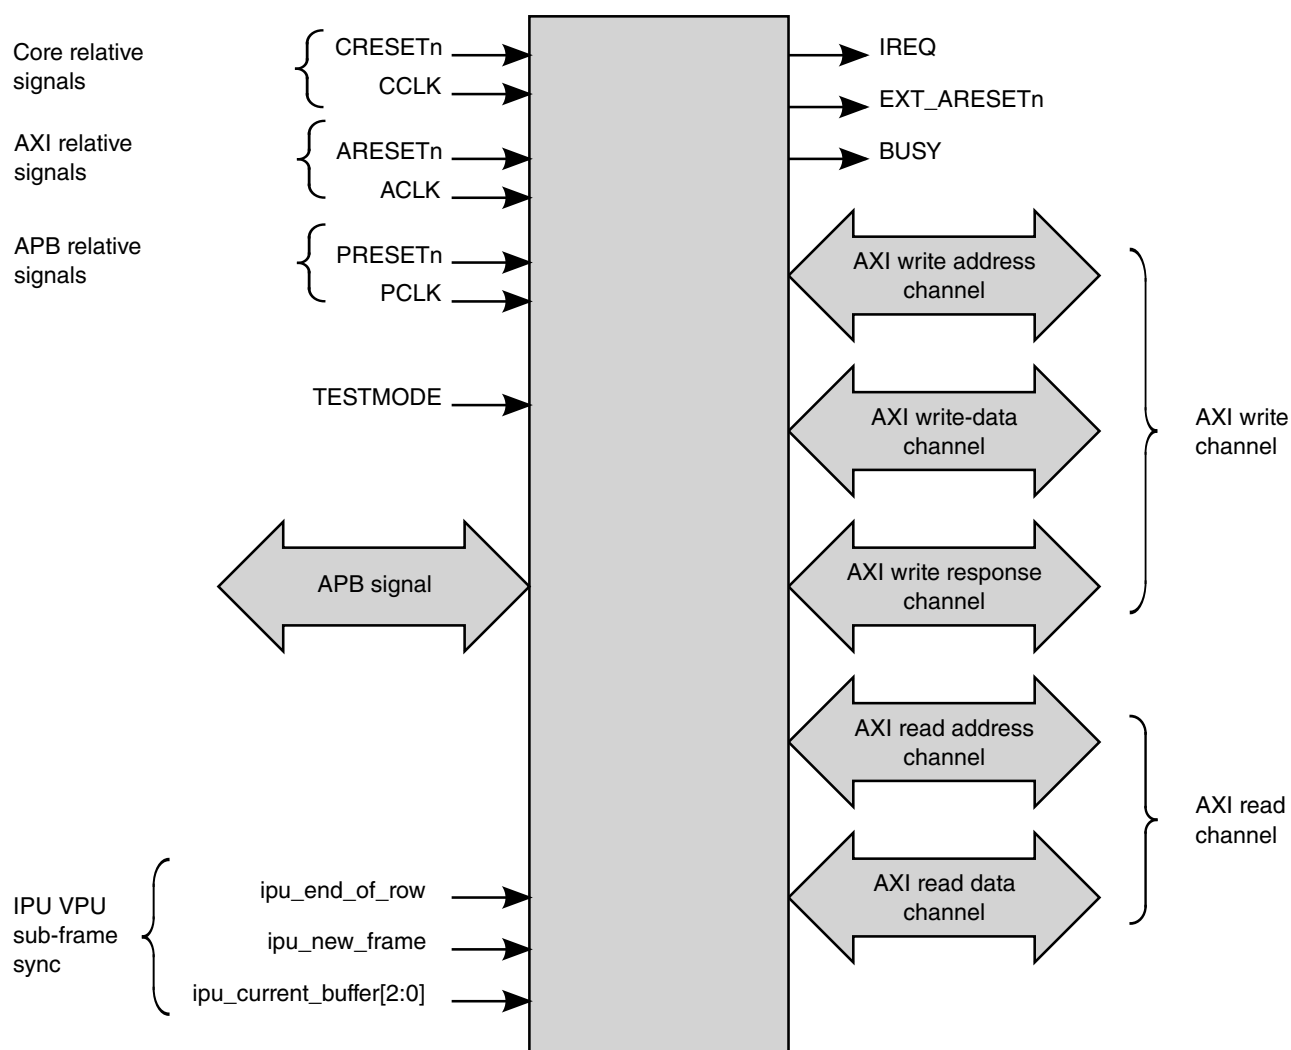

RealNetworks video codec is disabled by default on i.MX 6 series processors. Please contact your FSL sales representative for more details.

The i.MX 6Solo/6DualLite processor has a high-performance video processing unit (VPU), which covers many standard and high definition video decoders and encoders as a multi-standard video codec engine as well as several important video processing such as rotation and mirroring.

## 9.6.1 Basic Structure

The following [Figure 9-6](#) shows the basic structure of the VPU. The VPU is self contained except for memory accesses. It is connected to the memory subsystem through two AXI master ports. The ARM configures the VPU operation through the IP bus that is converted to APB in a gasket.

A new feature is added for allowing VPU encoding a frame even the IPU writes only a small portion of source video (from camera sensor) into the frame buffer. This feature is called IPU-VPU sub-frame synchronization. Four additional signals are added for implementing this feature with three of them from IPU to VPU, and one of them from VPU to IPU, as shown in [Figure 9-6](#) for the signal category of "IPU VPU sub-frame sync"

**Figure 9-6. The Block Diagram of the VPU**

## 9.6.2 Feature summary

The following table describes the VPU's encoding / decoding capabilities:

**Table 9-8. VPU decoding/encoding capabilities**

Dec/Enc	Standard	Profile	Resolution	Bitrate	Comments
HW Decoder	MPEG-2	Main-High	1080 i/p, 30fps	50 Mbps	1080p+SD at 30fps, 720p60
	MPEG4/XviD	SP/ASP	1080 i/p, 30fps	40 Mbps	—
	H.263	P0/P3	16CIF, 30 fps	20 Mbps	—
	H.264	BP/CBP/MP/HP	1080 i/p, 30 fps	50 Mbps	1080p+SD at 30 fps, 720p60
	H.264-MVC	BP/MP/HP	720p, 30 fps	—	—
	VC1	SP/MP/AP	1080 i/p, 30 fps	45 Mbps	1080p+SD at 30 fps, 720p60
	RV	8/9/10	1080 p, 30 fps	40 Mbps	—
	DivX	3/4/5/6	1080 i/p, 30 fps	40 Mbps	—
	On2 VP6	—	720p, 30 fps	20 Mbps	—
	On2 VP8	—	720p, 30 fps	20 Mbps	—
	Theora	—	720p, 30 fps	20 Mbps	—
	AVS	Jizhun	1080 i/p, 30fp	40 Mbps	—
MJPEG	Baseline	8192x8192	120 Mpixel/sec	Perf shown at 4:4:4 format	—
Hardware encoder	MPEG4	Simple	720p, 30 fps	12 Mbps	VPU can generate higher bitrate than the maximum specified by the corresponding standard.
	H.263	P0/P3	4CIF, 30 fps	8 Mbps	
	H.264	BP/CBP	1080p, 30 fps	14 Mbps	
	MJPEG	Baseline	8192 x 8192	160 Mpixel/sec	Perf shown at 4:2:2 format

VPU can also perform the following:

- On-the-fly (90 x n) degree simultaneous rotation and mirroring (n = 0,1,2,3).
- Post-processing
  - De-blocking filtering for MPEG-4
  - De-ringing filtering for MPEG-4 and H.264 decoder

## 9.7 OpenGL ES 3D Graphics Processing Unit (GPU3Dv5)

### 9.7.1 OpenGL Overview

## 9.7.2 OpenGL Features

Summary of features in the GPU3D includes:

- OpenGL ES 2.0 compliance, including extensions; OpenGL ES 1.1; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 12 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Support for 8 fragment shader simultaneous textures
- Support for 4 vertex shader simultaneous textures
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear
- 8k x 8k texture size and 8k x 8k rendering target

## 9.7.3 OpenGL Block Diagram

Figure 9-7. GPU System Integration Diagram

## 9.7.4 OpenGL Performance

- GPUv5 @ 532MHz (clock rate TBD)

## 9.7.5 OpenGL Software

### API / Driver Support

- OpenGL ES 1.1, 2.0, and 3.0 (draft)
- OpenVG 1.1
- EGL 1.4
- OpenVG 1.1

### Operating Systems

- Windows CE
- Linux Embedded and X11
- Android

## 9.8 2D Graphics Processing Unit (GPU2Dv2)

### 9.8.1 2D feature summary

GPU2D has the following features:

- Bit BLT & stretch BLT
- Rectangle fill and clear
- Line drawing
- High performance stretch and shrink
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending including Java 2 Porter-Duff compositing blending rules
- Support rendering size of 32Kx32K
- 90/180/270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask
- Color space conversion between YUV and RGB
- High quality image scaling, using up to 9x9 separable filter
- Bit-Blit Formats
  - A1R5G5B5 (source/destination)

- A4R4G4B4 (source/destination)
- X1R5G5B5 (source/destination)
- X4R4G4B4 (source/destination)
- R5G6B5 (source/destination)
- X8R8G8B8 (source/destination)
- A8R8G8B8 (source/destination)
- 8-bit color index (source only)
- A8 (source/destination)
- 1-bit monochrome (source only)
- Filter Blit Formats
  - A1R5G5B5 (source/destination)
  - A4R4G4B4 (source/destination)
  - A8R8G8B8 (source/destination)
  - R5G6B5 (source/destination)
  - X1R5G5B5 (source/destination)
  - X4R4G4B4 (source/destination)
  - X8R8G8B8 (source/destination)
  - YUV (source only):
    - NV12 (4:2:0, 2 planes)
    - NV16 (4:2:2, 2 planes)
    - UYVY (4:2:2, interleave)
    - YUY2 (4:2:2, interleave)
    - YV12 (4:2:0, 3 planes)
  - 8-bit color index(source only)

## 9.8.2 2D Block Diagram

Figure 9-8 below presents the integration of the GPU2D core in i.MX 6Solo/6DualLite SoC.

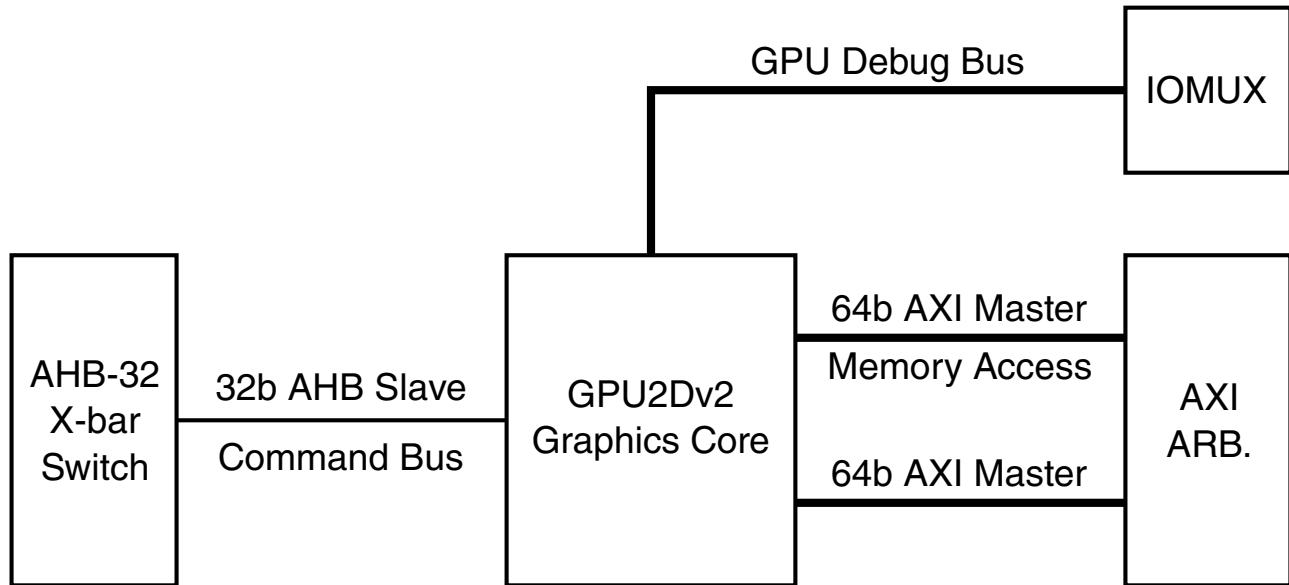

Figure 9-8. GPU2Dv2 (GPU2D) Interface Diagram

### 9.8.3 2D Performance

- Geometry Rate: 26.6M Triangles/sec
- Pixel Rate: 256M pixels/sec

### 9.8.4 2D Software

API / Driver Support

- GDI/DirectDraw
- DirectFB
- X11 EXA

Operating Systems

- Windows CE
- Linux Embedded and X11
- Android

## 9.9 HDMI TX - HD Multimedia Interface transmitter

## 9.9.1 HDMI Introduction

HDMI (High-Definition Multimedia Interface) is a compact audio/video interface for transmitting uncompressed digital video data and uncompressed/compressed digital audio data. HDMI connects digital audio/video sources—such as set-top boxes, Blu-ray Disc players, personal computers (PCs), video game consoles, and AV receivers to compatible digital audio devices, computer monitors, and digital televisions.

HDMI supports, on a single cable, any TV or PC video format, including standard, enhanced, and high-definition video, up to 8 channels of digital audio, and a Consumer Electronics Control (CEC) connection. The CEC allows HDMI devices to control each other when necessary and allows the user to operate multiple devices with one remote control handset.

Because HDMI is electrically compatible with the signals used by Digital Visual Interface (DVI), no signal conversion is necessary, nor is there a loss of video quality when a DVI-to-HDMI adapter is used.

The HDMI Transmitter (HDMI TX) consists of two parts:

- HDMI TX Controller
- HDMI TX PHY

Figure 9-9 depicts the HDMI TX integration scheme.

**Figure 9-9. HDMI TX integration**

The video interface is parallel with 24 bit/pixel data and separate signals for vertical (VSYNC) and horizontal (HSYNC) synchronization. The video data is supplied by the Image Processing Unit (IPU).

The audio data is read from an external memory by the internal Audio DMA via the master AHB interface. The HDMI TX is controlled via the AHB interface.

## 9.9.2 Features

The HDMI TX features are listed in [Table 9-9](#).

**Table 9-9. HDMI TX Features**

Specification item	Requirement
General Features	
Standard Compliance	HDMI 1.4a

*Table continues on the next page...*

**Table 9-9. HDMI TX Features (continued)**

	HDMI CTS 1.4a DVI 1.0 HDCP 1.4
Consumer Electronic Control	Supported
Monitor Detection	Hot plug/unplug detection and link status monitor supported
Video Features	
Video Standard Compliance	EIA/CEA-861D
Supported Video Resolutions	Up to 1080p@120Hz HDTV display, up to QXGA graphics display, HDMI 1.4a 4K x 2K video formats HDMI 1.4a 3D video modes with up to 340MHz TMDS clock
Pixel Clock Frequency	From 25 MHz to 340 MHz
Input Data Formats	Parallel YCbCr 4:4:4 and parallel RGB 4:4:4 and parallel YCbCr 4:2:2
Input Color Depth	24/30/36/48 bits/pixel
Input Syncs Format	Separate HSYNC and VSYNC plus data enable control
Internal Video Processing	Interpolation YCbCr 4:2:2 to 4:4:4 Color space conversion YCbCr to RGB and vice versa
Audio Features	
Audio Standard Compliance	IEC60958, IEC61937
Supported Audio Formats	All audio formats as specified by the HDMI Specification Version 1.4a supported.
Audio Input Interfaces	Audio DMA
Audio Sampling Rate	Up to 192 kHz

## 9.10 Display / Sensor MIPI interfaces

### 9.10.1 Introduction

i.MX 6Solo/6DualLite Application Processor features MIPI DSI/CSI-2 interfaces that includes:

- MIPI DSI Host controller with associated MIPI D-PHY Tx (One clock lane, two Data lanes)
- MIPI CSI-2 Host controller with associated MIPI D-PHY Rx (one clock lane, two Data Lanes)

## 9.10.2 DSI

DSI is a high performance serial interconnect bus for mobile applications connecting display system to the host system.

**Table 9-10. DSI Parametric Table**

Name	DSI
Function	High speed serial interface controller for MIPI Display interface
Supported standard version	MIPI DSI Compliant DSI Version 1.01 DPI Version 2.0 DBI Version 2.0 DCS Version 1.02 PPI for D-PHY MIPI D-PHY Version 1.0
External I/O Pins (List, Type, Schmidt Trigger, Speed)	Analog at chip boundary: DATAP[1:0] DATAN[1:0] CLKP CLKN Supplies AVDD -2.5V general analog supply AVDDREF - 2.5V analog supply for D-PHY reference source (low noise) should be directly connected to package ball VDD - 1.1V digital supply GND
SoC Buses (List, Type, Bandwidth)	Synchronous Pixel Interface (DPI) Display Bus Interface (DBI) IPB slave interface x 32 bit PPI to D-PHY
Interrupts	1
DMA Requests	N/A
Num of instantiations	1
Clock sources and range	AHB clock (132MHz) Reference clock for Tx D-PHY - 6 ... 27 MHz

There is one instance of DSI port in the i.MX 6Solo/6DualLite application processor. This interface support from 80 Mbps up to 1 Gbps speed per data lane. The DSI Receiver core can manage one clock lane and up to 4 data lanes through the lane management, however two data lanes are implemented in the transmitter D-PHY, therefore the maximum throughput of display port is 2Gbps.

DSI host core is capable of supporting a variety of resolutions and formats:

- Resolution:
  - QQVGA
  - QCIF, QVGA
  - CIF
  - VGA
  - WVGA
  - SVGA
  - XVGA
- Pixel format:
  - RGB565
  - LRGB565
  - RGB666
  - RGB888

The DSI can support both command and video modes and up to four virtual channels to accommodate multiple displays.

- Command and video mode support (type 1, 2, 3, and 4 display architecture)
- Mode switching: low power and ultra low power
- Burst mode: dual video channel
- Non-burst mode: single video channel
- Bus turnaround
- Fault error recovery scheme

DPI and DBI could coexist in the system but only one of them could be active in a certain time moment

### 9.10.3 CSI-2

CSI-2 is a high performance serial interconnect bus for mobile applications connecting camera sensors to the host system.

**Table 9-11. CSI Parametric Table**

Name	CSI-2
Function	High speed serial interface controller for MIPI sensor interface
Supported standard version	MIPI CSI-2 Version 1.0 MIPI PPI interface for D-PHY MIPI D-PHY Version 1.0
External I/O Pins (List, Type, Schmidt Trigger, Speed)	Analog at chip boundary: DATAP[1:0] DATAN[1:0] CLKP CLKN Supplies AVDD -2.5V general analog supply AVDDREF - 2.5V analog supply for D-PHY reference source (low noise) should be directly connected to package ball VDD - 1.1V digital supply GND
SoC Buses (List, Type, Bandwidth)	Synchronous Pixel Interface - 32 bit, data formatting compliant to CSI-2 specification IPS slave interface x 32 bit
Interrupts	2
DMA Requests	N/A
Num of instantiations	1
Clock sources and range	AHB clock (132 MHz)

There is one instance of CSI-2 port in the i.MX 6Solo/6DualLite application processor. This interface support from 80 Mbps up to 1 Gbps speed per data lane. The CSI-2 Receiver core can manage one clock lane and up to two data lanes through the lane management and de-packetization, providing a maximum throughput of 4 Gbps transfer rate.

### 9.10.4 D - PHY

D-PHY serves as physical layer for both MIPI DSI and CSI-2 interfaces.

D-PHY Transceiver unit is responsible for transmission and reception of data in High speed (HS) or Low Power (LP) mode. High speed mode is used for high-speed data transmission while the low power mode used for the control purpose. Point-to-point lane interconnect can be used for either data or clock signal transmission. High speed receiver is a differential line receiver while low- Power receiver is an un-terminated, single-ended receiver circuit.

**Table 9-12. D-PHY Parametric Table**

Name	D-PHY TX, D-PHY RX
Function	MIPI D-PHY dual mode transceiver
Supported standard version	D-PHY specification v1.0
External I/O Pins (List, Type, Schmidt Trigger, Speed)	One differential pair per lane. See CSI-2 and DSI parametric tables
SoC Buses (List, Type, Bandwidth)	PPI i/f
Interrupts	
DMA Requests	N/A
Num of instantiations	6 - 3 in DSI interface and 3 for CSI-2 interface
Clock sources and range	Reference clock - 6...27MHz

A single lane module is shown in the figure below.

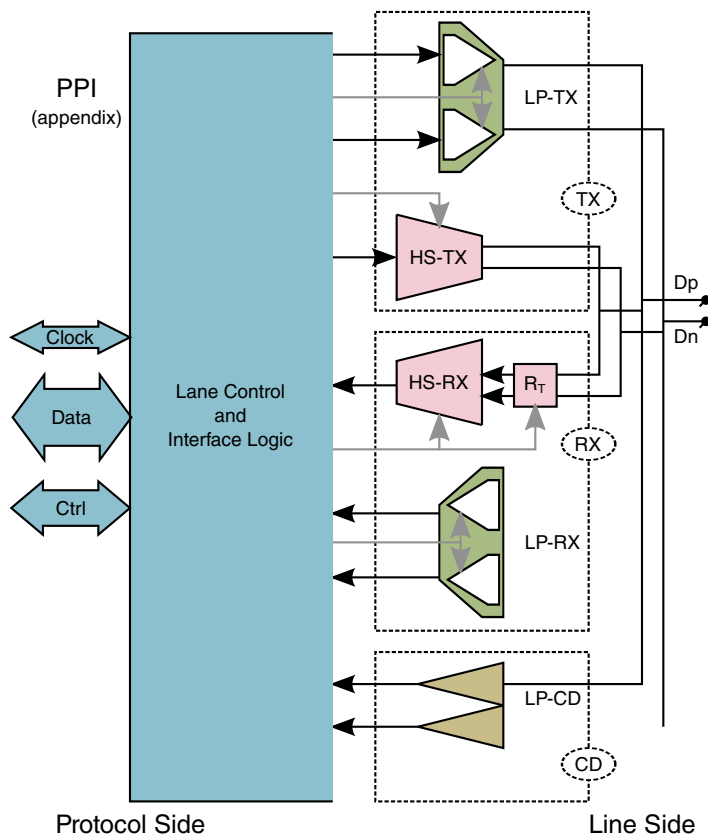

Figure 9-10. Single lane D-PHY- Block Diagram.

There is one instance of D-PHY TX (hard macro; two data lanes, one clock lane, PLL) and one instance of D-PHY RX (hard macro: four data lanes, one clock lane, no PLL) in i.MX 6Solo/6DualLite.

## 9.11 Audio subsystem

The audio subsystem consists of the following modules: SSI-1, SSI-2, SSI-3, AUDMUX, ESAI, SPDIF, ASRC, and MLB. In addition, the IOMUX must be appropriately configured to get signals in and out of the chip.

[Audio subsystem module overview](#) provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

### 9.11.1 Audio subsystem module overview

The following figure shows a high level block diagram of the audio subsystem.

**Figure 9-11. Audio subsystem block diagram**

SSI1–3 are synchronous serial interfaces used to transfer audio data. SSI1–3 are on the shared peripheral bus. Instead of connecting to the IOMUX directly, their serial lines connect to the digital audio mux (AUDMUX).

AUDMUX provides flexible, programmable routing of the serial interfaces (SSI1, SSI2, or SSI3) to and from off-chip devices. AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself. The ARM controls AUDMUX, but AUDMUX can route data even when the ARM is in a low-power mode.

ESAI (enhanced serial audio interface) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors. ESAI consists of independent transmitter and receiver sections, and each section has its own clock generator. ESAI is connected to the IOMUX and to the ESAI\_BIFIFO module.

ESAI\_BIFIFO (ESAI bus interface and FIFO) is the interface between the ESAI module and the shared peripheral bus. It contains the FIFOs used to buffer data to and from ESAI. It also provides the data word alignment and padding necessary to match the 24-bit data bus of the ESAI to the 32-bit data bus of the shared peripheral bus.

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system. SPDIF is connected to the shared peripheral bus.

ASRC (asynchronous sample rate converter) converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of over 120dB THD+N. The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs. ASRC is connected to the shared peripheral bus.

### **9.11.2 Synchronous Serial Interface (SSI)**

The Synchronous Serial Interface (SSI) is a full-duplex serial port that allows communication with external devices using a variety of serial protocols. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock/frame sync options.

The SSI has two pairs of 15x32 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream which reduces CPU overhead in use cases where two timeslots are being used simultaneously.

The three SSIs may support three audio streams (possibly at different sample rates) simultaneously. SSI1, SSI2 and SSI3 are located on the Shared Peripheral Bus. Since the SDMA can directly access SSI1...SSI3 (being on the Shared Peripheral Bus), they can be used for high-bandwidth data transfers in order to optimize bus bandwidth consumption.

### 9.11.3 Digital Audio MUX (AUDMUX)

The Digital Audio Mux (AUDMUX) provides a programmable interconnect fabric for voice, audio, and synchronous data routing between host serial interfaces, such as SSI, and peripheral serial interfaces—that is, audio and voice codecs.

The AUDMUX includes two types of interfaces. Internal ports connect to the processor serial interfaces, and External ports connect to off-chip audio devices. A desired connectivity is achieved by configuring the appropriate host and peripheral ports.

The AUDMUX provides flexible, programmable routing of the on-chip serial interfaces to and from off-chip audio devices. The AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself.

The following figure illustrates how the AUDMUX is connected in the system.

⊠ - Daisy Chain, i.e. more than one PAD is available (only one option shown above).

**Figure 9-12. AUDMUX System Block Diagram**  
 i.MX 6Solo/6DualLite Applications Processor Reference Manual, Rev. 2, 04/2015

### 9.11.4 Enhanced Serial Audio Interface (ESAI)

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. All serial transfers are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The ESAI has 12 pins for data and clocking connection to external devices. The ESAI is internally connected to the ESAI\_BIFIFO, and does not connect directly to the shared peripheral bus. The ESAI interface is designed for a 24-bit data bus, while the shared peripheral data bus is 32-bit wide. Also, the ESAI data paths are only double buffered, not allowing efficient DMA service in the applications processor environment. The ESAI\_BIFIFO allows increasing the data buffering and data width matching to the shared peripheral bus.

### 9.11.5 Sony/Philips Digital Interface (SPDIF)

The Sony/Philips Digital Interface (SPDIF) module is a stereo that allows the processor transmit digital audio over it using the IEC60958 standard, consumer format. i.MX 6Solo/6DualLite provides one SPDIF transmitter with one output.

The SPDIF allows the handling of both SPDIF channel status (CS) and User (U) data.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIFTxLeft and SPDIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or 32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately, starting with the left channel FIFO. The Channel Status bits are also provided via the

corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphase mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The ESAI, SSI's and MLB clock sources should provide a clock that is at least  $64 \times F_s$ , where  $F_s$  is the sampling frequency. The external clock source should provide at least  $128 \times F_s$ . Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example,  $128x$ ,  $256x$  or  $512x$ ). Also, clock frequency precision of 100ppm or better should be provided.

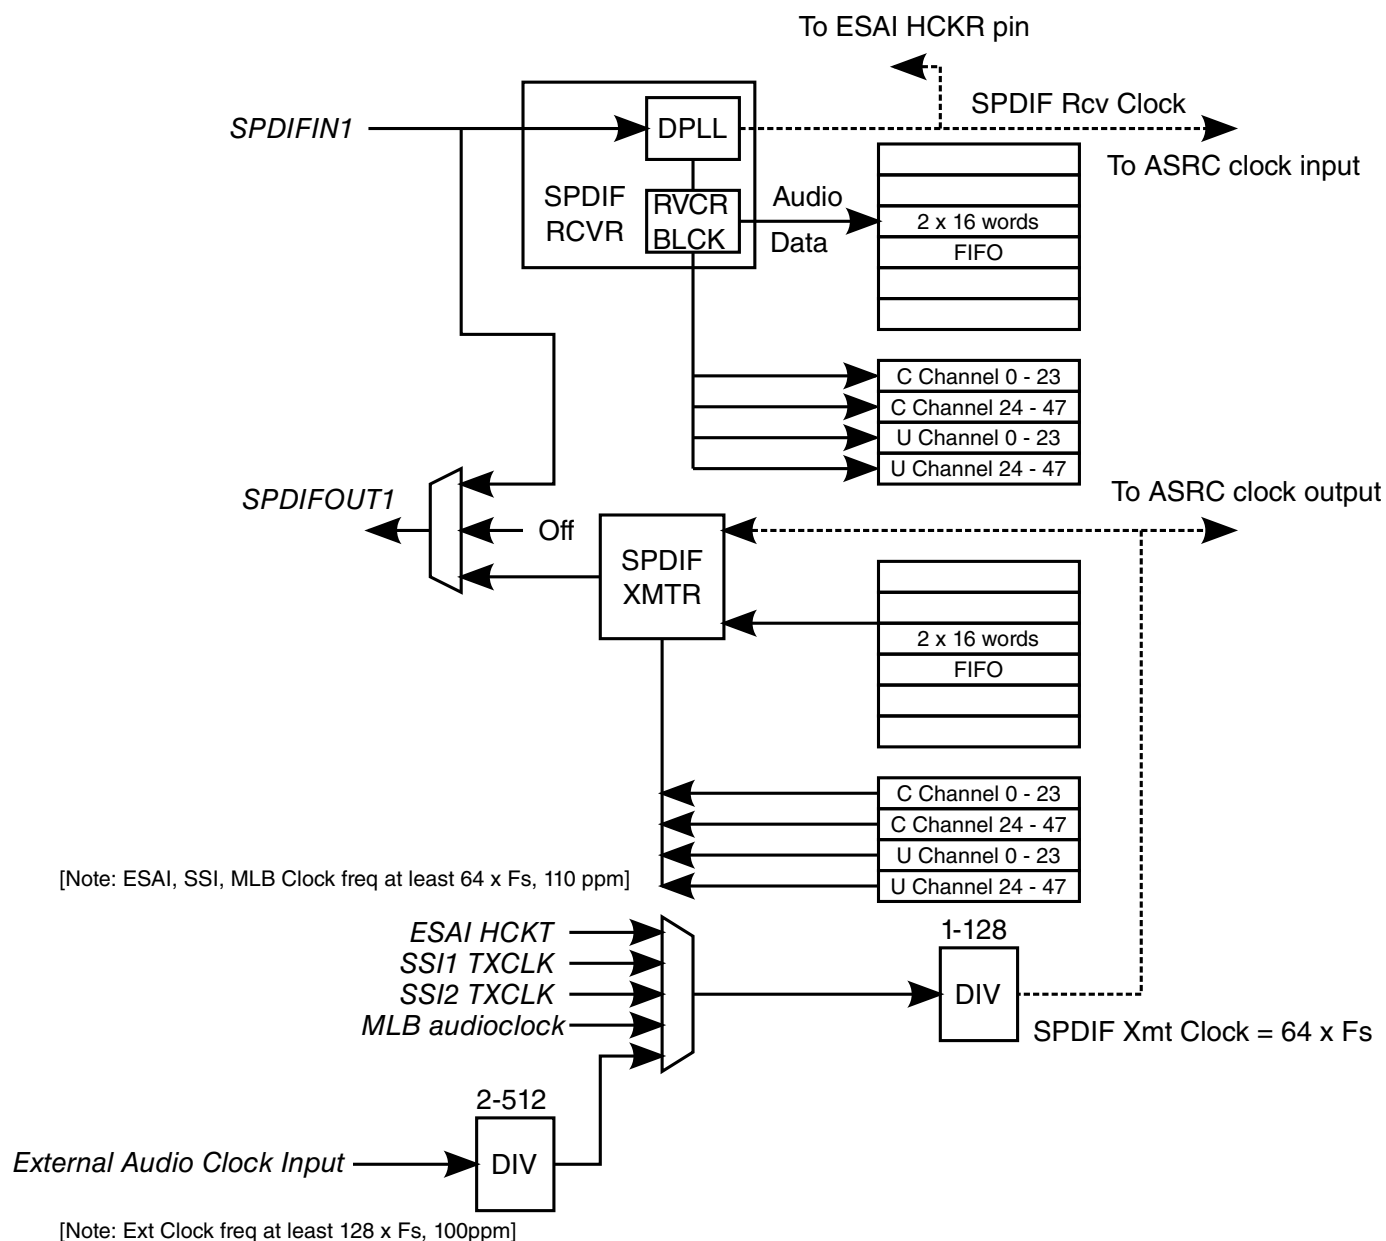

Figure 9-13. SPDIF Transceiver Clock Diagram

### 9.11.6 Asynchronous Sample Rate Converter (ASRC)

The incoming audio data may be received from various sources at different sampling rates. The outgoing audio data may have different sampling rates, and it can also be associated to output clocks that are asynchronous to the input clocks.

ASRC converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The sampling rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs.

In the real-time audio use case, both input/output sampling rate clocks are activated. Both sampling rate clocks are directly connected to ASRC, and the ratio estimation of the input clocks to output clocks is used to perform the sample rate conversion in ASRC hardware.

The SSI1, SSI2, SSI3, S/PDIF, ESAI, and MLB audio modules can act as either a clock master or a clock slave. Multiplexors are provided on a chip level to select which of the module's clock signal, input or output, will be connected to ASRC input in dependence of the module's operational mode as it is shown in [Figure 9-14](#) and [Table 9-13](#). [Figure 9-14](#) presents the multiplexor cell used for all ASRC input clocks. [Table 9-13](#) shows the detailed clocks, multiplexor control and data bits for each ASRC input clock. For the audio blocks clocks that are directly connected to ASRC (without the multiplexor scheme) see [Table 9-14](#).

In the non-real time streaming audio use case, the input sampling rate clock does not need to be provided. Instead the ideal-ratio value conversion is set in the ASRC interface registers. In this case only the output sampling rate clock must be provided, and the fixed ratio of the input to the output in the register is used to perform the sample rate conversion.

Figure 9-14. Muxing scheme template for ASRC input clocks

# Chapter 10

## Clock and Power Management

### 10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The device targets many applications where low power consumption, long battery life, always-on and instant-on capabilities, and no need for active cooling are paramount. For this reason, the design constantly focuses on reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility:

This introduction contains information about:

- Structural components of the power and clock management systems of the device
- Power, clock and thermal management techniques supported by the device

All the numerical values are typical or examples, for accurate values one should use the datasheet.

### 10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, the Clock and Power rails are considered managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of clock, power and thermal management system of the chip is presented in the figure below.

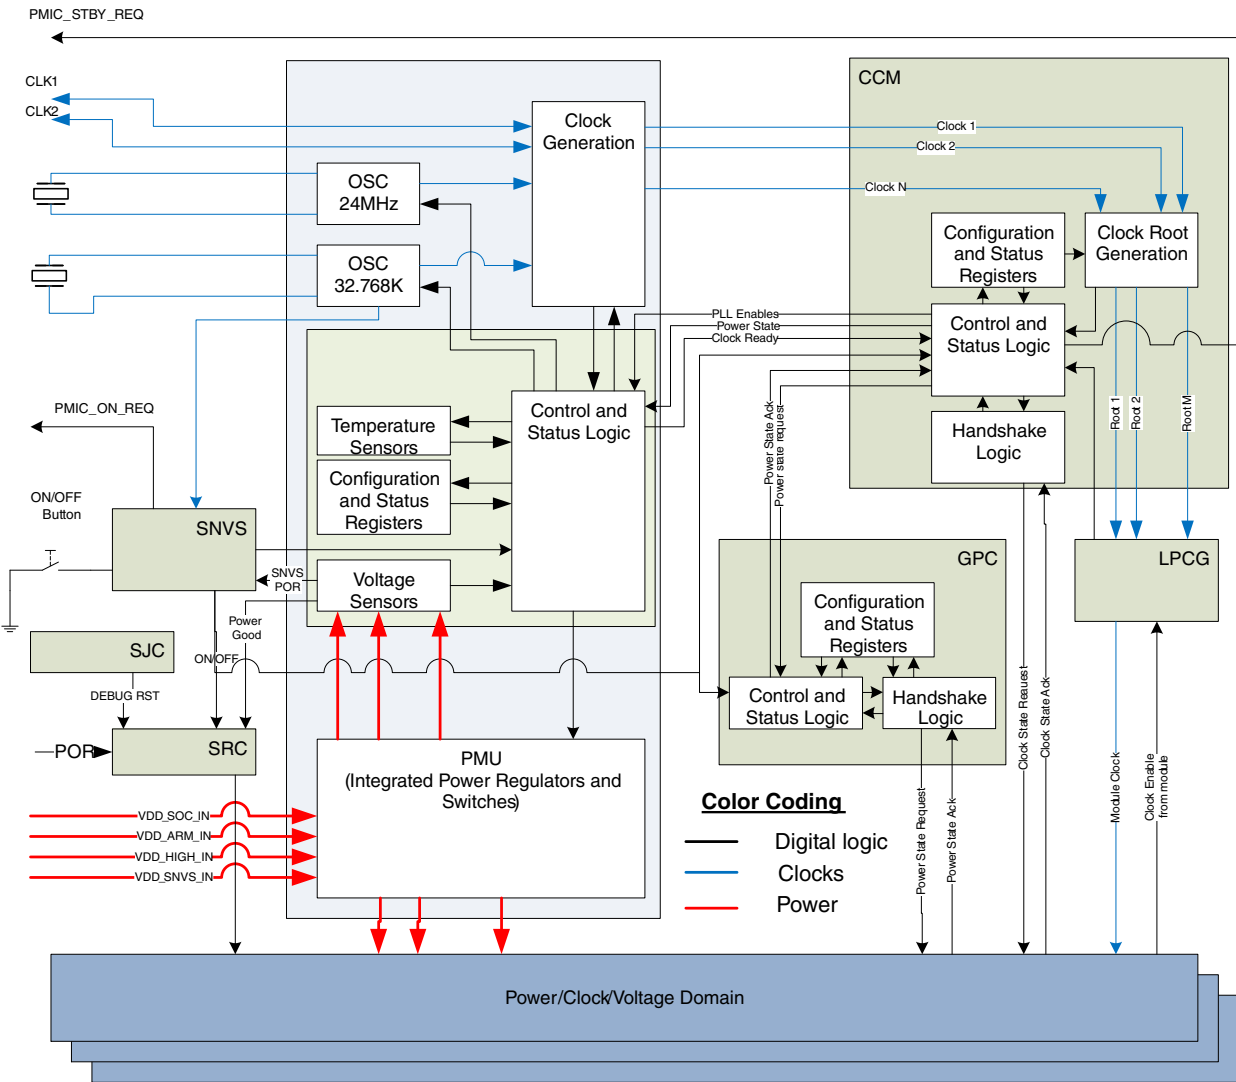

Figure 10-1. Power and clock management framework

### 10.2.1 Centralized components of clock generation and management

Centralized components of clock generation and management sub-system are implemented in the following blocks:

- CCM (Clock Control Module): The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating.

- See [Clock Controller Module \(CCM\)](#) for information on the CCM architecture, functional description and programming model.
- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

## 10.2.2 Centralized components of power generation, distribution and management

Centralized components of power generation, distribution and management sub-system are implemented in the following blocks:

- PMU (Integrated Power Management Unit). See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- GPC (General Power Controller). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

## 10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented [System Reset Controller \(SRC\)](#). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

## 10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with the centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management defines the minimal managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

### NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

## 10.3 Clock Management

### 10.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in figure below.

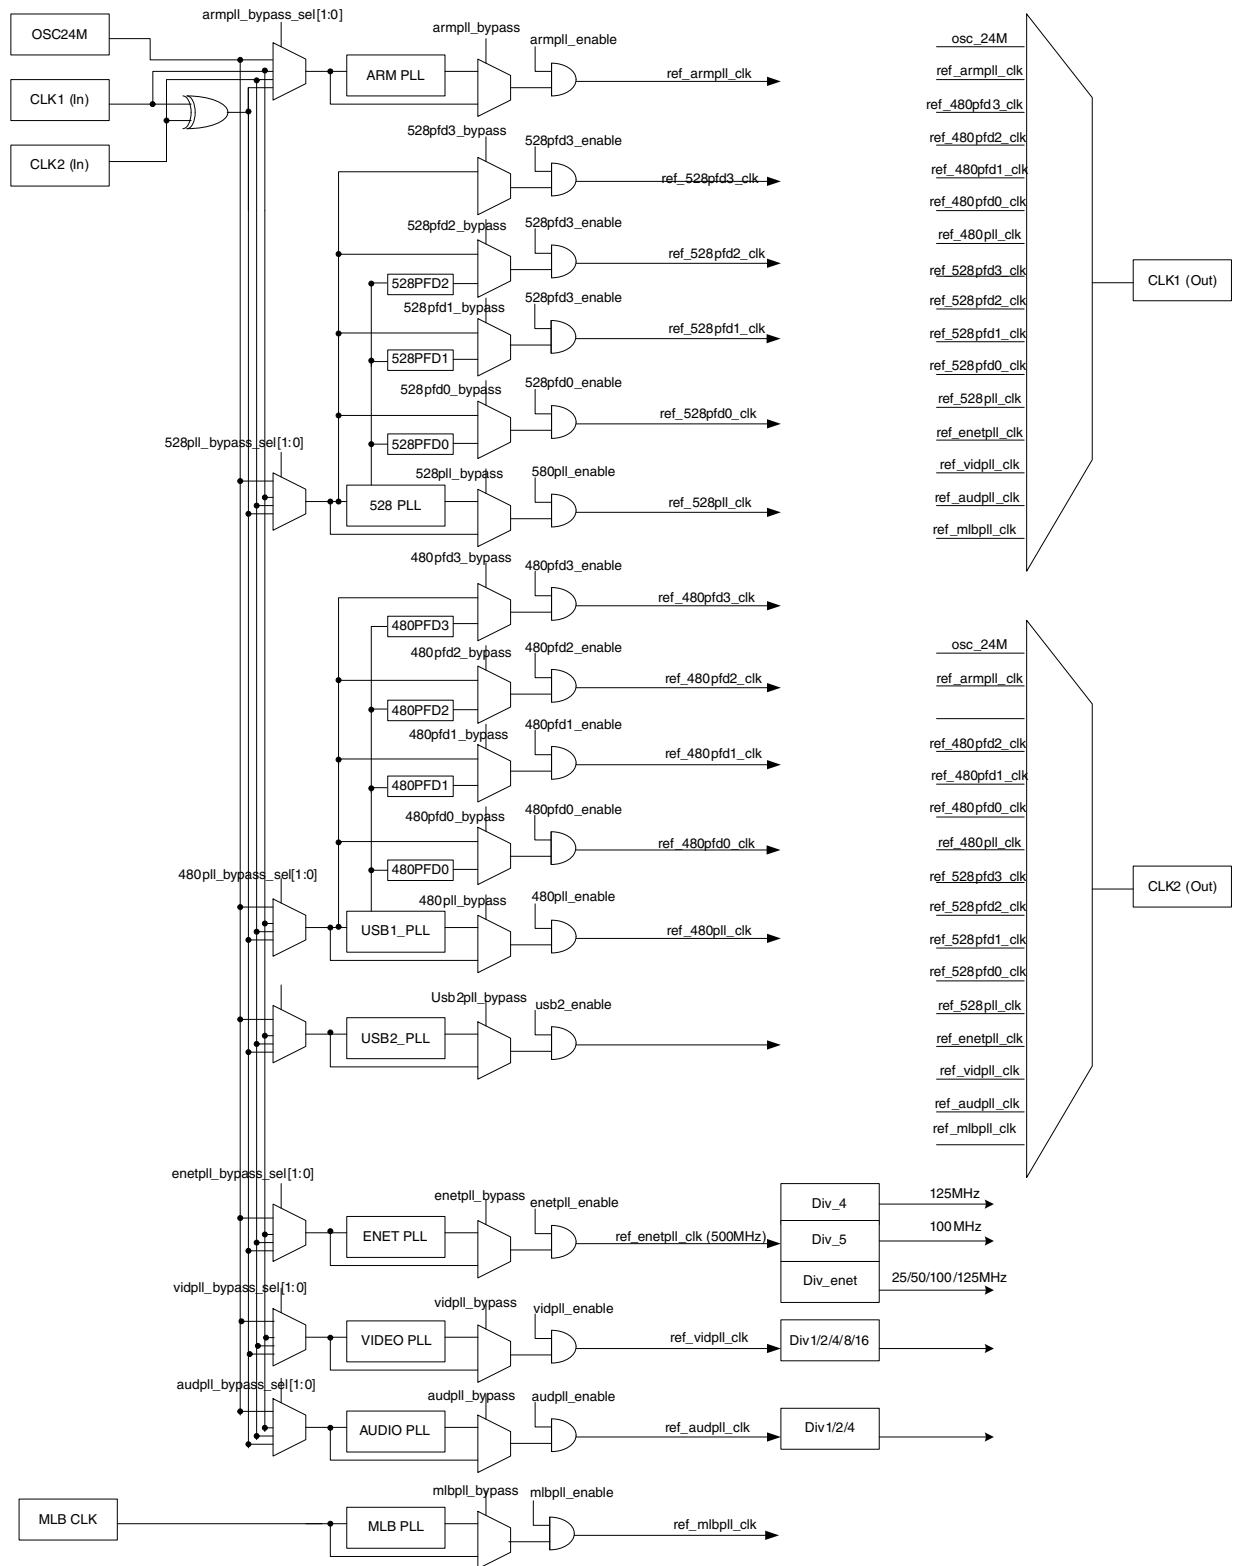

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

# Clock Management

**Figure 10-3. Primary Clock Generation**

## 10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

### 10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

### 10.3.2.2 LVDS I/O ports

There is two LVDS I/O ports used for clock generation. The low jitter differential I/O ports are provided to input and output clocks. They can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or they can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

### 10.3.2.3 PLLs

Eight PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

#### NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces  $18/N \times F_{vco}$  at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-

fly" without going through the output clock disabling/enabling process.

The eight PLLs are listed below:

- PLL1 (also referred to as ARM\_PLL) - This is the PLL clocking the ARM core complex. It is a programmable integer frequency multiplier capable of output frequency of up to 1.3GHz (may exceed chip capabilities, see datasheet for more information).
- PLL2 (also referred to as System\_PLL or 528\_PLL) - PLL2 generally runs at a fixed multiplier of 22, producing 528MHz output frequency with 24MHz reference from XTALOSC. It has the capability to spread spectrum the generated signal. Besides the main output, this PLL drives four PFDs (528\_PFD0...528\_PFD3). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure and/or can be spread-spectrum modulated. Typically, this PLL is a clock source for internal system buses, internal processing logic, DDR interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1\_PLL or 480 PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USB0 PHY, also known as OTG PHY). This PLL also drives four PFDs (480\_PFD0...480\_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480MHz with a 24MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART, CAN and other serial interfaces, audio interfaces, etc.
- 480\_PLL2 (also referred to as USB2\_PLL) - This PLL provides clock exclusively to USB2 PHY (also known as HOST PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480MHz with a 24MHz oscillator.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency

- PLL6 (also referred to as PLL\_ENET) - This PLL implements a fixed  $20+(5/6)$  multiplier. With a 24MHz input, it has a VCO frequency of 500MHz. This PLL is used to generate:
  - 125MHz for the PCIe serial interface and reduced gigabit ethernet interface.
  - 50 or 25 MHz for the external ethernet interface.
  - MLB\_PLL - This PLL takes the Media Link Bus (MLB) interface clock, multiplies it up by 1, 2, or 4, and delay compensates so that the MLB data stream can be captured.

### 10.3.2.3.1 General PLL Control and Status Functions

PLLs configuration and control functions are accessible via individual per PLL and PFDs and global configuration and status registers.

Reference input clock for any of the PLLs except the MLB PLL could be selected individually by the BYPASS\_CLK\_SRC field of the PLL control register. See [CCM Analog Memory Map/Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (ENABLE=0), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the ENABLE bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at [www.freescale.com](http://www.freescale.com) for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

### 10.3.2.4 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the [Power modes](#), namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- ARM core clock - "on the fly" without clock interruption, by either shifting between PLL sources [PLL clock change](#) or by changing the divider ratio.
- Graceful changing of the DDR memory controller clock. See [MMDC handshake](#) and [Self refresh and Frequency change entry/exit](#) for more details.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

#### NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces (SSI, ESAI), Audio Sample Rate Converter (ASRC), video and display interfaces (MIPI, IPU), or general purpose serial interfaces (UART, CAN) in general causes synchronization loss and should not be done.

### 10.3.2.5 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from four sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

### 10.3.3 Peripheral components of clock management system

The figure found here shows the clock interface of a functional module in the system.

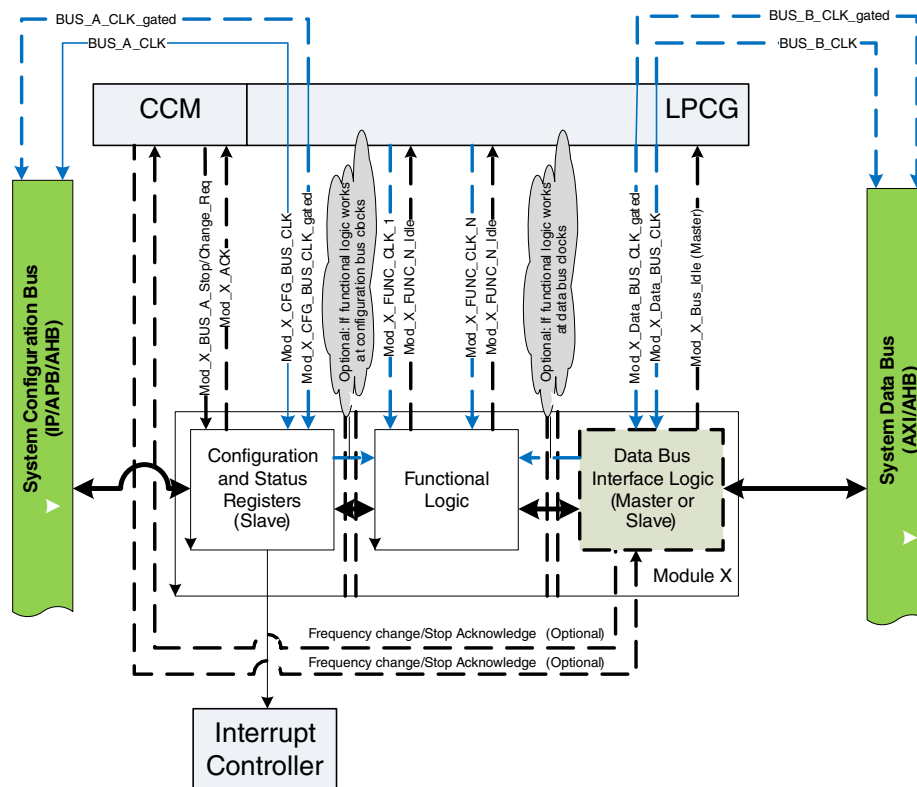

Figure 10-4. Clock interface of the functional module in system

### 10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity (in the case of IPU, that could be the clock for a display interface or a camera sensor interface).
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

### 10.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

### 10.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of modules supporting master clock protocol are GPU3D, VPU, GPU2D, VDOA and USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM\_CMEOR).

### 10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are CAN, EPIT and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Override Register (CCM\_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

### 10.3.3.3 Clock Domain(s)

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

Examples of clock domains are: Main AXI bus clock domain, VPU clock domain, GPU3D clock domain, etc.

### 10.3.3.4 Domain level clock management

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

### 10.3.3.5 Domain dependencies

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

## 10.4 Power management

## 10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks.

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

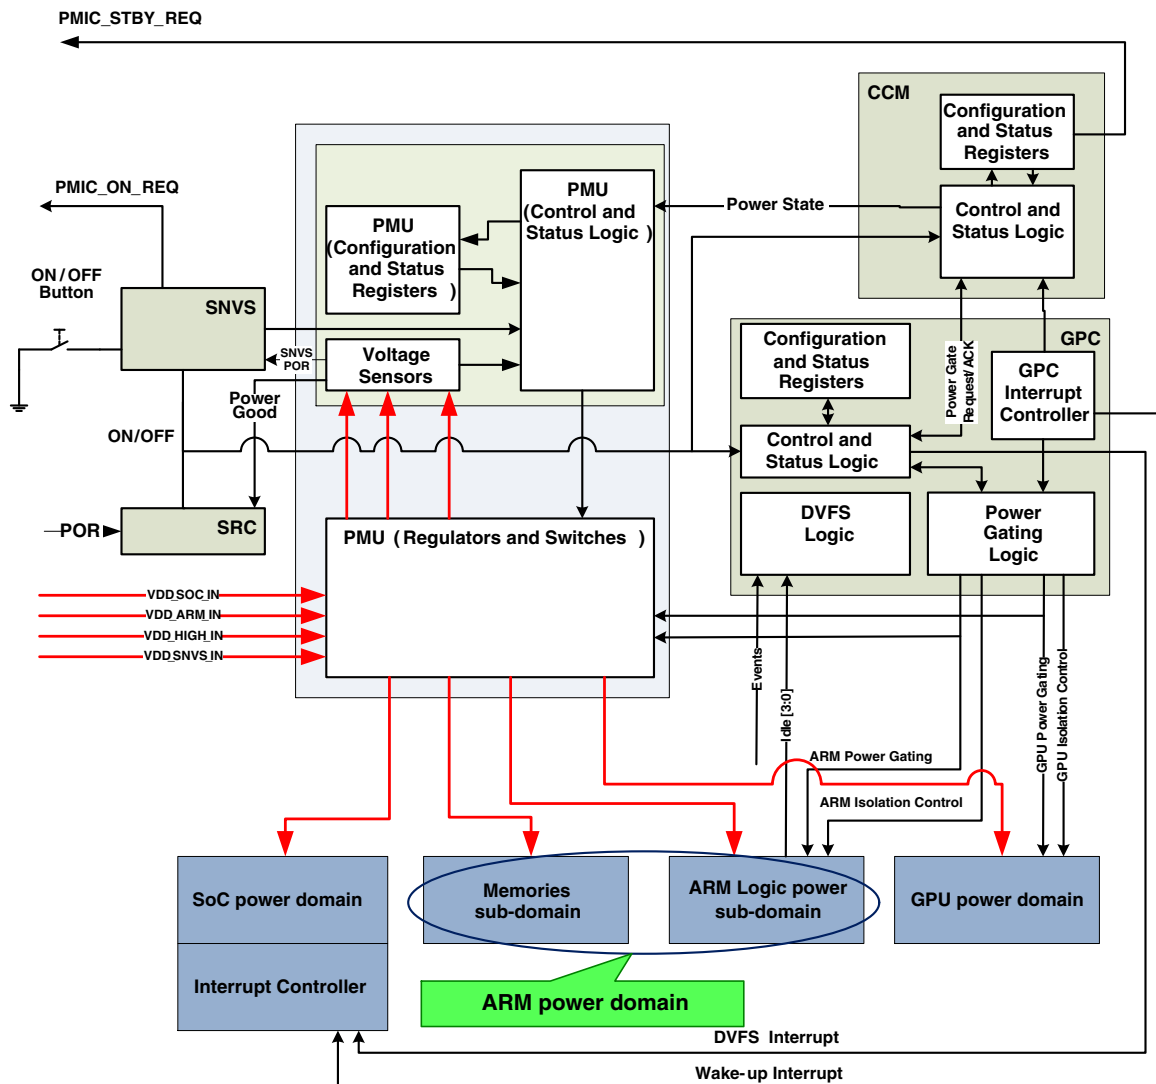

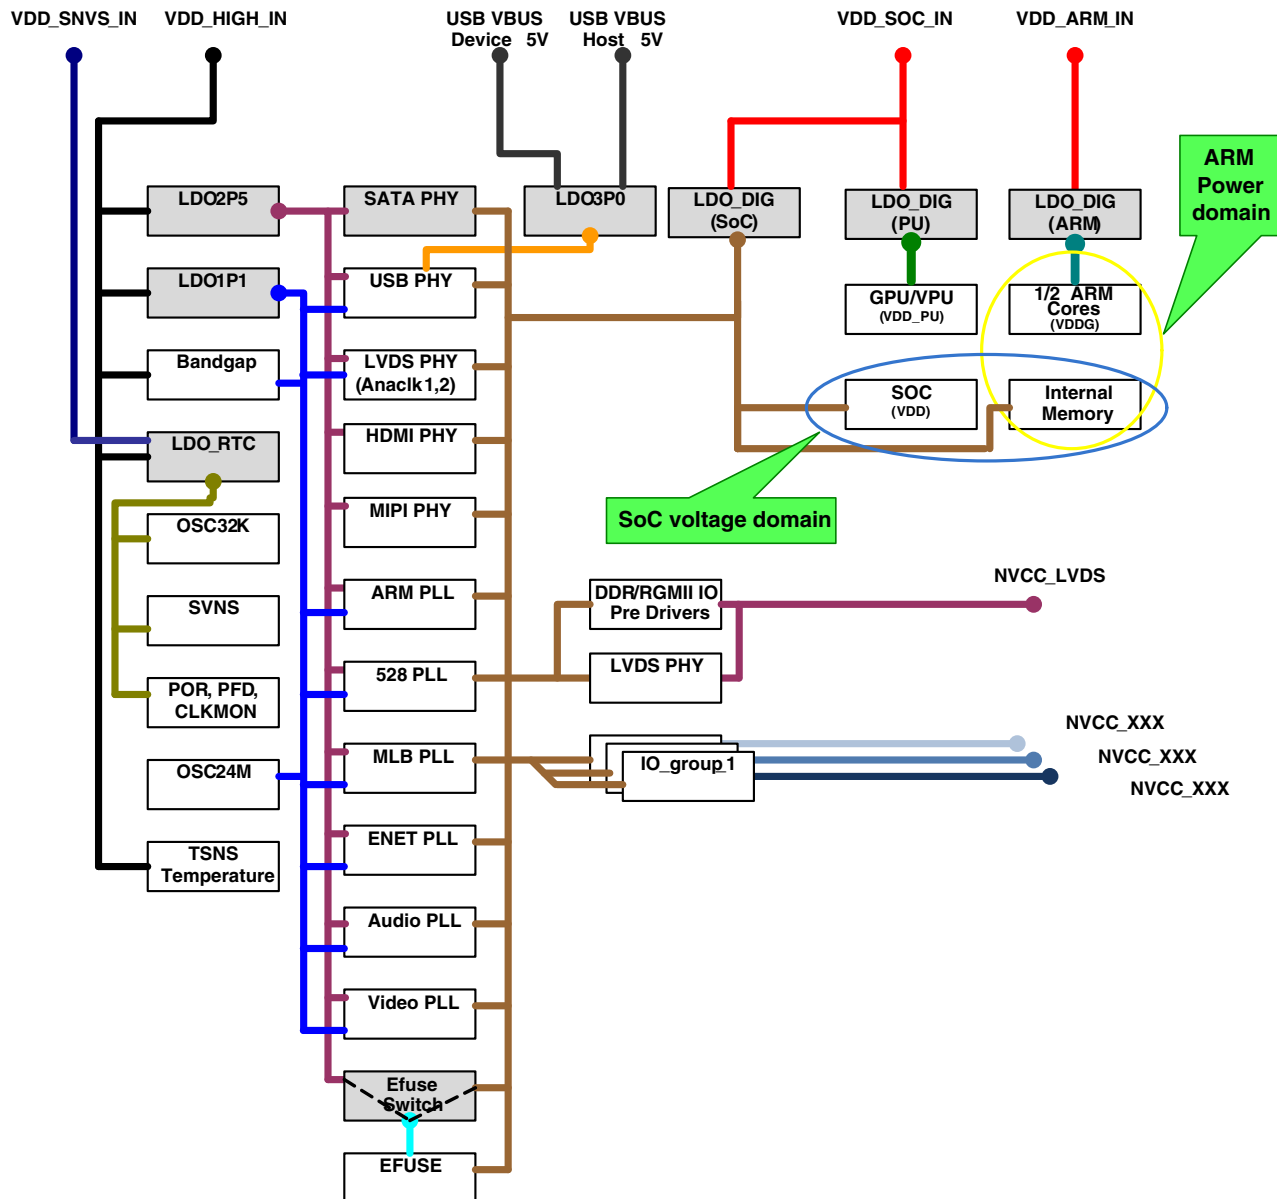

Figure 10-5. Power Management System

### 10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

## Power management

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

**Figure 10-6. i.MX 6Solo/6DualLite Power Tree**

The integrated PMU includes the following components:

- Three Digital LDO regulators
- Two Analog LDO regulators
- USB LDO
- SNVS regulator
- Reverse well biasing

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

#### 10.4.1.1.1 Digital LDO Regulators

The integrated PMU includes three digital LDO regulators: LDO\_ARM, LDO\_PU, and LDO\_SOC. These regulators provide power to the ARM\_Core power domain, the combined VPU, IPU and GPU power domain, and the rest of the SoC logic (except always-ON SNVS domain).

#### NOTE

The name "digital" only refers to the type of load. It is not related to the LDO design or feature set.

The digital LDO regulators can operate in the following modes:

- **Internal Bypass** - The regulation pass device (FET) is switched fully on, passing the external input voltage to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and the FET. Be aware that a period of time (see datasheet) is required to switch from the internal digital bypass mode to the analog regulation mode. Typically it takes less than 100us. Please refer to [PMU](#) for further details on bypass and power gate configuration.
- **External Bypass** - The input and output of the regulator are shorted externally to the SoC. If operating in this configuration, enable the internal bypass early in the startup sequence before attempting high frequency/high power operation. Be aware that internal power gating is not available in this mode.
- **Power Gate** - The regulation FET is switched fully off, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage will fall to a level where the residual leakage of the power FET balances with the leakage of the load. Power gating is applicable to ARM and PU power domains.
- **Analog regulation mode** - The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

These digital regulators also feature brownout detection, which is helpful to sense when supplies are starting to collapse. Note that the core will be interrupted on a brownout. Please see details in [Miscellaneous Control Register \(PMU\\_MISC2n\)](#).

For further details of LDO programming and configuration please refer to [Digital Regulator Core Register \(PMU\\_REG\\_CORE\)](#).

The power management system is built under assumption that in typical applications the single (and simple) shared power supply will be used for ARM core domain and SoC domain. The combined load gains some efficiency, especially in low power modes and saves BoM significantly.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal LDO. In "full speed" modes LDO bypass is considered in both domains. The dynamic voltage scaling to low load workpoints for ARM domain is implemented by programming associated LDO.

In highly power-optimized systems, it is possible to use multiple external DCDC buck converters and bypass internal LDO for high power domains. The obvious trade-off is in the increased complexity of the external power supply components and the associated increase in the BoM and board design complexity.

### 10.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO\_1P1 - The LDO\_1P1 (VDD\_HIGH\_IN, NVCC\_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24MHz oscillator.

### 10.4.1.1.3 USB LDO

The USB\_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

### 10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS\_IN supply and generates the SNVS\_CAP supply, which in turn powers the real time clock and low power section of the SNVS blocks. If VDDHIGH\_IN is present, then the SNVS\_IN supply is internally shorted to the VDDHIGH\_IN supply to allow coin cell recharging if necessary.

### 10.4.1.1.5 Reverse well biasing

The reverse well biasing module on the SoC consists of a self-clocked/self-regulating charge-pump circuit, used to generate a negative bias voltage for the floating PWELL, and a low-power regulator. The low-power regulator is used to generate a positive bias voltage for the NWELL of the digital logic cells on the SOC power domain. Static leakage reduction can be achieved during SoC low-power modes through the use of these reverse well bias voltages. Please refer to the CCM\_CLPCR register in [CCM Memory Map/Register Definition](#) and PMU\_MISC0 in [PMU Memory Map/Register Definition](#) for details about well bias control and [Static](#) " for functional description of the reverse well biasing.

### 10.4.1.2 GPC - General Power Controller

The GPC block provides hardware assistance to Dynamic Voltage Frequency Scaling (DVFS) and power gating, and includes the sub-blocks listed here.

- DVFS load tracking block - This block allows hardware tracking on the core load and generates an interrupt when a frequency change is requested. It does not generate any request for voltage and/or frequency changes made by a hardware signal. The frequency/voltage changing process requires interaction with the CCM block, as well as either the integrated PMU modules or the external programmable regulator. This process should be completed by either the CPU interrupt routine or a DMA transaction.
- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
  - Provides the user with the ability to switch off power to a target subsystem.
  - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
  - Provides programmable registers that adjust the timing of the power control signals.
  - Controls the CPU power domain and the combined GPU/VPU power domain.
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals. Additional features are as follows:
  - Supports up to 128 interrupts
  - Provides an option to mask/unmask each interrupt
  - Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

### 10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR, WARM, and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR\_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

### 10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

Figure below shows the power domain interface in the system

Figure 10-7. Power domain interface in system

#### 10.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- **ARM** - The ARM domain contains the ARM Core platform (except for memory arrays and interface logic). This domain can be supplied either from an integrated power supply or from an external controllable regulator, preferably high efficiency DCDC converter.
- **ARM Memory array** - Memory arrays are connected to a separate and dedicated power domain (separated from the Main logic and ARM domain). In normal operation mode (functional, non-DVFS mode), the memory arrays domain voltage level should be kept equal to (same as) the rest of the core logic domains (Main, ARM). Please refer to the Datasheet for further information about voltage level difference between domains allowed in different power modes.
- **Combined GPU and VPU domain** - The combined GPU/VPU domain contains all GPU3D and GPU2D engines and VPU engine.
- **SNVS/RTC low power domain** - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply.
- **Analog domain** - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal

regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.

- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Cortex-A9 Core Platform - DVFS and power gating.
- ARM Cortex-A9 memories - Power gating only.
- GPU3D and VPU - Power gating only.

See table below for details of the system power domains layout and dependencies.

### 10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating

The following is the list of relevant memories and logic domains with the description of their state-retention support:

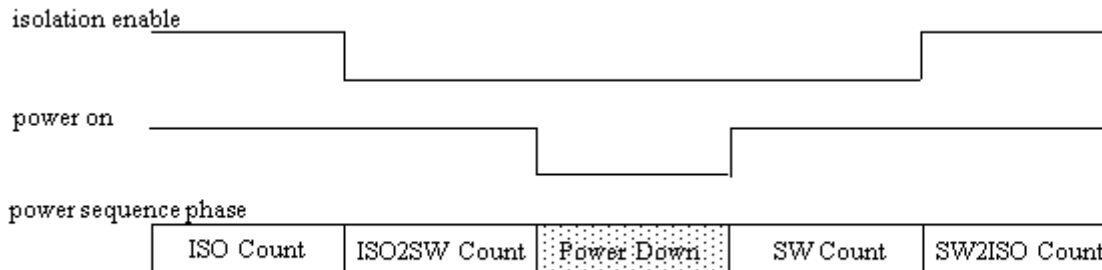

- Cortex-A9 Core Platform is sub-divided into three sub-domains listed below:
- Cortex-A9 Core Platform logic: The software state retention for all logic is implemented in this domain. That means that the content of relevant registers should be stored in some memory retaining its state (L2 cache for example) while the logic domain is power-gated. Details on how to implement the software retention can be found in the Cortex-A9 Core Platform TRM.
- GPU3D, GPU2D and VPU: These three modules can be power gated (together) independently of Cortex-A9 power gating, because it resides on a separate power domain. State retention is supported neither for GPU3D, GPU2D and VPU logic nor for their internal memories.
- ANALOG PHY IPs - PCIe and HDMI - hardware state-retention since its supplies are driven by non-gated supplies.
- SoC - hardware state-retention in Standby mode. Reverse Well Biasing is applicable for this domain.
- SNVS\_LP - hardware state-retention even when SoC supplies are removed.

### 10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

#### 10.4.1.4.3.1 Cortex-A9 Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
  - Configure the GPC/PGC PGC\_CPU\_PDNSCR Register ISO and ISO2SW bits. These bits determine the delay between the power-down request to enabling the platform isolation and the platform isolation to the actual power-off switch to the supplies accordingly.
  - Configure the GPC/PGC PGC\_CPU\_PUPSCR Register SW and SW2ISO bits. These bits determine the delay between the power-up request to the actual power-up of the supplies and the last to the platform isolation disabling.
  - Configure the GPC PGC PGC\_CPU\_CTRL PCR bit to allow the power down of the platform
  - Cortex-A9 Core Platform should execute a "WFI" instruction.

**Figure 10-8. Cortex-A9 Core Platform isolation and power on switch flow**

#### 10.4.1.4.3.2 GPU3D, GPU2D and VPU

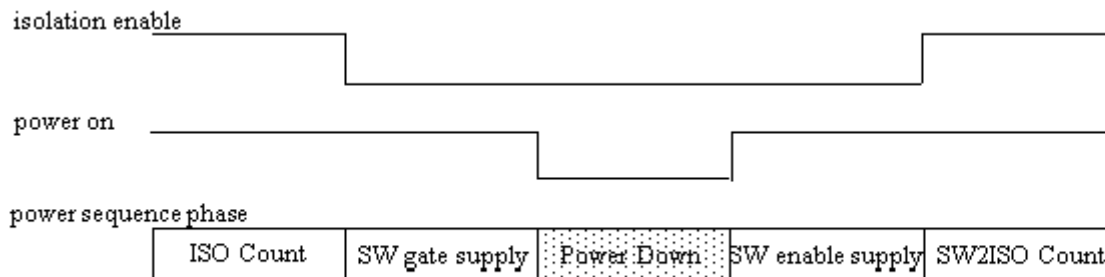

1. Configure the CCM CGR bits ([CCM Memory Map/Register Definition](#)) to disable the GPU3D, GPU2D and VPU clocks.
2. Configure the GPC/PGC Registers ([GPC Memory Map/Register Definition](#)) as follows to power-down isolate the GPU3D, GPU2D and VPU logic from the rest of the SoC logic:

Configure the GPC/PGC PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the LDO domain isolation.

Configure the GPC/PGC PUPSCR Register SW2ISO bits. These bits determine the power-up request to the LDO domain isolation disabling.

Configure the GPC/PGC CTRL[PCR] bit to allow the power down of the block.

Configure the GPC/PGC GPC\_CNTR to power down GPU3D, GPU2D and VPU

**Figure 10-9. GPUs and VPU isolation and power on switch flow**

### 10.4.1.4.3 SoC

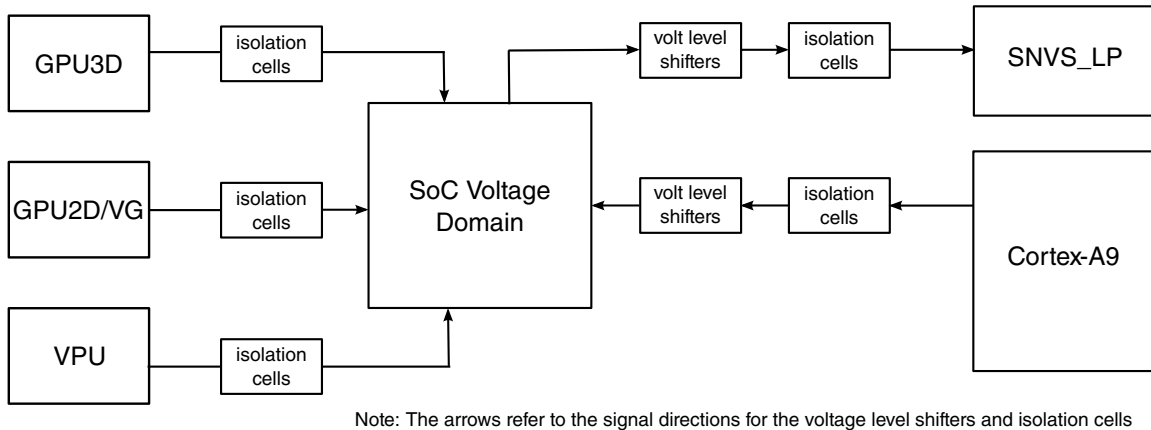

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM\_CCR[COSEC\_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24MHz XTAL for wake-up.
- Enable reverse well biasing by configuring the CCM\_CLPCR[WB\_PER\_AT\_LPM] bit ([CCM Memory Map/Register Definition](#)).
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS\_LP is powered through an "always on" supply, configuring the SNVS\_LP DP\_EN to "1" allows changing the PMIC\_ON\_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

### 10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Cortex-A9 Core Platform - Isolation needs to be enabled before power-down. This is taken care of automatically once CCM and PGC are configured and the Cortex-A9 Core Platform executes the "WFI" instruction.
- GPU3D, GPU2D and VPU - Isolation needs to be enabled before power-down. This should be taken care through software configuration of the PGC.
- SNVS\_LP - Different from the 2 cases above the SNVS\_LP isolation isolates the signals coming from the SoC to the SNVS\_LP. This is required for saving the contents of the SNVS\_LP. (such as the real-time clock) The isolation is activated in 2 ways:
  - Automatically through the power-fail detector in the PMU
  - Through software configuration

**Figure 10-10. Isolation cells and Voltage level shifters placing**

### 10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- ARM - Cortex-A9 Core Platform including L1 cache - Scalable voltage in both dynamic and static scenarios
- SoC and PU LDO Domains - Scalable voltage only in static scenarios
- ANALOG components including PCIe, LVDS and HDMI, MIPI, LVDS and PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS\_LP - Fixed voltage

### 10.4.1.6 Voltage domain management

#### 10.4.1.6.1 Dynamic

##### 10.4.1.6.1.1 DVFS

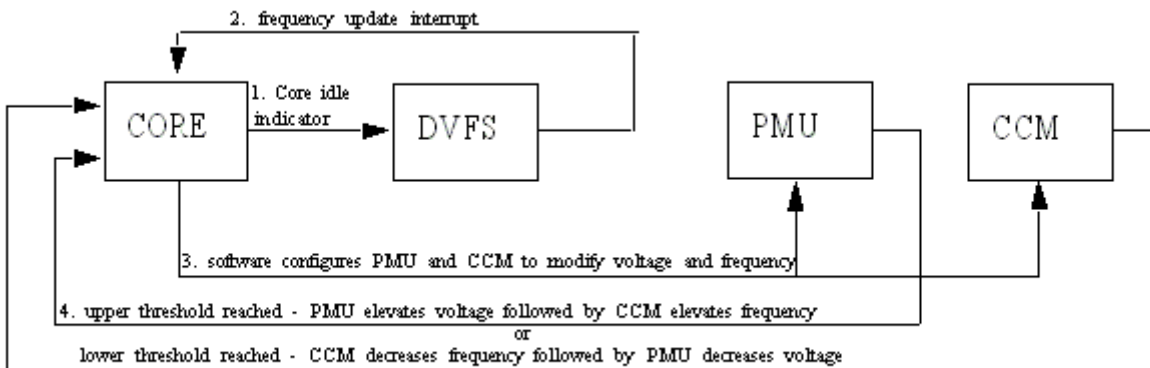

Dynamic Voltage and Frequency Scaling (DVFS) is a well-known technique to reduce power consumption in mobile devices. In order to improve power saving efficiency, DVFS is applied on the ARM core voltage domain.

In this scenario the Dynamic Voltage and Frequency Scaling (DVFS) block is used. More details can be found in [DVFS-CORE \(DVFS\)](#). The DVFS block can monitor separately the IDLE indication of each of the Cortex-A9 Cores. The DVFS performs the following:

- Simple, non-overlapping averaging providing a level-based average index of the tracked CPU load
- Sums the CPU load and the load detected from additional load indicators weighted according to software configurations
- Calculates an exponential moving average of the tracked load
- Provides up, down and "panic" threshold comparators and counters for generating interrupts to the Cortex-A9 Core Platform
- Frequency pattern generator is able to manage the frequency update requests periodically

The DVFS interrupts are then forwarded to the Cortex-A9 Core Platform. The Cortex-A9 Core Platform reacts according to the DVFS interrupt types. The following are 2 examples for handling different DVFS interrupt types:

- Upper threshold is reached, meaning that the Core is heavily loaded and the core frequency needs to be increased according to the following flow:
- Configure PMU to raise the core voltage
- Wait until the voltage is stable
- Configure CCM to raise the frequency.
- Lower threshold is reached, meaning that the Core is "IDLE" most of the time and the core frequency can be decreased according to the following flow:
- Configure CCM to reduce the frequency.
- Configure PMU to lower the core voltage.

**Figure 10-11. High Level DVFS working flow**

**NOTE**

PMU can not be used to change the voltage in case the LDO is bypassed.

### 10.4.1.6.1.2 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the ARM, SoC and PU LDOs voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

### 10.4.1.6.2 Static

#### 10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains
- Reverse well-biasing in STOP, WAIT, or Deep Sleep Mode (DSM) modes

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM\_CCR), CCM Low Power Control Register (CCM\_CLPCR) and PMU Miscellaneous Register 0 (PMU\_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage and reverse well bias to the SoC:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM\_CCR[RBC\_EN] bits to bypass and disable PMU regulators in the next ARM "WFI" execution.
- Configure CCM\_CCR[REG\_BYP\_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- Cortex-A9 Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode
- After that, the reverse well bias will be applied automatically (if enabled) with appropriate delay. Please refer to CCM\_CLPCR and CCM\_CCR Registers in CCM for further information on reverse bias enabling and counters configuration.

### 10.4.1.6.2 ANALOG PHYs IPs -

The PCIe and HDMI analog PHYs can also be configured to consume less power when they are in a non-active state. Details on how to put the IPs in low power mode can be found in each of the IP documentation. Further reduction can be achieved by settings the `ENABLE_WEAK_LINREG` in the PMU `PMU_REG_2P5` register.

### 10.4.1.6.3 Voltage domain dependencies

When applying voltage changes for power saving the following voltage domain limitations should be taken into account:

- In dynamic scenarios the SoC and PU voltage supplies should not differ
- In dynamic scenario's the ARM supply should not be higher than the SoC supply by more than 50mV.

The above limitations are also mentioned in datasheet.

### 10.4.1.6.4 IO voltage

### 10.4.1.7 System domains layout

The following table describes the different power modes.

#### NOTE

Wakeup time is the hardware perspective, and doesn't reflect the time it takes software to resume drivers and perform system operations.

**Table 10-1. Aimed power modes**

Mode	Description (Status of main power domains)	Wake-up capability	Wakeup time	Applicable use case
RUN	Power supplies are on, all clocks are on.	N/A	N/A	All
WAIT	Power supplies are on. ARM executes WFI command, Option to gate off clocks for specific modules based on programmable bits.	Based on interrupt from any module	Immediate (ARM exit WFI)	IDLE process of operating system.

*Table continues on the next page...*

Table 10-1. Aimed power modes (continued)

Mode	Description (Status of main power domains)	Wake-up capability	Wakeup time	Applicable use case
STOP	Power supplies are on. ARM executes WFI command. VPU and GPU are in power gating PLLs are off, hence all system clocks are off.	Based on interrupt from modules that can track operation with low frequency clock- like Keypad press, GPIO, Timer, CAN activity, etc.	~50us	Suspend state of operating system - system is on but is waiting for operation.
Standby	- PLLs disabled - Low voltage could be applied to ARM and SoC power inputs - Chip regulator bypass if reduce supply voltage, - Well Bias could be activated - CPU regulator disabled for power gating - PU regulator is disabled in software - xtal enabled	Same as above	~220 us	Low power standby mode with limited reaction on external events
Deep Sleep	Same as above but with OSC24M disabled	Interrupts from modules those could generate asynchronous interrupts (Keypad, GPIO, SNVS)	~1400us	
SRTC	Only SNVS domain and OSC32K keep alive	SRTC security alert / SRTC timer expire.  Based on each one of those, SRTC module will generate request to PMIC to perform POR sequence and walk-up the system. The system will go through boot process.  PMIC can also receive press on "ON" button to walk-up the system. This should be connected directly to PMIC.	~1700us to WARM boot  COLD boot, depends on boot procedure and boot device	

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the PMU\_MISC0[STOP\_MODE\_CONFIG] bit (See [PMU Memory Map/Register Definition](#)). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop\_mode signal. Blocks not described in the section below are unaffected by stop\_mode.

If the stop\_mode\_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop\_mode\_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

**Table 10-2. STOP mode configuration**

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
reg_core	bypassed if not power gated.	bypassed if not power gated
reg_pu	bypassed if not power gated.	bypassed if not power gated.
reg_soc	bypassed	bypassed
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLLs	off	off
OSC24M	off	Controlled by CCM configuration
LVDS clock I/O CLK1 and CLK2	off	off

## 10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for ARM A9) for preserving memory contents and device state in low-power modes
- Dynamic Voltage and Frequency Scaling (DVFS) support for the ARM A9 processor cluster
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

### 10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

**Table 10-3. Power saving design/architecture and power saving techniques**

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	√		
Cortex-A9 Core Platform DVFS	√		
Cortex-A9 Core Platform SRPG (Software)		√	
Cortex-A9 Core Platform Power Gating		√	
Cortex-M4 Asymmetric multicore	√	√	√
VPU and GPU3D Power Gating	√ <sup>1</sup>	√	
Clock gating (automatic dynamic and forced)	√		
Integrated PMU (IR drop, efficiency, accuracy)	√		√
C4 package (IR drop, thermal)	√		
Display Backlight optimization (IPU, SW)			√
Architecture: L2 cache, Video / Audio / Graphics acceleration	√		
Architecture: PCIe, LVDS, HDMI, USB integration			√
Low Power DDR: LPDDR2, LV-DDR3			√

1. Applicable to use cases where GPU3D and VPU operation is not required.

### 10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the ARM domain and the GPU domain, as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

### 10.4.2.3 Peripheral Power management

#### 10.4.2.3.1 Main memory power management

Main system memory, DDR3, and LPDDR2 are some of the most power-hungry system components, but the SoC provides several options to manage DDR power.

Automated power saving modes are supported by the MMDC hardware. This feature allows the DDR memory to automatically enter self-refresh mode when there are no DDR accesses for a configurable time. The default setting is 1024 clock cycles which can be optimized based on the customer use case and application.

See [Power Saving and Clock Frequency Change modes](#) for further details on MMDC power saving features and programmability options.

Software may support DDR frequency scaling. Automated frequency changing procedure is supported by MMDC and CCM modules.

#### NOTE

DDR frequency changes cost extra time and power. Slowing requestors while keeping DDR at full speed may increase total system power. Software may also implement Cooperative Dynamic Frequency Scaling in order to keep the system balanced, (that is, keep the system in balance when DDR throughput is equal or slightly higher than total amount of requests generated by all requestors).

Reducing the DDR frequency while in DLL-ON mode may be not efficient because:

- Reduction in DDR frequency will cause bus duty cycle to increase and thus reduces chance of automatic MMDC power saving (place memory into SR).
- Total amount of read/write operation does not change (power is per-operation).
- The termination is active longer, though, lowering frequency below 396 MHz may enable lowering drive strengths and termination.

When possible at lower performance use cases, software may switch DDR3 to DLL-off mode. This allows it to greatly reduce DDR3 frequency and thus disable or reduce termination and drive strength, which significantly reduces the power consumption of the DDR3 interface.

A good strategy for many types of workloads is to combine most activity in bursts (natively possible, for example, for typical multimedia applications, communication, etc.) and run this segment at maximal speed, then switch to DLL-OFF mode to support background activity (communication, display refresh, housekeeping).

The DRAM Interface power dissipation depends on many variables, however, proper termination and drive strength is key for power and thermal performance. Memory and controllers provide a host of programmable options for the drive strength of the output buffers and for the on-die termination impedance.

The ideal settings for drive strength and ODT also depend on the clock frequency to ensure that inter-symbol interference (ISI) effects are not introduced.

DDR PHY power is proportional to the amount and type of bus activity.

In cases where the DDR is placed into self-refresh, software can configure DDR I/O to be floated or lowered to the minimum drive allowed by JEDEC.

Modifying the DDR drive strength must be done by code that is executing from a memory region other than DDR (for example, IRAM). No access to DDR (including page table walks, cache misses, alternate bus master accesses, etc.) is allowed while the DDR I/O pads are being re-configured.

#### **10.4.2.3.2 Video-Graphics system power management**

#### **10.4.2.3.3 IO power reduction**

SW should configure IO to low power modes:

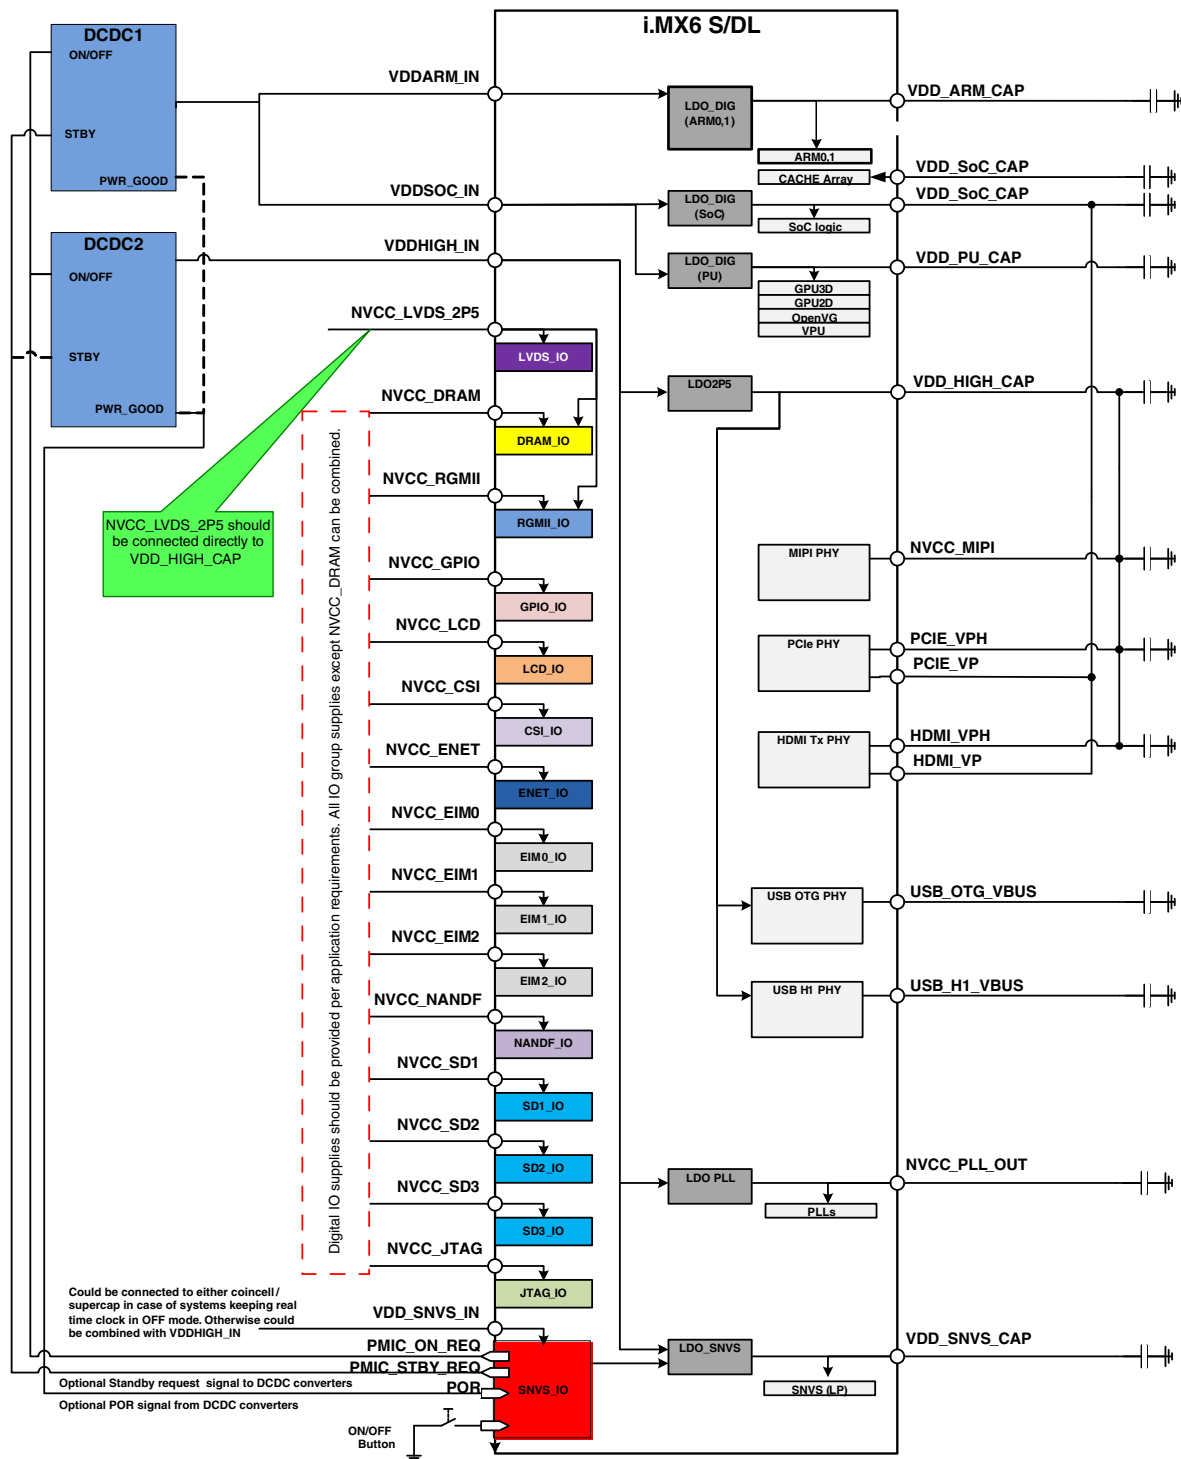

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)
- Set DDR type IO to CMOS mode if possible, specifically RGMII segment
- Disable all unused LVDS pads (ANALOG, MLB PHY, LDB)

### **10.4.3 Examples of External Power Supply Interfacing in the i.MX 6Solo/6DualLite based systems**

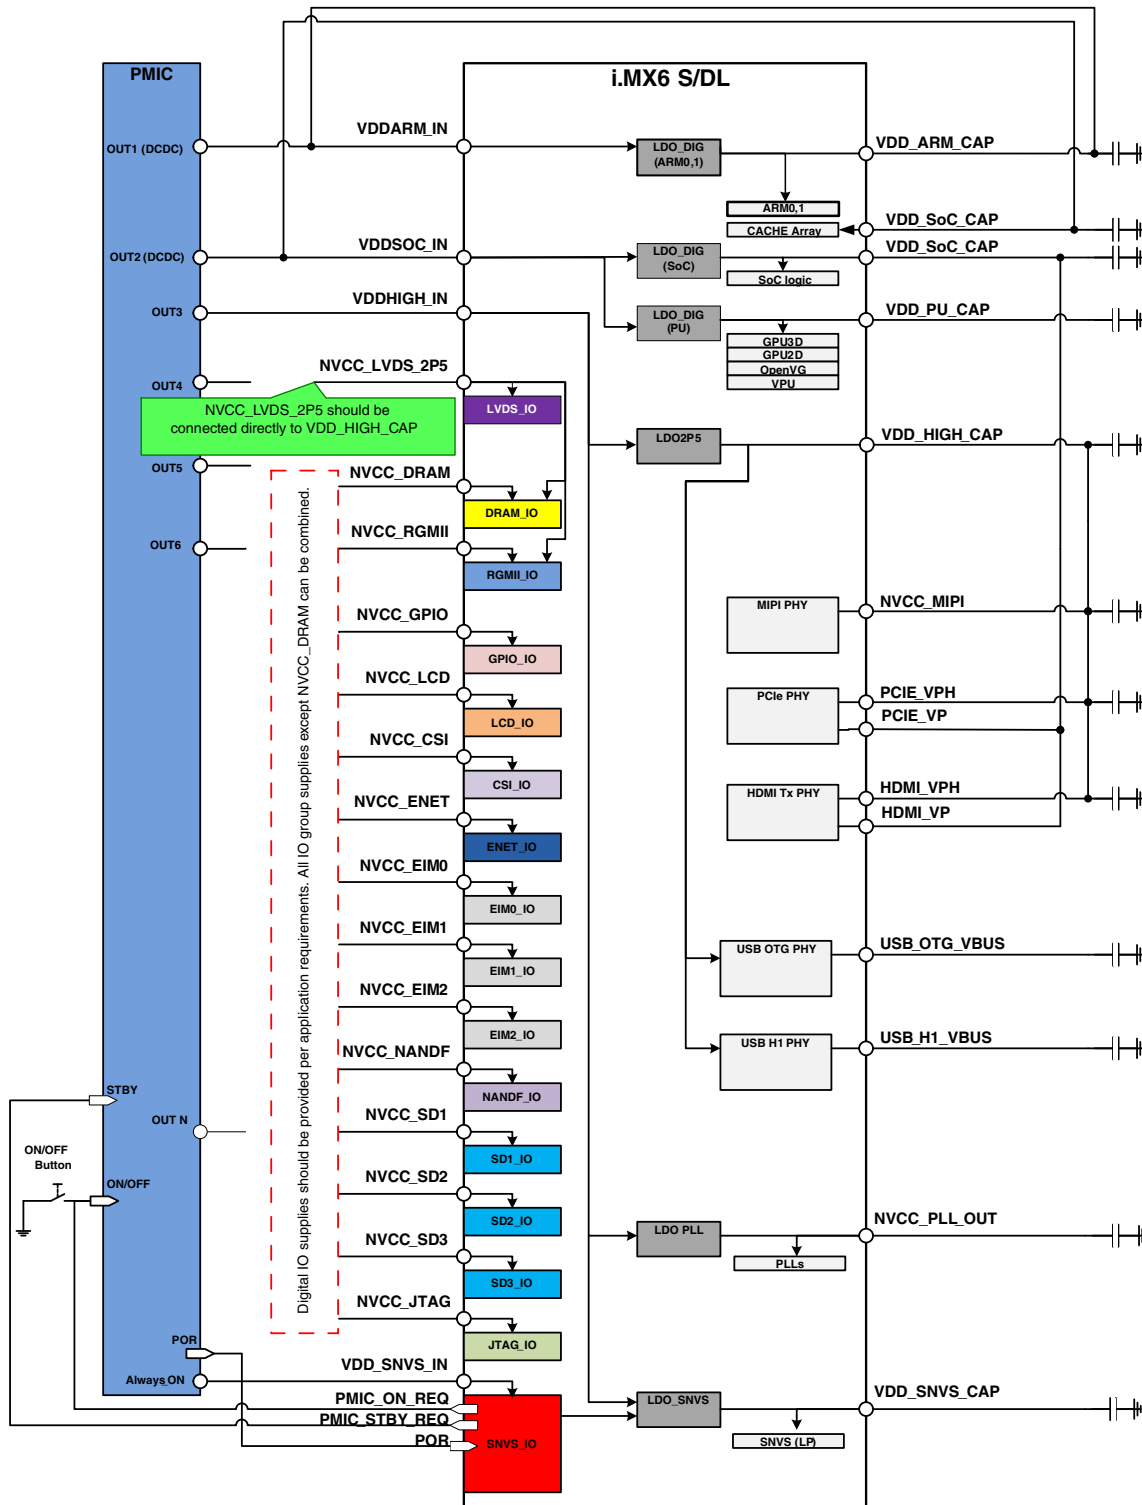

This section presents the examples of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented below. This scenario minimizes BoM and board design complexity.

The scenario based on external programmable regulators is presented below: This scenario could be used in highly power optimized systems.

## 10.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The button is used to power On and Off the SoC using an always-on (e.g., coin cell battery-backed) power domain.

- When the chip main power supply is Off, a button press greater in duration than 750 ms asserts an output signal to request power from a power IC to power up the SoC.
- When the chip main power supply is On, a button press between 750 ms and 5 seconds will send an interrupt to the core to request that software bring down the SoC safely. Software may respond to the interrupt by saving the processor state and then setting a control bit that requests to the power IC the removal of the main power supply.
- Button presses greater than 5 seconds, when the SoC is powered, results in a direct hardware power down request signal to the power IC without providing a software interrupt first. This long button press initiates a hardware-enforced mode which is applicable when software is unable to power Off the device.

The button is connected to input ONOFF and the power IC is connected the chip output PMIC\_ON\_REQ. The chip must have TEST\_MODE deasserted. An always-On supply (e.g. coin cell) is needed in the system for this feature.

# Chapter 11

## System Security

### 11.1 Overview

Security is a common requirement for platforms built using the i.MX 6Solo/6DualLite, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

For the platform designer to meet the requirements for each market, the i.MX 6Solo/6DualLite incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the i.MX 6Solo/6DualLite security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the i.MX 6Solo/6DualLite includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the i.MX 6Solo/6DualLite security components.

- Cryptographic module with AES 128/256 symmetric algorithms, random number generator entropy source and NIST-validated DRBG, cryptographic key protection, run-time integrity checking.
- High Assurance Boot (HAB) feature in the System Boot up to RSA-4096 signature verification
- Secure Non Volatile Storage (SNVS)
- TrustZone (TZ) Architecture in the ARM Cortex A7 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)

## Central Security Unit (CSU)

- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OCRAM) with TrustZone protection using OCRAM controller.
- 16 Kbyte of on-chip Secure RAM
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)
- Secure JTAG Controller (SJC)
- Locked mode in the Smart Direct Memory Access (SDMA) controller
- For DTCP (Digital Transmission Content Protection) adopters, DTCP functionality to support DTCP-MOST and DTCP-IP.
- DryICE (real-time monitors for frequency, temperature and voltage)
- 10 tamper pins with 5 active tamper detection sources support
- Hardware Cryptographic Accelerators
  - Symmetric: AES-128, AES-192, AES-256, DES, 3DES, and ARC4
  - Hash Message Digest and HMAC: SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, and MD-5
  - Public Key RSA (up to 4096 bit) and ECC (up to 1023 bit)
- DPA protection for 3DES engine
- True and Pseudo Random Number Generator

Detailed descriptions of the components are provided in the *Multimedia Applications Processor Security Reference Manual for i.MX 6Dual/6Quad and i.MX 6Solo/6DualLite*.

## 11.2 Central Security Unit (CSU)

### 11.2.1 CSU Overview

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privileges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

### 11.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus

master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

### 11.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers. These privilege values may originate in the command sequence file (CSF) which is processed by the High Assurance Boot (HAB) itself or by an HAB authenticated image which executes after the initial boot ROM phase.

#### 11.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- `csu_sec_level` for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the `csu_sec_level` signal and security operation mode is shown in the table

below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual.

**Table 11-1. Permission Access Table**

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(0) 000	RD+WR	RD+WR	RD+WR	RD+WR	8'b1111_1111
(1) 001	None	RD+WR	RD+WR	RD+WR	8'b1011_1011
(2) 010	RD	RD	RD+WR	RD+WR	8'b0011_1111
(3) 011	None	RD	RD+WR	RD+WR	8'b0011_1011
(4) 100	None	None	RD+WR	RD+WR	8'b0011_0011
(5) 101	None	None	None	RD+WR	8'b0010_0010
(6) 110	None	None	RD	RD	8'b0000_0011
(7) 111	None	None	None	None	Any other value

## 11.3 Cryptographic Acceleration and Assurance Module (CAAM)

### 11.3.1 CAAM Overview

CAAM is a cryptographic acceleration device that accelerates block encryption algorithms, stream cipher algorithms, hashing algorithms, and random number generation. It has an integral DMA engine that allows CAAM to fetch its command programs, read input data and write the resulting output.

CAAM works with the SNVS to provide platform assurance features, including support for High Assurance Boot, detection of and response to potential tamper events, and short-term and long-term protection of secret data such as public keypairs, Digital Rights Management keys and proprietary software.

CAAM provides the following features:

- Cryptographic acceleration of hashing, encryption and decryption
- Offloading of cryptographic functions via programmable command descriptor language
- Two independent queues for commands and results
- Register Bus Interface used for configuration, control and status
- DMA, including scatter/gather support for data

- Automatic short-term encryption/decryption of cryptographic keys
- Long-term protection of secret data via device-specific encryption keys
- Secure Memory for access-controlled protection of critical data, and automatic zeroization in the case of tampering
- Random Number Generation using a true random number generator and a NISTcompliant pseudo random number generator

## 11.4 Secure Non-Volatile Storage (SNVS)

### 11.4.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows CAAM use of special cryptographic keys to decrypt long-term secrets such as public/private keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential security violation, such as a tamper alert, the SNVS signals CAAM to erase sensitive data such as cryptographic keys, and sends an interrupt to alert the Operating System of the event. The SNVS also includes a general purpose real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and tamper detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key (OTPMK) stored in fuses
- Tamper detection circuits that detect JTAG events, power glitches, Master Key ECC check failure, and software-reported and hardware-reported security violations
- 256-bit Zeroizable Master Key that can be automatically erased in the event of a security breach
- Tamper-protected Secure Realtime Counter that continues running when the chip is powered off
- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt

## 11.4.2 Tamper Detection

Tamper Detection is a special mechanism provided through a chip pin to signal when the device encounters unauthorized opening or tampering.

When not in use, the Tamper Detection signal is pulled-down internally. In case of use, it should be connected to a Tamper Detection contact in a target system (Normally closed, pulled-up to the VDD\_SNVS\_IN).

An always-ON power supply (coin-cell battery) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Switches system power ON with a Tamper Detection alarm interrupt asserted (for software reaction)
- Activate security related hardware (e.g. automatic and immediate erasure of the Zeroizable Master Key and deny access and erase secure memory contents)

## 11.5 High Assurance Boot (HAB)

HAB, which is the high assurance boot feature in the system boot ROM, detects and prevents execution of unauthorized software (malware) during the boot sequence.

When unauthorized software is permitted to gain control of the boot sequence, it can be exploited for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks; or repurposing the platform.

Unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from USB connections or removable devices.

HAB protects against unauthorized software by:

- Using digital signatures to recognize authentic software. This allows the user to boot the device to a known initial state, running software signed by the device manufacturer.

## 11.6 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the ARM processor and the system bus. This allows program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary scan) testing.

SJC provides the following security levels:

- JTAG Disabled-JTAG use is permanently blocked.
- No-Debug-All security sensitive JTAG features are permanently blocked.
- Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- JTAG Enabled-JTAG use is unrestricted.

Security levels are selected via e-fuse configuration.

# Chapter 12

## ARM Cortex A9 MPCore Platform (ARM)

### 12.1 Overview

The Cortex-A9 Core Platform consists of an ARM<sup>®</sup>Cortex<sup>®</sup>-A9 MPCore processor, which includes a Neon co-processor, a private timer and watch-dog, and 32 KB + 32 KB L1 data and instruction caches per core.

The Cortex-A9 Core Platform consists of a unified 512 KB L2 cache, SCU (Snoop Control Unit), and Generic Interrupt Controller (GIC). In addition, the Cortex-A9 Core Platform includes various components composing the ARM CoreSight debug/Trace system, including PTM and a 2 / 3<sup>1</sup> x CTI, 2xCTM, and 16KB ETB.

The Cortex-A9 processor utilizes two AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

The core supports debug through real-time trace via PTM, and static debug via JTAG.

The core platform supports static debug through the debug logic to SOC. This includes the capability of real time trace via ARM's CoreSight PTM, ETB and TPIU modules. The CTI and CTM modules allow cross-triggering of internal and external trigger sources.

### 12.2 External Signals

The following table describes the external signals of ARM:

**Table 12-1. ARM External Signals**

Signal	Description	Pad	Mode	Direction
ARM_EVENTI	Input event signal	GPIO_5	ALT7	I

*Table continues on the next page...*

1. Depending on specific part: i.MX 6Solo, i.MX 6DualLite.

**Table 12-1. ARM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
ARM_EVENTO	Output event signal	CSI0_PIXCLK	ALT7	O
ARM_TRACE00	Trace signal	CSI0_VSYNC	ALT7	O
ARM_TRACE01	Trace signal	CSI0_DAT4	ALT7	O
ARM_TRACE02	Trace signal	CSI0_DAT5	ALT7	O
ARM_TRACE03	Trace signal	CSI0_DAT6	ALT7	O
ARM_TRACE04	Trace signal	CSI0_DAT7	ALT7	O
ARM_TRACE05	Trace signal	CSI0_DAT8	ALT7	O
ARM_TRACE06	Trace signal	CSI0_DAT9	ALT7	O
ARM_TRACE07	Trace signal	CSI0_DAT10	ALT7	O
ARM_TRACE08	Trace signal	CSI0_DAT11	ALT7	O
ARM_TRACE09	Trace signal	CSI0_DAT12	ALT7	O
ARM_TRACE10	Trace signal	CSI0_DAT13	ALT7	O
ARM_TRACE11	Trace signal	CSI0_DAT14	ALT7	O
ARM_TRACE12	Trace signal	CSI0_DAT15	ALT7	O
ARM_TRACE13	Trace signal	CSI0_DAT16	ALT7	O
ARM_TRACE14	Trace signal	CSI0_DAT17	ALT7	O
ARM_TRACE15	Trace signal	CSI0_DAT18	ALT7	O
ARM_TRACE_CLK	Clock signal	CSI0_DATA_EN	ALT7	O
ARM_TRACE_CTL	Control signal	CSI0_MCLK	ALT7	O

## 12.3 Platform configuration

The [Bus](#), [Cortex A9 Core](#), and [L2 Cache](#) configuration options are contained in the following subsections.

**Table 12-2. Cortex-A9 revision**

Core	MP004-BU-50000-r2p10-0rel0
Neon	AT397-BU-50001- r2p0-00rel0
PL310	PL310-BU-00000-r3p2-00rel0

## 12.3.1 Platform and SCU configuration

**Table 12-3. Cortex-A9 configuration**

Option	Selected Value	Comments
MP_MODE	Yes	Multi-Processor mode
POWER_DOMAIN_WRAPPER	No	Wrappers to support power off of individual cores.
PTM_INTERFACE_PRESENT	Yes	Use PTM as part of Trace/Debug logic.
PARITY	Yes	Using RAM arrays which support parity.
CORE_NUM	1/2 <sup>1</sup>	Number of cores
INT_NUM	128	Number of interrupts (SPIs) in GIC
ACP_PRESENT	No	Accelerator Coherency Port (ACP)
MASTER_NUM	2	Number of 64-bit AXI output master ports.

1. Depending on type of part - i.MX 6Solo, i.MXDualLite.

## 12.3.2 Core configuration

**Table 12-4. Cortex-A9 Core configuration**

Option	Selected Value	Comments
DCACHESIZE	32	L1 Data cache size
ICACHESIZE	32	L1 Instruction cache size
TLBSIZE	128	
JAZELLE_PRESENT	Yes	Providing ARM's Jazelle technology hardware extensions.
FPU_PRESENT	No	The FPU functions are provided by NEON, thus additional FPU cannot be used.
NEON_PRESENT	Yes	Use MPE, NEON Co-Processor and FPU
PRELOAD_ENGINE_PRESENT	No	May only be beneficial in Video processing.

## 12.3.3 PL310 L2 Cache configuration

**Table 12-5. PL310 L2 Cache configuration**

Option	Selected Value	Comments
Cache way size	64 KB	(For total of 512 KB L2 size)
Number of cache ways	16	Performance enhancement versus 8 ways
RAM latencies	4 <sup>1</sup>	
Data RAM banking	Yes	Significantly improves cache throughput

*Table continues on the next page...*

**Table 12-5. PL310 L2 Cache configuration (continued)**

Option	Selected Value	Comments
Slave port 1 present	Yes	
Master port 1 present	Yes	
Parity logic	Yes	For military / surveillance applications, and side ease the process of identify memory related issues.
Lockdown by master	Yes	Increase L2 optimization
Lockdown by line	Yes	Increase L2 optimization
AXI ID width	5	
Address filtering	No	Help in timing closure, not required for symmetric AXI bus connectivity scheme.
Speculative read	Yes	Performance boost, when used with CortexA9.
Size of L2 cache	512 KB	Size is implied by Cache-Size times cache-ways (i.e. 512 KB)

1. Preliminary estimate, final value TBD.

### 12.3.4 Endian Modes

The Cortex-A9 Core Platform supports little endian mode only. Big Endian is not supported even though both modes are supported by the Cortex-A9 processor.

### 12.3.5 Memory Parity error support

The i.MX 6Solo/6DualLite ARM Cortex A9 MPCore™ platform supports Parity Fail signals for several of the RAM arrays.

Parity fail indication is provided by "PARITYFAILn[7:0]" and "PARITYFAILSCU[N:0]" buses for system notification. On parity error event, these signals will be ORed together to provide a single event (interrupt) to the core, in case of any parity fail event.

## 12.4 Performance and Power

This section will discuss the operational conditions and performance goals for the Cortex-A9 Core Platform.

### 12.4.1 Low-Power design

The Cortex-A9 Core Platform low-power design is based on these characteristics:

- Symmetric processing and ARM design by using the same clock frequency on cores
- Low leakage of LP process
- C4 package

As a result, the proposed power modes and power management scheme is as follows:

- The same voltage level must be used for the logic part of the whole platform.
- Separate voltage for memories array is required to allow DVFS.
- On-chip power switches are not utilized by gating the power of the platform directly from the regulator.

### 12.4.1.1 SRPG (State Retention Power Gating)

ARM core SRPG is implemented by software save & restore of essential configuration registers prior to the complete power-down of the entire ARM platform.

Save & restore utilizes "Dormant mode" for the primary core (L1 cache flushed, L2 preserved), and power down mode of all other cores, as follows:

Power Down flow<sup>2</sup>

- Power down request
- Save cores' essential registers and platform registers to L2/DDR memory by Dormant mode routines.
- Perform L1 cache clean operation on all cores
- Enter WFI state
- Power Gating of all cores' and platform logic

Power Up flow<sup>2</sup>

- Power up request to GPC external controller (interrupt)
- Supply power
- Reset
- Restore registers of platform and cores from memory by Dormant mode routines.

### 12.4.1.2 Dynamic Voltage and Frequency Scaling (DVFS)

The Cortex-A9 Core Platform has been designed, in conjunction with external control logic and software, to support dynamic scaling of voltage and frequency.

---

2. Dormant mode implementation information, provided by ARM, is preliminary.

## 12.4.2 Clocks, frequency goals

### 12.4.2.1 ARM Clock

For ARM clock please see the product data sheet.

### 12.4.2.2 Bus Clocks

The AXI master ports are designed to run at half the frequency of the Cortex A9 core clock.

The on-platform debug components clock is asynchronous to the ARM core clock.

### 12.4.2.3 Debug Clocks

The ARM platform contains several debug components.

Their clock frequencies are as follows:

- Trace buffer (ETB) clock - 133 MHz
- Trace port (TPIU) clock - 133 MHz
- AHB clock - 133 MHz

## 12.5 Core Platform Sub-Blocks details

### 12.5.1 ARM Cortex A9 MPCore™ Processor

The information presented in this section focuses on design aspects of the ARM Cortex A9 MPCore™ in the AP subsystem.

The ARM Cortex A9 is a high-performance, low-power, synthesisable processor with an L1 cache subsystem that provides full virtual memory capabilities. The Cortex A9 processor implements the ARMv7-A architecture and runs 32-bit ARM instructions, 16-bit and 32-bit Thumb2 instructions, and 8-bit Java™ byte-codes in Jazelle state.

The ARM Cortex A9 MPCore™ processor in the chip consists of:

- Two (2) Cortex A9 processors in a cluster and a Snoop Control Unit (SCU) that can be used to ensure coherency within the cluster.

- A set of private memory-mapped peripherals, including a global timer and a watchdog and private timer for each Cortex-A9 processor present in the cluster.
- An integrated Interrupt Controller is an implementation of the Generic Interrupt Controller architecture. The integrated Interrupt Controller registers sit beside the timers and watchdog control registers in the private memory region of the Cortex-A9 MPCore.

Individual Cortex-A9 processors in the Cortex-A9 MPCore cluster are symmetrically implemented with hardware configurations as specified in [Platform configuration](#).

## 12.5.2 Media Processing Engine (MPE - NEON)

The Media Processing Engine (MPE) implements ARM NEON technology, a media and signal processing architecture that adds instructions targeted at audio, video, 3-D graphics, image, and speech processing.

Advanced SIMD instructions are available in both ARM and Thumb states. The MPE also implements a VFPv3-D32 Floating-Point Unit.

The ARM Cortex A9 MPCore™ Platform includes MPE per core.

## 12.5.3 Generic Interrupt Controller (GIC)

The Cortex-A9 MPCore contains an integrated interrupt controller that shares the same programmer's model as the PL390 (GIC), although there are implementation-specific differences.

### 12.5.3.1 Interrupt Controller Features

- 128 interrupt sources
- The Cortex-A9 multiprocessor contains the following types of interrupts:
  - Up to 16 Software Generated Interrupts (SGIs)
  - Private Peripheral Interrupt (PPI) - an interrupt generated by a peripheral that is specific to a single Cortex-A9 processor (there are 5 PPIs for each Cortex-A9 processor interface)

- Shared Peripheral Interrupt (SPI) - an interrupt generated by a peripheral which the Interrupt Controller can route to any or all Cortex-A9 processor interfaces. The Interrupt Controller supports a maximum of 224 SPIs .
- Lockable Shared Peripheral Interrupts (LSPI) - there are 31 LSPIs, interrupts 32-62. The user can configure and then lock these interrupts against further change using CFGSDISABLE. The LSPIs are present only if the SPIs are present.

For more information, see ARM MPCORE Technical Reference Manual.

### **12.5.3.2 About the Interrupt Controller**

The Interrupt Controller is a single functional unit that is located in a Cortex-A9 multiprocessor design.

The Interrupt Controller is memory-mapped. The Cortex-A9 processors access it by using a private interface through the SCU.

### **12.5.3.3 Interrupt Controller Clock frequency**

The interrupt controller's clock period is 2x multiple of the main clock period.

The watchdogs and timers use the same clock as the interrupt controller.

### **12.5.3.4 TrustZone support**

The Interrupt Controller permits all implemented interrupts to be individually defined as Secure or Non-secure.

The user can program Secure interrupts to use either the IRQ or FIQ interrupt mechanism of a Cortex-A9 processor through the FIQen bit in the ICPICR Register.

Non-secure interrupts are always signalled using the IRQ mechanism of a Cortex-A9 processor.

## **12.5.4 Instruction and data caches (L1)**

The Cortex-A9 processor is configured with a 32 Kbyte Instruction Cache and a 32 Kbyte Data Cache.

### 12.5.4.1 L1 features

- Four-way set associative cache
- Virtually indexed and physically addressed
- Capable of providing two words per cycle for all requesting sources
- Eight 32-bit words per cache line
- 128 indexes per tag RAM

### 12.5.5 L2 Cache and controller (PL310)

The platform includes unified (data / instruction) L2 cache unit, based on the cache controller IP by ARM.

The Cortex-A9 processor utilizes 2x AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

See [Table 12-5](#) for more information.

## 12.6 Debug and Trace Sub-blocks (CoreSight components)

This section gives a brief overview of the modules that are implemented within the Cortex-A9 Core Platform.

The Cortex-A9 Core Platform debug blocks are part of the overall CoreSight debug system which include the 16KB ETB, 2 x CTM's, 2 / 3<sup>3</sup> x CTI's, ATB replicator, DAP, TPIU and APB address decode.

The CoreSight™ compatible Program Flow Trace Macrocell (PTM) provides control for ARM software tracing and debug. The Cross Trigger Interface (CTI) is included in the Cortex-A9 platform to provide a common programming model for use by the debug tools, control the trigger sources, and interface to the Cross Trigger Matrix (CTM). The debug is controlled via an ARM Debug Access Port (DAP).

For details of the full CoreSight debug subsystem, see the [System Debug](#) chapter.

---

3. Depending on specific part: i.MX 6Solo, i.MX 6DualLite.

## 12.6.1 Debug Access Port (DAP)

The Debug Access Port (DAP) is an implementation of an ARM Debug Interface version 5.1 (ADIV5.1) comprised of a number of components supplied in a single configuration.

All the supplied components fit into the various architectural components for Debug Ports (DPs), which are used to access the DAP from an external debugger and Access Ports (APs), to access on-chip system resources.

The debug port and access ports together are referred to as the DAP. The DAP provides real-time access for the debugger without halting the processor to:

- AMBA system memory and peripheral registers
- All debug configuration registers

The DAP also provides debugger access to JTAG scan chains of system components, (to non-CoreSight compliant processors, for example).

## 12.6.2 Program Trace Macrocell (PTM)

The PTM unit is a nonintrusive trace macrocell that filters and compresses instruction trace for use in system debugging and system profiling.

The PTM unit has an external interface outside of the processor called the *Advanced Trace Bus* (ATB) interface. The PTM is an evolution of the ETM, designed for the Cortex A9 cores, handling program trace only.

The Cortex A9 PTM provides real time instruction trace for the Cortex A9. It's designed to be used with the CoreSight Design Kit.

Real time tracing is controlled by specifying a set of filtering and triggering resources which include address and data comparators, counters and sequencers.

Two main schemes can be used for connecting PTMs:

1. Single PTM - shared by all cores and resources.
2. Nx PTMs, where N is numbers of cores in the system.

### 12.6.2.1 Program Flow Trace (PFT)

The CoreSight Program Flow Trace Macrocell (PTM) is based on the Program Flow Trace (PFT) architecture. The PTM generates information that trace tools use to reconstruct the execution of all or part of a program.

The PFT architecture assumes the trace tools can access a copy of the code being traced. For this reason, the PTM generates trace only at certain points in program execution, called waypoints. This reduces the amount of trace data generated by the PTM compared to the ETM protocol. Waypoints are changes in the program flow or events, such as an exception. The trace tools use waypoints to follow the flow of program execution.

For full reconstruction of the program flow, the PTM traces:

- Indirect branches, with target address and condition code
- Direct branches with only the condition code
- Instruction barrier instructions
- Exceptions, with indication of where the exception occurred
- Changes in processor instruction set state
- Changes in processor security state
- Context-ID changes
- Entry to and return from Debug state when Halting Debug-mode is enabled

You can also configure the PTM to trace:

- Cycle count between traced waypoints
- Global system timestamps
- Target addresses for taken direct branches

PTM components include the following main components:

- Processor Interface to monitor the behavior of the processor.
- Trace Generation to create a real-time trace stream.
- Filtering and Triggering Resources used to affect when trace is generated and to control the capturing of trace by the trace tools.
- Main FIFO (72 bytes) flattens out any bursts in the trace stream, and signals an overflow in the trace when it becomes full, halting trace generation until the FIFO empties.
- ATB interface for PTM output.
- APB interface to access the PTM registers.

### 12.6.3 Cross Trigger Interface (CTI)

This block controls the Trigger Interface (TI). The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events.

When the CTI receives a channel event, it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the TI. Each CTI has 3/5 trigger inputs.

See [System Debug](#) for more information on the CTI.

## 12.6.4 Embedded Trace Buffer (ETB)

The ETB provides on-chip storage of trace data using 32-bit, 16KB RAM.

The ETB accepts trace data from the Cortex-A9 via an ATB port (passing through a replicator in between). Providing an on-chip buffer alleviates the pin count, bandwidth, and pad design requirements associated with sending trace data to a debugger directly through package pins in near real-time.

Features:

- compiled memory for the trace buffer and can be used as general purpose memory
- AMBA Peripheral Bus programming interface for configuration and memory access

### 12.6.4.1 AMBA Trace Bus (ATB) Replicator

The ATB Replicator enables two trace sinks (ETB and an off platform port generally connected to a Trace Port Interface Unit-TPIU) to be wired together and receive ATB trace data from the same trace source (PTM).

There are no programmable registers. It takes incoming trace data from a single source (PTM) and replicates it as multiple masters.

# Chapter 13

## AHB to IP Bridge (AIPSTZ)

### 13.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). This particular peripheral is designed as the bridge between AHB bus and peripherals with the lower bandwidth IP Slave (IPS) buses.

#### 13.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

## 13.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 13-1. AIPSTZ Clocks**

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

## 13.3 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

Each bridge that connects to the IPS (or peripherals) are referred as AIPS. The chip has three separate AIPS modules, and peripherals are grouped and assigned under each AIPS block. The list of peripherals are indicated as n-1, n-2, and n-3 for AIPS-1, AIPS-2, and AIPS-3 respectively.

AIPS occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16-Kbyte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16-Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to [AIPSTZ Memory Map/Register Definition](#) for more information.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

## 13.4 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

## 13.5 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

## 13.6 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ\_MPRs), the Peripheral Access Control registers (AIPSTZ\_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ\_OPACRs) described in [AIPSTZ Memory Map/Register Definition](#).

### 13.6.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

**Table 13-2. Peripheral Access Configuration options**

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (sec\_config\_X) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of [Table 13-2](#). If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

sec\_config\_0 [7:0] = 8'b0011\_0011

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

**Table 13-3. Security Levels**

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your Freescale representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line `csu\_sec\_level[2:0]' corresponding to each peripheral X.

## 13.7 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

## AIPSTZ memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
207_C000	Master Priviledge Registers (AIPSTZ1_MPR)	32	R/W	7700_0000h	13.7.1/552
207_C040	Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR)	32	R/W	4444_4444h	13.7.2/554
207_C044	Off-Platform Peripheral Access Control Registers (AIPSTZ1_OPACR1)	32	R/W	4444_4444h	13.7.3/558

217_C04C	Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR3)	32	R/W	4444_4444h	13.7.5/564
217_C050	Off-Platform Peripheral Access Control Registers (AIPSTZ2_OPACR4)	32	R/W	4444_4444h	13.7.6/567

### 13.7.1 Master Priviledge Registers (AIPSTZx\_MPR)

Each AIPSTZ\_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in [Table 13-6](#)

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in [Table 13-7](#).

**Table 13-16. MPROT Field**

Bit	Field	Description
3	MBW	<b>Master Buffer Writes</b> - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	<b>Master Trusted for Reads</b> - This bit determines whether the master is trusted for read accesses.
1	MTW	<b>Master Trusted for Writes</b> - This bit determines whether the master is trusted for write accesses.

*Table continues on the next page...*

**Table 13-16. MPROT Field (continued)**

Bit	Field	Description
0	MPL	<b>Master Privilege Level</b> - This bit determines how the privilege level of the master is determined.

**NOTE**

The reset value is set to 0000\_0000\_7700\_0000, which makes master 0 and master 1 (ARM CORE) the trusted masters. Trusted software can change the settings after reset.

**Table 13-17. Master Index Allocation**

Master Index	Master Name	Comments
Master 0	All masters excluding ARM core, SDMA and CAAM	Share the same number allocation.
Master 1	ARM CORE	
Master 2	CAAM	
Master 3	SDMA	
Master 4-15	Reserved	

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 13.7.2 Off-Platform Peripheral Access Control Registers (AIPSTZx\_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ\_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ\_OPACR has the following format shown in [Table 13-9](#)

Table 13-19. OPAC Field

Bit	Field	Description
3	BW	<b>Buffer Writes</b> - This bit determines whether write accesses to this peripheral are allowed to be buffered. <sup>1</sup>
2	SP	<b>Supervisor Protect</b> - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	<b>Write Protect</b> - This bit determines whether the peripheral allows write accesses.
0	TP	<b>Trusted Protect</b> - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

## Chapter 14

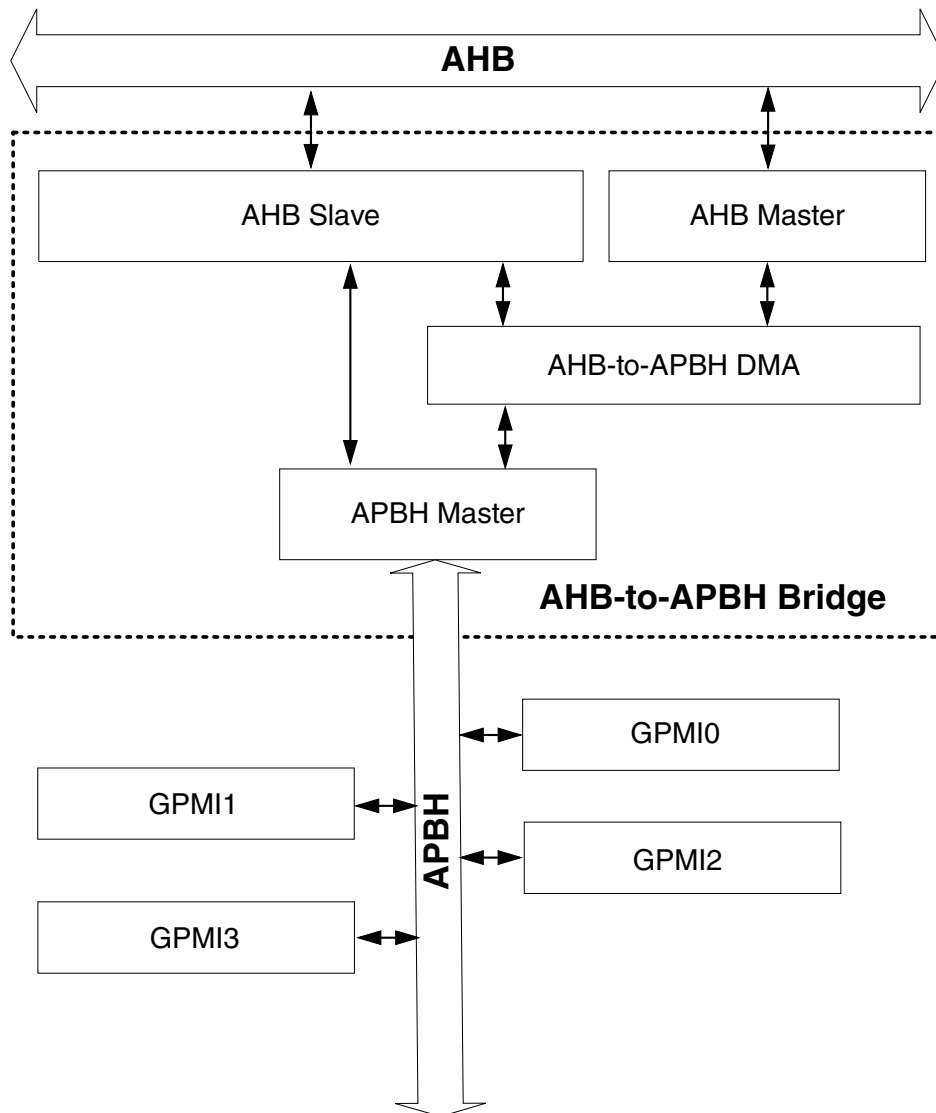

# AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)

### 14.1 Overview

The AHB-to-APBH bridge provides the i.MX 6Solo/6DualLite with an inexpensive peripheral attachment bus running on the AHB's HCLK.

(The H in APBH denotes that the APBH is synchronous to HCLK.)

As shown in the figure below, the AHB-to-APBH bridge includes the AHB-to-APB PIO bridge for a memory-mapped I/O to the APB devices, as well as a central DMA facility for devices on this bus and a vectored interrupt controller for the ARM core. Each one of the APB peripherals, including the vectored interrupt controller, is documented in their respective chapters.

**Figure 14-1. AHB-to-APBH Bridge DMA Block Diagram**

There is no separate DMA bus for these devices. Contention between the DMA's use of the APBH bus and the AHB-to-APB bridge functions' use of the APBH is mediated by an internal arbitration logic. For contention between these two units, the DMA is favored and the AHB slave will report "not ready" through its HREADY output until the bridge transfer can complete. The arbiter tracks repeated lockouts and inverts the priority, guaranteeing the ARM platform every fourth transfer on the APB.

## 14.2 Clocks

The table found here describes the clock sources for APBH.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 14-1. APBH Clocks**

Clock name	Clock Root	Description
hclk	usdhc3_clk_root	Module clock

## 14.3 APBH DMA

The DMA supports four channels of DMA services, as shown in the following table. The shared DMA resource allows each independent channel to follow a simple chained command list.

Command chains are built up using the general structure, as shown in [Figure 14-2](#).

**Table 14-2. APBH DMA channel assignments**

APBH DMA Channel #	Usage
0	GPMI0
1	GPMI1
2	GPMI2
3	GPMI3

A single command structure or channel command word specifies a number of operations to be performed by the DMA in support of a given device. Thus, the ARM platform can set up large units of work, chaining together many DMA channel command words, pass them off to the DMA, and have no further concern for the device until the DMA completion interrupt occurs. The goal is to have enough intelligence in the DMA and the devices to keep the interrupt frequency from any device below 1 KHz (arrival intervals longer than 1 ms).

A single command structure can issue 32-bit PIO write operations to key registers in the associated device using the same APB bus and controls that it uses to write DMA data bytes to the device. For example, this allows a chain of operations to be issued to the GPMI controller to send NAND command bytes, address bytes, and data transfers where the command and the address structure is completely under software control, but the administration of that transfer is handled autonomously by the DMA. Each DMA structure can have 0–15 PIO words appended to it. The CMDPIOWORDS field, if non-zero, instructs the DMA engine to copy these words to the APB, beginning at the first register address offset for the peripheral and incrementing the register offset each cycle.

The DMA master generates only normal read/write transfers to the APBH. It does *not* generate set, clear, or toggle (SCT) transfers.

After any requested PIO words have been transferred to the peripheral, the DMA examines the two-bit command field in the channel command structure. [Table 14-3](#) shows the four commands implemented by the DMA.

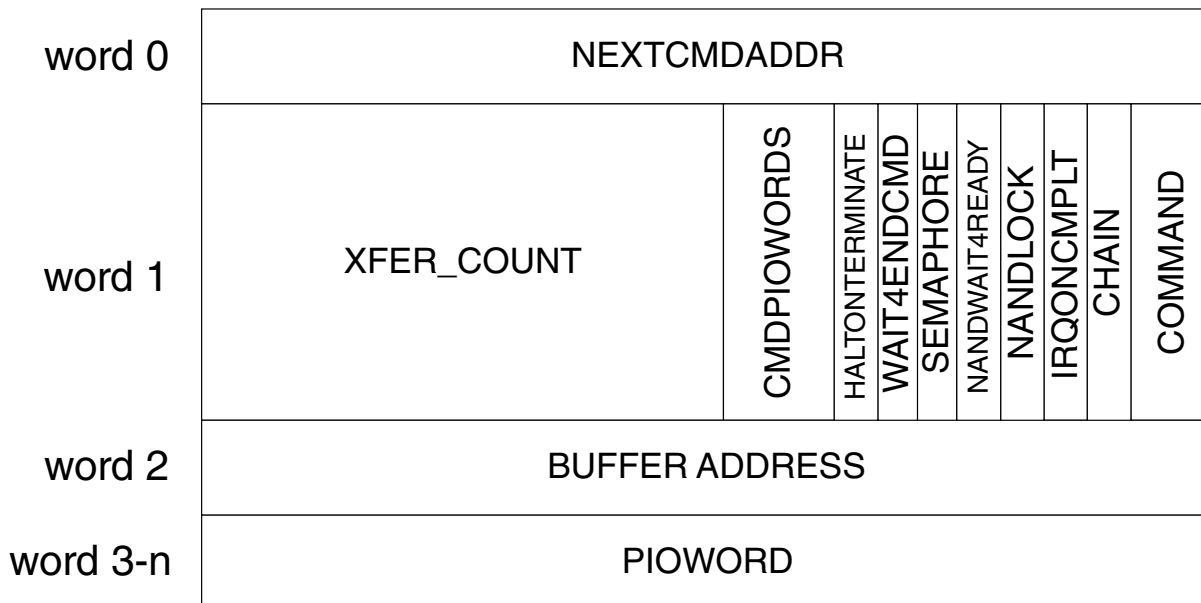

Figure 14-2. AHB-to-APBH Bridge DMA channel command structure

Table 14-3. APBH DMA commands

DMA Command	Usage
00	NO_DMA_XFER. Perform any requested PIO word transfers, but terminate the command before any DMA transfer.
01	DMA_WRITE. Perform any requested PIO word transfers, then perform a DMA transfer from the peripheral for the specified number of bytes.
10	DMA_READ. Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes.
11	DMA_SENSE. Perform any requested PIO word transfers, then perform a conditional branch to the next chained device. Follow the NEXTCMD_ADDR pointer if the peripheral sense is false. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is true. This command becomes a no-operation for any channel other than a GPMI channel.

DMA\_WRITE operations copy data bytes to the system memory (on-chip RAM or SDRAM) from the associated peripheral.

DMA\_READ operations copy data bytes to the APB peripheral from the system memory. The DMA engine contains a shared byte aligner that aligns bytes from system memory to or from the peripherals. Peripherals always assume little-endian-aligned data arrives or

departs on their 32-bit APB. The DMA\_READ transfer uses the BUFFER\_ADDRESS word in the command structure to point to the DMA data buffer to be read by the DMA\_READ command.

The NO\_DMA\_XFER command is used to write PIO words to a device without performing any DMA data byte transfers. This command is useful in such applications as activating the NAND devices CHECKSTATUS operation. The check status command reads a status byte from the NAND device, performs an XOR and MASK against an expected value supplied as part of the PIO transfer. Once the read check completes (see [NAND Read Status Polling Example](#)), the NO\_DMA\_XFER command completes. The result in the peripheral is that its sense line is driven by the results of the comparison. The sense flip-flop is only updated by CHECKSTATUS for the device that is executed. At some future point, the chain contains a DMA command structure with the fourth and final command value, that is, the DMA\_SENSE command.

As each DMA command completes, it triggers the DMA to load the next DMA command structure in the chain. The normal flow list of DMA commands is found by following the NEXTCMD\_ADDR pointer in the DMA command structure. The DMA\_SENSE command uses the DMA buffer pointer word of the command structure to point to an alternate DMA command structure chain or list. The DMA\_SENSE command examines the sense line of the associated peripheral. If the sense line is false, then the DMA follows the standard list found whose next command is found from the pointer in the NEXTCMD\_ADDR word of the command structure. If the sense line is true, then the DMA follows the alternate list whose next command is found from the pointer in the DMA Buffer Pointer word of the DMA\_SENSE command structure (see [Figure 14-2](#)). The sense command ignores the CHAIN bit, so that both pointers must be valid when the DMA comes to a sense command.

If the wait-for-end-command bit (WAIT4ENDCMD) is set in a command structure, the DMA channel waits for the device to signal completion of a command by toggling the endcmd signal before proceeding to load and execute the next command structure. Then, if DECREMENT\_SEMAPHORE is set, the semaphore is decremented after the end command is seen.

A detailed bit-field view of the DMA command structure is shown in the following table, which shows a field that specifies the number of bytes to be transferred by this DMA command. The transfer-count mechanism is duplicated in the associated peripheral, either as an implied or as a specified count in the peripheral.

**Table 14-4. DMA channel command word in system memory**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
NEXT_COMMAND_ADDRESS																															

*Table continues on the next page...*

**Table 14-4. DMA channel command word in system memory (continued)**

Number DMA Bytes to Transfer	Number PIO Words to Write					HALTONTERMINATE	WAIT4ENDCMD	DECREMENT SEMAPHORE	NANDWAIT4READY	NANDLOCK	IRQ_COMPLETE	CHAIN	COMMAND
DMA Buffer or Alternate CCW													
Zero or More PIO Words to Write to the Associated Peripheral Starting at its Base Address on the APBH Bus													

Figure 14-2 also shows the CHAIN bit in bit 2 of the second word of the command structure. This bit is set to 1, if the NEXT\_COMMAND\_ADDRESS contains a pointer to another DMA command structure. If a null pointer (0) is loaded into the NEXT\_COMMAND\_ADDRESS, it is not detected by the DMA hardware. Only the CHAIN bit indicates whether a valid list exists beyond the current structure.

If the IRQ\_COMPLETE bit is set in the command structure, then the last act of the DMA before loading the next command is to set the interrupt-status bit corresponding to the current channel. The sticky interrupt request bit in the DMA CSR remains set until cleared by the software. It can be used to interrupt the ARM platform.

The NAND\_LOCK bit is monitored by the DMA channel arbiter. succeeds in the arbiter with its NAND\_LOCK bit set, then the arbiter ignores the other NAND channels until a command is completed in which the NAND\_LOCK is not set. Notice that the semantic here is that the NAND\_LOCK state is to limit scheduling of a non-locked DMA. A DMA channel can go from unlocked to locked in the arbiter at the beginning of a command when the NAND\_LOCK bit is set. When the last DMA command of an atomic sequence is completed, the lock should be removed. To accomplish this, the last command does not have the NAND\_LOCK bit. It is still locked in the atomic state within the arbiter when the command starts, so that it is the only NAND command that can be executed. At the end, it drops from the atomic state within the arbiter.

The NAND\_WAIT4READY bit also has a special use for GPMI channels (from channel to channel), i.e., the NAND device channels. The GPMI peripheral supplies a sample of the ready line from the NAND device. This ready value is used to hold off of a command with this bit set until the ready line is asserted to 1. Once the arbiter sees a command with a wait-for-ready set, it holds off that channel until ready is asserted.

Receiving an IRQ for HALTONTERMINATE (HOT) is a feature in the APBH DMA descriptor that allows GPMI to signal to the DMA engine that an error has occurred. If a command is stalled due to an error, a HOT signal is sent from the peripheral to the DMA engine and causes an IRQ after terminating the DMA descriptor being executed.

Therefore, it is recommended that software use this signal as follows:

- Always set HALTONTERMINATE to 1 in a DMA descriptor. That way, if a peripheral signals HOT, the transfer will end, leaving the peripheral block and the DMA engine synchronized (but at the end of a command).
- When an IRQ from an APBH channel is received, and the IRQ is determined to be due to an error (as opposed to an IRQONCOMPLETE interrupt) the software should:
  - Reset the channel.
  - Determine the error from error reporting in the peripheral block, then manage the error in the peripheral that is attached to that channel in whatever appropriate way exists for that device (software recovery, device reset, block reset, etc).

Each channel has an eight-bit counting semaphore that controls whether it is in the idle state. When the semaphore is non-zero, the channel is ready to run, process commands and perform DMA transfers. Whenever a command finishes its DMA transfer, it checks the DECREMENT\_SEMAPHORE bit. If set, it decrements the counting semaphore. If the semaphore goes to 0 as a result, then the channel enters the idle state and remains there until the semaphore is incremented by the software. When the semaphore goes to non-zero and the channel is in its idle state, then it uses the value in the APBH\_CHn\_NXTCMDAR register (next command address register) to fetch a pointer to the next command to process.

### NOTE

This is a double indirect case. This method allows the software to append to a running command list under the protection of the counting semaphore.

To start processing the first time, software creates the command list to be processed. It writes the address of the first command into the APBH\_CHn\_NXTCMDAR register, and then writes 1 to the counting semaphore in APBH\_CHn\_SEMA. The DMA channel loads APBH\_CHn\_CURCMDAR register and then enters the normal state machine processing for the next command. When the software writes a value to the counting semaphore, it is added to the semaphore count by hardware, protecting the case where both hardware and software are trying to change the semaphore on the same clock edge.

Software can examine the value of APBH\_CHn\_CURCMDAR at any time to determine the location of the command structure currently being processed.

## 14.4 NAND Read Status Polling Example

The following figure shows a more complicated scenario.

This subset of a NAND device workload shows that the first two command structures are used during the data-write phase of an NAND device write operation (CLE and ALE transfers omitted for clarity).

- After writing the data, one must wait until the NAND device status register indicates that the write charge has been transferred. This is built into the workload using a check status command in the NAND in a loop created from the next two DMA command structures.
- The NO\_DMA\_TRANSFER command is shown here performing the read check, followed by a DMA\_SENSE command to branch the DMA command structure list, based on the status of a bit in the external NAND device.

**Figure 14-3. AHB-to-APBH Bridge DMA NAND Read Status Polling with DMA Sense Command**

The example in the above figure shows the workload continuing immediately to the next NAND page transfer. However, one could perform a second sense operation to see if an error has occurred after the write. One could then point the sense command alternate branch at a NO\_DMA\_XFER command with the interrupt bit set. If the CHAIN bit is not

set on this failure branch, then the ARM platform is interrupted immediately, and the channel process is also immediately terminated in the presence of a workload-detected NAND error bit.

Note that each word of the three-word DMA command structure corresponds to a PIO register of the DMA that is accessible on the APBH bus. Normally, the DMA copies the next command structure onto these registers for processing at the start of each command by following the value of the pointer previously loaded into the NEXTCMD\_ADDR register.

To start DMA processing for the first command, initialize the PIO registers of the desired channel, as follows:

- First, load the next command address register with a pointer to the first command to be loaded.
- Then, write 1 to the counting semaphore register. This causes the DMA to schedule the targeted channel for the DMA command structure load, just as if it had finished its previous command.

## 14.5 APBH Memory Map/Register Definition

### APBH Hardware Register Format Summary

**APBH memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 14.5.1 AHB to APBH Bridge Control and Status Register 0 (APBH\_CTRL0n)

The APBH CTRL 0 provides overall control of the AHB to APBH bridge and DMA.

This register contains module softreset, clock gating, channel clock gating/freeze bits.

Address: 11\_0000h base + 0h offset + (4d × i), where i=0d to 3d

**APBH\_CTRL0n field descriptions**

Field	Description
31 SFTRST	Set this bit to zero to enable normal APBH DMA operation. Set this bit to one (default) to disable clocking with the APBH DMA and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the APBH DMA block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 AHB_BURST8_EN	Set this bit to one (default) to enable AHB 8-beat burst. Set to zero to disable 8-beat burst on AHB interface.
28 APB_BURST_EN	Set this bit to one to enable apb master do a continous transfers when a device request a burst dma. Set to zero will treat a burst dma request as 4/8 individual requests.
27–16 RSVD0	This field is reserved. Reserved, always set to zero.
CLKGATE_CHANNEL	These bits must be set to zero for normal operation of each channel. When set to one they gate off the individual clocks to the channels.  0x0001 <b>NAND0</b> — 0x0002 <b>NAND1</b> — 0x0004 <b>NAND2</b> — 0x0008 <b>NAND3</b> — 0x0010 <b>NAND4</b> — 0x0020 <b>NAND5</b> — 0x0040 <b>NAND6</b> — 0x0080 <b>NAND7</b> — 0x0100 <b>SSP</b> —

## 14.5.2 AHB to APBH Bridge Control and Status Register 1 (APBH\_CTRL1n)

The APBH CTRL one provides overall control of the interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

### EXAMPLE

```
BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0); // use bitfield write macro
BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0; // or, assign to register
struct's bitfield
```

Address: 11\_0000h base + 10h offset + (4d × i), where i=0d to 3d

### APBH\_CTRL1n field descriptions

Field	Description
31 CH15_CMDCMPLT_IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 15.
30 CH14_CMDCMPLT_IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 14.

Table continues on the next page...

**APBH\_CTRL1n field descriptions (continued)**

<b>Field</b>	<b>Description</b>
29 CH13_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 13.
28 CH12_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 12.
27 CH11_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 11.
26 CH10_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 10.
25 CH9_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 9.
24 CH8_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 8.
23 CH7_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 7.
22 CH6_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 6.
21 CH5_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 5.
20 CH4_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 4.
19 CH3_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 3.
18 CH2_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 2.

*Table continues on the next page...*

**APBH\_CTRL1n field descriptions (continued)**

Field	Description
17 CH1_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 1.
16 CH0_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 0.
15 CH15_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 15. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
14 CH14_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 14. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
13 CH13_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 13. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
12 CH12_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 12. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
11 CH11_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 11. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
10 CH10_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 10. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
9 CH9_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 9. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
8 CH8_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 8. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
7 CH7_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 7. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
6 CH6_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 6. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

*Table continues on the next page...*

**APBH\_CTRL1n field descriptions (continued)**

Field	Description
5 CH5_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 5. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
4 CH4_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 4. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
3 CH3_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 3. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
2 CH2_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 2. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
1 CH1_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 1. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
0 CH0_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 0. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

### 14.5.3 AHB to APBH Bridge Control and Status Register 2 (APBH\_CTRL2n)

The APBH CTRL 2 provides channel error interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

#### EXAMPLE

```

BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0); // use bitfield write macro
BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0;    // or, assign to register
struct's bitfield

```

## APBH\_CTRL2n field descriptions (continued)

Field	Description
16 CH0_ERROR_STATUS	Error status bit for APBX DMA Channel 0. Valid when corresponding Error IRQ is set. 1 - AHB bus error 0 - channel early termination.  0x0 <b>TERMINATION</b> — An early termination from the device causes error IRQ. 0x1 <b>BUS_ERROR</b> — An AHB bus error causes error IRQ.
15 CH15_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 15. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
14 CH14_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 14. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
13 CH13_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 13. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
12 CH12_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 12. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
11 CH11_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 11. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
10 CH10_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 10. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
9 CH9_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 9. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
8 CH8_ERROR_IRQ	Error interrupt status bit for APBH DMA Channel 8. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
7 CH7_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 7. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
6 CH6_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 6. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
5 CH5_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 5. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
4 CH4_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 4. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
3 CH3_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 3. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
2 CH2_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 2. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.

Table continues on the next page...

**APBH\_CTRL2n field descriptions (continued)**

Field	Description
1 CH1_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 1. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.
0 CH0_ERROR_IRQ	Error interrupt status bit for APBX DMA Channel 0. This sticky bit is set by DMA hardware and reset by software. It is ORed with the corresponding cmdcmplt irq to generate an irq to ARM.

**14.5.4 AHB to APBH Bridge Channel Register (APBH\_CHANNEL\_CTRLn)**

The APBH CHANNEL CTRL provides reset/freeze control of each DMA channel. This register contains individual channel reset/freeze bits.

Address: 11\_0000h base + 30h offset + (4d × i), where i=0d to 3d

**APBH\_CHANNEL\_CTRLn field descriptions**

Field	Description
31–16 RESET_CHANNEL	Setting a bit in this field causes the DMA controller to take the corresponding channel through its reset state. The bit is reset after the channel resources are cleared.  0x0001 <b>NAND0</b> — 0x0002 <b>NAND1</b> — 0x0004 <b>NAND2</b> — 0x0008 <b>NAND3</b> — 0x0010 <b>NAND4</b> — 0x0020 <b>NAND5</b> — 0x0040 <b>NAND6</b> — 0x0080 <b>NAND7</b> — 0x0100 <b>SSP</b> —
FREEZE_CHANNEL	Setting a bit in this field will freeze the DMA channel associated with it. This field is a direct input to the DMA channel arbiter. When frozen, the channel is denied access to the central DMA resources.  0x0001 <b>NAND0</b> — 0x0002 <b>NAND1</b> — 0x0004 <b>NAND2</b> — 0x0008 <b>NAND3</b> — 0x0010 <b>NAND4</b> — 0x0020 <b>NAND5</b> — 0x0040 <b>NAND6</b> —

Table continues on the next page...

Field	Description
0x0080	NAND7 —
0x0100	SSP —

### 14.5.5 AHB to APBH DMA Device Assignment Register (APBH\_DEVSEL)

This register allows reassignment of the APBH device connected to the DMA Channels.

In this chip, APBH DMA channel resource is enough for high speed peripherals, so this register is of no use and reserved.

Address: 11\_0000h base + 40h offset = 11\_0040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

19–18 CH9	This field is reserved. Reserved.
17–16 CH8	DMA burst size for SSP.  0x0 <b>BURST0</b> — 0x1 <b>BURST4</b> — 0x2 <b>BURST8</b> —
15–14 CH7	DMA burst size for GPMI channel 7. Do not change. GPMI only support burst size 4.
13–12 CH6	DMA burst size for GPMI channel 6. Do not change. GPMI only support burst size 4.
11–10 CH5	DMA burst size for GPMI channel 5. Do not change. GPMI only support burst size 4.
9–8 CH4	DMA burst size for GPMI channel 4. Do not change. GPMI only support burst size 4.
7–6 CH3	DMA burst size for GPMI channel 3. Do not change. GPMI only support burst size 4.
5–4 CH2	DMA burst size for GPMI channel 2. Do not change. GPMI only support burst size 4.
3–2 CH1	DMA burst size for GPMI channel 1. Do not change. GPMI only support burst size 4.
CH0	DMA burst size for GPMI channel 0. Do not change. GPMI only support burst size 4.

**14.5.7 AHB to APBH DMA Debug Register (APBH\_DEBUG)**

This register is for debug purpose.

The debug register is for internal use only. Not recommend for customer useage.

Address: 11\_0000h base + 60h offset = 11\_0060h

## APBH Memory Map/Register Definition

### APBH\_DEBUG field descriptions

Field	Description
31-1 -	This field is reserved. Reserved, always set to zero.
0 GPMI_ONE_FIFO	Set to One and the 8 GPMI channels will share the DMA FIFO, and when set to zero, the 8 GPMI channels will use its own DMA FIFO.

## 14.5.8 APBH DMA Channel n Current Command Address Register (APBH\_CHn\_CURCMDAR)

The APBH DMA channel n current command address register points to the multiword command that is currently being executed. Commands are threaded on the command address.

APBH DMA Channel n is controlled by a variable sized command structure. This register points to the command structure currently being executed.

### EXAMPLE

```
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR_RD(0); // read the whole
register, since there is only one field
pCurCmd = (apbh_chn_cmd_t *) BF_RDn(APBH_CHn_CURCMDAR, 0, CMD_ADDR); // or, use multi-
register bitfield read macro
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR(0).CMD_ADDR; // or, assign from
bitfield of indexed register's struct
```

Address: 11\_0000h base + 100h offset + (112d × i), where i=0d to 15d

### APBH\_CHn\_CURCMDAR field descriptions

Field	Description
CMD_ADDR	Pointer to command structure currently being processed for channel n.

### 14.5.9 APBH DMA Channel n Next Command Address Register (APBH\_CHn\_NXTCMDAR)

The APBH DMA Channel n Next Command Address register contains the address of the next multiword command to be executed. Commands are threaded on the command address. Set CHAIN to 1 in the DMA command word to process command lists.

APBH DMA Channel n is controlled by a variable sized command structure. Software loads this register with the address of the first command structure to process and increments the Channel n semaphore to start processing. This register points to the next command structure to be executed when the current command is completed.

#### EXAMPLE

```
APBH_CHn_NXTCMDAR_WR(0, (reg32_t) pCommandTwoStructure);           // write the entire
register, since there is only one field
BF_WRn(APBH_CHn_NXTCMDAR, 0, (reg32_t) pCommandTwoStructure);     // or, use multi-
register bitfield write macro
APBH_CHn_NXTCMDAR(0).CMD_ADDR = (reg32_t) pCommandTwoStructure;  // or, assign to bitfield
of indexed register's struct
```

Address: 11\_0000h base + 110h offset + (112d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CMD_ADDR																															
W	CMD_ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### APBH\_CHn\_NXTCMDAR field descriptions

Field	Description
CMD_ADDR	Pointer to next command structure for channel n.

### 14.5.10 APBH DMA Channel n Command Register (APBH\_CHn\_CMD)

The APBH DMA Channel n command register specifies the DMA transaction to perform for the current command chain item.

The command register controls the overall operation of each DMA command for this channel. It includes the number of bytes to transfer to or from the device, the number of APB PIO command words included with this command structure, whether to interrupt at command completion, whether to chain an additional command to the end of this one and whether this transfer is a read or write DMA transfer.

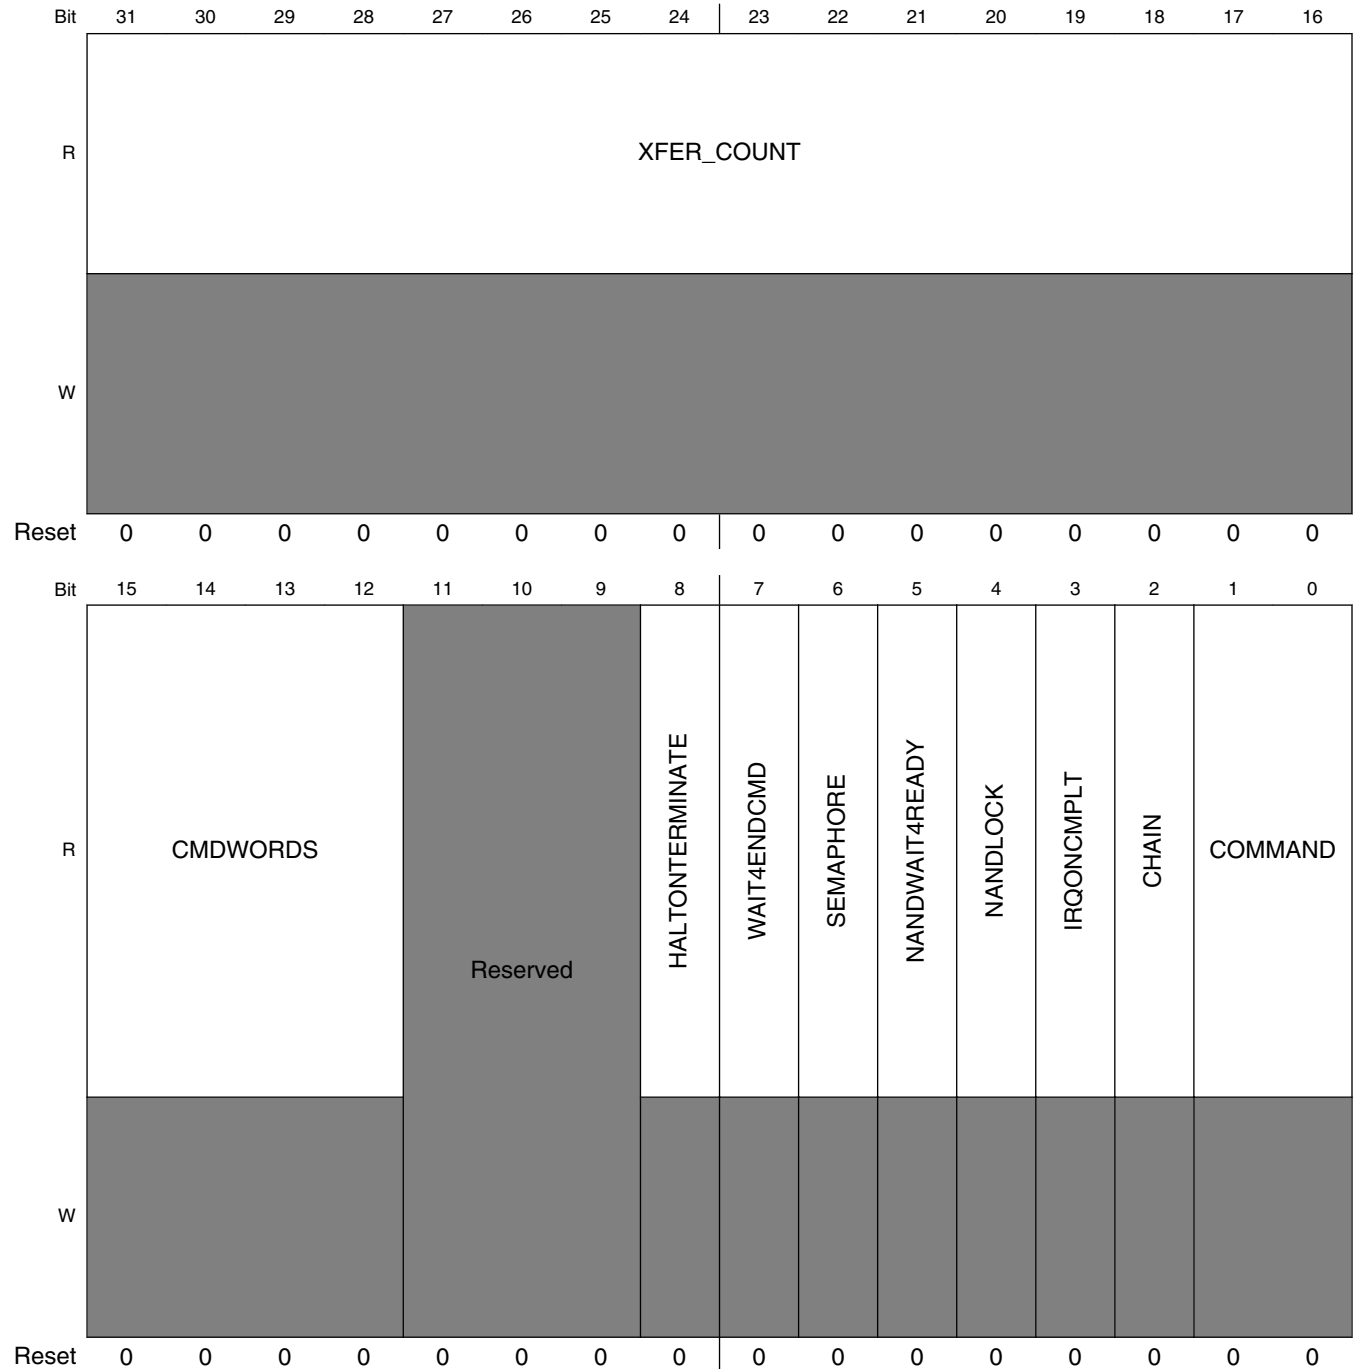

**APBH Memory Map/Register Definition**

**EXAMPLE**

```

apbh_chn_cmd_t dma_cmd;
dma_cmd.XFER_COUNT = 512; // transfer 512 bytes
dma_cmd.COMMAND = BV_APBH_CHn_CMD_COMMAND_DMA_WRITE; // transfer to system memory from
peripheral device
dma_cmd.CHAIN = 1; // chain an additional command
structure on to the list
dma_cmd.IRQONCMPLT = 1; // generate an interrupt on
completion of this command structure
    
```

Address: 11\_0000h base + 120h offset + (112d × i), where i=0d to 15d

## APBH\_CHn\_CMD field descriptions

Field	Description
31–16 XFER_COUNT	This field indicates the number of bytes to transfer to or from the appropriate PIO register in the GPMIO device. A value of 0 indicates a 64 KBytes transfer.
15–12 CMDWORDS	This field indicates the number of command words to send to the GPMIO, starting with the base PIO address of the GPMIO control register and incrementing from there. Zero means transfer NO command words
11–9 -	This field is reserved. Reserved, always set to zero.
8 HALTONTERMINATE	A value of one indicates that the channel will immediately terminate the current descriptor and halt the DMA channel if a terminate signal is set. A value of 0 will still cause an immediate terminate of the channel if the terminate signal is set, but the channel will continue as if the count had been exhausted, meaning it will honor IRQONCMPLT, CHAIN, SEMAPHORE, and WAIT4ENDCMD.
7 WAIT4ENDCMD	A value of one indicates that the channel will wait for the end of command signal to be sent from the APBH device to the DMA before starting the next DMA command.
6 SEMAPHORE	A value of one indicates that the channel will decrement its semaphore at the completion of the current command structure. If the semaphore decrements to zero, then this channel stalls until software increments it again.
5 NANDWAIT4READY	A value of one indicates that the NAND DMA channel will wait until the NAND device reports "ready" before executing the command. It is ignored for non-NAND DMA channels.
4 NANDLOCK	A value of one indicates that the NAND DMA channel will remain "locked" in the arbiter at the expense of other NAND DMA channels. It is ignored for non-NAND DMA channels.
3 IRQONCMPLT	A value of one indicates that the channel will cause the interrupt status bit to be set upon completion of the current command, i.e. after the DMA transfer is complete.
2 CHAIN	A value of one indicates that another command is chained onto the end of the current command structure. At the completion of the current command, this channel will follow the pointer in APBH_CHn_CMDAR to find the next command.
COMMAND	This bitfield indicates the type of current command:  0x0 <b>NO_DMA_XFER</b> — Perform any requested PIO word transfers but terminate command before any DMA transfer. 0x1 <b>DMA_WRITE</b> — Perform any requested PIO word transfers and then perform a DMA transfer from the peripheral for the specified number of bytes. 0x2 <b>DMA_READ</b> — Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes. 0x3 <b>DMA_SENSE</b> — Perform any requested PIO word transfers and then perform a conditional branch to the next chained device. Follow the NEXCMD_ADDR pointer if the peripheral sense is true. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is false.

### 14.5.11 APBH DMA Channel n Buffer Address Register (APBH\_CHn\_BAR)

The APBH DMA Channel n buffer address register contains a pointer to the data buffer for the transfer. For immediate forms, the data is taken from this register. This is a byte address which means transfers can start on any byte boundary.

## APBH Memory Map/Register Definition

This register holds a pointer to the data buffer in system memory. After the command values have been read into the DMA controller and the device controlled by this channel, then the DMA transfer will begin, to or from the buffer pointed to by this register.

### EXAMPLE

```
apbh_chn_bar_t dma_data;
dma_data.ADDRESS = (reg32_t) pDataBuffer;
```

Address: 11\_0000h base + 130h offset + (112d × i), where i=0d to 15d

### APBH\_CHn\_BAR field descriptions

Field	Description
ADDRESS	Address of system memory buffer to be read or written over the AHB bus.

## 14.5.12 APBH DMA Channel n Semaphore Register (APBH\_CHn\_SEMA)

The APBH DMA Channel n semaphore register is used to synchronize the ARM platform instruction stream and the DMA chain processing state.

Each DMA channel has an 8 bit counting semaphore that is used to synchronize between the program stream and the DMA chain processing. DMA processing continues until the DMA attempts to decrement a semaphore that has already reached a value of zero. When the attempt is made, the DMA channel is stalled until software increments the semaphore count.

### EXAMPLE

```
BF_WR(APBH_CHn_SEMA, 0, INCREMENT_SEMA, 2); // increment semaphore by two
current_sema = BF_RD(APBH_CHn_SEMA, 0, PHORE); // get instantaneous value
```

Address: 11\_0000h base + 140h offset + (112d × i), where i=0d to 15d

**APBH\_CHn\_SEMA field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 PHORE	This read-only field shows the current (instantaneous) value of the semaphore counter.
15–8 -	This field is reserved. Reserved, always set to zero.
INCREMENT_ SEMA	The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DMA hardware subtracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DMA channel decrements the count on the same clock, then the count is incremented by a net one.

**14.5.13 AHB to APBH DMA Channel n Debug Information (APBH\_CHn\_DEBUG1)**

This register gives debug visibility into the APBH DMA Channel n state machine and controls.

This register allows debug visibility of the APBH DMA Channel n.

## APBH Memory Map/Register Definition

Address: 11\_0000h base + 150h offset + (112d × i), where i=0d to 15d

## APBH\_CHn\_DEBUG1 field descriptions

Field	Description
31 REQ	This bit reflects the current state of the DMA Request Signal from the APB device
30 BURST	This bit reflects the current state of the DMA Burst Signal from the APB device
29 KICK	This bit reflects the current state of the DMA Kick Signal sent to the APB Device
28 END	This bit reflects the current state of the DMA End Command Signal sent from the APB Device
27 SENSE	This field is reserved. This bit is reserved for this DMA Channel and always reads 0.
26 READY	This bit is reserved for this DMA Channel and always reads 0.
25 LOCK	This field is reserved. This bit is reserved for this Channel and always reads 0.
24 NEXTCMDADDRVALID	This bit reflects the internal bit which indicates whether the channel's next command address is valid.
23 RD_FIFO_EMPTY	This bit reflects the current state of the DMA Channel's Read FIFO Empty signal.
22 RD_FIFO_FULL	This bit reflects the current state of the DMA Channel's Read FIFO Full signal.
21 WR_FIFO_EMPTY	This bit reflects the current state of the DMA Channel's Write FIFO Empty signal.
20 WR_FIFO_FULL	This bit reflects the current state of the DMA Channel's Write FIFO Full signal.
19–5 RSVD1	This field is reserved. Reserved
STATEMACHINE	<p>PIO Display of the DMA Channel n state machine state.</p> <p>0x00 <b>IDLE</b> — This is the idle state of the DMA state machine.</p> <p>0x01 <b>REQ_CMD1</b> — State in which the DMA is waiting to receive the first word of a command.</p> <p>0x02 <b>REQ_CMD3</b> — State in which the DMA is waiting to receive the third word of a command.</p> <p>0x03 <b>REQ_CMD2</b> — State in which the DMA is waiting to receive the second word of a command.</p> <p>0x04 <b>XFER_DECODE</b> — The state machine processes the descriptor command field in this state and branches accordingly.</p> <p>0x05 <b>REQ_WAIT</b> — The state machine waits in this state for the PIO APB cycles to complete.</p> <p>0x06 <b>REQ_CMD4</b> — State in which the DMA is waiting to receive the fourth word of a command, or waiting to receive the PIO words when PIO count is greater than 1.</p> <p>0x07 <b>PIO_REQ</b> — This state determines whether another PIO cycle needs to occur before starting DMA transfers.</p> <p>0x08 <b>READ_FLUSH</b> — During a read transfers, the state machine enters this state waiting for the last bytes to be pushed out on the APB.</p> <p>0x09 <b>READ_WAIT</b> — When an AHB read request occurs, the state machine waits in this state for the AHB transfer to complete.</p> <p>0x0C <b>WRITE</b> — During DMA Write transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel.</p> <p>0x0D <b>READ_REQ</b> — During DMA Read transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel.</p>

*Table continues on the next page...*

**APBH\_CHn\_DEBUG1 field descriptions (continued)**

Field	Description
0x0E	<b>CHECK_CHAIN</b> — Upon completion of the DMA transfers, this state checks the value of the Chain bit and branches accordingly.
0x0F	<b>XFER_COMPLETE</b> — The state machine goes to this state after the DMA transfers are complete, and determines what step to take next.
0x14	<b>TERMINATE</b> — When a terminate signal is set, the state machine enters this state until the current AHB transfer is completed.
0x15	<b>WAIT_END</b> — When the Wait for Command End bit is set, the state machine enters this state until the DMA device indicates that the command is complete.
0x1C	<b>WRITE_WAIT</b> — During DMA Write transfers, the state machine waits in this state until the AHB master completes the write to the AHB memory space.
0x1D	<b>HALT_AFTER_TERM</b> — If HALTONTERMINATE is set and a terminate signal is set, the state machine enters this state and effectively halts. A channel reset is required to exit this state
0x1E	<b>CHECK_WAIT</b> — If the Chain bit is a 0, the state machine enters this state and effectively halts.
0x1F	<b>WAIT_READY</b> — When the NAND Wait for Ready bit is set, the state machine enters this state until the GPMI device indicates that the external device is ready.

**14.5.14 AHB to APBH DMA Channel n Debug Information (APBH\_CHn\_DEBUG2)**

This register gives debug visibility for the APB and AHB byte counts for DMA Channel n.

This register allows debug visibility of the APBH DMA Channel n.

Address: 11\_0000h base + 160h offset + (112d × i), where i=0d to 15d

**APBH\_CHn\_DEBUG2 field descriptions**

Field	Description
31–16 APB_BYTES	This value reflects the current number of APB bytes remaining to be transferred in the current transfer.
AHB_BYTES	This value reflects the current number of AHB bytes remaining to be transferred in the current transfer.

## 14.5.15 APBH Bridge Version Register (APBH\_VERSION)

This register always returns a known read value for debug purposes it indicates the version of the block.

This register indicates the RTL version in use.

### EXAMPLE

```
if (APBH_VERSION.B.MAJOR != 3)
    Error();
```

Address: 11\_0000h base + 800h offset = 11\_0800h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	MAJOR								MINOR								STEP																	
W	[Shaded]																																	
Reset	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### APBH\_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

---

## Chapter 15

# Asynchronous Sample Rate Converter (ASRC)

### 15.1 Overview

The Asynchronous Sample Rate Converter (ASRC) converts the sampling rate of a signal associated with an input clock into a signal associated with a different output clock.

The ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The ASRC supports up to three sampling rate pairs.

The incoming audio data to this chip may be received from various sources at different sampling rates. The outgoing audio data of this chip may have different sampling rates and it can also be associated with output clocks that are asynchronous to the input clocks.

The ASRC is implemented as a co-processor in hardware, with minimal ARM Platform intervention required.

[Figure 15-1](#) is a system view of the connection between the ASRC block and other blocks.

**Figure 15-1. General System Overview**

Figure 15-2 is the ASRC block diagram.

The red dotted line designates the ASRC block. Objects outside the dotted line represent SoC-level resources.

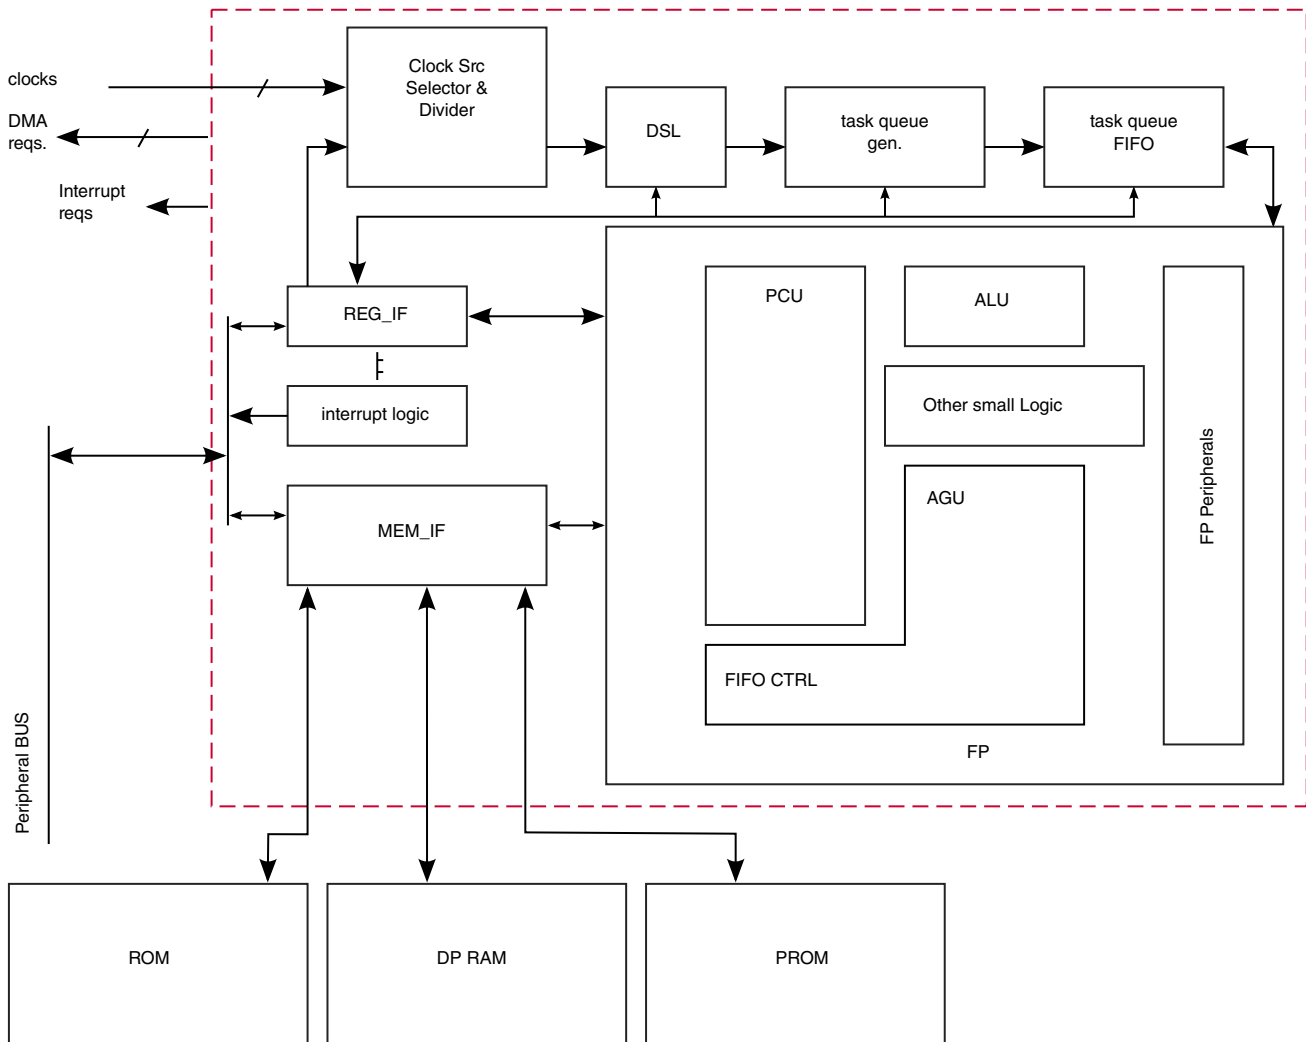

Figure 15-2. ASRC block diagram

### 15.1.1 Features

Table 15-1. ASRC Specifications

Parameters	Test Conditions	Minimum	Typical	Maximum	Unit
Channels Supported		0 <sup>1</sup>		10	
Pairs of Rate Conversion		1	-	3	
THD+N	120MHz < F <sub>SASRC</sub> <sup>2</sup> < 160MHz		-120		dB
Dynamic Range				144	dB
Settling Time			40		ms
Comment:					

1. When a pair has zero channels, the pair will be disabled, although the pair enable bit may be set in ASRCTR register.  
 2. F<sub>SASRC</sub> is the processing clock of ASRC block.

## Other Features:

- Support user-programmable threshold for the input/output FIFOs.
- Support flexible 8/16/24 bit width of input data, and 16/24 bit width of output data.
- Designed for rate conversion between 44.1kHz, 32kHz, 48kHz, 96kHz, and 192kHz. The useful signal bandwidth is below 24kHz.
- Other input sampling rates in the range of 8kHz to 200kHz is also supported, but possibly with less desirable bandwidth.
- Other output sampling rates in the range of 30kHz to 200kHz is also supported, but possibly with less desirable bandwidth.
- Automatic accommodation to slow variations in the incoming and outgoing sampling rates.
- Linear phase
- Tolerant to sample clock jitter

## Clock/Data Connections

- The sampling rate clocks are directly connected to the ASRC block, the ratio estimation of the input clocks with output clocks are done in ASRC hardware.
- The clock signals come from the following blocks, for example:
  - ESAI, receiving bit clock and transmitting bit clock
  - SPDIF, receiving bit clock and transmitting bit clock
  - other audio peripherals etc.
- The exchange of audio data is done by the processor accessing ASRC block through registers defined on shared peripheral bus.

## 15.1.2 Modes of Operation

See [ASRC Memory Map/Register Definition](#) for a definition of the registers and parameters used in ASRC.

### 15.1.2.1 Data Transfer Schemes

#### 15.1.2.1.1 Data Input Modes

The input mode for each of the three channel sets may be set independently. Three modes of supplying data to the ASRC input FIFOs are available:

- Polling
- Interrupt
- DMA

In all input-data transfer schemes, the ASRC fetches data from each enabled FIFO and processes the data sample-by-sample after each rising edge of the associated input sampling clock until the FIFO level reaches a threshold.

After the threshold is reached, the ASRC requests data. The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCR<sub>x</sub>, x=A, B or C.

If the ASRC attempts to fetch data from an empty FIFO, an error is generated and the ASRSTR\_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER\_AOLIE bit is set), an interrupt is generated.

When writing data to an input FIFO, you must ensure that it is in a predefined sequence. For example, when writing to an input FIFO, the sequence should be: channel\_0, channel\_1, channel\_2,..., channel\_n, channel\_0, channel\_1, channel\_2, etc. Here channel\_n stands for the data intended for the n-th channel. The hardware will re-allocate each data to its corresponding channel FIFO. The channel being re-allocated is shown by ASRCCR\_ACIX, x=A,B or C.

### Mode 1 (Polling Mode)

Polling mode is the default mode following power-on or individual reset, and is selected by clearing the associated channel set A, B, or C data-input interrupt enable bit (ASRIER\_ADIE<sub>x</sub>, where x=A, B or C). In this mode, data-input interrupts are disabled. When the FIFO level is below the threshold, the associated status bit (ASRSTR\_AIDEx, where x=A, B, or C) is set. To clear the status bit, the FIFO must be written with enough data to raise the level above the threshold.

### Mode 2 (Interrupt Mode)

The ASRC input FIFOs can also be serviced by interrupts. To enable interrupts, the corresponding data-input interrupt enable bits (ASRIER\_ADIE<sub>x</sub>, where x=A, B, or C) should be set. An interrupt is automatically generated any time the input FIFO level is below the threshold. The interrupt is cleared when enough data is written to the FIFO to raise the level above the threshold.

### Mode 3 (DMA Mode)

The ASRC input FIFOs can also be filled using DMA. In this mode, the data-input interrupt-enable bits (ASRIER\_ADIE<sub>x</sub>, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

## 15.1.2.1.2 Data Output Modes

The output mode for each of the 3 channel sets (A, B, and C) may be set independently.

Three modes of retrieving data from the ASRC output FIFOs are available:

- Polling
- Interrupt
- DMA

In all output-data transfer schemes, the ASRC places a processed sample into the associated output FIFO. After a threshold is reached, the ASRC requests that data be transferred out of the FIFO.

The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCR<sub>x</sub>, x=A, B or C.

If the ASRC attempts to place data into a FIFO that is already full, an error is generated and the ASRSTR\_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER\_AOLIE bit is set), an interrupt is generated.

Each output FIFO is organized in the same channel order in which the associated input FIFO was written.

Three transfer modes are supported by Interface Block.

### **Mode 1 (Polling Mode)**

The ASRC output FIFOs can be serviced by polling. In this mode, ensure the associated output-data interrupt enable bit (ASRIER\_ADOE<sub>x</sub>, where x=A, B, or C) is cleared. In this mode, all output-data interrupts are disabled. Any time the output FIFO exceeds the threshold the associated status bit (ASRSTR\_AODF<sub>x</sub>, where x=A, B, or C) is set. To clear the status bit, enough data must be read from the associated output FIFO to lower the level below the threshold.

### **Mode 2 (Interrupt Mode)**

The ASRC output FIFOs may also be serviced using interrupts. To enable this mode, the corresponding output-data interrupt-enable bits (ASRIER\_ADOE<sub>x</sub>, where x=A, B, or C) should be set. Any time the output FIFO level exceeds the threshold, an interrupt is automatically generated. The interrupt is cleared when enough data is read from the FIFO to lower the level below the threshold.

### **Mode 3 (DMA Mode)**

The ASRC output FIFOs can also be read using DMA. In this mode, the output-data interrupt-enable bits (ASRIER\_ADOE<sub>x</sub>, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

## **15.1.2.2 Word Alignment Supported**

**Table 15-3. Output Data Alignment (continued)**

Format	Bit Number																																
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
24-bit LSB Aligned with Sign Extension	2	2	2	2	2	2	2	2	2	2	2	2	1	1	1	1	1	1	1	1	1	1	1	9	8	7	6	5	4	3	2	1	0
24-bit MSB Aligned	2	2	2	2	1	1	1	1	1	1	1	1	1	1	9	8	7	6	5	4	3	2	1	0									

## 15.2 Clocks

The table found here describes the clock sources for ASRC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 15-4. ASRC Clocks**

Clock name	Clock Root	Description
asrc_clock_d	spdif1_clk_root	ASRC module clock (SPDIF clock)
ipg_clk	ahb_clk_root	Peripheral clock
mem_clk	ahb_clk_root	Peripheral access clock

## 15.3 Interrupts

ASRC has several interrupts events.

The priorities are shown as [Table 15-5](#) .

**Table 15-5. Interrupt Priorities/Vector**

Priority	Description
lowest	ASRC Pair A input data needed
	ASRC Pair B input data needed
	ASRC Pair C input data needed
	ASRC Pair A output data ready
	ASRC Pair B output data ready
	ASRC Pair C output data ready
	ASRC Overload

## 15.4 DMA requests

ASRC has six DMA requests. They are directly connected to the lowest six status bits in the ASRSTR register.

**Table 15-6. DMA requests**

Type	Description
0	ASRC Pair A input data needed
1	ASRC Pair B input data needed
2	ASRC Pair C input data needed
3	ASRC Pair A output data ready
4	ASRC Pair B output data ready
5	ASRC Pair C output data ready

## 15.5 Functional Description

This section provides a complete functional description of the block.

### 15.5.1 Algorithm Description

### 15.5.1.1 Signal processing flow

**Figure 15-3. Signal processing configurations**

The figure above shows the possible configurations of the ASRC. Each configuration consists of 2 to 4 stages.

- x2 up-sampling rate expander (zero insertion only) (input branch 1), direct connection (input branch 2), or low-pass pre decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (input branch 3),
- low-pass pre-filter, the low-pass bandwidth is at most  $0.25 \times F_s$ , where  $F_s$  is the sampling rate of the input signal to this low-pass pre-filter,
- polyphase filter,
- x2 post upsampling filter (consisting of a x2 up-sampling rate expander (zero insertion only) with low-pass half-band FIR filter) (output branch 1), direct connection (output branch 2), or low-pass post decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (output branch 3).

By flowing through different processing branches and different setups of the pre-filter, this ASRC scheme can be used to handle different rate conversion requirements.

- Configuration (a): Input Branch 1+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/2$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = F_{s_{out}}/2$ .

- Configuration (b): Input Branch 1+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/2$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = F_{s_{out}}$ .

- Configuration (c): Input Branch 1+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/2$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = 2F_{s_{out}}$ .

- Configuration (d): Input Branch 2+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/4$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = F_{s_{out}}/2$ .

- Configuration (e): Input Branch 2+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/4$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = F_{s_{out}}$ .

- Configuration (f): Input Branch 2+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/4$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = 2F_{s_{out}}$ .

- Configuration (g): Input Branch 3+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/8$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = F_{s_{out}}/2$ .

- Configuration (h): Input Branch 3+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/8$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = F_{s_{out}}$ .

- Configuration (i): Input Branch 3+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = F_{s_{in}}/8$ .  
The signal sampling rate of the polyphase filter output is  $F_{s_{ppout}} = 2F_{s_{out}}$ .

**Table 15-7. Pre-processing, post-processing options**

{Pre_Proc, Post_Proc}		Fsout (KHz)								
		8	32	44.1	48	64	88.2	96	128	192
Fsin (KHz)	8	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	12	{0,2}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	16	{1,2}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	24	{1,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}
	32	{1,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}
	44.1	{2,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}
	48	{2,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	64	{2,2}	{0,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	88.2	NA	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	96	NA	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	128	NA	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
192	NA	{2,2}	{2,2}	{2,2}	{2,1}	{2,1}	{2,1}	{2,1}	{2,1}	

**NOTE:** In the {Pre\_Proc, Post\_Proc} pair, the meaning of the values are:

Pre\_Proc:

- 0 --- Pre-processing Branch 1 as shown in [Figure 15-3](#)
- 1 --- Pre-processing Branch 2 as shown in [Figure 15-3](#)
- 2 --- Pre-processing Branch 3 as shown in [Figure 15-3](#), decimation-by-2

Post\_Proc:

- 0 --- Post-processing Branch 1 as shown in [Figure 15-3](#)
- 1 --- Post-processing Branch 2 as shown in [Figure 15-3](#)
- 2 --- Post-processing Branch 3 as shown in [Figure 15-3](#)

The latencies of the different option can be roughly calculated as follows:

- For PreProc = 0, PostProc = 1 : min latency = constant\_A / input-sample-rate + constant\_B / output-sample-rate
- For PreProc = 0, PostProc = 0 : min latency = constant\_A / input-sample-rate + constant\_C / output-sample-rate
- For PreProc = 1, PostProc = 1 : min latency = constant\_D / input-sample-rate + constant\_B / output-sample-rate

The constants above (e.g., constant\_A means the Constant for Preproc = 0, constant\_B means the Constant for Postproc = 1, ...) are only influenced by the PreProc/PostProc and (input/output) sampling rate to which they are connected. Input latencies have no relationship with the output latencies, but both elements add together to form the total latencies.

For a rough estimation, the constants can be set as:

- Constant for Preproc = 0: 39

- Constant for Preproc = 1: 78.5
- Constant for Preproc = 2: 235
- Constant for Postproc = 0: 42.5
- Constant for Postproc = 1: 8.5
- Constant for Postproc = 2: 172

The max latency can be derived from this value by using the following formula (where 32 means the input/output FIFO depth that will arouse data transfer):

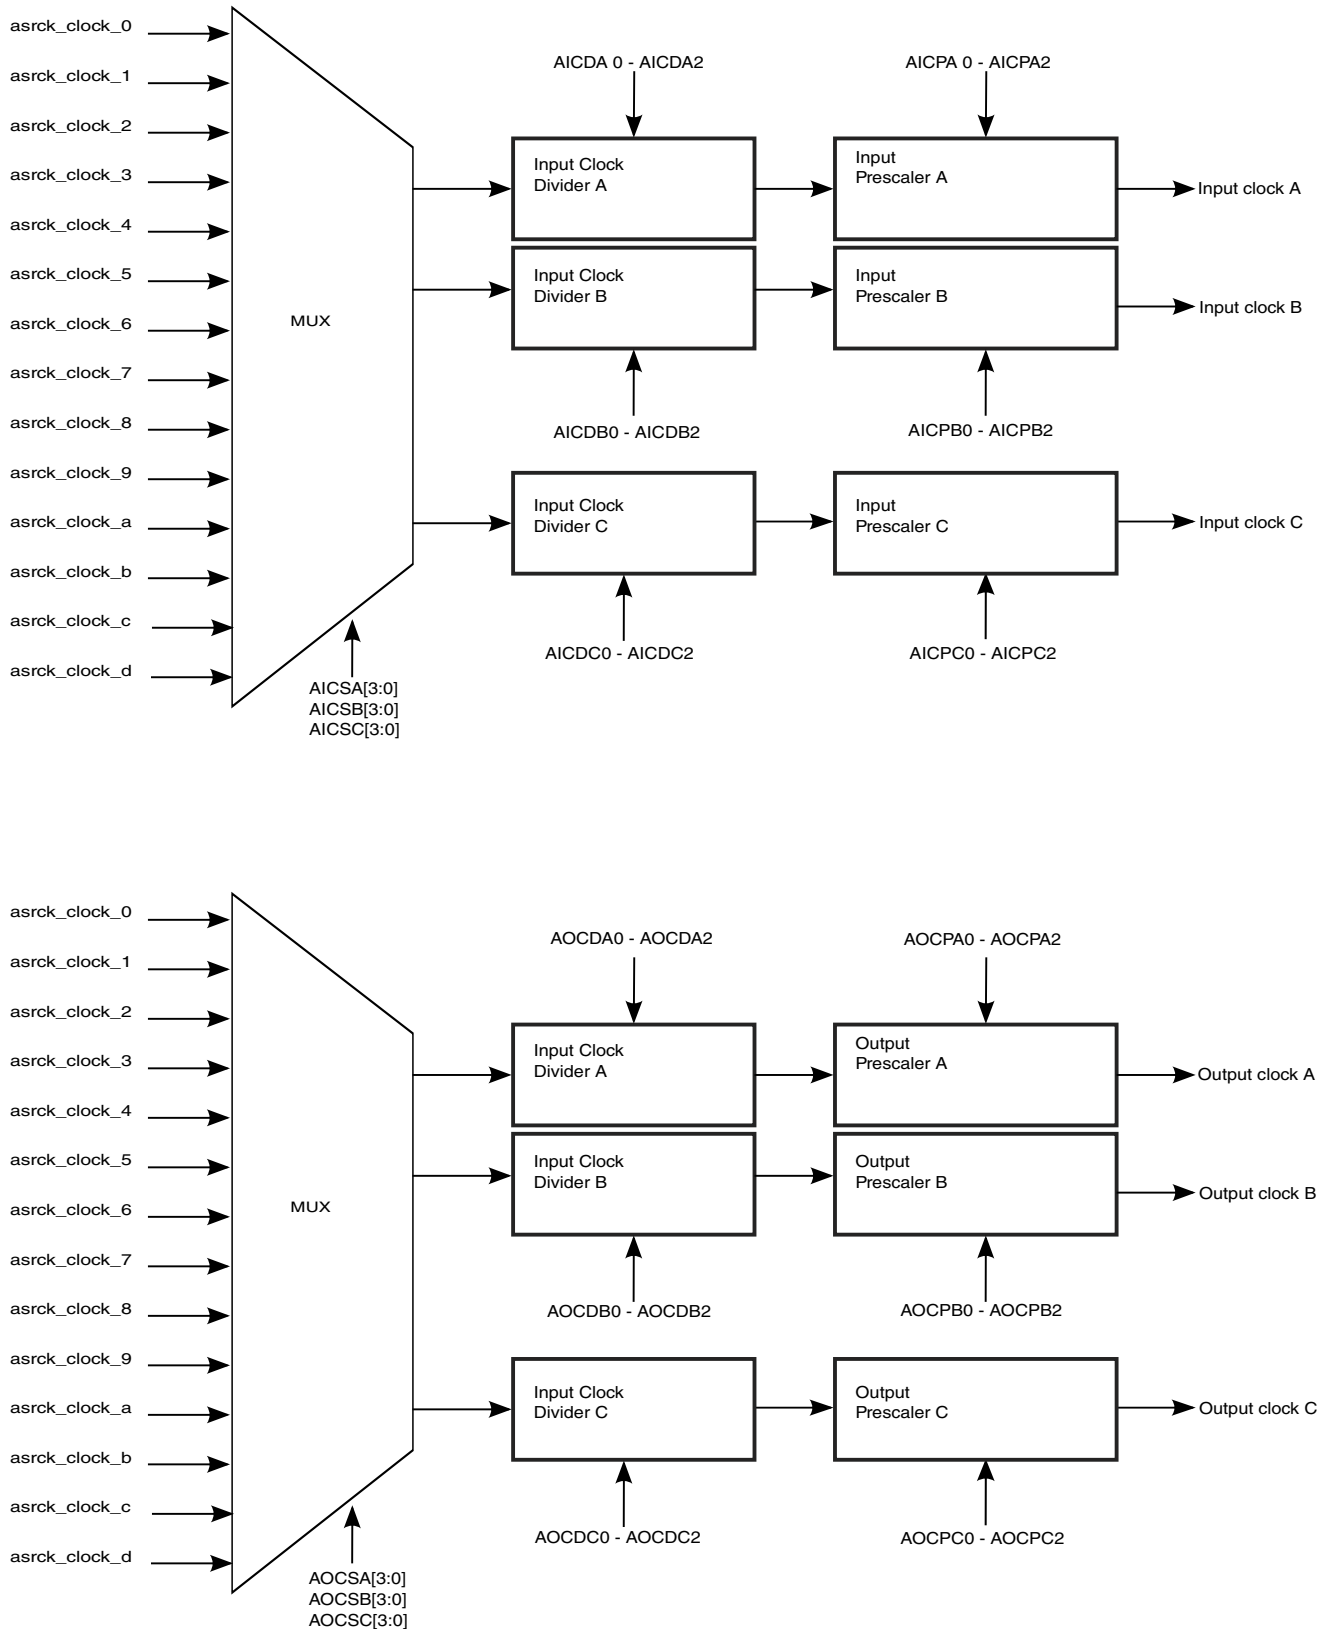

- $\text{max latency} = \text{min latency} + 32 / \text{input-sample-rate} + 32 / \text{output-sample-rate}$

## 15.5.1.2 Operation of the Filter

### 15.5.1.2.1 Support of Physical Clocks

This design supports physical sampling clocks. The clocks can be provided by Sony/Phillips digital interface (SPDIF), enhanced serial audio interface (ESAI), media local bus controller (MLB) , Core master clock derivative as ASRCK1 .

## Functional Description

**Figure 15-4. Clock Source Selector & Divider**

Software can set the ASRC Clock Source Register (ASRC\_CSR) and the Clock Divider Register to select the desired clock source and divide it to the needed sample rate clock for use by the ASRC. The clocks have the following restriction. If the prescaler is set to 1, the clock divider can only be set to 1 and the clock source must have a 50% duty cycle.

## 15.6 Startup Procedure

The following example shows the normal setup procedure for the ASRC block.

```
#include "asrc_common.h"
#include "stdio.h"
#include "soc_api.h"

int incnt=0;
int outcnt=0;

#include "wy_ideal_ratio_dataini_part.h"

WORD IdealRatio_High=0x04; //
WORD IdealRatio_Low=0x0; //

void asrc_config_alloc(WORD ASRCCTR_VAL, WORD ASRIER_VAL, WORD ASRCNCR_VAL,
                      WORD ASRCFG_VAL, WORD ASRCDR1_VAL, WORD ASRCDR2_VAL,
                      WORD ASRC_CSR_VAL)

{ // Disable ASRC

    reg32_write(ASRC_ASRCCTR, 0x0);

    reg32_write(ASRC_ASRCCTR, ASRCCTR_VAL);

    reg32_write(ASRC_ASRIER, ASRIER_VAL);

    reg32_write(ASRC_ASRIEM, 0x0);

    reg32_write(ASRC_ASRCNCR, ASRCNCR_VAL);

    reg32_write(ASRC_ASRCFG, ASRCFG_VAL);

    reg32_write(ASRC_ASRCDR1, ASRCDR1_VAL);

    reg32_write(ASRC_ASRCDR2, ASRCDR2_VAL);

    reg32_write(ASRC_ASRC_CSR, ASRC_CSR_VAL);

    reg32_write(ASRC_ASRPM1, 0x7fffffff);

    reg32_write(ASRC_ASRPM2, 0x255555);

    reg32_write(ASRC_ASRPM3, 0xff7280);

    reg32_write(ASRC_ASRPM4, 0xff7280);

    reg32_write(ASRC_ASRPM5, 0xff7280);
```

## Startup Procedure

```
    reg32_write(ASRC_ASRQFIFO1, 0x001f00);

    reg32_write(ASRC_ASRMCRA, 0x001f00);

    reg32_write(ASRC_ASRMCRB, 0x001f00);

    reg32_write(ASRC_ASRMCRC, 0x001f00);

## 15.7 ASRC Memory Map/Register Definition

All useful registers are listed in the memory map below. The access of undefined registers will behave as normal registers.

All the interface registers are LSB aligned except the input FIFOs and the output FIFOs, and each register has only 24 effective bits.

The input FIFO and output FIFO word alignment can be defined using ASRMCR1{A,B,C} registers in 32-bit interface system.

### 15.7.1 ASRC Control Register (ASRC\_ASRCTR)

The ASRC control register (ASRCTR) is a 24-bit read/write register that controls the ASRC operations.

Address: 203\_4000h base + 0h offset = 203\_4000h

## ASRC\_ASRCCTR field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented.  This field is reserved.
23 -	This field is reserved. Reserved. Should be written as zero for compatibility.
22 ATSC	ASRC Pair C Automatic Selection For Processing Options  When this bit is 1, pair C will automatic update its pre-processing and post-processing options (ASRCFG:PREMODC, ASRCFG:POSTMODC see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> and <a href="#">ASRC Misc Control Register 1 for Pair C</a> ).  When this bit is 0, the user is responsible for choosing the proper processing options for pair C.  This bit should be disabled when {USRC, IDRC}={1,1}.
21 ATSB	ASRC Pair B Automatic Selection For Processing Options  When this bit is 1, pair B will automatic update its pre-processing and post-processing options (ASRCFG:PREMODB, ASRCFG:POSTMODB see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> and <a href="#">ASRC Misc Control Register 1 for Pair C</a> ).  When this bit is 0, the user is responsible for choosing the proper processing options for pair B.  This bit should be disabled when {USRB, IDRB}={1,1}.
20 ATSA	ASRC Pair A Automatic Selection For Processing Options  When this bit is 1, pair A will automatic update its pre-processing and post-processing options (ASRCFG:PREMODA, ASRCFG:POSTMODA see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> and <a href="#">ASRC Misc Control Register 1 for Pair C</a> ).  When this bit is 0, the user is responsible for choosing the proper processing options for pair A.  This bit should be disabled when {USRA, IDRA}={1,1}.
19 -	This field is reserved. Reserved. Should be written as zero for compatibility.
18 USRC	Use Ratio for Pair C  Use ratio as the input to ASRC. This bit is used in conjunction with IDRC control bit.
17 IDRC	Use Ideal Ratio for Pair C  When USRC=0, this bit has no usage.  When USRC=1 and IDRC=0, ASRC internal measured ratio will be used.  When USRC=1 and IDRC=1, the idea ratio from the interface register ASRIDRHC, ASRIDRLC will be used. It is suggested to manually set ASRCFG:POSTMODC, ASRCFG:PREMODC according to <a href="#">Table 15-7</a> in this case.
16 USRB	Use Ratio for Pair B  Use ratio as the input to ASRC. This bit is used in conjunction with IDRB control bit.
15 IDRB	Use Ideal Ratio for Pair B  When USRB=0, this bit has no usage.  When USRB=1 and IDRB=0, ASRC internal measured ratio will be used.

*Table continues on the next page...*

## ASRC\_ASRCR field descriptions (continued)

Field	Description
	When USRB=1 and IDRB=1, the idea ratio from the interface register ASRIDRHB, ASRIDRLB will be used. It is suggested to manually set ASRCFG:POSTMODB, ASRCFG:PREMODB according to <a href="#">Table 15-7</a> in this case.
14 USRA	Use Ratio for Pair A Use ratio as the input to ASRC. This bit is used in conjunction with IDRA control bit.
13 IDRA	Use Ideal Ratio for Pair A When USRA=0, this bit has no usage. When USRA=1 and IDRA=0, ASRC internal measured ratio will be used. When USRA=1 and IDRA=1, the idea ratio from the interface register ASRIDRHA, ASRIDRLA will be used. It is suggested to manually set ASRCFG:POSTMODA, ASRCFG:PREMODA according to <a href="#">Table 15-7</a> in this case.
12–5 -	This field is reserved. Reserved. Should be written as zero for compatibility.
4 SRST	Software Reset This bit is self-clear bit. Once it is been written as 1, it will generate a software reset signal inside ASRC. After 9 cycles of the ASRC processing clock, this reset process will stop, and this bit will be cleared automatically.
3 ASREC	ASRC Enable C Enable the operation of the conversion C of ASRC. When ASREC is cleared, operation of conversion C is disabled.
2 ASREB	ASRC Enable B Enable the operation of the conversion B of ASRC. When ASREB is cleared, operation of conversion B is disabled.
1 ASREA	ASRC Enable A Enable the operation of the conversion A of ASRC. When ASREA is cleared, operation of conversion A is disabled.
0 ASRCEN	ASRC Enable Enable the operation of ASRC.

## 15.7.2 ASRC Interrupt Enable Register (ASRC\_ASRIER)

Address: 203\_4000h base + 4h offset = 203\_4004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved								Reserved							
W	Reserved								Reserved

### ASRC\_ASRIER field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–8 -	This field is reserved. Reserved. Should be written as zero for compatibility.
7 AFPWE	FP in Wait State Interrupt Enable Enables the FP in wait state interrupt.  1 interrupt enabled 0 interrupt disabled
6 AOLIE	Overload Interrupt Enable Enables the overload interrupt.  1 interrupt enabled 0 interrupt disabled
5 ADOEC	Data Output C Interrupt Enable Enables the data output C interrupt.  1 interrupt enabled 0 interrupt disabled
4 ADOEB	Data Output B Interrupt Enable Enables the data output B interrupt.

Table continues on the next page...

**ASRC\_ASRIER field descriptions (continued)**

Field	Description
	1 interrupt enabled 0 interrupt disabled
3 ADOEA	Data Output A Interrupt Enable Enables the data output A interrupt.  1 interrupt enabled 0 interrupt disabled
2 ADIEC	Data Input C Interrupt Enable Enables the data input C interrupt.  1 interrupt enabled 0 interrupt disabled
1 ADIEB	Data Input B Interrupt Enable Enables the data input B interrupt.  1 interrupt enabled 0 interrupt disabled
0 ADIEA	Data Input A Interrupt Enable Enables the data input A Interrupt.  1 interrupt enabled 0 interrupt disabled

**15.7.3 ASRC Channel Number Configuration Register (ASRC\_ASRCNCR)**

The ASRC channel number configuration register (ASRCNCR) is a 24-bit read/write register that sets the number of channels used by each ASRC conversion pair.

There are 10 channels available for distribution among 3 conversion pairs, they are ordered as 0,1,...,9. The bottom [0, ANCA-1] channels are used for pair A, the top [10-ANCC, 9] channels are used for pair C, and the [ANCA, ANCA+ANCB-1] channels are allocated for pair B. In case that ANCA=0, then the [0, ANCB-1] channels are assigned for pair B.

Address: 203\_4000h base + Ch offset = 203\_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved																ANCC				ANCB			ANCA								
W	Reserved																ANCC				ANCB			ANCA								
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ASRC\_ASRCNCR field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–12 -	This field is reserved. Reserved. Should be written as zero for compatibility.
11–8 ANCC	Number of C Channels <sup>1</sup> 0000 0 channels in C (Pair C is disabled) 0001 1 channel in C 0010 2 channels in C 0011 3 channels in C 0100 4 channels in C 0101 5 channels in C 0110 6 channels in C 0111 7 channels in C 1000 8 channels in C 1001 9 channels in C 1010 10 channels in C 1011-1111 Should not be used.
7–4 ANCB	Number of B Channels 0000 0 channels in B (Pair B is disabled) 0001 1 channel in B 0010 2 channels in B 0011 3 channels in B 0100 4 channels in B 0101 5 channels in B 0110 6 channels in B 0111 7 channels in B 1000 8 channels in B 1001 9 channels in B 1010 10 channels in B 1011-1111 Should not be used.
ANCA	Number of A Channels 0000 0 channels in A (Pair A is disabled) 0001 1 channel in A 0010 2 channels in A 0011 3 channels in A 0100 4 channels in A 0101 5 channels in A 0110 6 channels in A 0111 7 channels in A 1000 8 channels in A 1001 9 channels in A 1010 10 channels in A 1011-1111 Should not be used.

## ASRC Memory Map/Register Definition

1.  $ANCC+ANCB+ANCA \leq 10$ . Hardware is not checking the constraint. Programmer should take the responsibility to ensure the constraint is satisfied.

### 15.7.4 ASRC Filter Configuration Status Register (ASRC\_ASRCFG)

The ASRC configuration status register (ASRCFG) is a 24-bit read/write register that sets and/or automatically senses the ASRC operations.

Address: 203\_4000h base + 10h offset = 203\_4010h

## ASRC\_ASRCFG field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented.  This field is reserved.
23 INIRQC	Initialization for Conversion Pair C is served  When this bit is 1, it means the initialization for conversion pair C is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREC=0 or ASRCTR:ASRCEN=0).
22 INIRQB	Initialization for Conversion Pair B is served  When this bit is 1, it means the initialization for conversion pair B is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREB=0 or ASRCTR:ASRCEN=0).
21 INIRQA	Initialization for Conversion Pair A is served  When this bit is 1, it means the initialization for conversion pair A is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREA=0 or ASRCTR:ASRCEN=0).
20 NDPRC	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair C  0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameters. Use the parameters already stored in RAM.
19 NDPRB	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair B  0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameter. Use the parameters already stored in RAM.
18 NDPRA	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair A  0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameters. Use the parameters already stored in RAM.
17–16 POSTMODC[1-0]	Post-Processing Configuration for Conversion Pair C  These bits will be read/write by user if ASRCTR:ATSC=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSC=1 (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ). These bits set the selection of the post-processing configuration.  00 Select Upsampling-by-2 as defined in Signal Processing Flow. 01 Select Direct-Connection as defined in Signal Processing Flow. 10 Select Downsampling-by-2 as defined in Signal Processing Flow.
15–14 PREMODC[1-0]	Pre-Processing Configuration for Conversion Pair C  These bits will be read/write by user if ASRCTR:ATSC=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSC=1 (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ). These bits set the selection of the pre-processing configuration.  00 Select Upsampling-by-2 as defined in <a href="#">Signal processing flow</a> 01 Select Direct-Connection as defined in <a href="#">Signal processing flow</a> 10 Select Downsampling-by-2 as defined in <a href="#">Signal processing flow</a> 11 Select passthrough mode. In this case, POSTMODC[1-0] have no use.
13–12 POSTMODB[1-0]	Post-Processing Configuration for Conversion Pair B  These bits will be read/write by user if ASRCTR:ATSB=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSB=1 (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ). These bits set the selection of the post-processing configuration.

*Table continues on the next page...*

## ASRC\_ASRCFG field descriptions (continued)

Field	Description
	00 Select Upsampling-by-2 as defined in <a href="#">Signal processing flow</a> 01 Select Direct-Connection as defined in <a href="#">Signal processing flow</a> 10 Select Downsampling-by-2 as defined in <a href="#">Signal processing flow</a>
11–10 PREMODB[1-0]	Pre-Processing Configuration for Conversion Pair B These bits will be read/write by user if ASRCR:ATSB=0, and can also be automatically updated by the ASRC internal logic if ASRCR:ATSB=1 (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ). These bits set the selection of the pre-processing configuration.  00 Select Upsampling-by-2 as defined in <a href="#">Signal processing flow</a> 01 Select Direct-Connection as defined in <a href="#">Signal processing flow</a> 10 Select Downsampling-by-2 as defined in <a href="#">Signal processing flow</a> 11 Select passthrough mode. 9–8 POSTMODA[1-0]	Post-Processing Configuration for Conversion Pair A These bits will be read/write by user if ASRCR:ATSA=0, and can also be automatically updated by the ASRC internal logic if ASRCR:ATSA=1 (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ). These bits set the selection of the post-processing configuration.  00 Select Upsampling-by-2 as defined in <a href="#">Signal processing flow</a> 01 Select Direct-Connection as defined in <a href="#">Signal processing flow</a> 10 Select Downsampling-by-2 as defined in <a href="#">Signal processing flow</a>
7–6 PREMODA[1-0]	Pre-Processing Configuration for Conversion Pair A These bits will be read/write by user if ASRCR:ATSA=0, and can also be automatically updated by the ASRC internal logic if ASRCR:ATSA=1 (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ). These bits set the selection of the pre-processing configuration.  00 Select Upsampling-by-2 as defined in <a href="#">Signal processing flow</a> 01 Select Direct-Connection as defined in <a href="#">Signal processing flow</a> 10 Select Downsampling-by-2 as defined in <a href="#">Signal processing flow</a> 11 Select passthrough mode. In this case, POSTMODA[1-0] have no use.
-	This field is reserved. Reserved. Should be written as zero for compatibility.

### 15.7.5 ASRC Clock Source Register (ASRC\_ASRCR)

The ASRC clock source register (ASRCR) is a 24-bit read/write register that controls the sources of the input and output clocks of the ASRC.

The clock connections are shown in [Figure 1](#) :

**Table 15-14. Bit Clock Definitions**

Bit Clk Name	Definitions
0	ESAI RX clock
1	SSI-1 RX clock
2	SSI-2 RX clock

*Table continues on the next page...*

**Table 15-14. Bit Clock Definitions (continued)**

Bit Clk Name	Definitions
3	SSI-3 RX clock
4	SPDIF RX clock
5	MLB Bit clock
6	bit clock 6 should connect to one of the three pads: KEY_ROW3,GPIO_0,GPIO_18, which is configured by register IOMUXC_ASRC_ASRCCK_CLOCK_6_SELECT_INPUT
7	tied to zero
8	ESAI TX clock
9	SSI-1 TX clock
a	SSI-2 TX clock
b	SSI-3 TX clock
c	SPDIF TX clock
d	bit clock d is configured by spdif1_clk_pred and spdif1_clk_podf in CCM_CDCDR, but it is better to describe it also in CCM spec.

Address: 203\_4000h base + 14h offset = 203\_4014h

11–9 AOCD	Output Clock Divider C Specify the divide ratio of the output clock divider C. The divide ratio may range from 1 to 8 (AOCD[2:0] = 000 to 111).
8–6 AOPC	Output Clock Prescaler C Specify the prescaling factor of the output prescaler C. The prescaling ratio may be any power of 2 from 1 to 128.
5–3 AICD	Input Clock Divider C Specify the divide ratio of the input clock divider C. The divide ratio may range from 1 to 8 (AICD[2:0] = 000 to 111).
AIPC	Input Clock Prescaler C Specify the prescaling factor of the input prescaler C. The prescaling ratio may be any power of 2 from 1 to 128.

### 15.7.8 ASRC Status Register (ASRC\_ASRSTR)

The ASRC status register (ASRSTR) is a 24-bit read-write register used by the processor core to examine the status of the ASRC block and clear the overload interrupt request and AOLE flag bit. Read the status register will return the current state of ASRC.

Address: 203\_4000h base + 20h offset = 203\_4020h

ASRC\_ASRSTR field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.

Table continues on the next page...

**ASRC\_ASRSTR field descriptions (continued)**

<b>Field</b>	<b>Description</b>
23–22 -	This field is reserved. Reserved. Should be written as zero for compatibility.
21 DSL CNT	DSL Counter Input to FIFO ready When set, this bit indicates that new DSL counter information is stored in the internal ASRC FIFO. When clear, this bit indicates that new DSL counter information is in the process of storage into the internal ASRC FIFO. When ASRIER:AFPWE=1, the rising edge of this signal will propose an interrupt request. Writing any value with this bit set will clear the interrupt request proposed by the rising edge of this bit.
20 ATQOL	Task Queue FIFO overload When set, this bit indicates that task queue FIFO logic is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
19 AOOLC	Pair C Output Task Overload When set, this bit indicates that pair C output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
18 AOOLB	Pair B Output Task Overload When set, this bit indicates that pair B output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
17 AOOLA	Pair A Output Task Overload When set, this bit indicates that pair A output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
16 AIOLC	Pair C Input Task Overload When set, this bit indicates that pair C input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
15 AIOLB	Pair B Input Task Overload When set, this bit indicates that pair B input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
14 AIOLA	Pair A Input Task Overload When set, this bit indicates that pair A input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
13 AODOC	Output Data Buffer C has overflowed When set, this bit indicates that output data buffer C has overflowed. When clear, this bit indicates that output data buffer C has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
12 AODOB	Output Data Buffer B has overflowed

*Table continues on the next page...*

## ASRC\_ASRSTR field descriptions (continued)

Field	Description
	When set, this bit indicates that output data buffer B has overflowed. When clear, this bit indicates that output data buffer B has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
11 AODOA	Output Data Buffer A has overflowed When set, this bit indicates that output data buffer A has overflowed. When clear, this bit indicates that output data buffer A has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
10 AIDUC	Input Data Buffer C has underflowed When set, this bit indicates that input data buffer C has underflowed. When clear, this bit indicates that input data buffer C has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
9 AIDUB	Input Data Buffer B has underflowed When set, this bit indicates that input data buffer B has underflowed. When clear, this bit indicates that input data buffer B has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
8 AIDUA	Input Data Buffer A has underflowed When set, this bit indicates that input data buffer A has underflowed. When clear, this bit indicates that input data buffer A has not underflowed. The bit is cleared when writing ASRSTR:AOLE as 1.
7 FPWT	FP is in wait states This bit is for debug only. When set, this bit indicates that ASRC is in wait states. When clear, this bit indicates that ASRC is not in wait states.
6 AOLE	Overload Error Flag When set, this bit indicates that the task rate is too high for the ASRC to handle. The reasons for overload may be: <ul style="list-style-type: none"> <li>- too high input clock frequency,</li> <li>- too high output clock frequency,</li> <li>- incorrect selection of the pre-filter,</li> <li>- low ASRC processing clock,</li> <li>- too many channels,</li> <li>- underrun,</li> <li>- or any combination of the reasons above.</li> </ul> Since the ASRC uses the same hardware resources to perform various tasks, the real reason for the overload is not straight forward, and it should be carefully analyzed by the programmer. If ASRIER:AOLIE=1, an interrupt will be proposed when this bit is set. Write any value with this bit set as one into the status register will clear this bit and the interrupt request proposed by this bit.
5 AODFC	Number of data in Output Data Buffer C is greater than threshold

*Table continues on the next page...*

**ASRC\_ASRSTR field descriptions (continued)**

Field	Description
	When set, this bit indicates that number of data already existing in ASRDORC is greater than threshold and the processor can read data from ASRDORC. When AODFC is set, the ASRC generates data output C interrupt request to the processor, if enabled (that is, ASRIER:ADOEC = 1). A DMA request is always generated when the AODFC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
4 AODFB	Number of data in Output Data Buffer B is greater than threshold  When set, this bit indicates that number of data already existing in ASRDORB is greater than threshold and the processor can read data from ASRDORB. When AODFB is set, the ASRC generates data output B interrupt request to the processor, if enabled (that is, ASRIER:ADOEB = 1). A DMA request is always generated when the AODFB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
3 AODFA	Number of data in Output Data Buffer A is greater than threshold  When set, this bit indicates that number of data already existing in ASRDORA is greater than threshold and the processor can read data from ASRDORA. When AODFA is set, the ASRC generates data output A interrupt request to the processor, if enabled (that is, ASRIER:ADOEA = 1). A DMA request is always generated when the AODFA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
2 AIDEC	Number of data in Input Data Buffer C is less than threshold  When set, this bit indicates that number of data still available in ASRDIRC is less than threshold and the processor can write data to ASRDIRC. When AIDEC is set, the ASRC generates data input C interrupt request to the processor, if enabled (that is, ASRIER:ADIEC = 1). A DMA request is always generated when the AIDEC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
1 AIDEB	Number of data in Input Data Buffer B is less than threshold  When set, this bit indicates that number of data still available in ASRDIRB is less than threshold and the processor can write data to ASRDIRB. When AIDEB is set, the ASRC generates data input B interrupt request to the processor, if enabled (that is, ASRIER:ADIEB = 1). A DMA request is always generated when the AIDEB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
0 AIDEA	Number of data in Input Data Buffer A is less than threshold  When set, this bit indicates that number of data still available in ASRDIRA is less than threshold and the processor can write data to ASRDIRA. When AIDEA is set, the ASRC generates data input A interrupt request to the processor, if enabled (that is, ASRIER:ADIEA = 1). A DMA request is always generated when the AIDEA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.

**15.7.9 ASRC Parameter Register n (ASRC\_ASRPMnn)**

Parameter registers determine the performance of ASRC.

The parameter registers must be initialized by software before ASRC is enabled. Recommended values are given in [ASRC Misc Control Register 1 for Pair C](#) below,

**Table 15-21. ASRC Parameter Registers (ASRPM1~ASRPM5)**

Register	Offset	Access	Reset Value	Recommend Value
asrcpm1	0x40	R/W	0x00_0000	0x7fffff
asrcpm2	0x44	R/W	0x00_0000	0x255555
asrcpm3	0x48	R/W	0x00_0000	0xff7280
asrcpm4	0x4C	R/W	0x00_0000	0xff7280
asrcpm5	0x50	R/W	0x00_0000	0xff7280

Address: 203\_4000h base + 40h offset + (4d × i), where i=0d to 4d

**ASRC\_ASRPMnn field descriptions**

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
PARAMETER_VALUE	See recommended values table.

**15.7.10 ASRC ASRC Task Queue FIFO Register 1 (ASRC\_ASRTFR1)**

The register defines and shows the parameters for ASRC inner task queue FIFOs.

Address: 203\_4000h base + 54h offset = 203\_4054h

**ASRC\_ASRTFR1 field descriptions**

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–20 -	This field is reserved. Reserved. Should be written as zero for compatibility.

*Table continues on the next page...*

**ASRC\_ASRTFR1 field descriptions (continued)**

Field	Description
19–13 TF_FILL	Current number of entries in task queue FIFO.
12–6 TF_BASE	Base address for task queue FIFO. Set to 0x7C.
-	This field is reserved. Reserved. Should be written as zero for compatibility.

**15.7.11 ASRC Channel Counter Register (ASRC\_ASRCCR)**

The ASRC channel counter register (ASRCCR) is a 24-bit read/write register that sets and reflects the current specific input/output FIFO being accessed through shared peripheral bus for each ASRC conversion pair.

Address: 203\_4000h base + 5Ch offset = 203\_405Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

23–8 -	This field is reserved. Reserved
IDRATIOA[31:24]	IDRATIOA[31:24]. High part of ideal ratio value for pair A

### 15.7.15 ASRC Ideal Ratio for Pair A -Low Part (ASRC\_ASRIDRLA)

The ideal ratio registers (ASRIDRHA, ASRIDRLA) hold the ratio value IDRATIOA.  $IDRATIOA = F_{s_{inA}}/F_{s_{outA}} = T_{s_{outA}}/T_{s_{inA}}$  is a 32-bit fixed point value with 26 fractional bits. This value is only useful when ASRCRTR:{USRA, IDRA}=2'b11.

Address: 203\_4000h base + 84h offset = 203\_4084h

#### ASRC\_ASRIDRLA field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
IDRATIOA[23:0]	IDRATIOA[23:0]. Low part of ideal ratio value for pair A

### 15.7.16 ASRC Ideal Ratio for Pair B-High Part (ASRC\_ASRIDRHB)

The ideal ratio registers (ASRIDRHB, ASRIDRLB) hold the ratio value IDRATIOB.  $IDRATIOB = F_{s_{inB}}/F_{s_{outB}} = T_{s_{outB}}/T_{s_{inB}}$  is a 32-bit fixed point value with 26 fractional bits. This value is only useful when ASRCRTR:{USRB, IDRB}=2'b11.

Address: 203\_4000h base + 88h offset = 203\_4088h

#### ASRC\_ASRIDRHB field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.

Table continues on the next page...

## ASRC\_ASRIDRHB field descriptions (continued)

Field	Description
23–8 -	This field is reserved. Reserved
IDRATIOB[31:24]	IDRATIOB[31:24]. High part of ideal ratio value for pair B.

## 15.7.17 ASRC Ideal Ratio for Pair B-Low Part (ASRC\_ASRIDRLB)

The ideal ratio registers (ASRIDRHB, ASRIDRLB) hold the ratio value IDRATIOB.  $IDRATIOB = F_{S_{inB}}/F_{S_{outB}} = T_{S_{outB}}/T_{S_{inB}}$  is a 32-bit fixed point value with 26 fractional bits. This value is only useful when  $ASRC_{CTR}:\{USRB, IDRB\}=2'b11$ .

Address: 203\_4000h base + 8Ch offset = 203\_408Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								IDRATIOB[23:0]																							
W	Reserved								IDRATIOB[23:0]

**ASRC\_ASRIDRHC field descriptions**

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–8 -	This field is reserved. Reserved
IDRATIOC[31:24]	IDRATIOC[31:24]. High part of ideal ratio value for pair C.

**15.7.19 ASRC Ideal Ratio for Pair C-Low Part (ASRC\_ASRIDRLC)**

The ideal ratio registers (ASRIDRHC, ASRIDRLC) hold the ratio value IDRATIOC.  $IDRATIOC = F_{s_{inC}}/F_{s_{outC}} = T_{s_{outC}}/T_{s_{inC}}$  is a 32-bit fixed point value with 26 fractional bits. This value is only useful when  $ASRC_{CTR}:\{USRC, IDRC\}=2'b11$ .

Address: 203\_4000h base + 94h offset = 203\_4094h

**ASRC\_ASRIDRLC field descriptions**

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
IDRATIOC[23:0]	IDRATIOC[23:0]. Low part of ideal ratio value for pair C.

## 15.7.20 ASRC 76kHz Period in terms of ASRC processing clock (ASRC\_ASR76K)

The register (ASR76K) holds the period of the 76kHz sampling clock in terms of the ASRC processing clock with frequency  $F_{S_{ASRC}}$ .  $ASR76K = F_{S_{ASRC}}/F_{S_{76k}}$ . Reset value is 0x0A47 which assumes that  $F_{S_{ASRC}}=200MHz$ . This register is used to help the ASRC internal logic to decide the pre-processing and the post-processing options automatically (see [ASRC Misc Control Register 1 for Pair C](#) and [ASRC Misc Control Register 1 for Pair C](#)). In a system when  $F_{S_{ASRC}}=133MHz$ , the value should be assigned explicitly as 0x06D6 in user application code.

Address: 203\_4000h base + 98h offset = 203\_4098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASRC\_ASR76K field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–17 -	This field is reserved. Reserved
ASR76K	Value for the period of the 76kHz sampling clock.

### 15.7.21 ASRC 56kHz Period in terms of ASRC processing clock (ASRC\_ASR56K)

The register (ASR56K) holds the period of the 56kHz sampling clock in terms of the ASRC processing clock with frequency  $F_{s_{ASRC}}$ .  $ASR56K = F_{s_{ASRC}}/F_{s_{56k}}$ . Reset value is 0x0DF3 which assumes that  $F_{s_{ASRC}}=200MHz$ . This register is used to help the ASRC internal logic to decide the pre-processing and the post-processing options automatically (see [ASRC Misc Control Register 1 for Pair C](#) and [ASRC Misc Control Register 1 for Pair C](#)). In a system when  $F_{s_{ASRC}}=133MHz$ , the value should be assigned explicitly as 0x0947 in user application code.

Address: 203\_4000h base + 9Ch offset = 203\_409Ch

#### ASRC\_ASR56K field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–17 -	This field is reserved. Reserved
ASR56K	Value for the period of the 56kHz sampling clock

## 15.7.22 ASRC Misc Control Register for Pair A (ASRC\_ASRMCRA)

The register (ASRMCRA) is used to control Pair A internal logic.

Address: 203\_4000h base + A0h offset = 203\_40A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved								ZEROBUFA	EXTTHRSA	BUFSTALLA	BYPASSPOLY A	Reserved		OUTFIFO_ THRESHOL DA[5:0]

### ASRC\_ASRMCRA field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 ZEROBUFA	Initialize buf of Pair A when pair A is enabled. Always clear option. This bit is used to control whether the buffer is to be zeroized when pair A is enabled.  1 Don't zeroize the buffer 0 Zeroize the buffer
22 EXTTHRSA	Use external thresholds for FIFO control of Pair A This bit will determine whether the FIFO thresholds externally defined in this register is used to control ASRC internal FIFO logic for pair A.  1 Use external defined thresholds. 0 Use default thresholds.
21 BUFSTALLA	Stall Pair A conversion in case of Buffer Near Empty/Full Condition This bit will determine whether the near empty/full FIFO condition will stall the rate conversion for pair A. This option can only work when external ratio is used. Near empty condition is the condition when input FIFO has less than 4 useful samples per channel. Near full condition is the condition when the output FIFO has less than 4 vacant sample words to fill per channel.

Table continues on the next page...

## ASRC\_ASRMCRA field descriptions (continued)

Field	Description
	<p>1 Stall Pair A conversion in case of near empty/full FIFO conditions.</p> <p>0 Don't stall Pair A conversion even in case of near empty/full FIFO conditions.</p>
20 BYPASSPOLYA	<p>Bypass Polyphase Filtering for Pair A</p> <p>This bit will determine whether the polyphase filtering part of Pair A conversion will be bypassed.</p> <p>1 Bypass polyphase filtering.</p> <p>0 Don't bypass polyphase filtering.</p>
19–18 -	<p>This field is reserved.</p> <p>Reserved. Should be written as zero for future compatibility.</p>
17–12 OUTFIFO_ THRESHOLDA[5:0]	<p>The threshold for Pair A's output FIFO per channel</p> <p>These bits stand for the threshold for Pair A's output FIFO per channel. Possible range is [0,63].</p> <p>When the value is n, it means that:</p> <p>when the number of output FIFO fillings of the pair is greater than n samples per channel, the output data ready flag is set;</p> <p>when the number of output FIFO fillings of the pair is less than or equal to n samples per channel, the output data ready flag is automatically cleared.</p>
11 RSYNIFA	<p>Re-sync Input FIFO Channel Counter</p> <p>If bit set, force ASRCCR:ACIA=0. If bit clear, untouch ASRCCR:ACIA.</p>
10 RSYNOFA	<p>Re-sync Output FIFO Channel Counter</p> <p>If bit set, force ASRCCR:ACOA=0. If bit clear, untouch ASRCCR:ACOA.</p>
9–6 -	<p>This field is reserved.</p> <p>Reserved. Should be written as zero for future compatibility.</p>
INFIFO_ THRESHOLDA[5:0]	<p>The threshold for Pair A's input FIFO per channel</p> <p>These bits stand for the threshold for Pair A's input FIFO per channel. Possible range is [0,63].</p> <p>When the value is n, it means that:</p> <p>when the number of input FIFO fillings of the pair is less than n samples per channel, the input data needed flag is set;</p> <p>when the number of input FIFO fillings of the pair is greater than or equal to n samples per channel, the input data needed flag is automatically cleared.</p>

### 15.7.23 ASRC FIFO Status Register for Pair A (ASRC\_ASRFSTA)

The register (ASRFSTA) is used to show Pair A internal FIFO conditions.

Address: 203\_4000h base + A4h offset = 203\_40A4h

**ASRC\_ASRFSTA field descriptions**

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 OAF A	Output FIFO is near Full for Pair A This bit is to indicate whether the output FIFO of Pair A is near full.
22–19 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
18–12 OUTFIFO_FILL A[5:0]	The fillings for Pair A's output FIFO per channel These bits stand for the fillings for Pair A's output FIFO per channel. Possible range is [0,64].

Table continues on the next page...

**ASRC\_ASRFSTA field descriptions (continued)**

Field	Description
11 IAEA	Input FIFO is near Empty for Pair A This bit is to indicate whether the input FIFO of Pair A is near empty.
10-7 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
INFIFO_FILLA[5:0]	The fillings for Pair A's input FIFO per channel These bits stand for the fillings for Pair A's input FIFO per channel. Possible range is [0,64].

**15.7.24 ASRC Misc Control Register for Pair B (ASRC\_ASRMCRB)**

The register (ASRMCRB) is used to control Pair B internal logic.

Address: 203\_4000h base + A8h offset = 203\_40A8h

**ASRC\_ASRMCRB field descriptions**

Field	Description
31-24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 ZEROFBUF	Initialize buf of Pair B when pair B is enabled This bit is used to control whether the buffer is to be zeroized when pair B is enabled.  1 Don't zeroize the buffer 0 Zeroize the buffer

Table continues on the next page...

Possible range is [0,63].</p> <p>When the value is n, it means that:</p> <p>when the number of input FIFO fillings of the pair is less than n samples per channel, the input data needed flag is set;</p> <p>when the number of input FIFO fillings of the pair is greater than or equal to n samples per channel, the input data needed flag is automatically cleared.</p>

### 15.7.27 ASRC FIFO Status Register for Pair C (ASRC\_ASRFSTC)

The register (ASRFSTC) is used to show Pair C internal FIFO conditions.

Address: 203\_4000h base + B4h offset = 203\_40B4h

**ASRC\_ASRFSTC field descriptions**

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 O AFC	Output FIFO is near Full for Pair C This bit is to indicate whether the output FIFO of Pair C is near full.
22–19 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
18–12 OUTFIFO_FILLC[5:0]	The fillings for Pair C's output FIFO per channel These bits stand for the fillings for Pair C's output FIFO per channel. Possible range is [0,64].

Table continues on the next page...

**ASRC\_ASRFSTC field descriptions (continued)**

Field	Description
11 IAEC	Input FIFO is near Empty for Pair C This bit is to indicate whether the input FIFO of Pair C is near empty.
10–7 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
INFIFO_FILLC[5:0]	The fillings for Pair C's input FIFO per channel These bits stand for the fillings for Pair C's input FIFO per channel. Possible range is [0,64].

**15.7.28 ASRC Misc Control Register 1 for Pair X (ASRC\_ASRMCR1n)**

The register (ASRMCR1x) is used to control Pair x internal logic (for data alignment etc.).

The bit assignment for all the input data formats is the same as that supported by the SSI.

Address: 203\_4000h base + C0h offset + (4d × i), where i=0d to 2d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**ASRC\_ASRMCR1n field descriptions**

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–12 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
11–9 IWD[2:0]	Data Width of the input FIFO These three bits will determine the bitwidth for the audio data into ASRC All other settings not shown are reserved. 3'b000 24-bit audio data.

*Table continues on the next page...*

**ASRC\_ASRMCR1n field descriptions (continued)**

Field	Description
	3'b001 16-bit audio data. 3'b010 8-bit audio data.
8 IMSB	Data Alignment of the input FIFO This bit will determine the data alignment of the input FIFO.  1 MSB aligned. 0 LSB aligned.
7-3 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
2 OMSB	Data Alignment of the output FIFO This bit will determine the data alignment of the output FIFO.  1 MSB aligned. 0 LSB aligned.
1 OSGN	Sign Extension Option of the output FIFO This bit will determine the sign extension option of the output FIFO.  1 Sign extension. 0 No sign extension.
0 OW16	Bit Width Option of the output FIFO This bit will determine the bit width option of the output FIFO.  1 16-bit output data 0 24-bit output data.

---

# Chapter 16

## Digital Audio Multiplexer (AUDMUX)

### 16.1 Overview

The Digital Audio Multiplexer (AUDMUX) provides a programmable interconnect device for voice, audio, and synchronous data routing between Synchronous Serial Interface Controller (SSI) and audio/voice codec's (also known as coder-decoders) peripheral serial interfaces.

This section includes a top level diagram that shows the functional organization of the block, including all off-chip signals.

AUDMUX allows the users to reconfigure the audio system signal routing through programming, as opposed to altering the PCB design. The full description of the block is in [Functional Description](#).

[Figure 16-1](#) shows the block diagram.

Figure 16-1. AUDMUX Block Diagram

AUDMUX supports single source to single destination connectivity or single source to multiple destination connectivity.

AUDMUX includes two types of interfaces: Internal ports and External ports. Internal ports are hard wired to Synchronous Serial Interface Controller (SSI). The connection between each SSI and AUDMUX's Internal ports cannot be modified, however, routing of the signals connected to each of the internal port can be routed within AUDMUX. External ports are connected to IOMUX module where the ports connect to off-chip audio devices and serial interfaces of other processors. The connectivity of the External port and IOMUX cannot be configured, but the output or input of the signal can be routed easily by setting the appropriate AUDMUX registers.

### 16.1.1 Features

Key features of the block include:

- Three internal ports
- Four external ports
- Full 6-wire SSI interfaces for asynchronous receive and transmit
- Configurable 4-wire (synchronous) or 6-wire (asynchronous) peripheral interfaces
- Independent Tx/Rx Frame sync and clock direction selection for host or peripheral
- Each host interface's capability to connect to any other host or peripheral interface in a point-to-point or point-to-multipoint (network mode)

### 16.1.2 Modes and Operations

The AUDMUX supports the modes described in [Operating Modes](#).

## 16.2 External Signals

The following table describes the external signals of AUDMUX:

**Table 16-1. AUDMUX External Signals**

Signal	Description	Pad	Mode	Direction
AUD3_RXC (RXC)	Receive clock signal	CSI0_DAT10	ALT1	IO
AUD3_RXD (RXD)	Data receive signal	CSI0_DAT7	ALT4	IO
AUD3_RXFS (RXFS)	Receive Frame sync signal	CSI0_DAT11	ALT1	IO
AUD3_TXC (TXC)	Transmit clock signal	CSI0_DAT4	ALT4	IO

*Table continues on the next page...*

Table 16-1. AUDMUX External Signals (continued)

Signal	Description	Pad	Mode	Direction
AUD3_TXD (TXD)	Data transmit signal	CSI0_DAT5	ALT4	IO
AUD3_TXFS (TXFS)	Transmit Frame sync signal	CSI0_DAT6	ALT4	IO
AUD4_RXC (RXC)	Receive clock signal	DISP0_DAT19	ALT4	IO
		SD2_CMD	ALT3	
AUD4_RXD (RXD)	Data receive signal	DISP0_DAT23	ALT3	IO
		SD2_DAT0	ALT3

AUD5_RXD (RXD)	Data receive signal	DISP0_DAT19	ALT3	IO
		KEY_ROW1	ALT2	
AUD5_RXFS (RXFS)	Receive Frame sync signal	DISP0_DAT13	ALT3	IO
		EIM_D24	ALT6	
AUD5_TXC (TXC)	Transmit clock signal	DISP0_DAT16	ALT3	IO
		KEY_COL0	ALT2	
AUD5_TXD (TXD)	Data transmit signal	DISP0_DAT17	ALT3	IO
		KEY_ROW0	ALT2	
AUD5_TXFS (TXFS)	Transmit Frame sync signal	DISP0_DAT18	ALT3	IO
		KEY_COL1	ALT2	
AUD6_RXC (RXC)	Receive clock signal	DISP0_DAT6	ALT3	IO
AUD6_RXD (RXD)	Data receive signal	DI0_PIN4	ALT2	IO
AUD6_RXFS (RXFS)	Receive Frame sync signal	DISP0_DAT5	ALT3	IO
AUD6_TXC (TXC)	Transmit clock signal	DI0_PIN15	ALT2	IO
AUD6_TXD (TXD)	Data transmit signal	DI0_PIN2	ALT2	IO
AUD6_TXFS (TXFS)	Transmit Frame sync signal	DI0_PIN3	ALT2	IO

## 16.3 Clocks

This section provides information about AUDMUX clocking including clock inputs and the clock diagram.

The following table describes the clock source for AUDMUX. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 16-2. AUDMUX Clocks**

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

### 16.3.1 Clock Inputs

The IP Bus read/write clock-peripheral clock (ipg\_clk\_s) is an input to the AUDMUX. It is used for all AUDMUX register accesses. It is driven only when there is an AUDMUX access on the IP Bus.

### 16.3.2 Clock Diagram

The figure below shows the clocking used in the AUDMUX.

**Figure 16-2. AUDMUX Clocking Scheme**

### 16.3.3 Clocking Restrictions

- Since the AUDMUX requires only peripheral clock, it places no restrictions on the bus frequency.
- All registers in the AUDMUX are control registers so their values will not change frequently. These values will be programmed when changing between use cases (not during operation in a particular mode).

## 16.4 Default Register Configuration

There are two configuration registers for each port. Each pair of configuration registers is identical for each port; however, the default values following a reset differ as shown in the Memory Map.

[Default Port Configuration](#), describes the default configuration of the ports.

### 16.4.1 Default Port Configuration

After a reset, each port defaults to normal mode ( $PDCR_n[MODE] = 0$ ) with synchronous timing mode ( $PTCR_n[SYN] = 1$ ) enabled.

The default port-to-port connections are as follows:

- Port 1 to Port 6
  - Port 6 provides the clock and frame sync.
- Port 2 to Port 5
  - Port 5 provides the clock and frame sync.
- Port 3 to Port 4
  - Port 4 provides the clock and frame sync.
- Port 7 to Port 7 (in data loopback mode)
  - Clock and frame syncs are inputs.

## 16.5 Functional Description

This section provides a complete functional description of the AUDMUX.

## 16.5.1 Operating Modes

This section describes all functional operation modes of the AUDMUX.

Figure 16-1 shows the AUDMUX block diagram.

All of the ports are essentially identical; there is no functional difference among Ports 1 through 7. The main difference is whether a port is hard wired to synchronous serial interface (SSI) or hard wired to the chip's pads. Each of the connection is hard wired to specific AUDMUX port. AUDMUX provides flexibility in routing the signal within the module, but all Internal and External port connections are fixed to specific configuration.

All ports can be configured as four- or six-wire interfaces. When configured as a six-wire interface, Receive Frame Sync (RXFS) and Receive Clock (RXC) signals of SSI interface enable the serial interface to be used in asynchronous mode with separate receive and transmit clocks.

AUDMUX supports both Normal mode (not to be confused with SSI's Normal Mode), External Network mode and Internal Network mode. The definition of each mode will be given in the next section.

All ports have a TXRXEN bit to provide flexibility in supporting network mode configurations. The TXRXEN bit reverses the functions of transmit and receive data lines where the transmit line is configured as receive and transmit line to be configured as transmit line. This function is provided so that mastership of the serial bus can be passed among multiple external devices connected to a single port.

In addition to supporting the External Network mode (default), all ports support an internal network mode:

- With internal network mode, single point-to-multipoint network configuration with an arbitrary number of slaves can be supported if the external slaves are put into the high-impedance state (as defined in the SSI network mode protocol) and have pull-up resistors on their TxD pins. (Alternatively, this can be viewed as requiring a pull-up resistor on the corresponding AUDMUX RxD pin.)

Bit clock direction selection enables each port to be configured as a master or slave in the flow.

Possible scenarios include:

- SSI (hard wired to internal port) transmits data to a voice codec and a BT (Blue tooth) codec (both on external Port 4Port 5) and the Bottom Connector (on external Port 5Port 6) simultaneously using network mode. SSI is configured as the master.
- An external processor (external port - Port 4Port 3) drives a voice codec and a BT codec (both on external Port 5Port 4) and the Bottom Connector (on Port 6Port 5) simultaneously using network mode. The external processor is the master.

### 16.5.1.1 Port Receive Data Modes

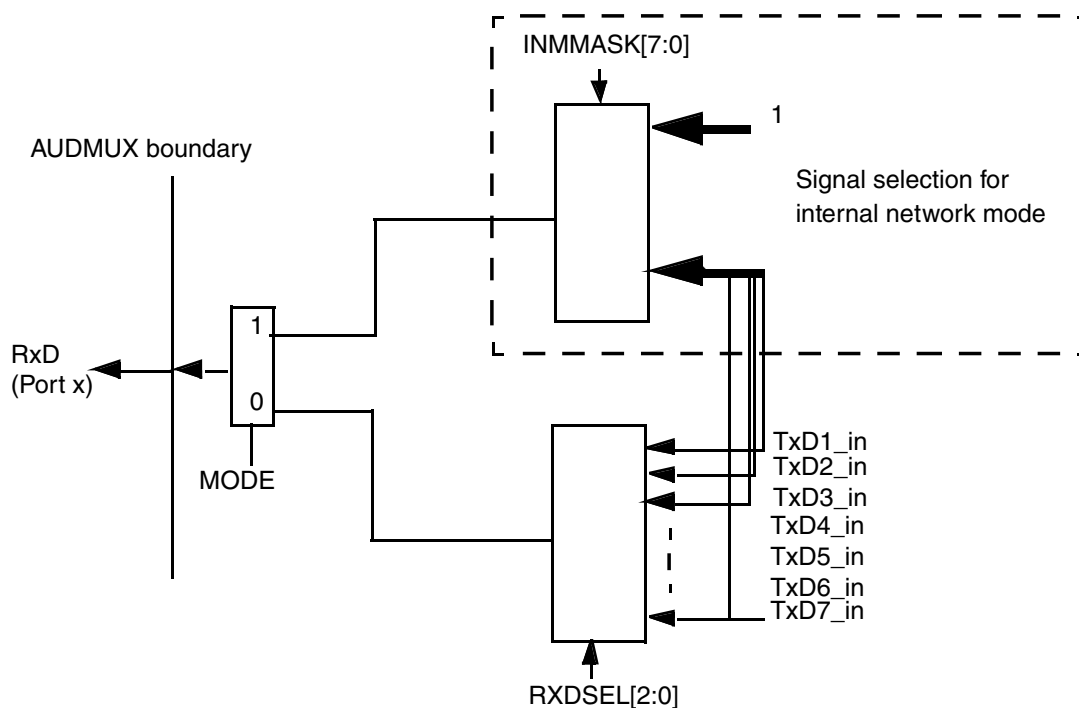

Each port has logic to select which data lines are used to create the RXD line for the corresponding host interface.

Figure 16-3 shows the logic used to create the RXD line for Port 1. This logic has the following modes of operation (as determined by MODE:

- Normal (not to be confused with SSI's normal mode)
- Internal network mode

The subsequent sections describe the various modes of the port receive data logic. The following terms are used to define the operation of the AUDMUX:

- Network mode- Time-Division Multiplexed protocol for sending unique data to multiple devices on a serial bus or single devices with multi-channel capabilities.
- Internal network mode-Physical bus configuration where multiple serial buses are effectively connected within the AUDMUX via digital logic to create point-to-multipoint connectivity. An arbitrary number of devices are supported. Devices must be put into the high-impedance state as specified by the network mode protocol.
- External network mode-Physical bus configuration where multiple serial buses are electrically connected together on a printed circuit board (that is, external to the AUDMUX). Devices must put their TXD lines into the high-impedance state as specified by the network mode protocol. TXD lines of devices must be pulled high.

**Figure 16-3. Receive Data Logic for Port x**

### 16.5.1.1.1 Normal Mode

In normal mode ( $\text{MODE} = 0$ ), not to be confused with SSI's Normal Mode, the port is connected in a single device point-to-single device port configuration (as a master or a slave) and the  $\text{RXDSEL}[2:0]$  setting selects the transmit signal from any port. In normal mode, any data format can be used (that is, SSI normal mode, SSI network mode, AC-97, and others).

If a user wishes to transmit SSI1's data (TXD) to port 5,  $\text{PDCR5}'s \text{RXDSEL}[2:0]$  must be set to 000b. If the clock (TCK) and frame clock (TFS) are sent out to the external device from SSI1,  $\text{PTCR5}'s \text{TFSEL}[3:0]$  and  $\text{TCSEL}[3:0]$  must be set to 0000b (port1) and 0000b (port1), while setting  $\text{PTCR5}'s \text{TFSDIR}$  and  $\text{TCLKDIR}$  to 1.

If either or both of the clocks are to be received from external device to SSI1,  $\text{PTCR5}'s \text{TCLKDIR}$  and/or  $\text{TFSDIR}$  must be set to 0 (input), and  $\text{PTCR1}'s \text{TFSEL}[3:0]$  and/or  $\text{TCLKDIR}[3:0]$  to 0100b (port5).

Likewise, if a user wishes to receive serial data from Port 4 and send the receiving data to SSI2's RXD, one must set  $\text{PDCR2}'s \text{RXDSEL}[2:0]$  to 11b. If the frame (RXFS) and bit clocks (RXC) are to be received from the external device,  $\text{PTCR2}'s \text{RFSEL}[3:0]$  and  $\text{RCSEL}[3:0]$  must be set to 011b while  $\text{PTCR4}'s \text{RFSDIR}$  and  $\text{RCLKDIR}$  set to 0.

### 16.5.1.1.2 Internal Network Mode

In internal network mode (MODE = 1), the output of the AND gate is routed (via the output of the port) to the RXD signal of the corresponding host interface.

The INMMASK bit vector selects the transmit signals of the ports that are to be connected in network mode. The transmit signals received at the AUDMUX ports (TxDn\_in) are ANDed together to form the output. In internal network mode, only one device can be transmitting in its predesignated timeslot and all other transmit signals must remain high (be in high-impedance state and pulled-up). Therefore, non-active signals in the selection will be high and do not influence the output of the AND gate.

Network mode is a protocol where a master SSI is connected to more than one slave SSI device and communication occurs on a time-slotted frame. Though network mode can allow master-slave and slave-slave communication, internal network mode supports only master-slave communication.

There are two scenarios where internal network mode can be used with external network mode:

1. Slave-only devices are attached to an external port.
2. A master device is attached to an external port and all slave devices connected to the same external port are disabled.

#### NOTE

When internal network mode is enabled at an external port, RXDSEL[3:0] for RxDn\_obe selection is ignored and RxD\_obe is always driven high (that is, asserted for all timeslots). All slave devices connected to the same port must be disabled.

#### Internal Network Mode Example 1

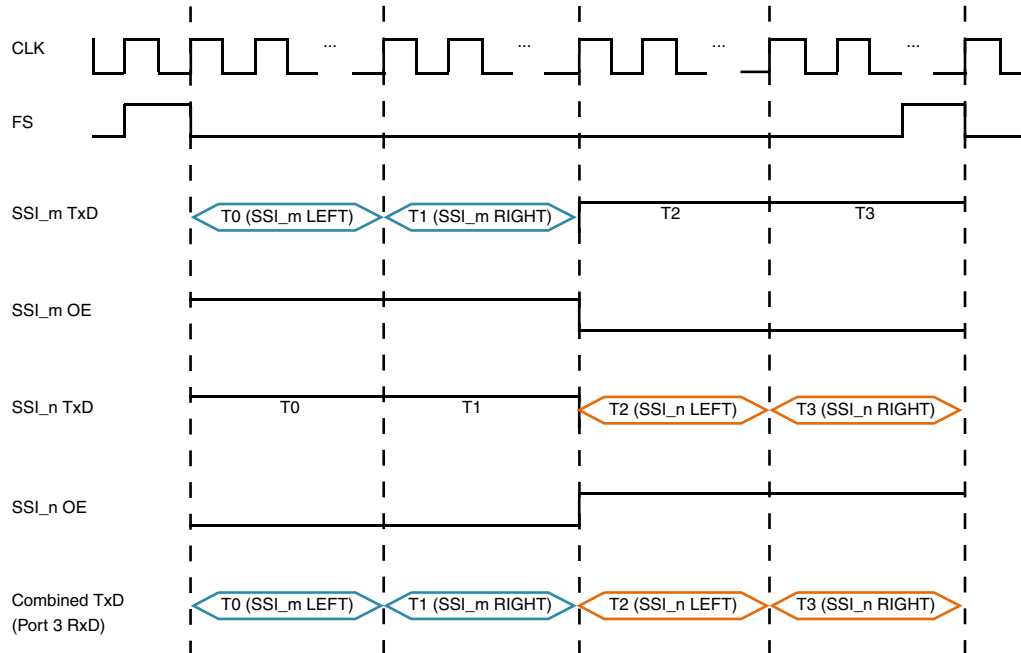

SSI\_m and SSI\_n are used with Port 3 in internal network mode as shown in [Figure 16-4](#). No pull-up resistors are required because the interfaces combined in internal network mode are on-chip interfaces.

**Figure 16-4. Block Diagram For Example 1**

See [Figure 16-5](#) for the timing diagram of Example 1. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

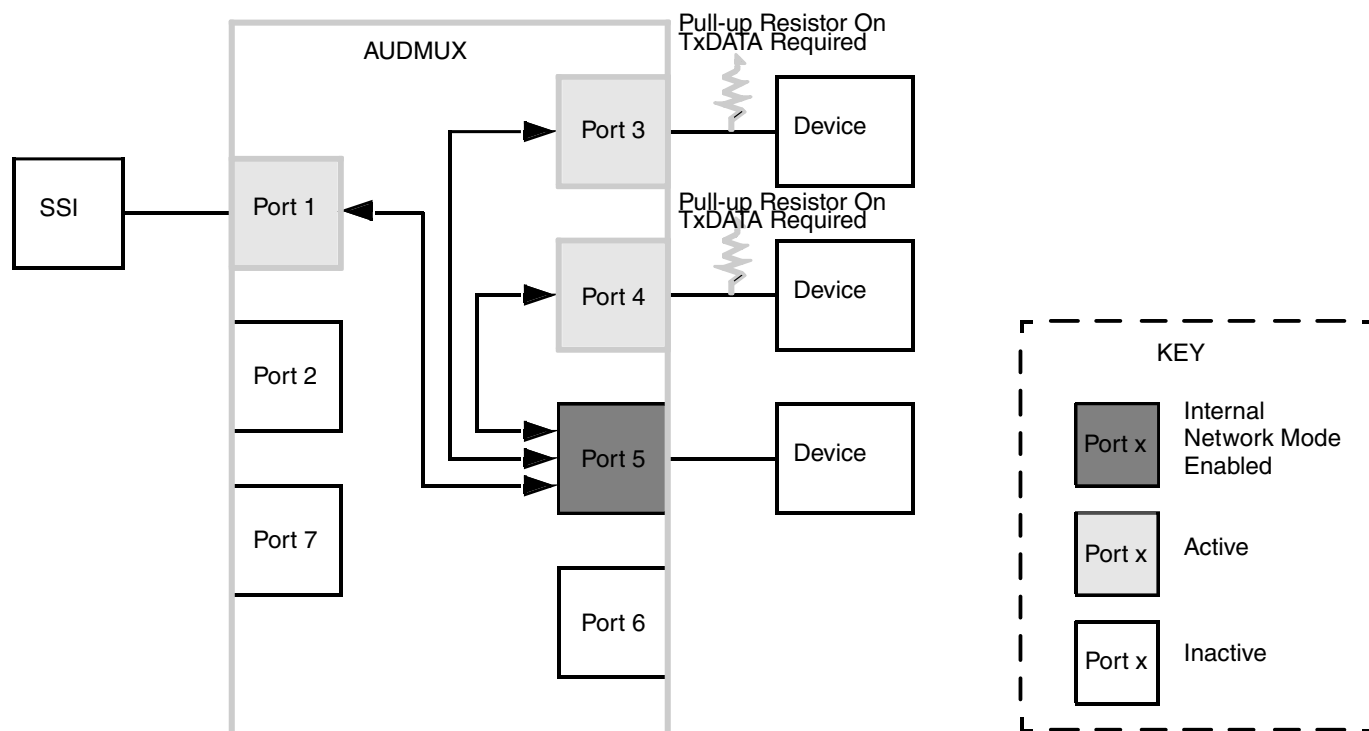

The data lines for SSI\_m and SSI\_n (as well as their output enables) are shown. Note that the on-chip interfaces drive a logic '1' when their output enables are logic '0'. The combined TXD line, which is the logical AND of the individual TXD lines, is used for Port 3's TXD line.

**Figure 16-5. Example Using Internal Ports For Transmit Data**

### Internal Network Mode Example 2

The SSI, Port 3, and Port 4 are used with Port 5 in internal network mode, as shown in the following figure. Note that Port 3 and Port 4 are external ports. Therefore, pull-up resistors are required on the Port 3 RXD and Port 4 RXD pins. This example shows the timing associated with using adjacent timeslots for the SSI, Port 3 and Port 4 .

**Figure 16-6. Block Diagram For Example 2**

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' within half of a period of the bitclock. The required resistance must be no larger than:

$R_{max} = 1 / (2 * f_{bc} * C)$  where:

- $f_{bc}$  is the frequency of the bitclock
- $C$  is the total system capacitance (ICs, board traces, and so on)

The following figure shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI, Port 3 and Port 4 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data lines from Port 3 and Port 4 at the pad are pulled high by pull-up resistors when they are in the high-impedance state. The data lines from Port 3 and Port 4 at the AUDMUX are pure digital signals and are constantly driven. The combined TXD line, which is the logical AND of the SSI, Port 3 and Port 4's TXD lines, is used for Port 5's TXD line.

## Functional Description

Note the highlighted areas in the [Figure 16-7](#). This shows the transition time that occurs while a TXD line is being pulled high. In this example, this transition time is a maximum of 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis should be enabled at Port 3's RXD pad and Port 4's RXD pad to prevent the digital signals created by the pad from toggling rapidly during the pull-up period. The pads typically require a transition within 25ns unless hysteresis is enabled. Instead of using hysteresis, one could select a pull-up resistor sufficiently high to pull-up the signal at the pad within 25 ns; however, that would result in a higher resistance value and higher current drain.

**Figure 16-7. Example Using External Ports for Transmit Data in Consecutive Timeslots**

### Internal Network Mode Example 3

The SSI and Port 3 are used with Port 5 in internal network mode as shown in the following figure. Note that Port 3 is an external port. Therefore, a pull-up resistor is required on the Port 3TXD pin. This example shows the timing associated with inserting empty timeslots after the timeslots have been used by external ports.

**Figure 16-8. Block Diagram For Example 3**

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' by the time that the next occupied timeslot occurs. This allows a much weaker pull-up to be used as compared to Example 2. The required resistance must be no larger than:

$R_{max} = (4 * n + 1) / (2 * f_{bc} * C)$  where:

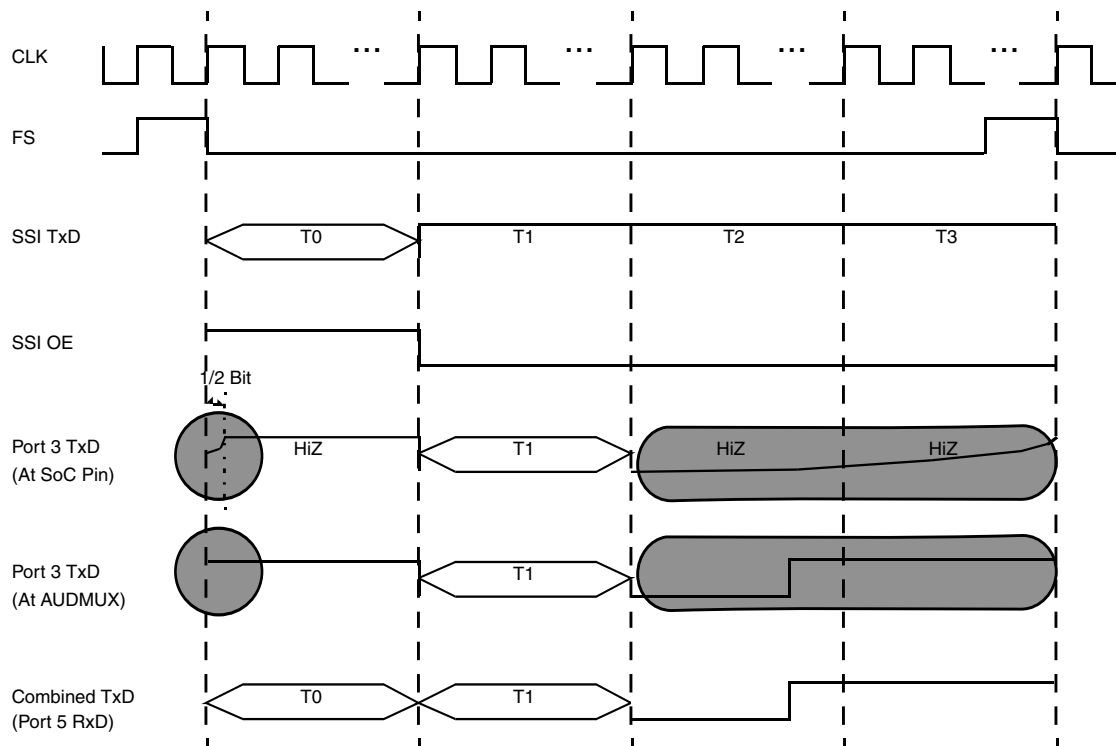

- $n$  is the number of bits per timeslot
- $f_{bc}$  is the frequency of the bitclock
- $C$  is the total system capacitance (ICs, board traces, and so on)

The figure below shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI and Port 3 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data line from Port 3 at the pad is pulled high by a pull-up resistor when they are in the high-impedance state. The data line from Port 3 at the AUDMUX is a pure digital signal and is constantly driven. The combined TXD line, which is the logical AND of the SSI and Port 3's TXD lines, is used for Port 5's RXD line.

Note the highlighted area in the [Figure 16-9](#). This shows the transition time that occurs while Port 3's TXD line is being pulled high. In this example, this transition time is a maximum of two timeslots plus 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis must be enabled at Port 3's RXD pad to prevent the digital signal created by the pad from toggling rapidly during the extended pull-up period. The pads typically require a transition within 25 ns unless hysteresis is enabled.

**Figure 16-9. Example Using External Ports For Transmit Data In Nonconsecutive Timeslots**

### 16.5.1.1.3 Transmit Data Output Enable Assertion

The TXD line from the internal network mode master (connected at any internal port) is put into the high-impedance state at the pad depending upon the assertion or deassertion of TxD\_obe, its corresponding output enable generated by the network mode master.

In the case of an external network mode master (connected at an external port), the corresponding TxD\_obe is always asserted after the port data register configuration.

### 16.5.1.2 Tx/Rx Switch and External Network Mode

External network mode is the traditional network mode connection. It is called external network mode to differentiate from the internal network mode. In external network mode, devices are connected to a single external port in a star or multi-drop configuration.

In network mode, there can be only one master (driving the frame sync and clock source) with the other devices configured in normal slave mode or network slave mode. Unlike internal network mode, both master-slave and slave-slave communication can take place in external network mode. Codec devices transmit on a single timeslot while processor serial interfaces (that is, SSI) can process more than one timeslot of data while in network master or slave mode.

The following figure shows the Tx/Rx data switch. `RxD_obe` is the output buffer enable signal and `RxD_out` is the data transmit signal from the serial interface. The `TxD_in` signal is the receive data signal going towards the `RXDSEL` muxes of all ports.

`D_TxRx` is the data pin which serves as the chip-level transmit data pin when the TxRx switch is not enabled. `D_RxTx` is the data pin which serves as the chip-level receive data pin when the TxRx switch is not enabled. The roles of these pins are reversed when the TxRx switch is enabled.

When `TXRXEN` is disabled (`TXRXEN=0`), `RxD_out` is routed to `D_TxRx` and `D_RxTx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Db_obe`.

When the Tx/Rx switch is enabled (`TXRXEN=1`), `RxD_out` is routed to `D_RxTx` and `D_TxRx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Da_obe`.

If the `RXDSELn[2:0]` field for any Port *n* is configured to select data from an internal port, the output buffer enable is selected by `RXDSELn[2:0]` and is routed to `Dan_obe/Dbn_obe`. In the case when the `RXDSELn[2:0]` field for Port *n* is configured to select data from an external port, the output buffer enable is always high and routed to `Dan_obe/Dbn_obe`, depending on the `TXRXENn` switch configuration.

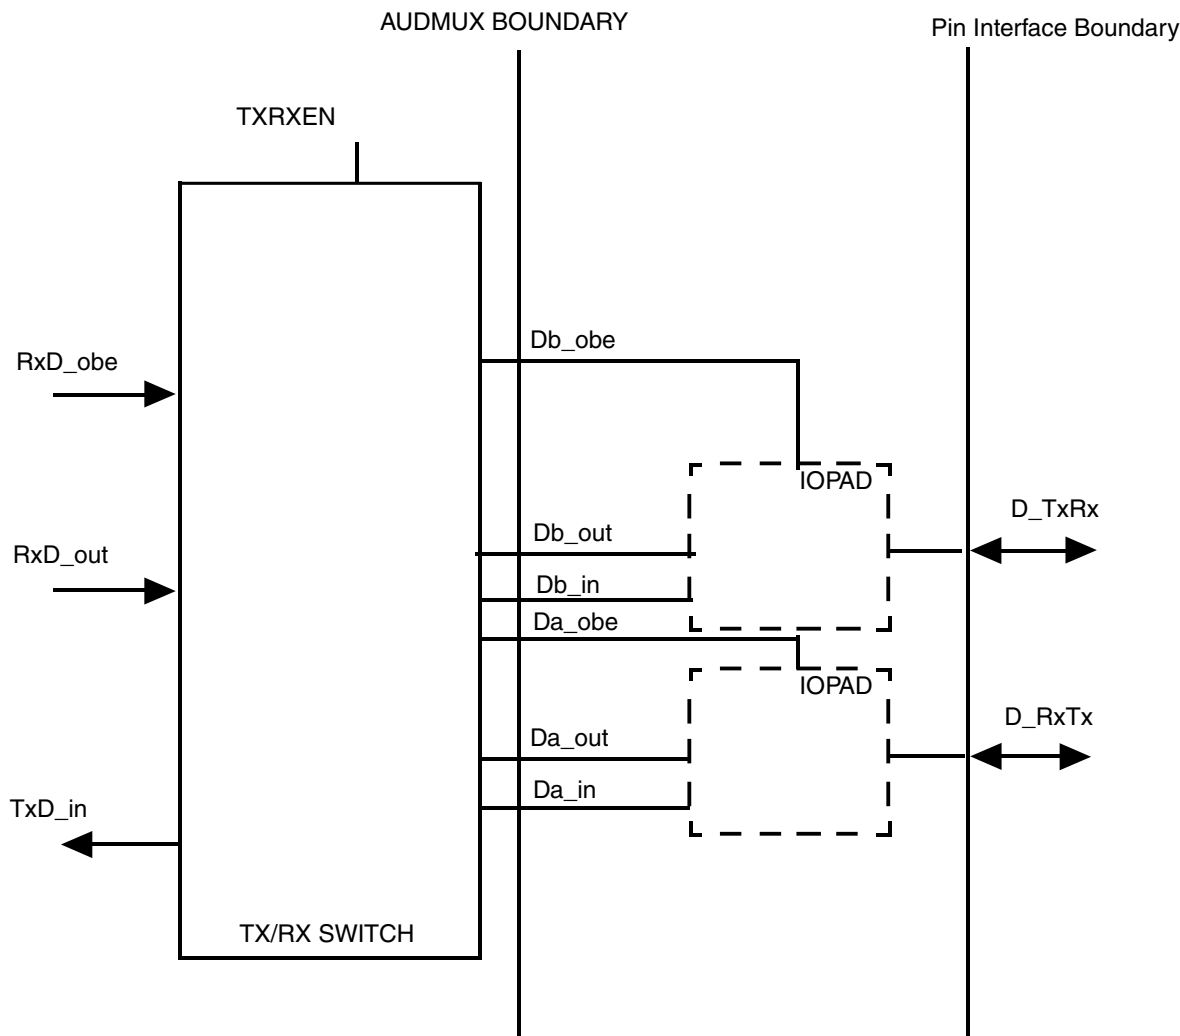

Figure 16-10. Tx/Rx Switch

### 16.5.1.3 Timing Modes

The AUDMUX ports are constructed as 6-wire interfaces. However, they can be used either in synchronous or asynchronous modes as determined by the SYN bit.

#### 16.5.1.3.1 Synchronous Mode (4-Wire Interface)

In Synchronous mode, each port set in SYN=1 will be a 4-wire interface (that is, RXD, TXD, TXC, TXFS). In this setup, receive data timing is determined by TXC and TXFS..

As shown in the following figure, SSI signals interfaced to Port x signals are routed to Port y. When SYN = 1 the 6-wire signal from SSI is reduced to 4-wire within the internal logic.

TFS\_in, RFS\_in, TCLK\_in, and RCLK\_in are the input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (\_obe). TFS\_out, RFS\_out, TCLK\_out, and RCLK\_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

The TFS\_out and TCLK\_out are selected at Port x by the TFSEL and TCSEL mux settings, respectively. RFS\_out and RCLK\_out are selected at Port x by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, Port y is configured as a 4-wire port; TFSEL selects the FS\_obe and FS\_out signals. In this mode, the configuration of RFSEL and RCSEL is not used, since the RFS\_out and RCLK\_out pins at Port y are not available.

Figure 16-11. Frame Sync and Clock Routing When External Port Is 4-Wire

### 16.5.1.3.2 Asynchronous Mode (6-Wire Interface)

In Asynchronous mode, the port has a 6-wire interface (meaning RXD, TXD, TXC, TXFS, RXC, RXFS). This mode has additional receive clock (RXC) and frame sync (RXFS) signals as compared to the synchronous or 4-wire interface.

As shown in the figures below, Port x signals can be routed to Port y, producing 6-wire to 6-wire port connectivity.

TFS\_in, RFS\_in, TCLK\_in, and RCLK\_in are input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (\_obe). TFS\_out, RFS\_out, TCLK\_out, and RCLK\_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

TFS\_out and TCLK\_out are selected by the TFSEL and TCSEL mux settings, respectively. RFS\_out and RCLK\_out are selected by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, the TFSEL selects the TxFS\_obe and TxFS\_out signals and TCSEL selects the TxCLK\_obe and TxClk\_out signals. The RFSEL selects the RxFS\_obe and RxFS\_out signals and RCSEL selects the RxCLK\_obe and RxCLK\_out signals.

### NOTE

Because FS\_in and CLK\_in from external interfaces are also routed to the TFSEL and TCSEL muxes of the external ports, these signals do not have corresponding buffer enable signals. Consequently, their corresponding inputs to the TFSEL and TCSEL mux of the external ports have to be tied high.

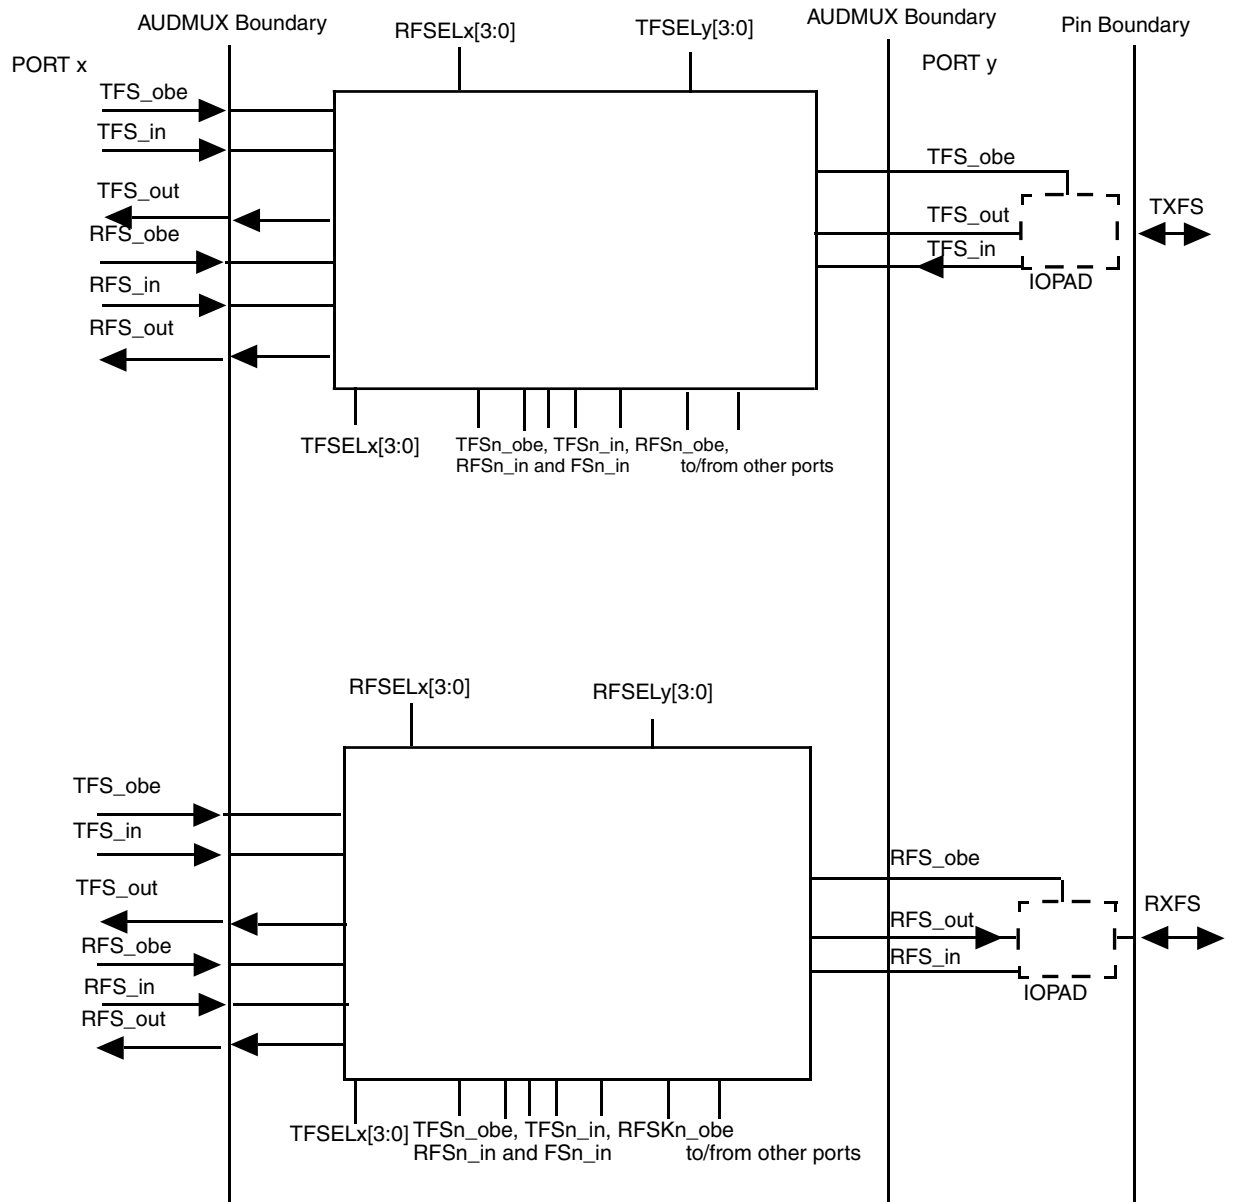

Figure 16-12. Frame Sync Routing When External Port Is 6-Wire

Figure 16-13. Clock Routing When External Port Is 6 Wire

### 16.5.2 Connectivity Between Ports

Four basic types of connections are provided by the AUDMUX:

- Internal port to external port
- External port to external port
- Internal port to internal port
- Loopback

The corresponding data connections are described in the following sections.

### 16.5.2.1 Internal Port to External Port Connectivity

The internal port is connected to a processor's serial interface. TxD\_obe is the buffer enable signal from the serial interface, TxD\_in is the input transmit data from the serial interface to the AUDMUX, and RxD\_out is the receive data output from the AUDMUX to the serial interface.

RXDSEL[2:0] of the external port selects the buffer enable signal (TxD\_obe) and transmit data output (TxD\_out) signal from the TxD\_obe and RxD\_in signals. RXDSEL[2:0] is a common signal to both selection muxes.

#### NOTE

Because buffer TxD\_in signals from external interfaces do not have corresponding buffer enable signals, their buffer enable signals into the selection mux are tied high. This will ensure that selection of TxD\_in, as RxD\_out will also drive the RxD\_obe output high.

Transmit Data from the serial interface goes into the RXDSEL data mux and comes out as RxD\_out. RxD\_out is routed to Da\_TxRx when TXRXEN is disabled and to D\_RxTx when TXRXEN is enabled. Similarly, D\_RxTx is routed to TxD\_in when TXRXEN is disabled and D\_TxRx is routed to TxD\_in when TXRXEN is enabled. The routing of frame syncs is shown in [Figure 16-12](#) and the routing of interface clocks is shown in [Figure 16-10](#).

If internal network mode is disabled, then RXDSEL selects the TxD\_in, which is sent from the AUDMUX to the serial interface connected at Port x. When the internal network mode is selected, RxD\_out is constructed by ANDing selected TxD\_in signals from the ports (as determined by INMMASK).

If there is more than one device attached to the external port at D\_TxRx and D\_RxTx and one of the devices is a network master, then two conditions must be noted:

1. When the external master is enabled in network mode, then the serial interface at Port x must be configured as a slave (normal or network mode). No Tx/Rx switching is required.
2. When the external master is disabled and the serial interface at Port x and other slave devices must communicate, then the serial interface at Port x must be configured as a network mode master and the Tx/Rx switch at Port y must be enabled (TXRXEN=1). This will ensure that the transmit and receive paths are connected appropriately.

To communicate with more than one port, internal network mode can be enabled at Port x. In internal network mode, it is possible to communicate with any device attached to the other ports. Internal network mode shall be enabled at the port that is the SSI network mode master.

### 16.5.2.2 External Port to External Port Connectivity

External ports can communicate with external ports directly.

External ports can communicate together in three ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. Since an external port is being used as the internal network mode master, all other devices on the same AUDMUX port as the internal network mode master must be disabled. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

### 16.5.2.3 Internal Port to Internal Port Connectivity

Internal ports can communicate with other internal ports directly, thereby providing a means for synchronous interprocessor communication.

Internal ports can communicate together in two ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

### 16.5.2.4 Loopback Connectivity

AUDMUX ports can communicate with themselves in order to provide loopback functionality. Port x can route its TXD signal to its own RxD\_out signal by setting RXDSELx[2:0] to its own port number. This is supported by all ports in the AUDMUX.

In addition, ports can provide loopback support in internal network mode. With internal network mode, the internal network mode master can loop its TXD signal (combined with those of other ports, if desired) back into its RxD\_out signal. Port x's INMMASK should be set such that bit (x - 1) is clear in order to enable the loopback.

## 16.6 AUDMUX Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a specific sub-block instantiation, see the system memory map in this manual.

The AUDMUX memory map is shown in the following table.

**AUDMUX memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
21D_8000	Port Timing Control Register 1 (AUDMUX_PTCR1)	32	R/W	AD40_0800h	<a href="#">16.6.1/695</a>
21D_8004	Port Data Control Register 1 (AUDMUX_PDCR1)	32	R/W	0000_A000h	<a href="#">16.6.2/697</a>
21D_8008	Port Timing Control Register 2 (AUDMUX_PTCR2)	32	R/W	A500_0800h	<a href="#">16.6.3/698</a>
21D_800C	Port Data Control Register 2 (AUDMUX_PDCR2)	32	R/W	0000_8000h	<a href="#">16.6.4/700</a>
21D_8010	Port Timing Control Register 3 (AUDMUX_PTCR3)	32	R/W	9CC0_0800h	<a href="#">16.6.5/701</a>
21D_8014	Port Data Control Register 3 (AUDMUX_PDCR3)	32	R/W	0000_6000h	<a href="#">16.6.6/703</a>

## AUDMUX\_PTCR1 field descriptions

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync.  0 TXFS is an input. 1 TXFS is an output.
30–27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced.  0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
26 TCLKDIR	Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock.

Table continues on the next page...

**AUDMUX\_PTCR1 field descriptions (continued)**

Field	Description
	<p>0 TXC is an input.                      1 TXC is an output.</p>
25–22 TCSEL[3:0]	<p>Transmit Clock Select. Selects the source port from which TXC is sourced.</p> <p>0xxx Selects TXC from port.                      1xxx Selects RXC from port.                      x000 Port 1                      x110 Port 7                      x111 Reserved</p>
21 RFS_DIR	<p>Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync.</p> <p>0 RXFS is an input.                      1 RXFS is an output.</p>
20–17 RFSEL[3:0]	<p>Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports.</p> <p>0xxx Selects TXFS from port.                      1xxx Selects RXFS from port.                      x000 Port 1                      x110 Port 7                      x111 Reserved</p>
16 RCLKDIR	<p>Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock.</p> <p><b>NOTE:</b> RCLKDIR and SYN should not be changed at the same time.</p> <p>0 RXC is an input.                      1 RXC is an output.</p>
15–12 RCSEL[3:0]	<p>Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports.</p> <p>0xxx Selects TXC from port.                      1xxx Selects RXC from port.                      x000 Port 1                      x110 Port 7                      x111 Reserved</p>
11 SYN	<p>Synchronous/Asynchronous Select. When SYN is set, synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals (that is, the port is a 4-wire interface). When SYN is cleared, asynchronous mode is chosen and separate clock and frame sync signals are used for the transmit and receive sections (that is, the port is a 6-wire interface).</p> <p><b>NOTE:</b> RCLKDIR and SYN should not be changed at the same time.</p> <p>0 Asynchronous mode                      1 Synchronous mode (default)</p>
Reserved	<p>This read-only field is reserved and always has the value 0.</p>

## 16.6.2 Port Data Control Register 1 (AUDMUX\_PDCR1)

PDCR1 is the Port Data Control Register for Port 1.

Address: 21D\_8000h base + 4h offset = 21D\_8004h

**AUDMUX\_PDCR1 field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 RXDSEL[2:0]	Receive Data Select. Selects the source port for the RXD data. RXDSEL is ignored if MODE = 1 (that is, Internal Network Mode is enabled).  xxx Port number for RXD 000 Port 1 110 Port 7 111 Reserved
12 TXRXEN	Transmit/Receive Switch Enable. Swaps the transmit and receive signals.  0 No switch (Transmit Pin = Transmit, Receive Pin = Receive) 1 Switch (Transmit Pin = Receive, Receive Pin = Transmit)
11–9 Reserved	This read-only field is reserved and always has the value 0.
8 MODE	Mode Select. This field selects the mode in which the port is to operate. The modes of operation include the following: <ul style="list-style-type: none"> <li>Normal mode, in which the RXD from the port selected by RXDSEL is routed to the port.</li> <li>Internal Network mode in which RXD from other ports are ANDed together. RXDSEL is ignored. INMMASK determines which RXD signals are ANDed together.</li> </ul> 0 Normal mode 1 Internal Network mode

Table continues on the next page...

**AUDMUX\_PDCR1 field descriptions (continued)**

Field	Description
INMMASK[7:0]	Internal Network Mode Mask. Bit mask that selects the ports from which the RXD signals are to be ANDed together for internal network mode. Bit 6 represents RXD from Port 7 and bit0 represents RXD from Port 1.  0 Includes RXDn for ANDing 1 Excludes RXDn from ANDing

**16.6.3 Port Timing Control Register 2 (AUDMUX\_PTCR2)**

PTCR2 is the Port Timing Control Register for Port 2.

Address: 21D\_8000h base + 8h offset = 21D\_8008h

**AUDMUX\_PTCR2 field descriptions**

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync.  0 TXFS is an input. 1 TXFS is an output.
30-27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced.  0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved

Table continues on the next page...

## AUDMUX\_PTCR2 field descriptions (continued)

Field	Description
26 TCLKDIR	<p>Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock.</p> <p>0 TXC is an input. 1 TXC is an output.</p>
25–22 TCSEL[3:0]	<p>Transmit Clock Select. Selects the source port from which TXC is sourced.</p> <p>0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved</p>
21 RFS_DIR	<p>Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync.</p> <p>0 RXFS is an input. 1 RXFS is an output.</p>
20–17 RFSEL[3:0]	<p>Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports.</p> <p>0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved</p>
16 RCLKDIR	<p>Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock.</p> <p><b>NOTE:</b> RCLKDIR and SYN should not be changed at the same time.</p> <p>0 RXC is an input. 1 RXC is an output.</p>
15–12 RCSEL[3:0]	<p>Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports.</p> <p>0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved</p>
11 SYN	<p>Synchronous/Asynchronous Select. When SYN is set, synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals (that is, the port is a 4-wire interface). When SYN is cleared, asynchronous mode is chosen and separate clock and frame sync signals are used for the transmit and receive sections (that is, the port is a 6-wire interface).</p> <p><b>NOTE:</b> RCLKDIR and SYN should not be changed at the same time.</p>

*Table continues on the next page...*

**AUDMUX\_PTCR2 field descriptions (continued)**

Field	Description
0	Asynchronous mode
1	Synchronous mode (default)
Reserved	This read-only field is reserved and always has the value 0.

**16.6.4 Port Data Control Register 2 (AUDMUX\_PDCR2)**

PDCR2 is the Port Data Control Register for Port 2.

Address: 21D\_8000h base + Ch offset = 21D\_800Ch

**AUDMUX\_PDCR2 field descriptions**

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 RXDSEL[2:0]	Receive Data Select. Selects the source port for the RXD data. RXDSEL is ignored if MODE = 1 (that is, Internal Network Mode is enabled).  xxx Port number for RXD 000 Port 1 110 Port 7 111 Reserved
12 TXRXEN	Transmit/Receive Switch Enable. Swaps the transmit and receive signals.  0 No switch (Transmit Pin = Transmit, Receive Pin = Receive) 1 Switch (Transmit Pin = Receive, Receive Pin = Transmit)
11–9 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

## AUDMUX\_PDCR2 field descriptions (continued)

Field	Description
8 MODE	<p>Mode Select. This field selects the mode in which the port is to operate. The modes of operation include the following:</p> <ul style="list-style-type: none"> <li>Normal mode, in which the RXD from the port selected by RXDSEL is routed to the port.</li> <li>Internal Network mode in which RXD from other ports are ANDed together. RXDSEL is ignored. INMMASK determines which RXD signals are ANDed together.</li> </ul> <p>0 Normal mode 1 Internal Network mode</p>
INMMASK[7:0]	<p>Internal Network Mode Mask. Bit mask that selects the ports from which the RXD signals are to be ANDed together for internal network mode. Bit 6 represents RXD from Port 7 and bit0 represents RXD from Port 1.</p> <p>0 Includes RXDn for ANDing 1 Excludes RXDn from ANDing</p>

## 16.6.5 Port Timing Control Register 3 (AUDMUX\_PTCR3)

PTCR3 is the Port Timing Control Register for Port 3.

Address: 21D\_8000h base + 10h offset = 21D\_8010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

# Chapter 17

## 40-BIT Correcting ECC Accelerator (BCH)

### 17.1 Overview

The hardware ECC accelerator provides a forward error-correction function for improving the reliability of various storage media that may be attached to the device.

For example, NAND flash devices use a spare area to store ecc codes to correct some hard bit errors in data stored within the device, allowing higher device yields and, therefore, lower NAND device costs.

The Bose, Ray-Chaudhuri, Hocquenghem (BCH) Encoder and Decoder module is capable of correcting from 2 to 40 single bit errors within a block of data no larger than about 1900 bytes (512 bytes or 1024 bytes are typical) in applications such as protecting data and resources stored on modern NAND flash devices. The correction level in the BCH block is programmable to provide flexibility for varying applications and configurations of flash page size. The design can be programmed to encode protection of 2 to 40 bit errors when writing flash and to correct the corresponding number of errors on decode. The correction level when decoding **MUST** be programmed to the same correction level as was used during the encode phase.

BCH-codes are a type of block-code, which implies that all error-correction is performed over a block of N-symbols. The BCH operation will be performed over  $GF(2^{13} = 8192)$  or  $GF(2^{14} = 16384)$ , which is the Galois Field consisting of 8191 or 16383 one-bit symbols. BCH-encoding (or encode for any block-code) can be performed by two algorithms: systematic encoding or multiplicative encoding. Systematic encoding is the process of reading all the symbols which constitute a block, dividing continuously these symbols by the generator polynomial for the  $GF(8192)$  or  $GF(16384)$  and appending the resulting  $t$  parity symbols to the block to create a BCH codeword (where  $t$  is the number of correctable bits).

The BCH encode process creates  $t \times 13$  (or  $t \times 14$ )-bit parity symbols for each data block when the data is written to the flash device. The parity symbols are written to the flash device after the corresponding data block, and together these are collectively called the codeword. The codeword can be used during the decode process to correct errors that occur in either the data or parity blocks.

The BCH decoder processes code words in a 4-step fashion:

1. Syndrome Calculation (SC): This is the process of reading in all of the symbols of the codeword and continuously dividing by the generator polynomial for the field.  $2 \times t$  syndromes must be calculated for each codeword and inspection of the syndromes determines if there are errors: a non-zero set of syndromes indicates one or more errors. This process is implemented parallel hardware to minimize processing time since it must be done every time the decode is performed.
2. Key Equation Solver (KES): The syndromes represent  $2t$ -linear equations with  $2t$ -unknown variables. The process of solving these equations and selecting from the numerous solutions constitutes the KES module. When the KES block completes its operations, it generates an error locator polynomial ( $\sigma$ ) that is used in the proceeding block to determine the locations and values of the errors.
3. Chien Search (CS): This block takes input from the KES block and uses the Chien Algorithm for finding the locations of the errors based on the error locator polynomial. The method basically involves substituting all 8191 symbols from the GF(8192) or 16383 symbols from the GF(16383) into the locator polynomial. All evaluations that produce a zero solution indicate locations of the various errors. Since each located error corresponds to a single bit, the bit in the original data may be corrected by simply flipping the polarity of the incorrect location.
4. Correction: this block has to convert the symbol index and mask information to memory byte indexes and masks.

The BCH block, shown in the figure, was designed to operate in a pipelined fashion to maximize throughput. Aside from the initial latency to fill the pipeline stages, the BCH throughput is about 7/4 cycles/byte. Thus, the bottleneck in performing NAND reads and error corrections is the BCH rate. Current GPMI read rates are approximately 1/2 cycles/byte maximally for the current generation of NAND flash. Fortunately, BCH has a different master clock from GPMI, this gives some flexibility to match the throughput rate. The CPU is not directly involved in generating parity symbols, checking for errors, or correcting them.

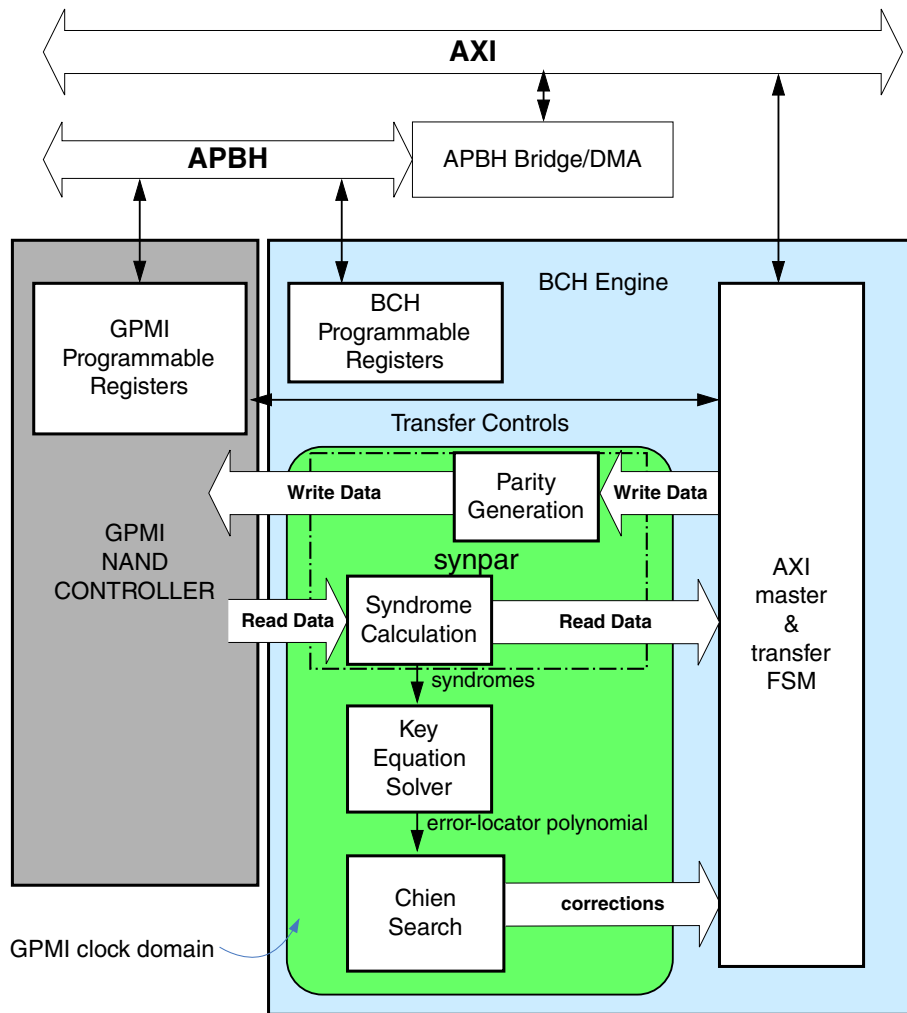

Figure 17-1. Hardware BCH Accelerator

## 17.2 Operation

Before performing any NAND flash read or write operations, software should first program the BCH's flash layout registers (see [Flash Page Layout](#)) to specify how data is to be formatted on the flash device.

The BCH hardware allows full programmability over the flash page layout to enable users flexibility in balancing ECC correction levels and ever-changing flash page sizes.

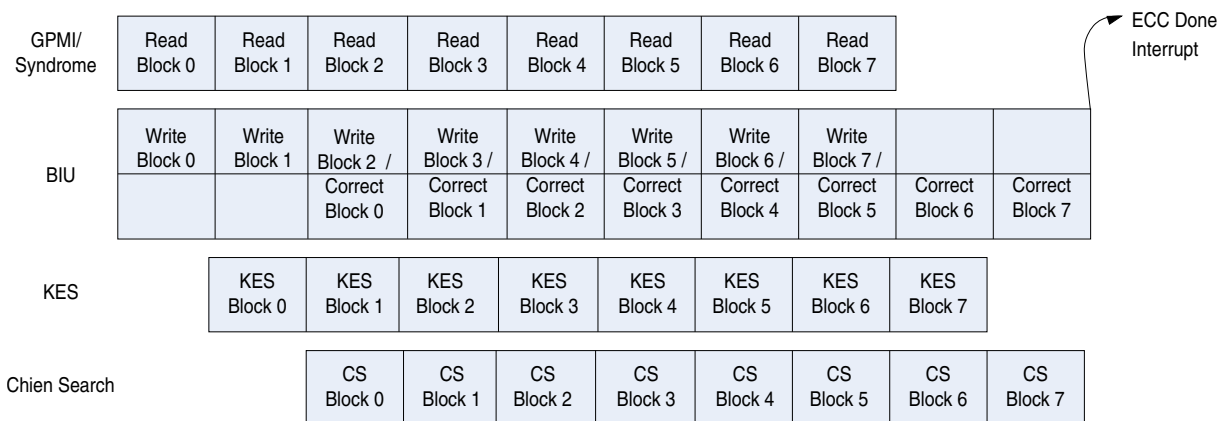

To initiate a NAND Flash write, software will program a GPMI DMA operation. The DMA need only program the GPMI control registers (and handle the requisite flash addressing handshakes) since the BCH will handle all data operations using its AXI bus interface. The BCH will then send the data to the GPMI controller to be written to flash

## Operation

as it computes the parity symbols. At the end of each data block the BCH will insert the parity symbols into the data stream so that the GPMI sees only a continuous stream of data to be written.

NAND Flash read operations operate in a similar manner. As the GPMI controller reads the device, all data is sent to the BCH hardware for error detection/correction. The BCH controller writes all incoming read data to system memory and in parallel computes the syndromes used to detect bit errors. If errors are detected within a block, the BCH hardware activates the error correction logic to determine where bit errors have occurred and ultimately correct them in the data buffer in system memory. After an entire flash page has been read and corrected, the BCH will signal an interrupt to the CPU.

The figure below indicates how data read from the GPMI is operated on within the BCH hardware. As the BCH receives data from the GPMI (top row), it is written to memory by the BCH's Bus Interface Unit (BIU) (second row). For blocks requiring correction, the KES logic will be activated after the entire block has been received. Once the error locator polynomial has been computed, the corrections are determined by the Chien Search and fed back to the BIU, which performs a read, modify, write operation on the buffer in memory to correct the data.

**Figure 17-2. Block Pipeline while Reading Flash**

### 17.2.1 BCH Limitations and Assumptions

- The BCH is programmable to support 2 to 40 bit error correction. ECC0 is supported as a pass-through, non-correcting mode.
- Data block sizes must be a multiple of 4 bytes and be aligned in system memory.
- The BCH supports a programmable number of metadata/auxiliary data bytes, from 0 to 255.

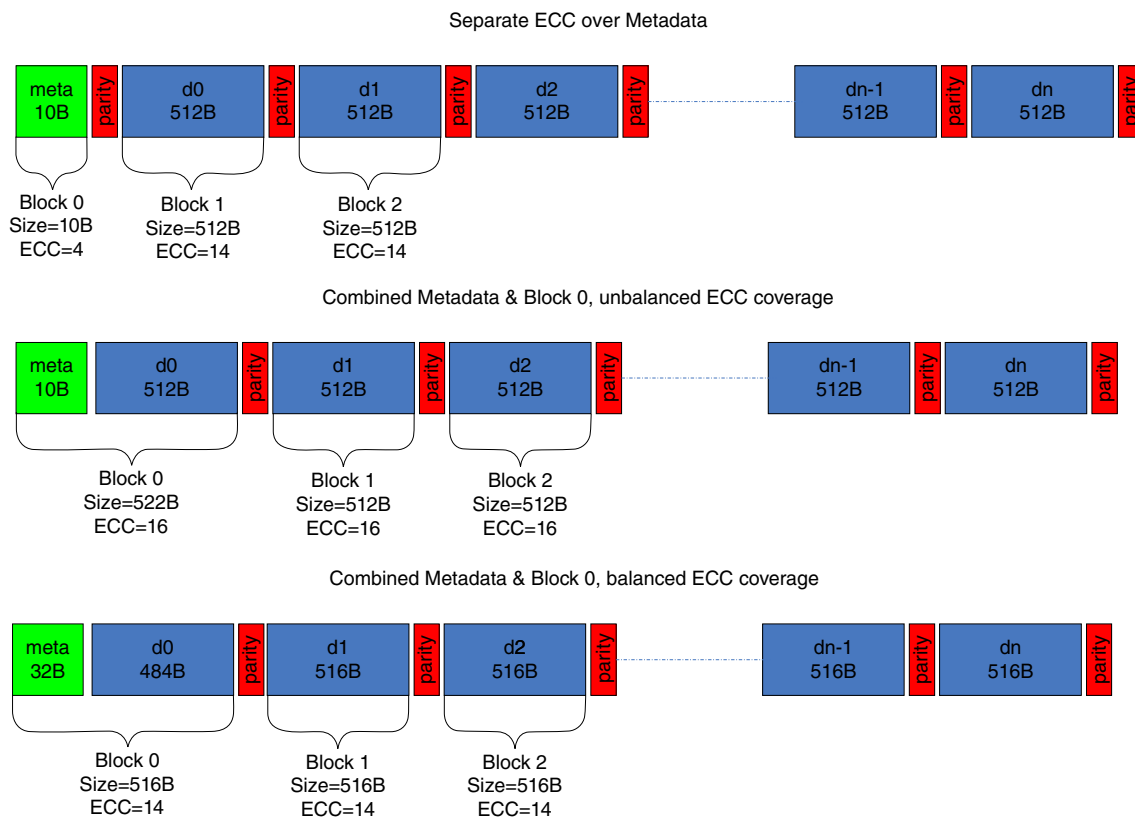

- Metadata will be written at the beginning of the flash page to facilitate fast access for filesystem operations.
- Metadata may be treated as an independent block for ECC purposes or combined with the first data block to conserve bits in the flash.
- The BCH does not support a partial page write (this can be accomplished by programming the BCH layout registers such that the BCH only sees a portion of the page).
- Flash read operations can read the entire page or the first block on the page.
- The BCH also supports a memory-to-memory mode of operation that does not require the use of DMA or the GPMI.

## 17.2.2 Flash Page Layout

The BCH supports a fully programmable flash page layout. The BCH maintains four independent layout registers that can describe four completely different NAND devices or layouts.

When the BCH initiates an operation, it selects one of the layouts by using the chip select as an index into the BCH\_LAYOUTSELECT register that determines which layout should be used for the operation.

Three possible (generic) flash layout schemes are supported, as indicated in the figure below. (In each case, the metadata size may also be programmed to 0 bytes). Metadata may either be combined with the first block of data or the size of the first data block can be programmed to 0 to allow the metadata to be protected by its own ECC parity bits.

**Figure 17-3. FLASH Page Layout Options**

Each layout is determined by a pair of registers that define the following parameters:

- **DATA0\_SIZE:** Indicates the number of data bytes in the first block on the page (this should not include parity or metadata bytes). This should be set to 0 when the metadata is to be covered separately with its own ECC. This must be a multiple of 4 bytes.
- **ECC0:** Indicates the ECC level to be used for the first block on the flash (data0+metadata).
- **META\_SIZE:** Indicates the number of bytes (from 0-255) that are stored as metadata.
- **NBLOCKS:** Indicates the number of subsequent DATAN blocks on the flash, or the number of blocks following the DATA0 block.
- **DATAN\_SIZE:** Indicates the number of data bytes in all subsequent data blocks. This **MUST** be a multiple of 4 bytes.
- **ECCN:** Indicates the ECC level to be used for the subsequent data blocks.

- GF0 or GFN: Indicates the Galois field the meta / data blocks are using
- PAGE\_SIZE: Indicates the total number of bytes available per page on the physical flash device. This includes the spare area and is typically 4096+128, 4096+218, or 2048+64 bytes.

### 17.2.3 Determining the ECC layout for a device

Since the BCH is programmable, a system can trade off ECC levels for flash size and layout configurations.

The following examples indicate how to determine a valid layout based on the required storage space and flash size. For all cases, the size of the parity will be 13 (or 14 for GF(2<sup>14</sup>))\*ECC level *bits*-- so for ECC8, 13 (or 14) bytes are required (per block).

#### 17.2.3.1 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(2<sup>13</sup>)

In this case, we have 8 data blocks each consisting of 512 bytes. Since the flash has 218 spare bytes (1744 bits), first estimate an ECC level for the data blocks by first subtracting the number of metadata bytes from the spare bytes (218 – 10 = 208 bytes = 1664 bits) then dividing the number of bits by 8 (number of blocks) and then by 13 (bits per ECC level).

$$(218 - 10) \times 8 = 1664/13(8) = 16$$

Therefore all the data blocks could be covered by ECC16 if the metadata had no parity. This isn't acceptable, so assume ECC14 for all the data blocks. Now calculate the number of free bits for the metadata parity as

$$1664 - (14) \times 13 \times 8 = 208$$

Therefore, 208 bits remain for metadata parity. Dividing by 13 (bits/ECC) gives 16, so the metadata can be covered with ECC16. The settings for this device would then be

**Table 17-1. Settings for 4K+218 FLASH**

Setting	Value
PAGE_SIZE	4096+218=4314=0x10DA
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	16=0x10

*Table continues on the next page...*

**Table 17-1. Settings for 4K+218 FLASH (continued)**

Setting	Value
GF0	GF(2 <sup>13</sup> )
DATAN_SIZE	512=0x200 (in register interface, assigned as 0x80)
ECCN	14=0x0E
GFN	GF(2 <sup>13</sup> )
NBLOCKS	8

### 17.2.3.2 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(2<sup>13</sup>) for data and GF(2<sup>14</sup>) for metadata

This flash will have 118 bytes available for ECC (after subtracting the metadata size), therefore, 994 bits.

Dividing by 4\*14 (number of blocks \* ECC level) we get 17.75, therefore we can support ECC16 on the data blocks. The number of free spare bits becomes 944 - 16 \* 4 \* 14 = 944 - 896 = 48, divided by 13 = 3.69, therefore the metadata can be also covered by ECC2.

**Table 17-2. Settings for 4K+128 FLASH**

Setting	Value
PAGE_SIZE	4096+128=4224=0x1080
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	2
GF0	GF(2 <sup>13</sup> )
DATAN_SIZE	1024=0x400 (in register interface, assigned as 0x100)
ECCN	16
GFN	GF(2 <sup>14</sup> )
NBLOCKS	4

In this case, there will be additional unused spare bits, with the BCH will pad out with zeros.

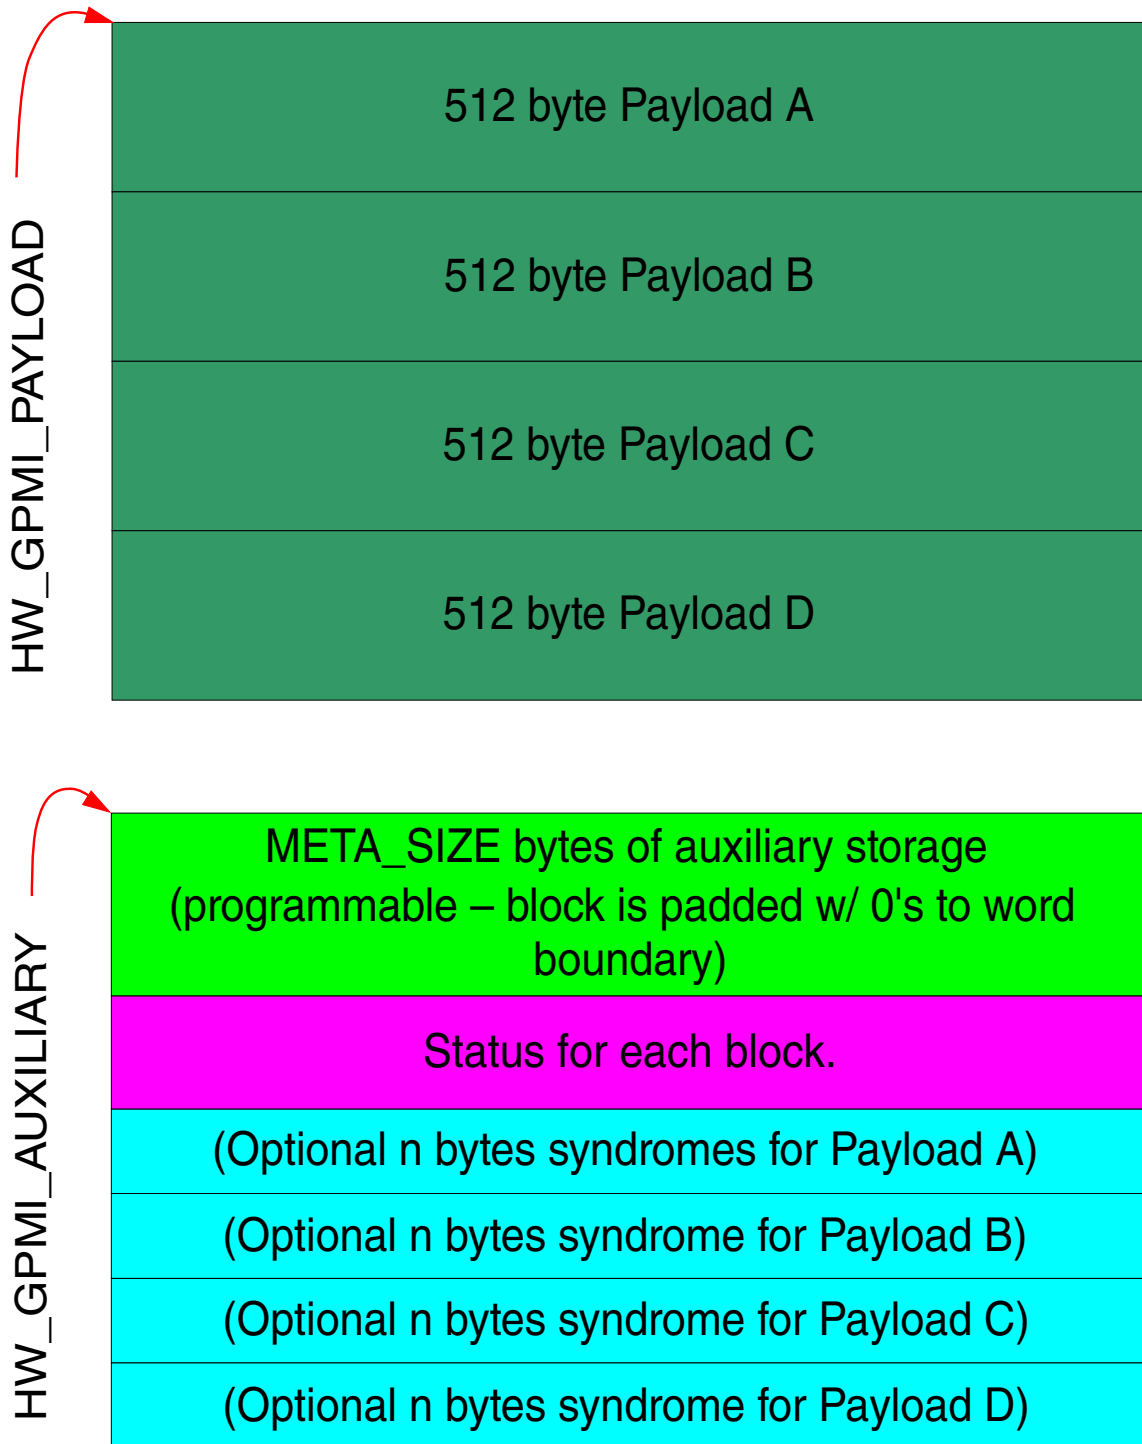

## 17.2.4 Data Buffers in System Memory

While the data on the flash is interleaved with parity symbols, the BCH assumes that the data buffers in memory are contiguous.

Metadata read from the flash will be stored to the location pointed to by the `GPMI_AUXILIARY` register and data will be written to the address specified in the `GPMI_PAYLOAD` register as is shown in the following figure where the block length is 512 bytes for example. Since the number of blocks on a flash page is programmable, the BCH also writes individual block correction status to the auxiliary pointer at the word-aligned address following the end of the metadata. Optionally, the computed syndromes may also be written to the auxiliary area if the `DEBUGSYNDROME` bit is set in the control register.

As blocks complete processing, the bus master will accumulate the status for each block and write it to the auxiliary data buffer following the metadata. The metadata area will be padded with 0's until the next word boundary and the status for blocks 0-3 will be written to the next word. The status for subsequent blocks will then be written to the buffer. The status for the first block (metadata block) is also stored in the `STATUS_BLK0` register in the `BCH_STATUS` register. The completion codes for the blocks are indicated in the [Table 17-3](#). Note that the definition of the bytes and their ordering in the auxiliary and payload storage areas are user defined. When this data is read back from the flash and put into memory, it will resemble the original buffer that was written out to the flash.

### Minimum System Memory Footprint:

*Computed syndrome area consists of 2\*t 13 (or 14)-bit symbols written as 16-bit half word.*

**Figure 17-4. BCH Data Buffers in Memory**

**Table 17-3. Status Block Completion Codes**

Code	Description
0xFF	Block is erased
0xFE	Block is uncorrectable
0x00	No errors found
0x01-0x28	Number of errors corrected

The following figure shows the layout of the bytes within the status field.

Status bytes are allocated based on the NBLOCKS programmed into the flash format register. The number of status bytes will be computed by the NBLOCKS+1. The status area will be padded with zeros to the next word boundary.

Syndrome data written for debug purposes will follow the end of the status block.

**Figure 17-5. Memory-to-Memory Operations**

## 17.3 Memory to Memory (Loopback) Operation

The BCH supports a memory-to-memory mode of operation where both the encoded and decoded buffers reside in system memory.

This can be useful for applications where data must be protected by ECC, but the storage device does not reside on the GPMI bus.

The BCH operation in memory to memory mode is much simpler than in GPMI mode since DMAs are not required to manage the operation. Instead, software simply writes the BCH\_DATAPTR and BCH\_METAPTR with the addresses of the data and metadata (auxiliary) buffers and the BCH\_ENCODEPTR with the address of the buffer for encoded data. To initiate the operation, software simply sets the M2M\_ENCODE and M2M\_ENABLE bits in the control register. The BCH can be programmed to either issue an interrupt at the end of the operation or software may poll the status bits for completion.

Memory to memory decode operations work in a similar manner. The encoded data address is written to the BCH\_ENCODEPTR and the data and meta pointers are written to buffers that correspond to the desired decoded data addresses. To initiate a decode, software must set the M2M\_ENCODE bit to 0 while writing the M2M\_ENABLE bit. Note that the addresses written to the BCH\_DATAPTR, BCH\_METAPTR and BCH\_ENCODEPTR registers should always be aligned on a 4 byte boundary. In other words, the 2 lower bits of the address should always be written with zeros.

## 17.4 Programming the BCH/GPMI Interfaces

Programming the BCH for NAND operations consists largely of disabling the soft reset and clock bits (SFTRST and CLKGATE) from the BCH\_CTRL register and then programming the flash layout registers to correspond to the format of the attached NAND device(s).

The BCH\_LAYOUTSELECT register should also be programmed to map the chip select of each attached device into one of the four layout registers.

The bulk of the programming is actually applied to the GPMI through PIO operations embedded in DMA command structures. The DMA will perform all the requisite handshaking with the GPMI interface to negotiate the address portion of the transfer, then the BCH will handle all the movement of data from memory to the GPMI (writes) or the GPMI to memory (reads). The BCH will direct all data blocks to the buffer pointed to by the PAYLOAD\_BUFFER and the metadata will be written to the AUXILIARY\_BUFFER. Both of these registers are located in the GPMI PIO data space and are communicated to the BCH hardware at the beginning of the transfer. Thus, the normal multi-NAND DMA based device interleaving is preserved, that is, four NANDs on four separate chip selects can be scheduled for read or write operations using the BCH. Whichever channel finishes its ready wait first and enters the DMA arbiter with its lock bit set owns the GPMI command interface and through it owns the BCH resources for the duration of its processing.

## 17.4.1 BCH Encoding for NAND Writes

The BCH encoder flowchart in [Figure 17-6](#) shows the detailed steps involved in programming and using the BCH encoder. This flowchart shows how to use the BCH block with the GPMI.

To use the BCH encoder with the GPMI's DMA, create a DMA command chain containing ten descriptor structures, as shown in [Figure 17-8](#) and detailed in the DMA structure code example that follows it in [DMA Structure Code Example](#). The ten descriptors perform the following tasks:

1. Disable the BCH block (in case it was enabled) and issue NAND write setup command byte (under CLE) and address bytes (under ALE).
2. Configure and enable the BCH and GPMI blocks to perform the NAND write.
3. Disable the BCH block and issue NAND write execute command byte (under CLE).
4. Wait for the NAND device to finish writing the data by watching the ready signal.
5. Check for NAND timeout through PSENSE.
6. Issue NAND status command byte (under CLE).
7. Read the status and compare against expected.
8. If status is incorrect or incomplete, branch to error handling descriptor chain.
9. Otherwise, write is complete and emit GPMI interrupt.

```

## Programming the BCH/GPMI Interfaces

```
last
descriptor
write[8].dma_cmd = BF_APBH_CHn_CMD_XFER_COUNT      (0)      | // no dma transfer
                  BF_APBH_CHn_CMD_CMDWORDS        (0)      | // no words sent to GPMI
                  BF_APBH_CHn_CMD_WAIT4ENDCMD      (0)      | // do not wait to continue
                  BF_APBH_CHn_CMD_SEMAPHORE        (0)
                  BF_APBH_CHn_CMD_NANDWAIT4READY  (0)
                  BF_APBH_CHn_CMD_NANDLOCK         (0)
                  BF_APBH_CHn_CMD_IRQONCMPLT      (1)      | // emit GPMI interrupt
                  BF_APBH_CHn_CMD_CHAIN            (0)      | // terminate DMA chain
processing
                  BV_FLD(APBH_CHn_CMD, COMMAND, NO_DMA_XFER); // no dma transfer
```

### 17.4.1.2 Using the BCH Encoder

To use the BCH encoder, first turn off the module-wide soft reset bit in both the GPMI and BCH blocks before starting any DMA activity.

Turning off the soft reset must take place by itself, prior to programming the rest of the control registers. Turn off the BCH bus master soft reset bit. Turn off the clock gate bits.

Program the remainder of the GPMI, BCH and APBH DMA as follows:

```
// bring APBH out of reset
APBH_CTRL0_CLR(BM_APBH_CTRL0_SFRST);
APBH_CTRL0_CLR(BM_APBH_CTRL0_CLKGATE);

// bring BCH out of reset
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

// bring gpmi out of reset
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_SFTRST);
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_CLKGATE);
GPMI_CTRL1_SET(BM_GPMI_CTRL1_DEV_RESET | // deassert reset
               BM_GPMI_CTRL1_BCH_MODE ); // enable BCH mode

// enable pinctrl
PINCTRL_CTRL_WR(0x00000000);

// enable gpmi pins
PINCTRL_MUXSEL0_CLR(0x0000ffff); // data bits
PINCTRL_MUXSEL1_CLR(0x03ffffff); // control bits
PINCTRL_MUXSEL8_CLR(0x0003f3ff); // control bits
PINCTRL_MUXSEL8_SET(0x00015155); // control bits
```

Note that for writing NANDs (ECC encoding), only GPMI DMA command complete interrupts are used. The BCH engine is used for writing to the NAND but may optionally produce an interrupt. From the sample code in [DMA Structure Code Example](#):

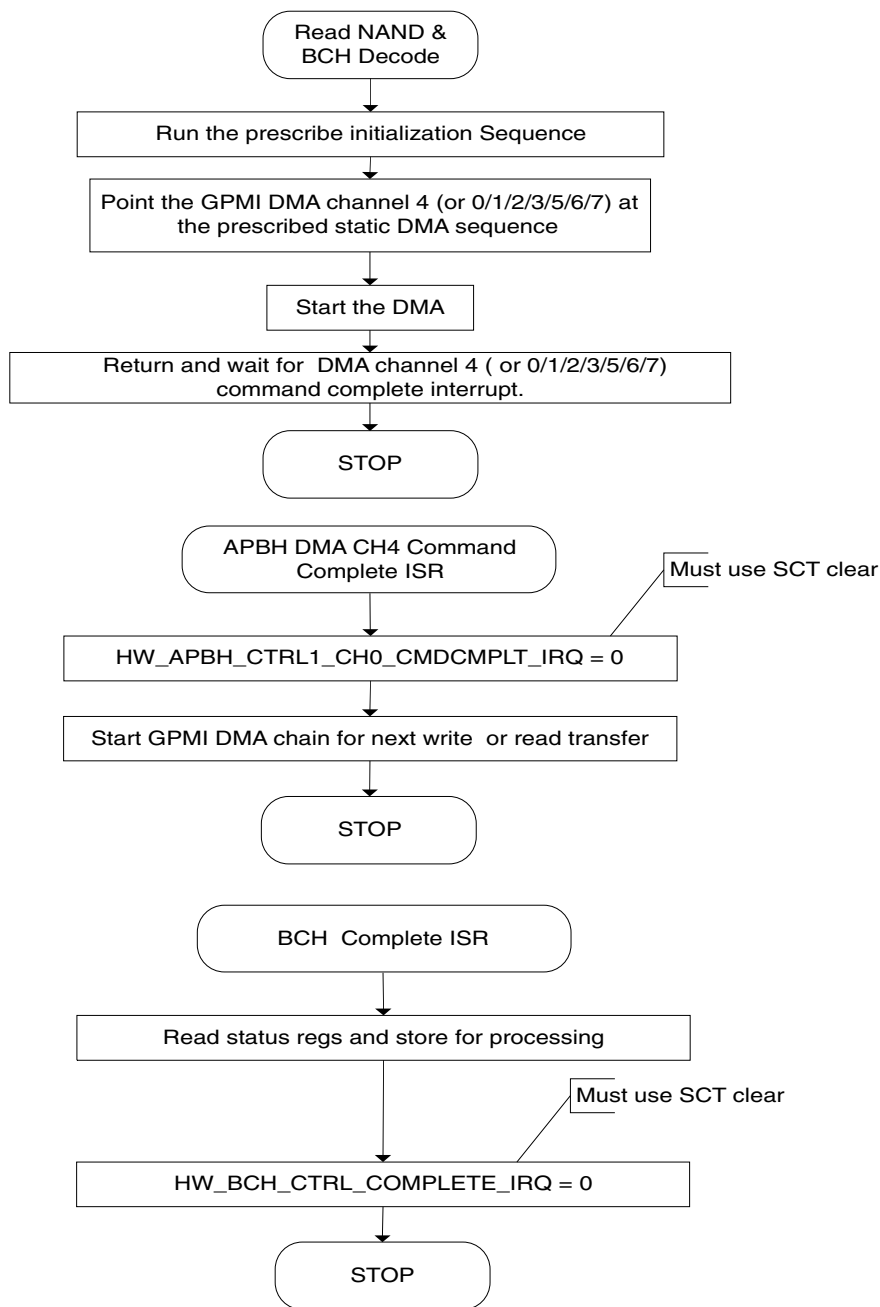

- DMA descriptor 1 prepares the NAND for data write by using the GPMI to issue a write setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is disabled and not used for these commands.

- DMA descriptor 2 enables the BCH engine for encoding to begin the initial writing of the NAND data by specifying where the data and auxiliary payload are coming from in system memory.
- DMA descriptor 3 issues the write commit command byte under CLE to the NAND.
- DMA descriptor 4 waits for the NAND to complete the write commit/transfer by watching the NAND's ready line status. This descriptor relinquishes the NANDLOCK on the GPMI to enable the other DMA channels to initiate NAND transactions on different NAND CS lines.
- DMA descriptor 6 issues a NAND status command byte under "CLE" to check the status of the NAND device following the page write.
- DMA descriptor 7 reads back the NAND status and compares the status with an expected value. If there are differences, then the DMA processing engine follows an error-handling DMA descriptor path.
- DMA descriptor 8 disables the BCH engine and emits a GPMI interrupt to indicate that the NAND write has been completed.

## 17.4.2 BCH Decoding for NAND Reads

When a page is read from NAND flash, BCH syndromes will be computed and, if correctable errors are found, they will be corrected on a per block basis within the NAND page.

This decoding process is fully overlapped with other NAND data reads and with CPU execution. The BCH decoder flowchart in the figure below shows the steps involved in programming the decoder. The hardware flow of reading and decoding a 4096-byte page is shown in [Figure 17-10](#).

**Figure 17-9. BCH Decode Flowchart**

Conceptually, an APBH DMA Channel (0,1,2 or 3) command chain with seven command structures linked together is used to perform the BCH decode operation (as shown in [Figure 17-10](#)).

**Note**

The GPMI's DMA command structures controls the BCH decode operation.

To use the BCH decoder with the GPMI's DMA, create a DMA command chain containing seven descriptor structures, as shown in the figure below and detailed in the DMA structure code example that follows it in [DMA Structure Code Example](#). The seven DMA descriptors perform the following tasks:

1. Issue NAND read setup command byte (under "CLE") and address bytes (under "ALE").
2. Issue NAND read execute command byte (under "CLE").
3. Wait for the NAND device to complete accessing the block data by watching the ready signal.
4. Check for NAND timeout through "PSENSE".
5. Configure and enable the BCH block and read the NAND block data.
6. Disable the BCH block.
7. Descriptor NOP to allow NANDLOCK in the previous descriptor to the thread-safe.

## Programming the BCH/GPMI Interfaces

Descriptor 1: Disable BCH engine and issue NAND read set-up command and address (CLE/ALE).

Descriptor 2: NAND read execute command (CLE).

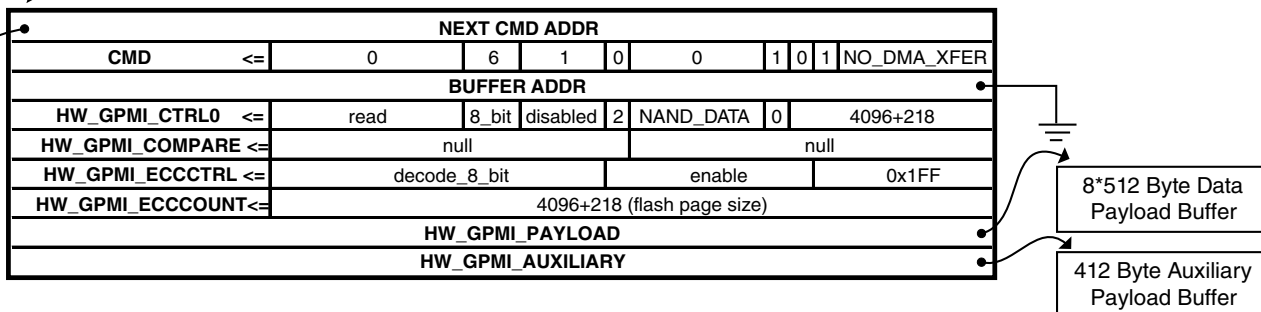

Descriptor 3: Wait for NAND ready.

Descriptor 4: PSENSE compare for time-out.

Descriptor 5: Enable BCH engine and read NAND data.

Descriptor 6: Disable BCH engine (wait for ready is a NOP here).

Descriptor 7: NOP to ensure NANDLOCK in previous descriptor .

Figure 17-10. BCH Decode DMA Descriptor Chain

### 17.4.2.1 DMA Structure Code Example

The following sample code illustrates the coding for one read transaction, consisting of a seven DMA command structure chain for reading all 4096 bytes of payload data (eight 512-byte blocks) and 65 bytes of metadata with the associative parity bytes ( $8 * (18) + 9$ ) from a 4K NAND page sitting on GPMI CS2.

```
//-----
// generic DMA/GPMI/ECC descriptor struct, order sensitive!
//-----
typedef struct {
    // DMA related fields
    unsigned int dma_nxtcmdar;
    unsigned int dma_cmd;
    unsigned int dma_bar;
    // GPMI related fields

### 17.4.2.2 Using the Decoder

As illustrated in [Figure 17-10](#) and the sample code in [DMA Structure Code Example](#) :

- DMA descriptor 1 prepares the NAND for data read by using the GPMI to issue a NAND read setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is not used for these commands.
- DMA descriptor 2 issues a one-byte read execute command to the NAND device that triggers its read access. The NAND then goes not ready.

- DMA descriptor 3 performs a wait for ready operation allowing the DMA chain to remain dormant until the NAND device completes its read access time.
- DMA descriptor 5 handles the reading and error correction of the NAND data. This command's PIOs activate the BCH engine to write the read NAND data to system memory and to process it for any errors that need to be corrected. This DMA descriptor contains two PIO values that are system memory addresses pointing to the PAYLOAD data area and to the AUXILIARY data area. These addresses are used by the BCH engine's AHB master to move data into system memory and to correct it. While this example is reading an entire 4K page—payload plus metadata—it is equally possible to read just one 512-byte payload block or just the uniquely protected metadata block in a single 7 DMA structure transfer.
- DMA descriptor 6 disables the BCH engine with the NANDLOCK asserted. This is necessary to ensure that the GPMI resource is not arbitrated to another DMA channel when multiple DMA channels are active concurrently.
- DMA descriptor 7 deasserts the NANDLOCK to free up the GPMI resource to another channel.

As the BCH block receives data from the GPMI:

- The decoder transforms the read NAND data block into a BCH code word and computes the codeword syndrome.
- If no errors are present, then the BCH block can immediately report back to firmware. This report is passed as the BCH\_CTRL\_COMPLETE\_IRQ interrupt status bit and the associated status registers in BCH\_STATUS0/1 registers.
- If an error is present, then the BCH block corrects the necessary data block or parity block bytes, if possible (not all errors are correctable).

As the BCH decoder reads the data and parity blocks, it records a special condition, i.e., that all of the bits of a payload data block or metadata block are one, including any associated parity bytes. The all-ones case for both parity and data indicates an erased block in the NAND device.

The BCH\_STATUS0 register contains a 4-bit field that indicates the final status of the auxiliary block. A value of 0x0 indicates no errors found for a block.

- A value of 1 to 20 inclusive indicates that many correctable errors were found and fixed.
- A value of 0xFE indicates uncorrectable errors detected on the block.

- A value of 0xFF indicates that the block was in the special ALL ONES state and is therefore considered to be an ERASED block.
- All other values are disallowed by the hardware design.

Recall that up to eight NAND devices can have DMA chains in-flight at once, i.e. they can all be contending for access to the GPMI data bus. It is impossible to predict which NAND device will enter the BCH engine with a transfer first, because each chain includes a wait4ready command structure. As a result, firmware should look at the BCH\_STATUS0\_COMPLETED\_CE bit field to determine which block is being reported in the status register. There is also a 16-bit HANDLE field in the GPMI\_ECCCTRL register that is passed down the pipeline with each transaction. This handle field can be used to speed firmware's detection of which transaction is being reported.

These examples of reading and writing have focused on full page transfers of 4K page NAND devices. Other device configurations can be specified by changing the ECCOUNT field in the GPMI registers and reprogramming the BCH's FLASHnLAYOUTm registers.

The BCH and GPMI blocks are designed to be very efficient at reading single 512 (or 1024)-byte pages in one transaction. With no errors, the transaction takes less than 20 HCLKs longer than the time to read the raw data from the NAND.

To summarize, the APBH DMA command chain for a BCH decode operation is shown in [Figure 17-10](#). Seven DMA command structures must be present for each NAND read transaction decoded by the BCH. The seven DMA command structures for multiple NAND read transaction blocks can be chained together to make larger units of work for the BCH, and each will produce an appropriate error report in the BCH PIO space. Multiple NAND devices can have such multiple chains scheduled. The results can come back out of order with respect to the multiple chains.

### 17.4.3 Interrupts

There are two interrupt sources used in processing BCH protected NAND read and write transfers.

Since all BCH operations are initiated by GPMI DMA command structures, the DMA completion interrupt for the GPMI is an important ISR. Both of the flow charts of [Figure 17-6](#) and [Figure 17-9](#) show the GPMI DMA complete ISR skeleton. In both reads and writes, the GPMI DMA completion interrupt is used to schedule work *INTO* the error correction pipeline. As the front end processing completes, the DMA interrupt is

generated and additional work, such as DMA chains, are passed to the GPMI DMA to keep it *fed*. For write operations, this is the only interrupt that is generated for processing the NAND write transfer.

For reads, however, two interrupts are needed. Every read is started by a GPMI DMA command chain and the front end queue is fed as described above. The back end of the read pipeline is drained by monitoring the BCH completion interrupt found in `HW_BCH_CTRL_COMPLETE_IRQ`.

An BCH transaction consists of reading or writing all of the blocks requested in the `HW_GPMI_ECCCTRL_BUFFER_MASK` bit field. As every read transaction completes, it posts the status of all of the blocks to the `HW_BCH_STATUS0` and `HW_BCH_STATUS1` registers and sets the completion interrupt. The five stages of the BCH read pipeline completes, one in the GPMI and four in the BCH, are independently stalled as they complete and try to deliver to the next stage in the data flow. Several of these stages can be skipped if no-errors are found or once an uncorrectable error is found in a block.

In any case, the final stage will stall if the status register is busy waiting for the CPU to take status register results. The hardware monitors the state of the `HW_BCH_CTRL_COMPLETE_IRQ` bit. If it is still set when the last pipeline stage is ready to post data, then the stage will stall. It follows that the next previous stage will stall when it is ready to hand off work to the final stage, and so on up the pipeline.

### CAUTION

It is important that firmware read the STATUS0/1 results and save them before clearing the interrupt request bit. Otherwise, a transaction and its results could be completely lost.

## 17.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set `CLKGATE` when setting SFTRST.

The reset process gates the clocks automatically. The exemplary code is shown below.

```
// A soft reset can take multiple clocks to complete, so do NOT gate the
// clock when setting soft reset. The reset process will gate the clock
// automatically. Poll until this has happened before subsequently
// preparing soft-reset and clock gate
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
// asserting soft-reset
BCH_CTRL_SET(BM_BCH_CTRL_SFTRST);
// waiting for confirmation of soft-reset
while (!BCH_CTRL.B.CLKGATE)
```

## BCH Memory Map/Register Definition

```

{
// busy wait
}
// Done.
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

```

## 17.6 BCH Memory Map/Register Definition

### BCH Hardware Register Format Summary

#### BCH memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
11_4000	Hardware BCH ECC Accelerator Control Register (BCH_CTRL)	32	R/W	C000_0000h	<a href="#">17.6.1/752</a>

### 17.6.1 Hardware BCH ECC Accelerator Control Register (BCH\_CTRLn)

The BCH CTRL provides overall control of the hardware ECC accelerator

Address: 11\_4000h base + 0h offset + (4d × i), where i=0d to 3d

**BCH\_CTRLn field descriptions**

Field	Description
31 SFTRST	Set this bit to 0 to enable normal BCH operation. Set this bit to 1 (default) to disable clocking with the BCH and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the BCH block to its default state. This bit resets all state machines except for the AHB master state machine  0x0 <b>RUN</b> — Allow BCH to operate normally. 0x1 <b>RESET</b> — Hold BCH in reset.
30 CLKGATE	This bit must be set to 0 for normal operation. When set to 1 it gates off the clocks to the block.  0x0 <b>RUN</b> — Allow BCH to operate normally. 0x1 <b>NO_CLKS</b> — Do not clock BCH gates in order to minimize power consumption.
29–23 RSVD5	This field is reserved.  This read-only field is reserved and always has the value 0.
22 DEBUGSYNDROME	(For debug purposes only). Enable write of computed syndromes to memory on BCH decode operations. Computed syndromes will be written to the auxiliary buffer after the status block. Syndromes will be written as padded 16-bit values.
21–20 RSVD4	This field is reserved.  This read-only field is reserved and always has the value 0
19–18 M2M_LAYOUT	Selects the flash page format for memory-to-memory operations.
17 M2M_ENCODE	Selects encode (parity generation) or decode (correction) mode for memory-to-memory operations.
16 M2M_ENABLE	NOTE! WRITING THIS BIT INITIATES A MEMORY-TO-MEMORY OPERATION. The BCH module must be inactive (not processing data from the GPML) when this bit is set. The M2M_ENCODE and

Table continues on the next page...

**BCH\_CTRLn field descriptions (continued)**

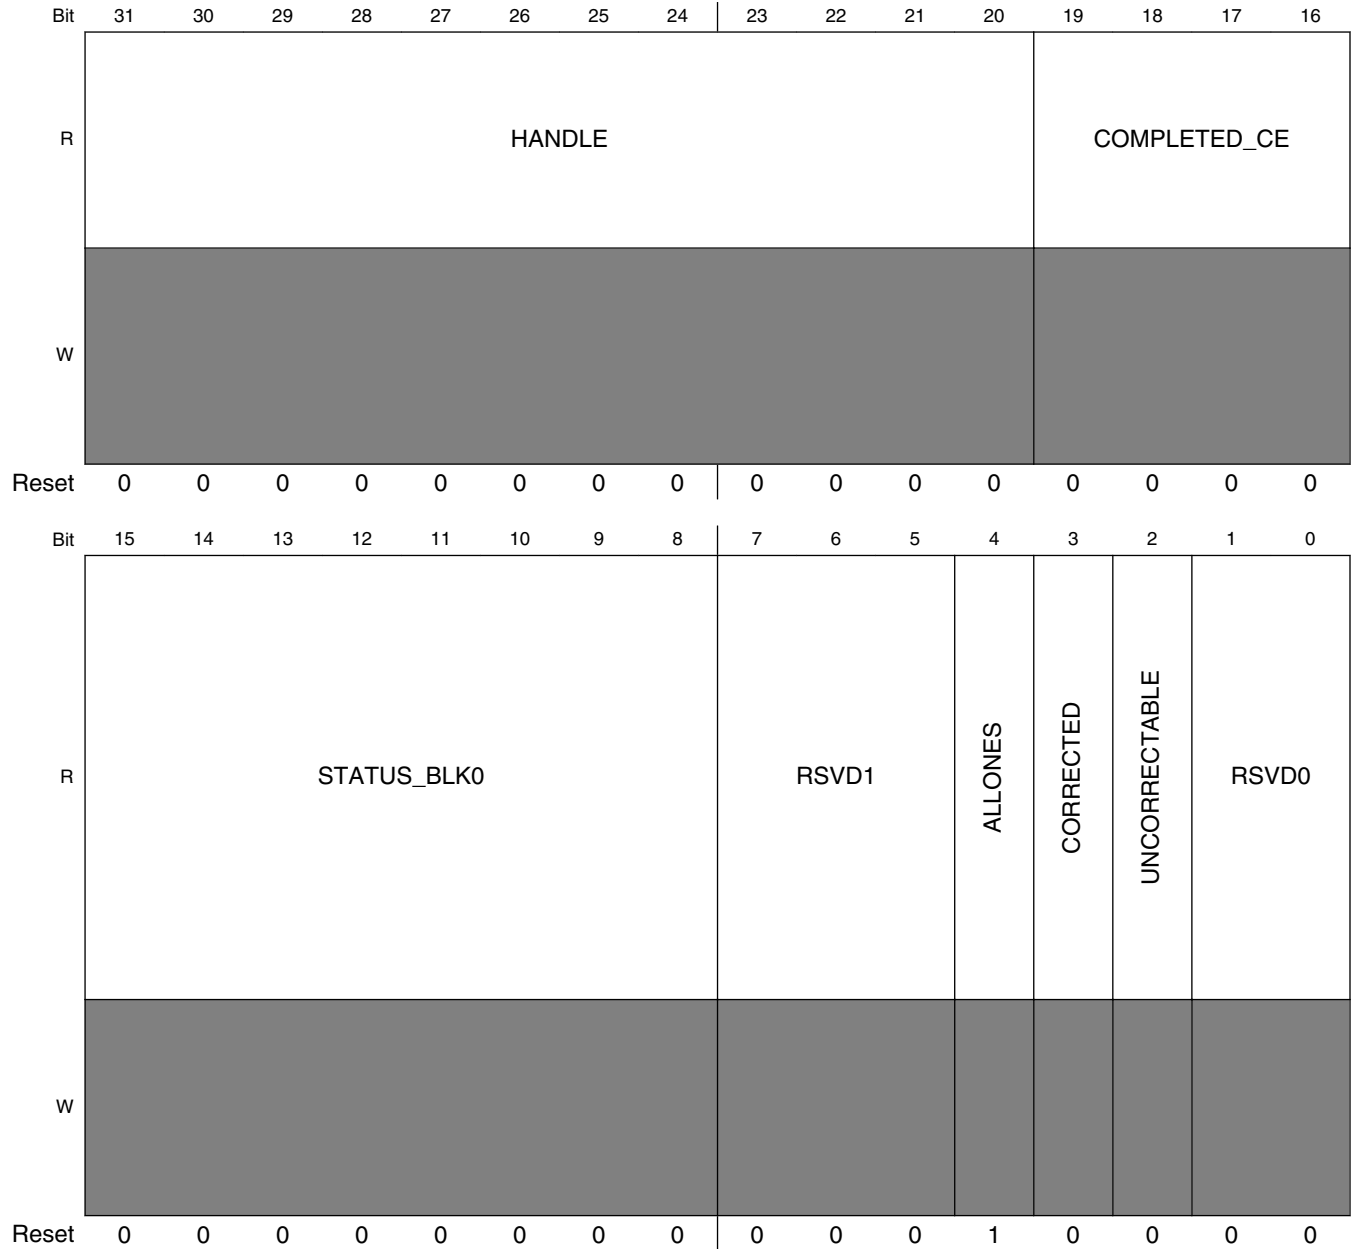

Field	Description
	M2M_LAYOUT bits as well as the ENCODEPTR, DATAPTR, and METAPTR registers are used for memory-to-memory operations and must be correctly programmed before writing this bit.
15–11 RSVD3	This field is reserved.  This read-only field is reserved and always has the value 0
10 DEBUG_STALL_ IRQ_EN	1 = interrupt on debug stall mode is enabled. The IRQ is raised on every block
9 RSVD2	This field is reserved.  This read-only field is reserved and always has the value 0.
8 COMPLETE_IRQ_ EN	1 = interrupt on completion of correction is enabled.
7–4 RSVD1	This field is reserved.  This read-only field is reserved and always has the value 0.
3 BM_ERROR_IRQ	AHB Bus interface Error Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
2 DEBUG_STALL_IRQ	DEBUG STALL Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
1 RSVD0	This field is reserved.  This read-only field is reserved and always has the value 0.
0 COMPLETE_IRQ	This bit indicates the state of the external interrupt line. Write a 1 to the SCT clear address to clear the interrupt status bit. NOTE: subsequent ECC completions will be held off as long as this bit is set. Be sure to read the data from BCH_STATUS0, 1 before clearing this interrupt bit.

**17.6.2 Hardware ECC Accelerator Status Register 0 (BCH\_STATUS0n)**

The BCH STAT register provides visibility into the run-time status of the BCH and status information when processing is complete. It provides overall status of the hardware ECC accelerator.

Address: 11\_4000h base + 10h offset + (4d × i), where i=0d to 3d

**BCH\_STATUS0n field descriptions**

Field	Description
31–20 HANDLE	Software supplies a 12 bit handle for this transfer as part of the GPMI DMA PIO operation that started the transaction. That handle passes down the pipeline and ends up here at the time the BCH interrupt is signaled.
19–16 COMPLETED_CE	This is the chip enable number corresponding to the NAND device from which this data came.
15–8 STATUS_BLK0	Count of symbols in error during processing of first block of flash (metadata block). The number of errors reported will be in the range of 0 to the ECC correction level for block 0.  0x00 <b>ZERO</b> — No errors found on block.

Table continues on the next page...

**BCH\_STATUS0n field descriptions (continued)**

Field	Description
	0x01 <b>ERROR1</b> — One error found on block. 0x02 <b>ERROR2</b> — One errors found on block. 0x03 <b>ERROR3</b> — One errors found on block. 0x04 <b>ERROR4</b> — One errors found on block. 0xFE <b>UNCORRECTABLE</b> — Block exhibited uncorrectable errors. 0xFF <b>ERASED</b> — Page is erased.
7–5 RSVD1	This field is reserved.  This read-only field is reserved and always has the value 0.
4 ALLONES	1 = All data bits of this transaction are ONE.
3 CORRECTED	1 = At least one correctable error encountered during last processing cycle.
2 UNCORRECTABLE	1 = Uncorrectable error encountered during last processing cycle.
RSVD0	This field is reserved.  This read-only field is reserved and always has the value 0.

**17.6.3 Hardware ECC Accelerator Mode Register (BCH\_MODEn)**

The BCH MODE register provides additional mode controls.

Contains additional global mode controls for the BCH engine.

Address: 11\_4000h base + 20h offset + (4d × i), where i=0d to 3d

**BCH\_MODEn field descriptions**

Field	Description
31–8 RSVD	This field is reserved.  This read-only field is reserved and always has the value 0.
ERASE_ THRESHOLD	This value indicates the maximum number of zero bits on a flash subpage for it to be considered erased. For SLC NAND devices, this value should be programmed to 0 (meaning that the entire page should consist of bytes of 0xFF. For MLC NAND devices, bit errors may occur on reads (even on blank pages), so this threshold can be used to tune the erased page checking algorithm.

## 17.6.4 Hardware BCH ECC Loopback Encode Buffer Register (BCH\_ENCODEPTR<sub>n</sub>)

When performing memory to memory operations, indicates the address of the encode buffer. This register should be programmed before writing a 1 to the M2M\_ENABLE bit in the CTRL register.

For memory to memory operations, this register is used as the pointer to the encoded data, which is an output when encoding and an input while decoding.

Address: 11\_4000h base + 30h offset + (4d × i), where i=0d to 3d

### BCH\_ENCODEPTR<sub>n</sub> field descriptions

Field	Description
ADDR	Address pointer to encode buffer. This is the source for decode operations and the destination for encode operations. This value must be aligned on a 4 bytes boundary.

## 17.6.5 Hardware BCH ECC Loopback Data Buffer Register (BCH\_DATAPTR<sub>n</sub>)

When performing memory to memory operations, indicates the address of the data buffer.

For memory to memory operations, this register is used as the pointer to the data to encode or the destination buffer for decode operations.

Address: 11\_4000h base + 40h offset + (4d × i), where i=0d to 3d

### BCH\_DATAPTR<sub>n</sub> field descriptions

Field	Description
ADDR	Address pointer to data buffer. This is the source for encode operations and the destination for decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 byte boundary.

### 17.6.6 Hardware BCH ECC Loopback Metadata Buffer Register (BCH\_METAPTR<sub>n</sub>)

When performing memory to memory operations, indicates the address of the metadata buffer.

For memory to memory operations, this register is used as the pointer to the metadata to encode or the extracted metadata for decode operations.

Address: 11\_4000h base + 50h offset + (4d × i), where i=0d to 3d

#### BCH\_METAPTR<sub>n</sub> field descriptions

Field	Description
ADDR	Address pointer to metadata buffer. This is the source for encode metadata read operations and the destination for metadata decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 bytes boundary.

### 17.6.7 Hardware ECC Accelerator Layout Select Register (BCH\_LAYOUTSELECT<sub>n</sub>)

The BCH LAYOUTSELECT register provides a mapping of chip selects to layout registers.

When the BCH engine receives a request to process a data block from the GPMI interface, it will use this register to map the incoming chip select to one of the four possible flash layout registers

Address: 11\_4000h base + 70h offset + (4d × i), where i=0d to 3d

**BCH\_LAYOUTSELECT $n$  field descriptions**

Field	Description
31–30 CS15_SELECT	Selects which layout is used for chip select 15.
29–28 CS14_SELECT	Selects which layout is used for chip select 14.
27–26 CS13_SELECT	Selects which layout is used for chip select 13.
25–24 CS12_SELECT	Selects which layout is used for chip select 12.
23–22 CS11_SELECT	Selects which layout is used for chip select 11.
21–20 CS10_SELECT	Selects which layout is used for chip select 10.
19–18 CS9_SELECT	Selects which layout is used for chip select 9.
17–16 CS8_SELECT	Selects which layout is used for chip select 8.
15–14 CS7_SELECT	Selects which layout is used for chip select 7.
13–12 CS6_SELECT	Selects which layout is used for chip select 6.
11–10 CS5_SELECT	Selects which layout is used for chip select 5.
9–8 CS4_SELECT	Selects which layout is used for chip select 4.
7–6 CS3_SELECT	Selects which layout is used for chip select 3.
5–4 CS2_SELECT	Selects which layout is used for chip select 2.
3–2 CS1_SELECT	Selects which layout is used for chip select 1.
CS0_SELECT	Selects which layout is used for chip select 0.

**17.6.8 Hardware BCH ECC Flash 0 Layout 0 Register (BCH\_FLASH0LAYOUT0 $n$ )**

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT1 register to control the format for the devices selecting layout 0 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data,

## BCH Memory Map/Register Definition

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See the BCH programming reference manual for more information on setting up the flash layout registers.

Address: 11\_4000h base + 80h offset + (4d × i), where i=0d to 3d

### BCH\_FLASH0LAYOUT0n field descriptions

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field.  0x0 <b>NONE</b> — No ECC to be performed 0x1 <b>ECC2</b> — ECC 2 to be performed 0x2 <b>ECC4</b> — ECC 4 to be performed 0x3 <b>ECC6</b> — ECC 6 to be performed 0x4 <b>ECC8</b> — ECC 8 to be performed 0x5 <b>ECC10</b> — ECC 10 to be performed 0x6 <b>ECC12</b> — ECC 12 to be performed 0x7 <b>ECC14</b> — ECC 14 to be performed

Table continues on the next page...

0xE	<b>ECC28</b> — ECC 28 to be performed
0xF	<b>ECC30</b> — ECC 30 to be performed
0x10	<b>ECC32</b> — ECC 32 to be performed
0x11	<b>ECC34</b> — ECC 34 to be performed
0x12	<b>ECC36</b> — ECC 36 to be performed
0x13	<b>ECC38</b> — ECC 38 to be performed
0x14	<b>ECC40</b> — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATA0_SIZE	Indicates the size of the data 0 block (in DWORDS / four bytes) to be stored on the flash page. If set to 0, the first block only contains metadata.

### 17.6.9 Hardware BCH ECC Flash 0 Layout 1 Register (BCH\_FLASH0LAYOUT1n)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT0 register to control the format for the device selecting layout 0 in the LAYOUTSELECT register.

Address: 11\_4000h base + 90h offset + (4d × i), where i=0d to 3d

**BCH\_FLASH0LAYOUT1n field descriptions**

Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata).  0x0 <b>NONE</b> — No ECC to be performed 0x1 <b>ECC2</b> — ECC 2 to be performed 0x2 <b>ECC4</b> — ECC 4 to be performed 0x3 <b>ECC6</b> — ECC 6 to be performed 0x4 <b>ECC8</b> — ECC 8 to be performed 0x5 <b>ECC10</b> — ECC 10 to be performed 0x6 <b>ECC12</b> — ECC 12 to be performed 0x7 <b>ECC14</b> — ECC 14 to be performed 0x8 <b>ECC16</b> — ECC 16 to be performed 0x9 <b>ECC18</b> — ECC 18 to be performed 0xA <b>ECC20</b> — ECC 20 to be performed 0xB <b>ECC22</b> — ECC 22 to be performed 0xC <b>ECC24</b> — ECC 24 to be performed 0xD <b>ECC26</b> — ECC 26 to be performed 0xE <b>ECC28</b> — ECC 28 to be performed 0xF <b>ECC30</b> — ECC 30 to be performed 0x10 <b>ECC32</b> — ECC 32 to be performed 0x11 <b>ECC34</b> — ECC 34 to be performed 0x12 <b>ECC36</b> — ECC 36 to be performed 0x13 <b>ECC38</b> — ECC 38 to be performed 0x14 <b>ECC40</b> — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.

**17.6.10 Hardware BCH ECC Flash 1 Layout 0 Register (BCH\_FLASH1LAYOUT0n)**

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH1LAYOUT1 register to control the format for the devices selecting layout 1 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data,

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See the BCH programming reference manual for more information on setting up the flash layout registers.

Address: 11\_4000h base + A0h offset + (4d × i), where i=0d to 3d

**BCH\_FLASH1LAYOUT0n field descriptions**

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design supports from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data is in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field.  0x0 <b>NONE</b> — No ECC to be performed 0x1 <b>ECC2</b> — ECC 2 to be performed 0x2 <b>ECC4</b> — ECC 4 to be performed 0x3 <b>ECC6</b> — ECC 6 to be performed 0x4 <b>ECC8</b> — ECC 8 to be performed 0x5 <b>ECC10</b> — ECC 10 to be performed 0x6 <b>ECC12</b> — ECC 12 to be performed 0x7 <b>ECC14</b> — ECC 14 to be performed

**17.6.13 Hardware BCH ECC Flash 2 Layout 1 Register (BCH\_FLASH2LAYOUT1n)**

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH2LAYOUT0 register to control the format for the device selecting layout 2 in the LAYOUTSELECT register.

Address: 11\_4000h base + D0h offset + (4d × i), where i=0d to 3d

**BCH\_FLASH2LAYOUT1n field descriptions**

Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata).  0x0 <b>NONE</b> — No ECC to be performed 0x1 <b>ECC2</b> — ECC 2 to be performed 0x2 <b>ECC4</b> — ECC 4 to be performed 0x3 <b>ECC6</b> — ECC 6 to be performed 0x4 <b>ECC8</b> — ECC 8 to be performed 0x5 <b>ECC10</b> — ECC 10 to be performed 0x6 <b>ECC12</b> — ECC 12 to be performed 0x7 <b>ECC14</b> — ECC 14 to be performed 0x8 <b>ECC16</b> — ECC 16 to be performed 0x9 <b>ECC18</b> — ECC 18 to be performed 0xA <b>ECC20</b> — ECC 20 to be performed 0xB <b>ECC22</b> — ECC 22 to be performed 0xC <b>ECC24</b> — ECC 24 to be performed 0xD <b>ECC26</b> — ECC 26 to be performed 0xE <b>ECC28</b> — ECC 28 to be performed 0xF <b>ECC30</b> — ECC 30 to be performed 0x10 <b>ECC32</b> — ECC 32 to be performed 0x11 <b>ECC34</b> — ECC 34 to be performed 0x12 <b>ECC36</b> — ECC 36 to be performed 0x13 <b>ECC38</b> — ECC 38 to be performed 0x14 <b>ECC40</b> — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.

**17.6.14 Hardware BCH ECC Flash 3 Layout 0 Register (BCH\_FLASH3LAYOUT0n)**

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH3LAYOUT1 register to control the format for the devices selecting layout 3 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data,

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See the BCH programming reference manual for more information on setting up the flash layout registers.

Address: 11\_4000h base + E0h offset + (4d × i), where i=0d to 3d

**BCH\_FLASH3LAYOUT0n field descriptions**

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and will be covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field.  0x0 <b>NONE</b> — No ECC to be performed 0x1 <b>ECC2</b> — ECC 2 to be performed 0x2 <b>ECC4</b> — ECC 4 to be performed 0x3 <b>ECC6</b> — ECC 6 to be performed 0x4 <b>ECC8</b> — ECC 8 to be performed 0x5 <b>ECC10</b> — ECC 10 to be performed 0x6 <b>ECC12</b> — ECC 12 to be performed 0x7 <b>ECC14</b> — ECC 14 to be performed

Table continues on the next page...

**BCH\_FLASH3LAYOUT0n field descriptions (continued)**

Field	Description
0x8	<b>ECC16</b> — ECC 16 to be performed
0x9	<b>ECC18</b> — ECC 18 to be performed

0x13	<b>ECC38</b> — ECC 38 to be performed
0x14	<b>ECC40</b> — ECC 40 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATA0_SIZE	Indicates the size of the data 0 block (in DWORDS / four bytes) to be stored on the flash page. If set to 0, the first block will only contain metadata.

**17.6.15 Hardware BCH ECC Flash 3 Layout 1 Register (BCH\_FLASH3LAYOUT1n)**

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH3LAYOUT0 register to control the format for the device selecting layout 3 in the LAYOUTSELECT register.

Address: 11\_4000h base + F0h offset + (4d × i), where i=0d to 3d

**BCH\_FLASH3LAYOUT1n field descriptions**

Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accommodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). 10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.

**17.6.16 Hardware BCH ECC Debug Register0 (BCH\_DEBUG0n)**

The hardware BCH accelerator internal state machines and signals can be seen in the ECC debug register.

The BCH\_DEBUG0 register provides access to various internal state information which might prove useful during hardware debug and validation.

## BCH Memory Map/Register Definition

Address: 11\_4000h base + 100h offset + (4d × i), where i=0d to 3d

### BCH\_DEBUG0n field descriptions

Field	Description
31–25 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
24–16 KES_DEBUG_SYNDROME_SYMBOL	The 9 bit value in this bit field shifts into the syndrome register array at the input of the KES engine whenever BCH_DEBUG0_KES_DEBUG_SHIFT_SYND is toggled. 0x0 <b>NORMAL</b> — Bus master address generator for SYND_GEN writes operates normally. 0x1 <b>TEST_MODE</b> — Bus master address generator always addresses last four bytes in Auxiliary block.
15 KES_DEBUG_SHIFT_SYND	Toggling this bit causes the value in BCH_DEBUG0_KES_SYNDROME_SYMBOL to be shift into the syndrome register array at the input to the KES engine. After shifting in 16 symbols, one can kick off both KES and CF cycles by toggling BCH_DEBUG0_KES_DEBUG_KICK. Make sure that set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.

Table continues on the next page...

## BCH\_DEBUG0n field descriptions (continued)

Field	Description
14 KES_DEBUG_ PAYLOAD_FLAG	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input payload flag.  0x1 <b>DATA</b> — Payload is set for 512 bytes data block. 0x1 <b>AUX</b> — Payload is set for 65 or 19 bytes auxiliary block.
13 KES_DEBUG_ MODE4K	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input mode (4K or 2K pages).  0x1 <b>4k</b> — Mode is set for 4K NAND pages. 0x1 <b>2k</b> — Mode is set for 2K NAND pages.
12 KES_DEBUG_ KICK	Toggling causes KES engine FSM to start as if kick by the Bus Master. This allows stand alone testing of the KES and Chien Search engines. Be sure to set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.
11 KES_ STANDALONE	Set to one, cause the KES engine to suppress toggling the KES_BM_DONE signal to the bus master and suppress toggling the CF_BM_DONE signal by the CF engine.  0x0 <b>NORMAL</b> — Bus master address generator for SYND_GEN writes operates normally. 0x1 <b>TEST_MODE</b> — Bus master address generator always addresses last four bytes in Auxiliary block.
10 KES_DEBUG_ STEP	Toggling this bit causes the KES FSM to skip passed the stall state if it is in DEBUG_STALL mode and completed processing a block.
9 KES_DEBUG_ STALL	Set to one to cause KES FSM to stall after notifying Chien search engine to start processing its block but before notifying the bus master that the KES computation is complete. This allows a diagnostic to stall the FSM after each blocks key equations are solved. This also has the effect of stalling the CSFE search engine so it's state can be examined after it finishes processing the KES stalled block.  0x0 <b>NORMAL</b> — KES FSM proceeds to next block supplied by bus master. 0x1 <b>WAIT</b> — KES FSM waits after current equations are solved and the search engine is started.
8 BM_KES_TEST_ BYPASS	1 = Point all SYND_GEN writes to dummy area at the end of the AUXILLIARY block so that diagnostics can preload all payload, parity bytes and computed syndrome bytes for test the KES engine.  0x0 <b>NORMAL</b> — Bus master address generator for SYND_GEN writes operates normally. 0x1 <b>TEST_MODE</b> — Bus master address generator always addresses last four bytes in Auxiliary block.
7–6 RSVD0	This field is reserved.  This read-only field is reserved and always has the value 0.
DEBUG_REG_ SELECT	The value loaded in this bit field is used to select the internal register state view of KES engine or the Chien search engine.

## 17.6.17 KES Debug Read Register (BCH\_DBGKESREADn)

The hardware BCH ECC accelerator key equation solver internal state machines and signals can be seen in the ECC debug registers.

## BCH Memory Map/Register Definition

Address: 11\_4000h base + 110h offset + (4d × i), where i=0d to 3d

### BCH\_DBGKESREADn field descriptions

Field	Description
VALUES	This register returns the ROM BIST CRC value after a BIST test.

## 17.6.18 Chien Search Debug Read Register (BCH\_DBGCSFEREADn)

The hardware BCH ECC accelerator Chien Search internal state machines and signals can be seen in the ECC debug registers.

Address: 11\_4000h base + 120h offset + (4d × i), where i=0d to 3d

### BCH\_DBGCSFEREADn field descriptions

Field	Description
VALUES	Reserved

## 17.6.19 Syndrome Generator Debug Read Register (BCH\_DBGSYNDGENREADn)

The hardware BCH ECC accelerator syndrome generator internal state machines and signals can be seen in the ECC debug registers.

Address: 11\_4000h base + 130h offset + (4d × i), where i=0d to 3d

**BCH\_DBGSYNDGENREAD<sub>n</sub> field descriptions**

Field	Description
VALUES	Reserved

**17.6.20 Bus Master and ECC Controller Debug Read Register (BCH\_DBGAHBMREAD<sub>n</sub>)**

The hardware BCH ECC accelerator bus master, ECC controller internal state machines, and signals can be seen in the ECC debug registers.

Address: 11\_4000h base + 140h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	VALUES																															
W	[Reserved]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**BCH\_DBGAHBMREAD<sub>n</sub> field descriptions**

Field	Description
VALUES	Reserved

**17.6.21 Block Name Register (BCH\_BLOCKNAME<sub>n</sub>)**

Read only view of the block name string BCH.

Fixed pattern read only value is for test purposes. It can be read as an ASCII string with the zero termination coming from the first byte of the BLOCKVERSION register.

Address: 11\_4000h base + 150h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	NAME																															
W	[Reserved]																															
Reset	0	0	1	0	0	0	0	0	0	0	1	0	0	1	0	0	0	1	0	0	0	0	1	1	0	1	0	0	0	0	1	0

**BCH\_BLOCKNAME<sub>n</sub> field descriptions**

Field	Description
NAME	The name is in the ASCII characters BCH (0x20, H, C, B).

## 17.6.22 BCH Version Register (BCH\_VERSIONn)

This register always returns a known read value for debug purposes and indicates the version of the block and RTL version in use.

Address: 11\_4000h base + 160h offset + (4d × i), where i=0d to 3d

### BCH\_VERSIONn field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value indicates the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value indicates the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

### 17.6.23 Hardware BCH ECC Debug Register 1 (BCH\_DEBUG1n)

The BCH\_DEBUG1 register provides erased zero count information and pre-erase check.

Address: 11\_4000h base + 170h offset + (4d × i), where i=0d to 3d

**BCH\_DEBUG1n field descriptions**

Field	Description
31 DEBUG1_ PREERASECHK	Blank page enables pre-erase check. 0x0 Turn off pre-erase check 0x1 Turn on pre-erase check
30–9 RSVD	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

**BCH\_DEBUG1n field descriptions (continued)**

Field	Description
ERASED_ ZERO_COUNT	The zero counts on one page.

# Chapter 18

## Clock Controller Module (CCM)

### 18.1 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
  - PLL1 also referenced as ARM PLL
  - PLL2 also referenced as System PLL
  - PLL3 also referenced as USB1 PLL
  - PLL4 also referenced as Audio PLL
  - PLL5 also referenced as Video PLL
  - PLL6 also referenced as ENET PLL
  - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
  - PLL8 also referenced as MLB PLL
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of DVFS and power gating operations.

#### 18.1.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- ARM core root clock is generated from a dedicated source clock.

- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM\_CLKO1 and CCM\_CLKO2 onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for ARM core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
  - PLL - Interfaces for each PLL
  - LPCG - Low Power Clock Gating unit
  - SRC - System Reset Controller
  - GPC - General Power Controller

### 18.1.2 CCM Block Diagram

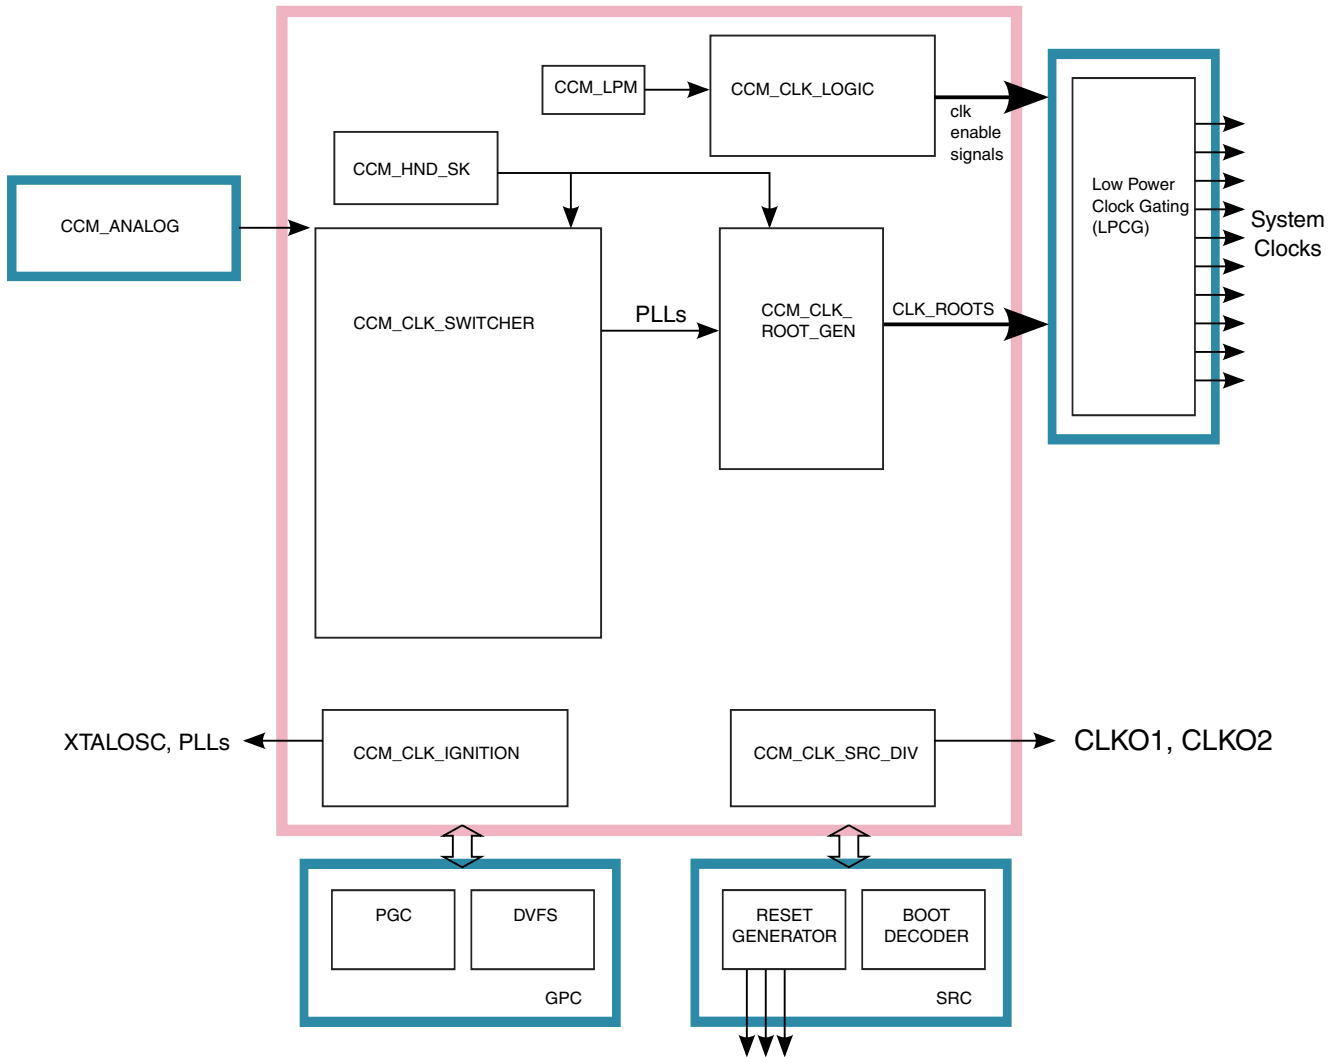

Figure 18-1. Block Diagram

CCM Contains the following sub-blocks:

Table 18-1. CCM Sub-blocks

Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality once CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates three switcher clock outputs (pll1_sw_clk, pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.
CCM_CLK_ROOT_GEN	Receives the main clocks (PLLs / PFDs) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.

Table continues on the next page...

**Table 18-1. CCM Sub-blocks (continued)**

Sub-block	Description
CCM_LPM	Manages the low power modes of the IC.
CCM_CLK_SRC_DIV	Muxes different clocks to two output clocks, CCM_CLKO1 and CCM_CLKO2, for observability. These output clocks are connected to the pads and can provide support for testing.
CCM_HND_SK	Manages the handshake when changing root clock dividers that require handshake, and manages the frequency change in case of dvfs scenario.

## 18.2 External Signals

The following table describes the external signals of CCM:

**Table 18-2. CCM External Signals**

Signal	Description	Pad	Mode	Direction
CCM_CLKO1	Observability clock 1 output	CSI0_MCLK	ALT3	O
		GPIO_0	ALT0	
		GPIO_19	ALT3	
		GPIO_5	ALT3	
CCM_CLKO2	Observability clock 2 output	GPIO_3	ALT4	O
		NANDF_CS2	ALT4	
CCM_PMIC_STBY_REQ	Goes to PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage.	PMIC_STBY_REQ	No Muxing (ALT0)	O
CCM_REF_EN_B	Enable external reference clock (CKIH)	GPIO_9	ALT3	O
CCM_PLL3_BYP	PLL3 bypass clock	RGMIU_TD1	ALT7	I

## 18.3 CCM Clock Tree

The figure found here shows the clock tree configuration and clock roots for CCM.

For detailed sub-block information, please see:

- [Clock Switcher](#)
- [Clock Root Generator](#)
- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

**NOTE**

The default frequency values (in MHz) for the PLLs and PFDs is the maximum allowed frequency. The PLL and PFD control registers should not be programmed to exceed these values.

CCM Clock Tree

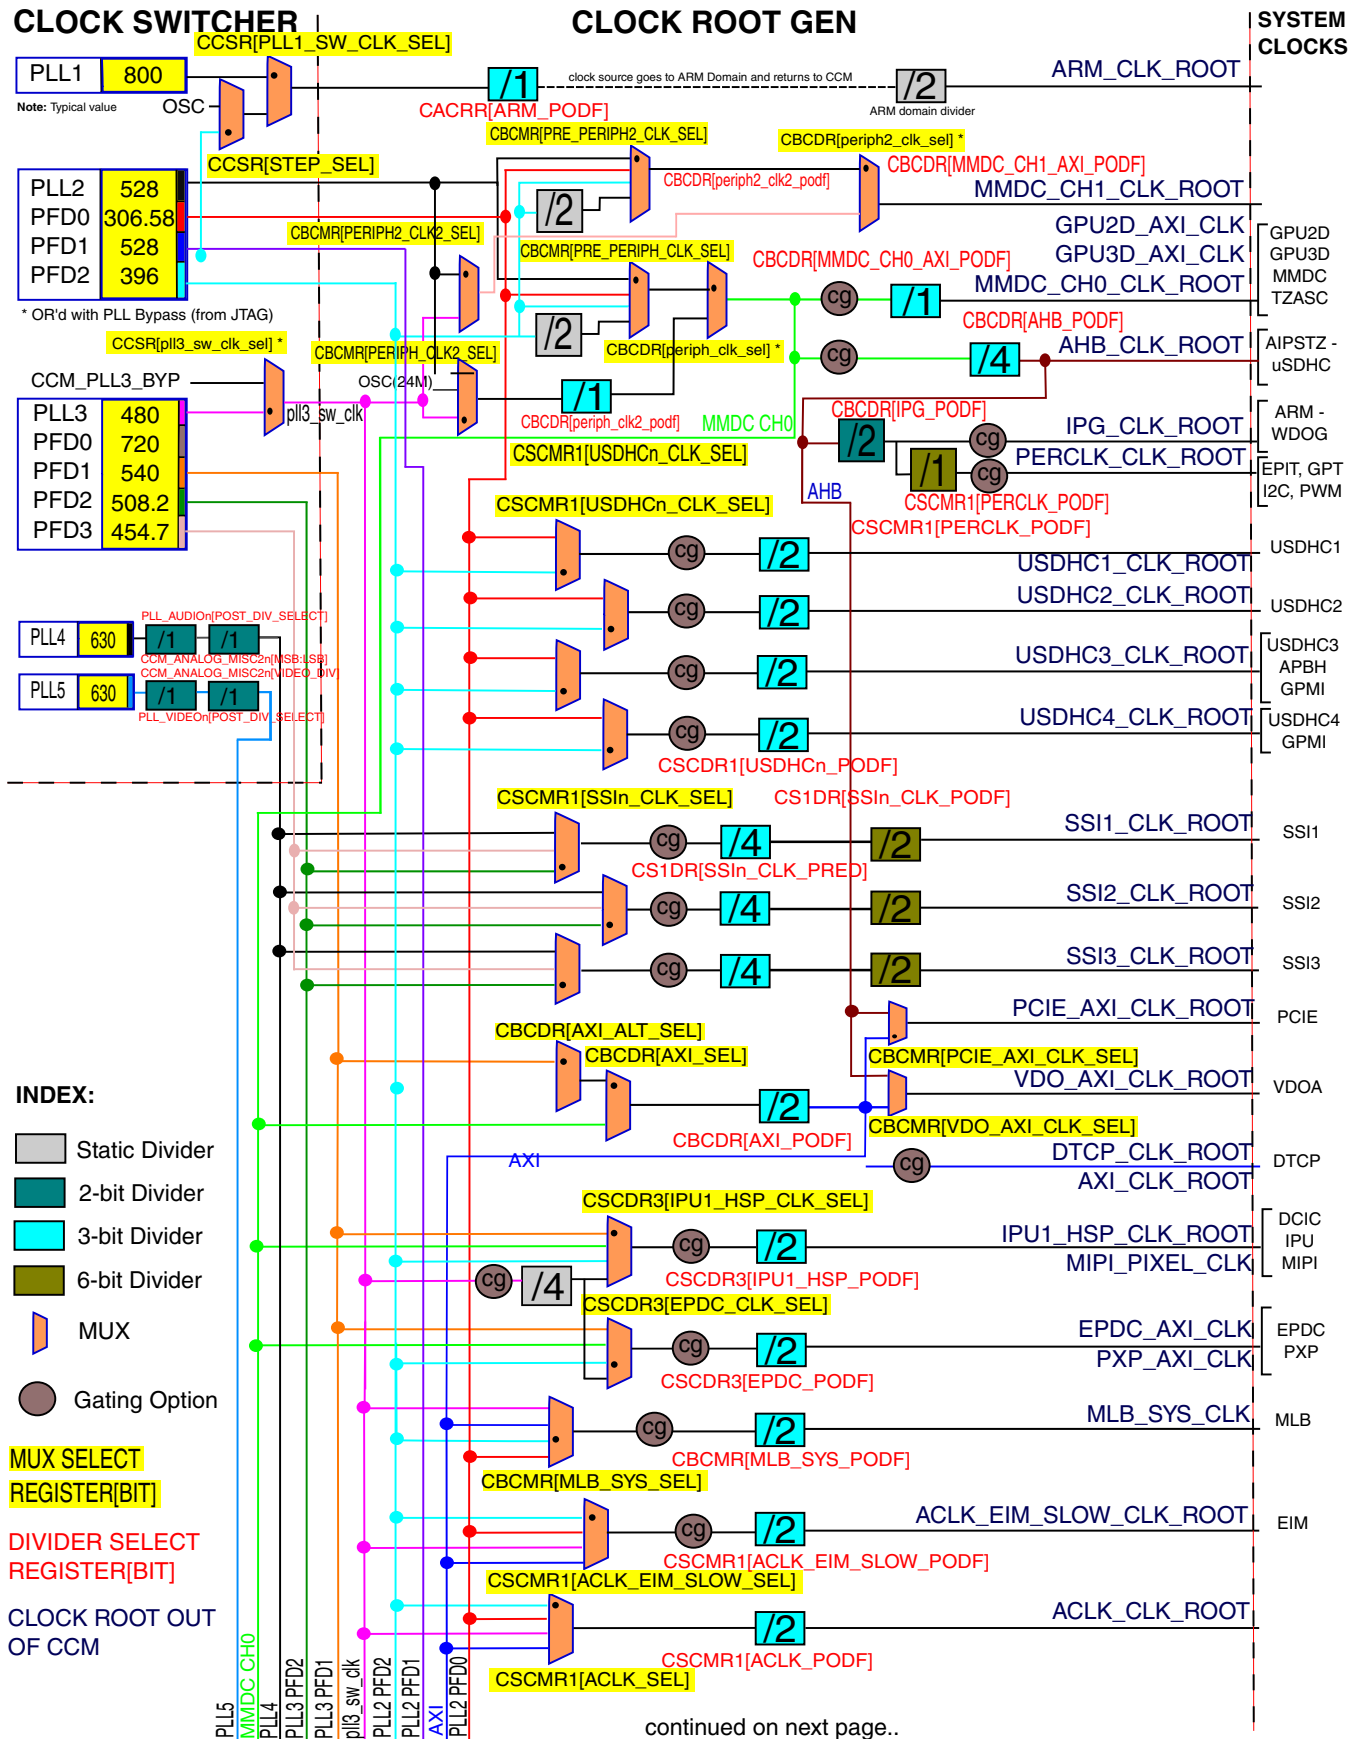

Figure 18-2. Clock Tree - Part 1

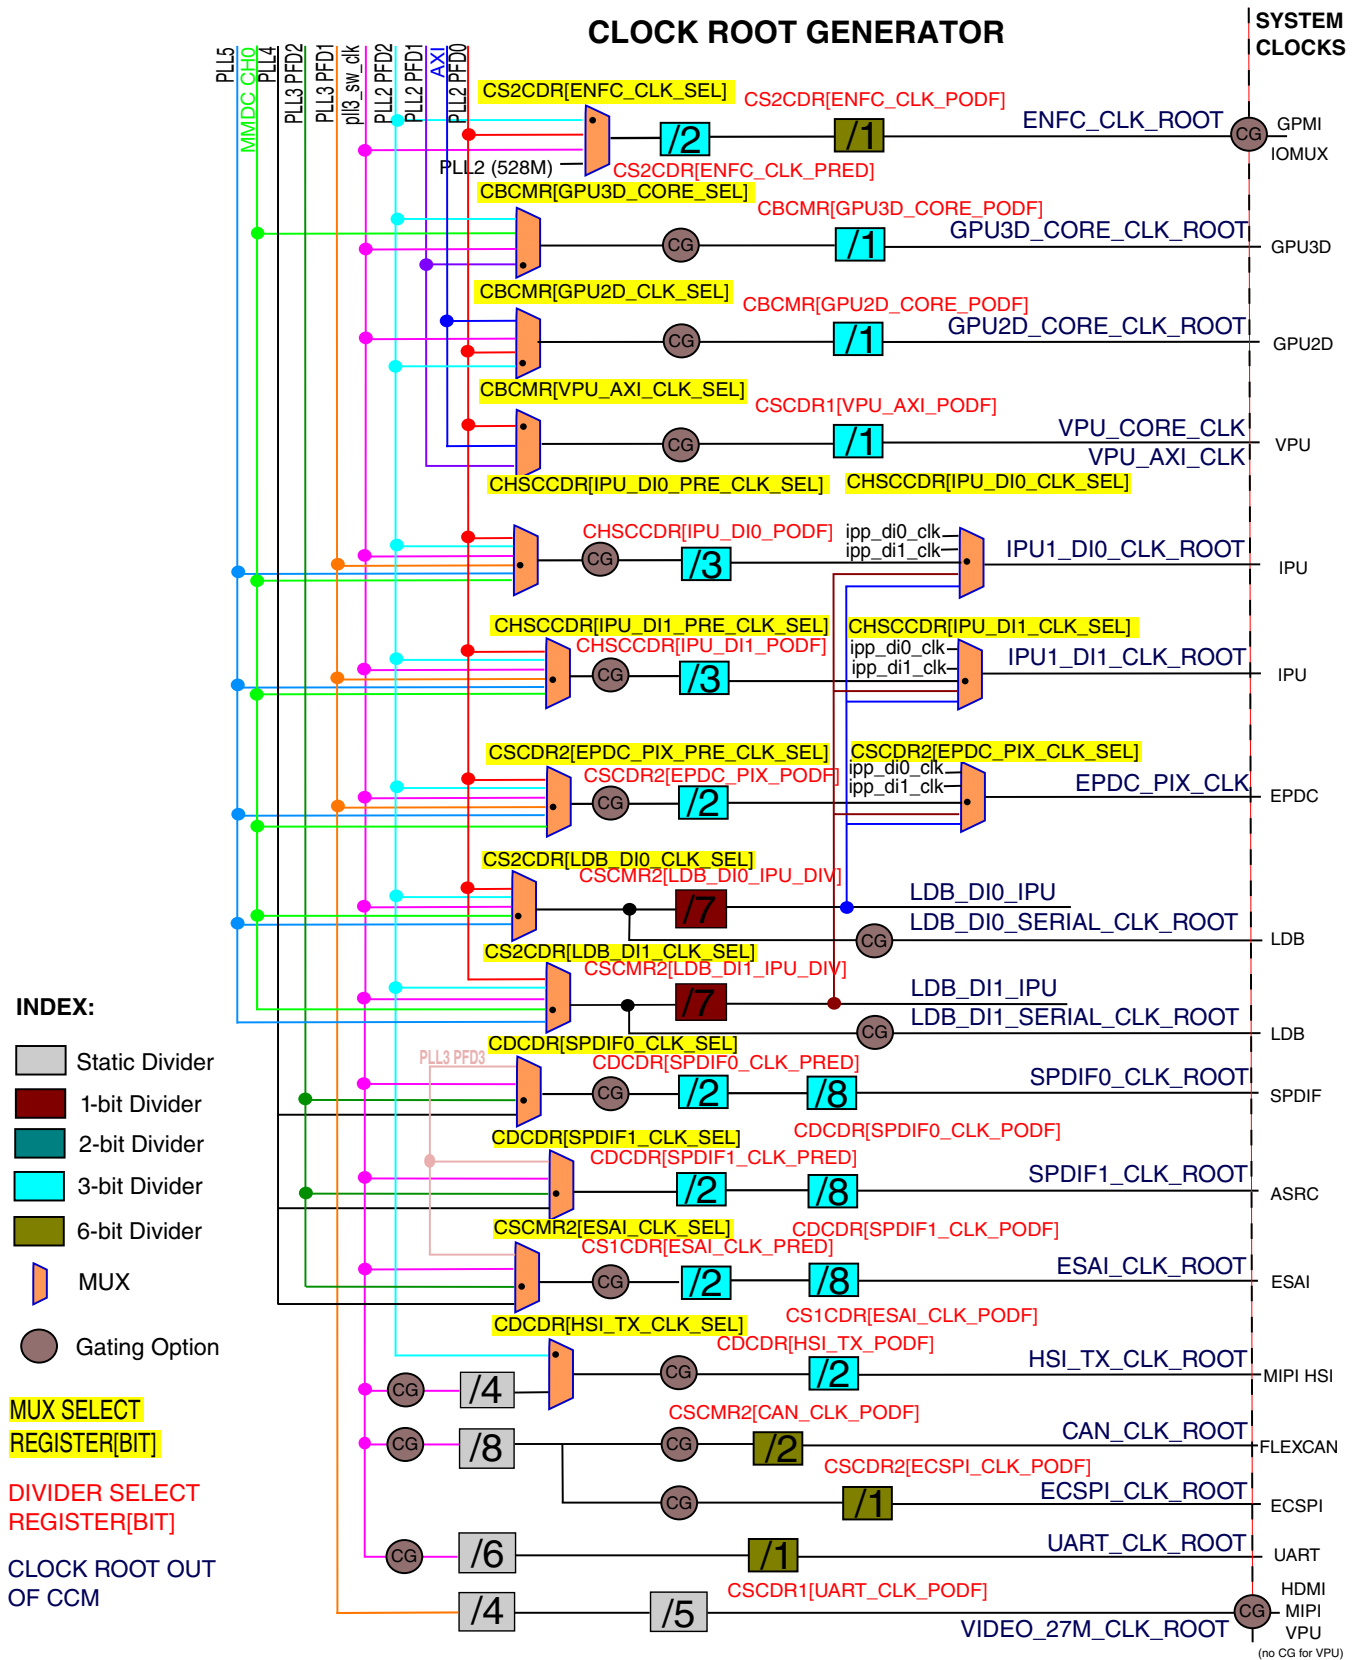

Figure 18-3. Clock Tree - Part 2

## 18.4 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

**Table 18-3. System Clocks, Gating, and Override**

Module	Module Clock	Clock Root	Module Clock Gating Enable	Module Override Enable

## 18.5 Functional Description

This section provides a complete functional description of the block.

### 18.5.1 Clock Generation

#### 18.5.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG\_CLK and supplied to modules that need it.

##### 18.5.1.1.1 CKIL synchronizing to IPG\_CLK

CKIL is synchronized to ipg\_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG\_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

### 18.5.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

### 18.5.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency 800 MHz)

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

PLL8 - MLB PLL

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/ Register Definition](#) for register information.

#### 18.5.1.3.1 ARM PLL

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM\_ANALOG\_PLL\_ARM[DIV\_SELECT].

PLL output frequency =  $F_{ref} * DIV\_SEL/2$

#### NOTE

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

### 18.5.1.3.2 USB PLLs

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV\_SELECT register field, this PLL should always be set to 480 MHz in normal operation. USB2 PLL is only used by the USB UTM interface through a direct connection.

### 18.5.1.3.3 System PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 3 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM\_ANALOG\_PLL\_SYS\_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM\_ANALOG\_PLL\_SYS\_SS[STOP]}}{\text{CCM\_ANALOG\_PLL\_SYS\_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM\_ANALOG\_PLL\_SYS\_SS[STEP]}}{2 \times \text{CCM\_ANALOG\_PLL\_SYS\_SS[STOP]}}$$

Although this PLL does have a DIV\_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

This PLL also supports a Fractional-N synthesizer.

### 18.5.1.3.4 Audio / Video PLL

The audio PLL and video PLL each synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL and /1, /2, /4, /8, /16 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM\_ANALOG\_PLL\_AUDIO, CCM\_ANALOG\_PLL\_VIDEO, and CCM\_ANALOG\_MISC2 register sets according to the following equation.

PLL output frequency = Fref \* (DIV\_SELECT + NUM/DENOM)

### 18.5.1.3.5 MLB PLL

The MediaLB PLL is necessary in the MediaLB 6-Pin implementation to phase align the internal and external clock edges, effectively tuning out the delay of the differential clock receiver. The PLL is also responsible for generating the higher speed internal clock when the internal-to-external clock ratio is not 1:1.

### 18.5.1.3.6 Ethernet PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The PLL outputs a 500 MHz clock. The reference clocks generated by this PLL are:

- Ref\_PCIE = 125 MHz
- Ref\_ethernet, which is configurable based on the PLL\_ENET[1:0] register field.

## 18.5.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to  $F_{vco} * 18/N$ , N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but

must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at [www.freescale.com](http://www.freescale.com) for procedure details.

### 18.5.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM\_CLK\_SWITCHER

CCM\_CLK\_ROOT\_GEN

#### 18.5.1.5.1 Clock Switcher

The Clock Switcher (CCM\_CLK\_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

[Figure 18-4](#) describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

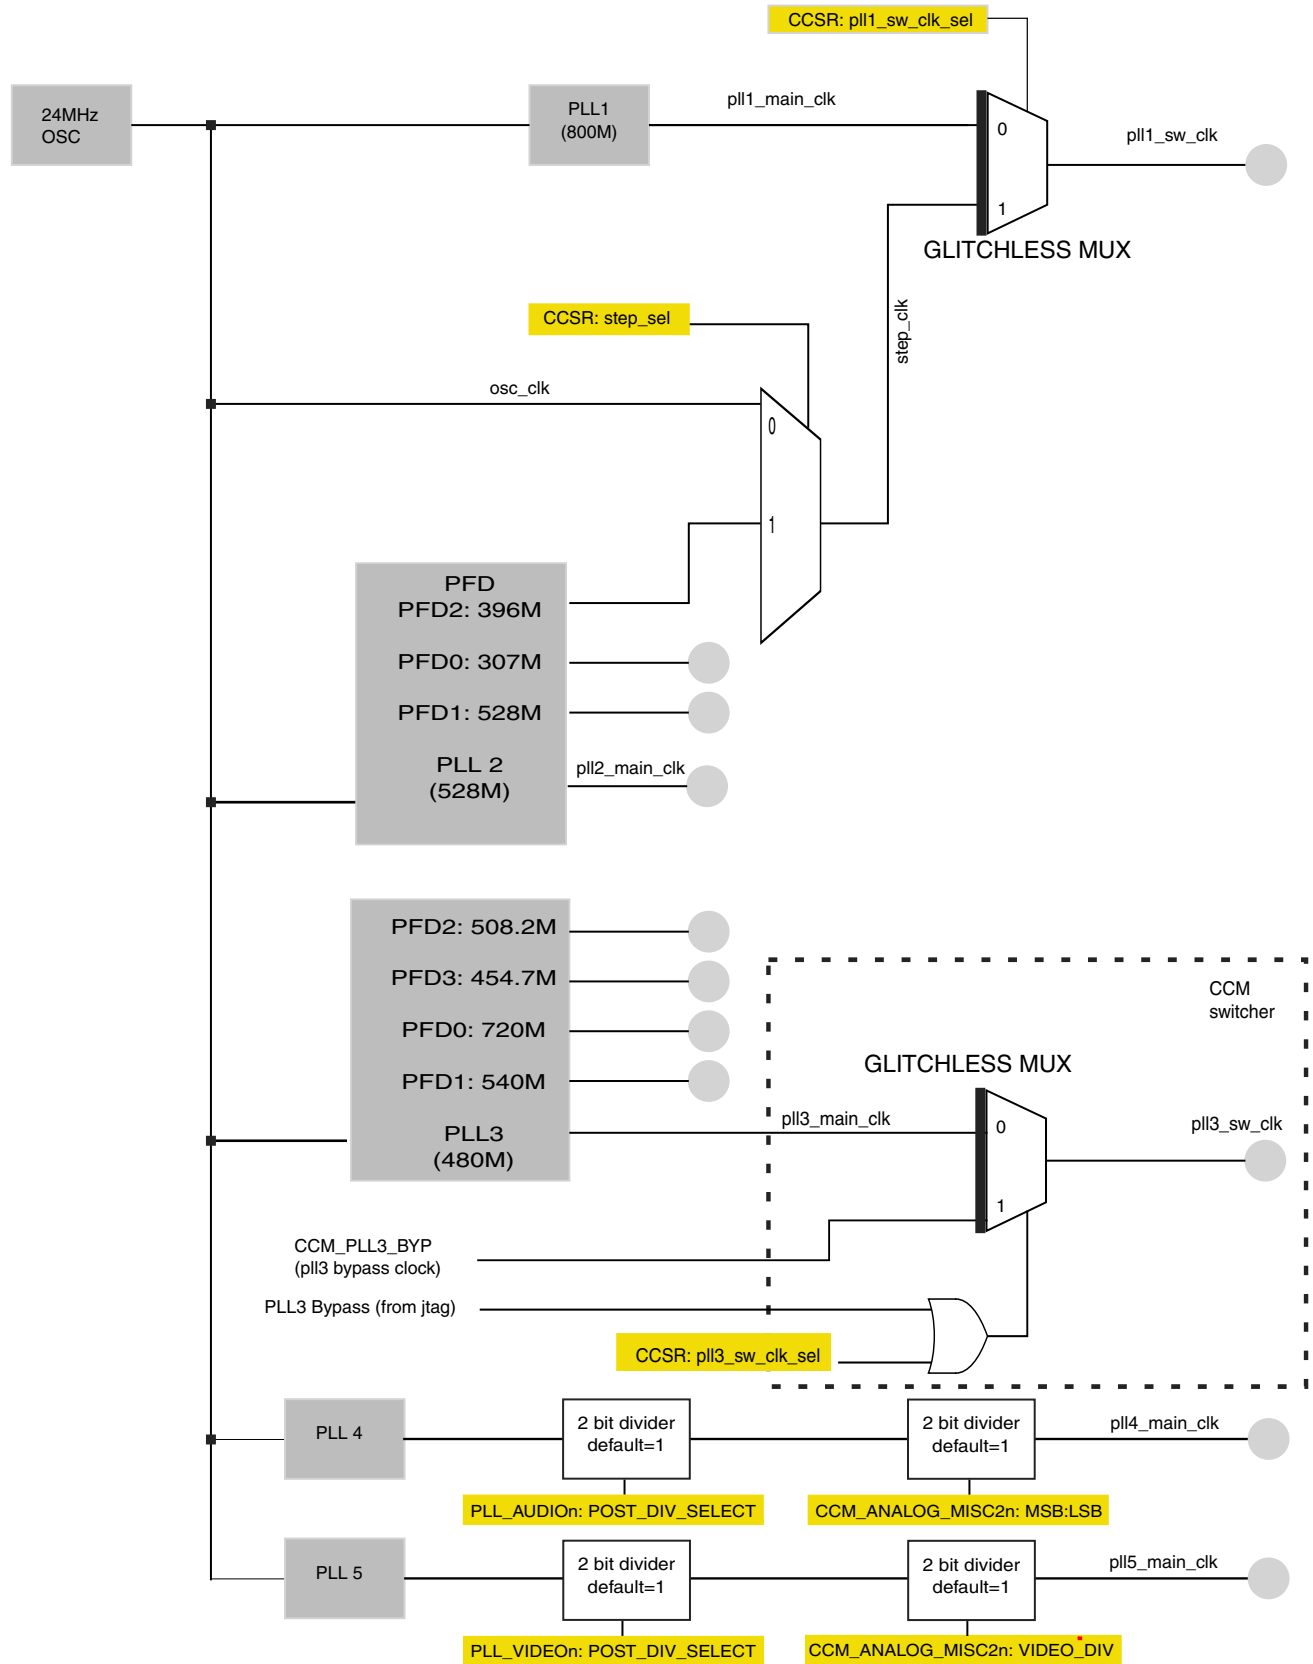

Figure 18-4. Switcher clock generation

### 18.5.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM\_ANALOG module, switcher and clk\_root\_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

### 18.5.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

### 18.5.1.5.4 Clock Root Generator

The Clock Root Generator (CCM\_CLK\_ROOT\_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

# Functional Description

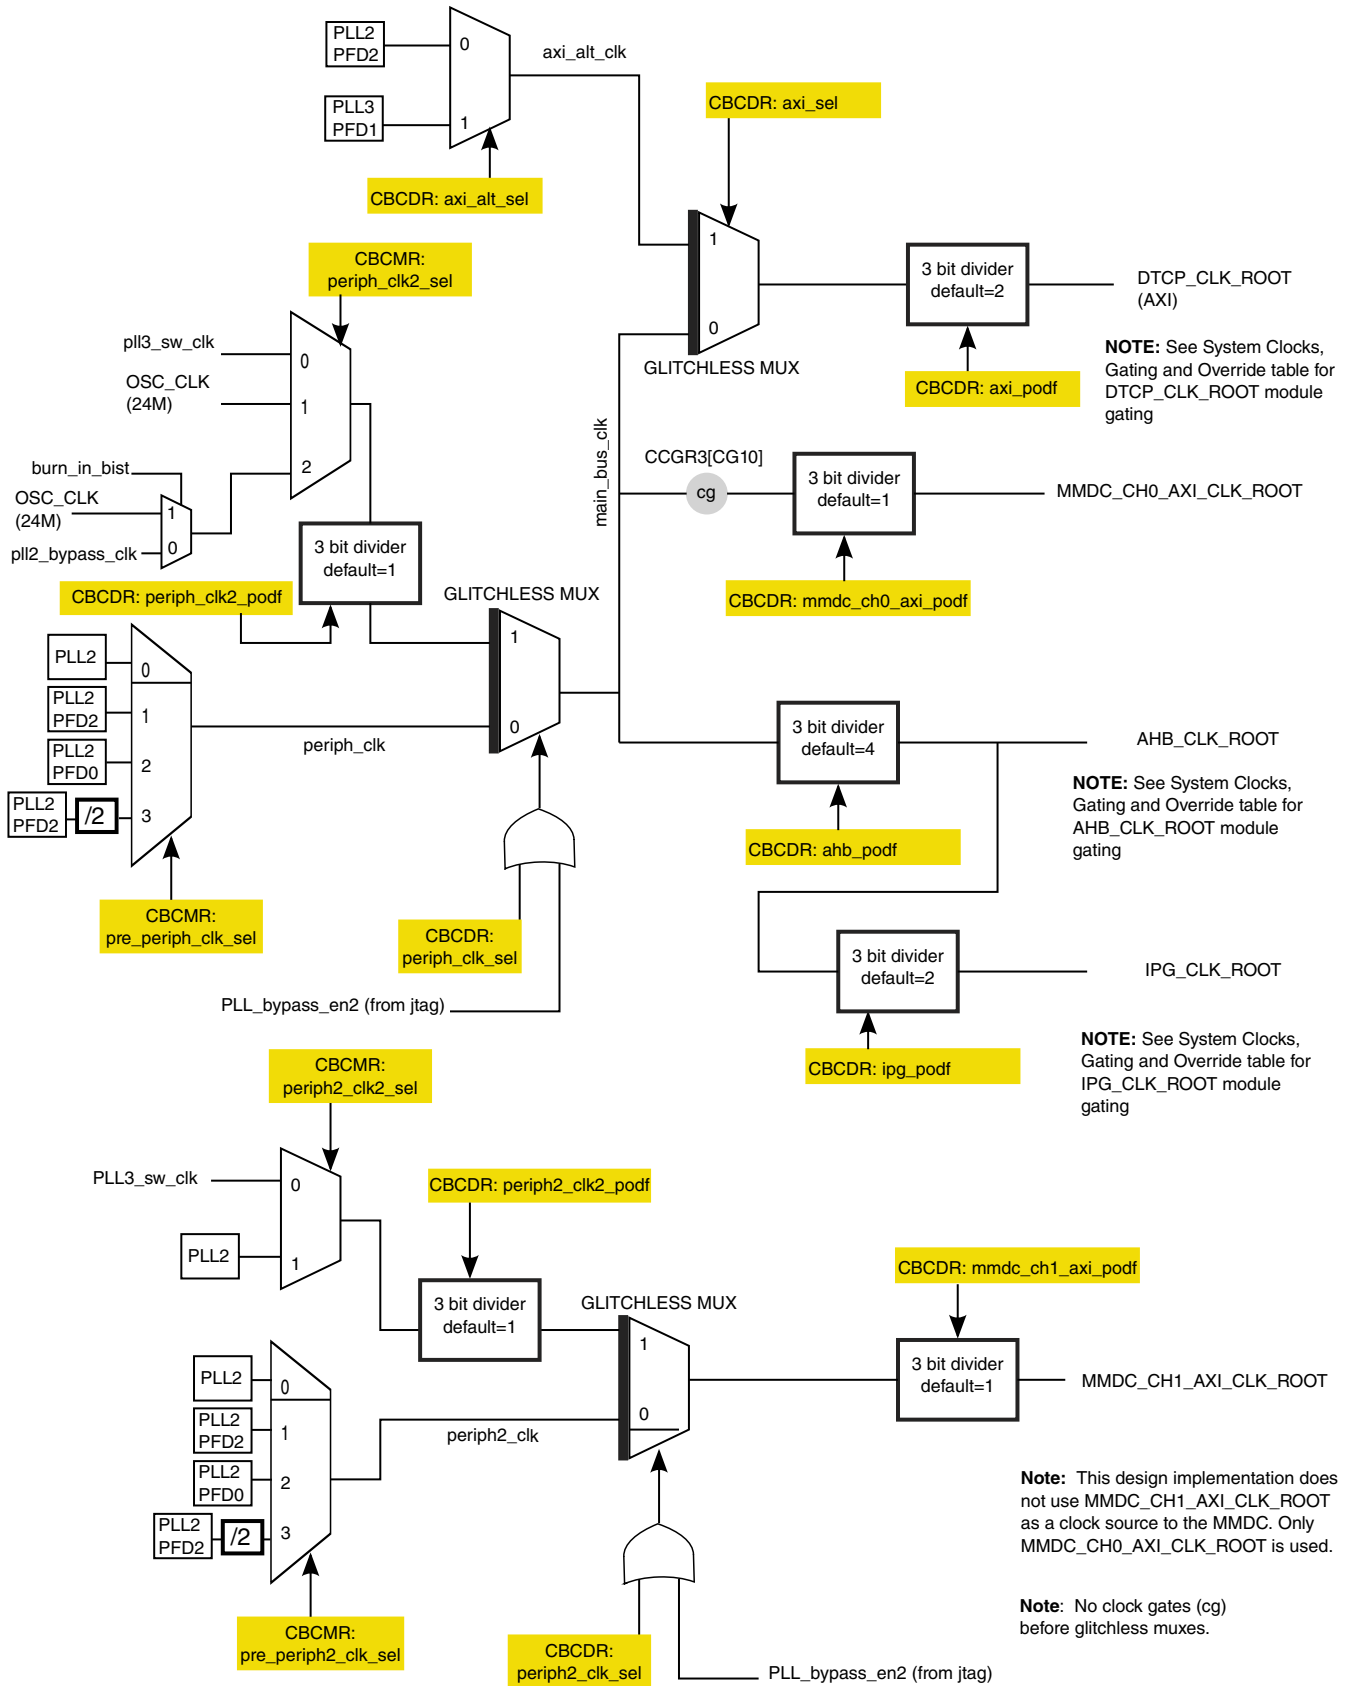

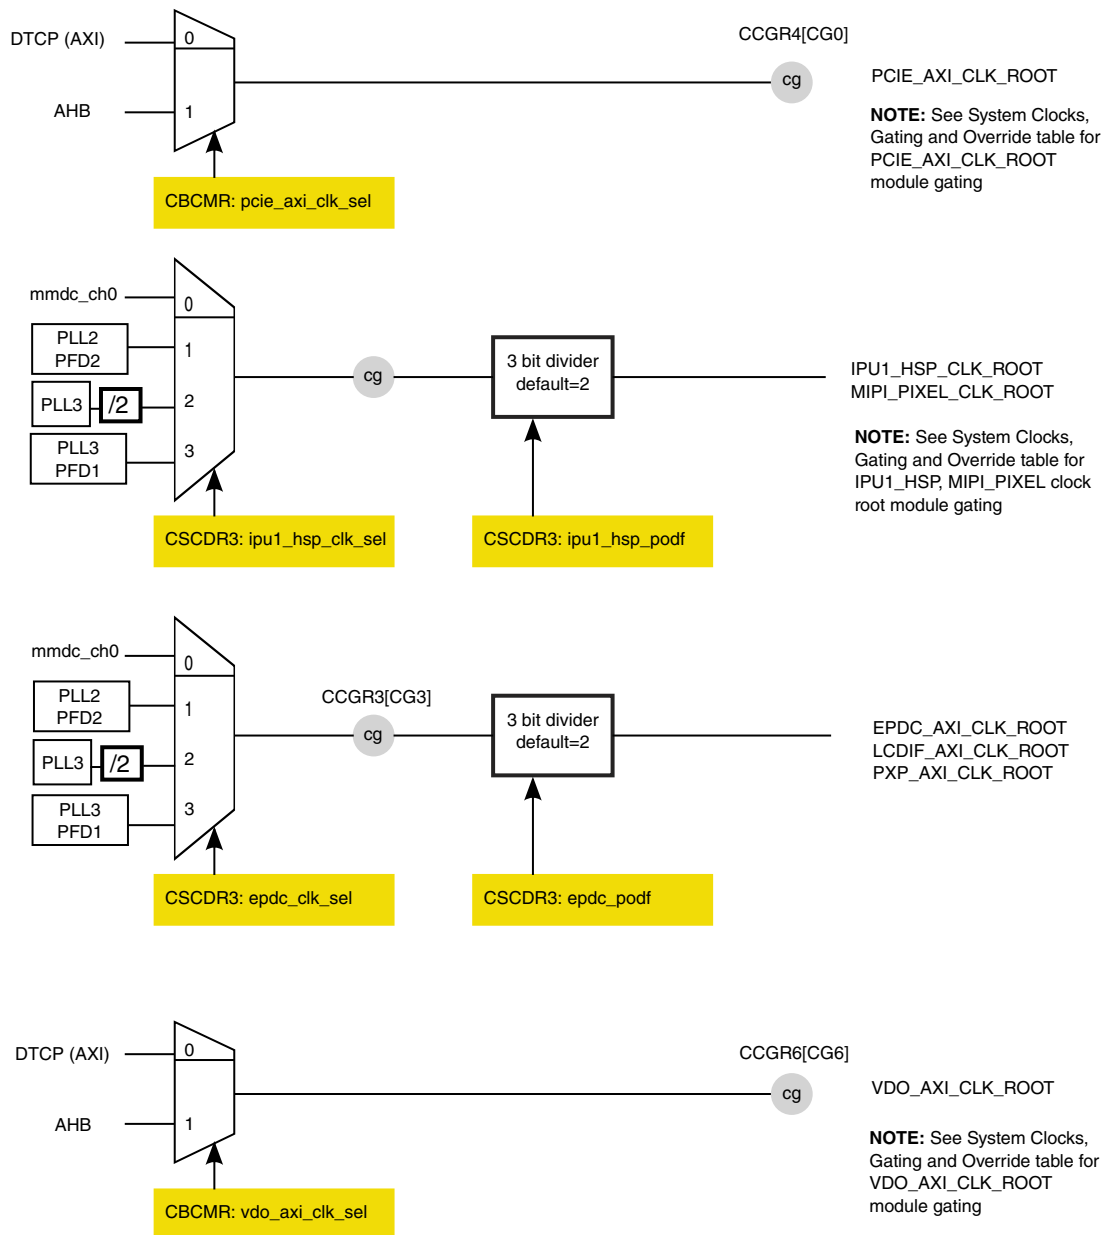

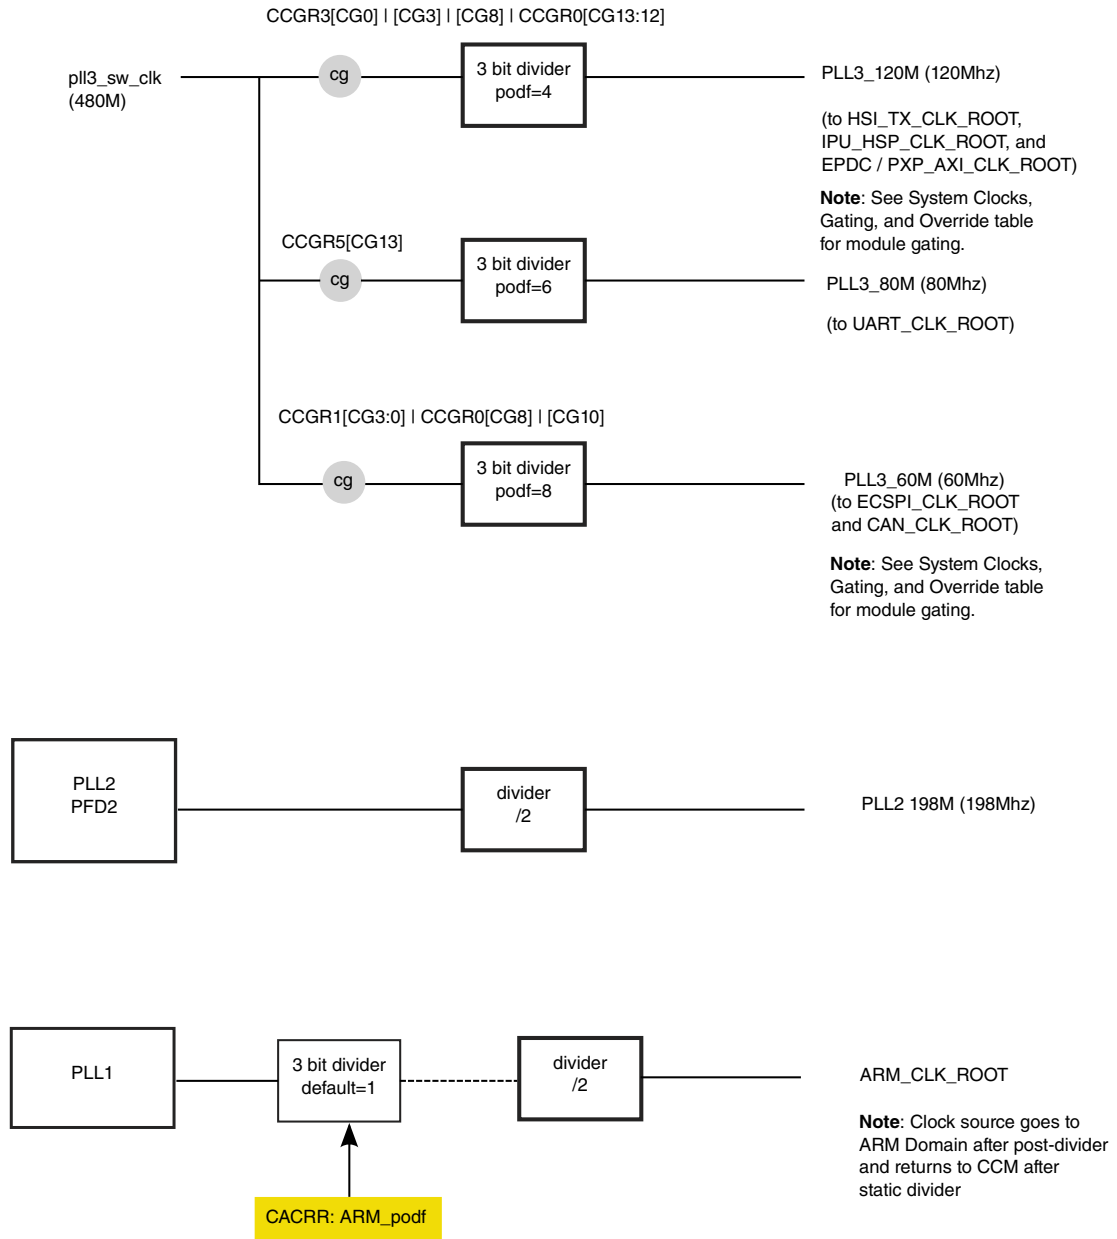

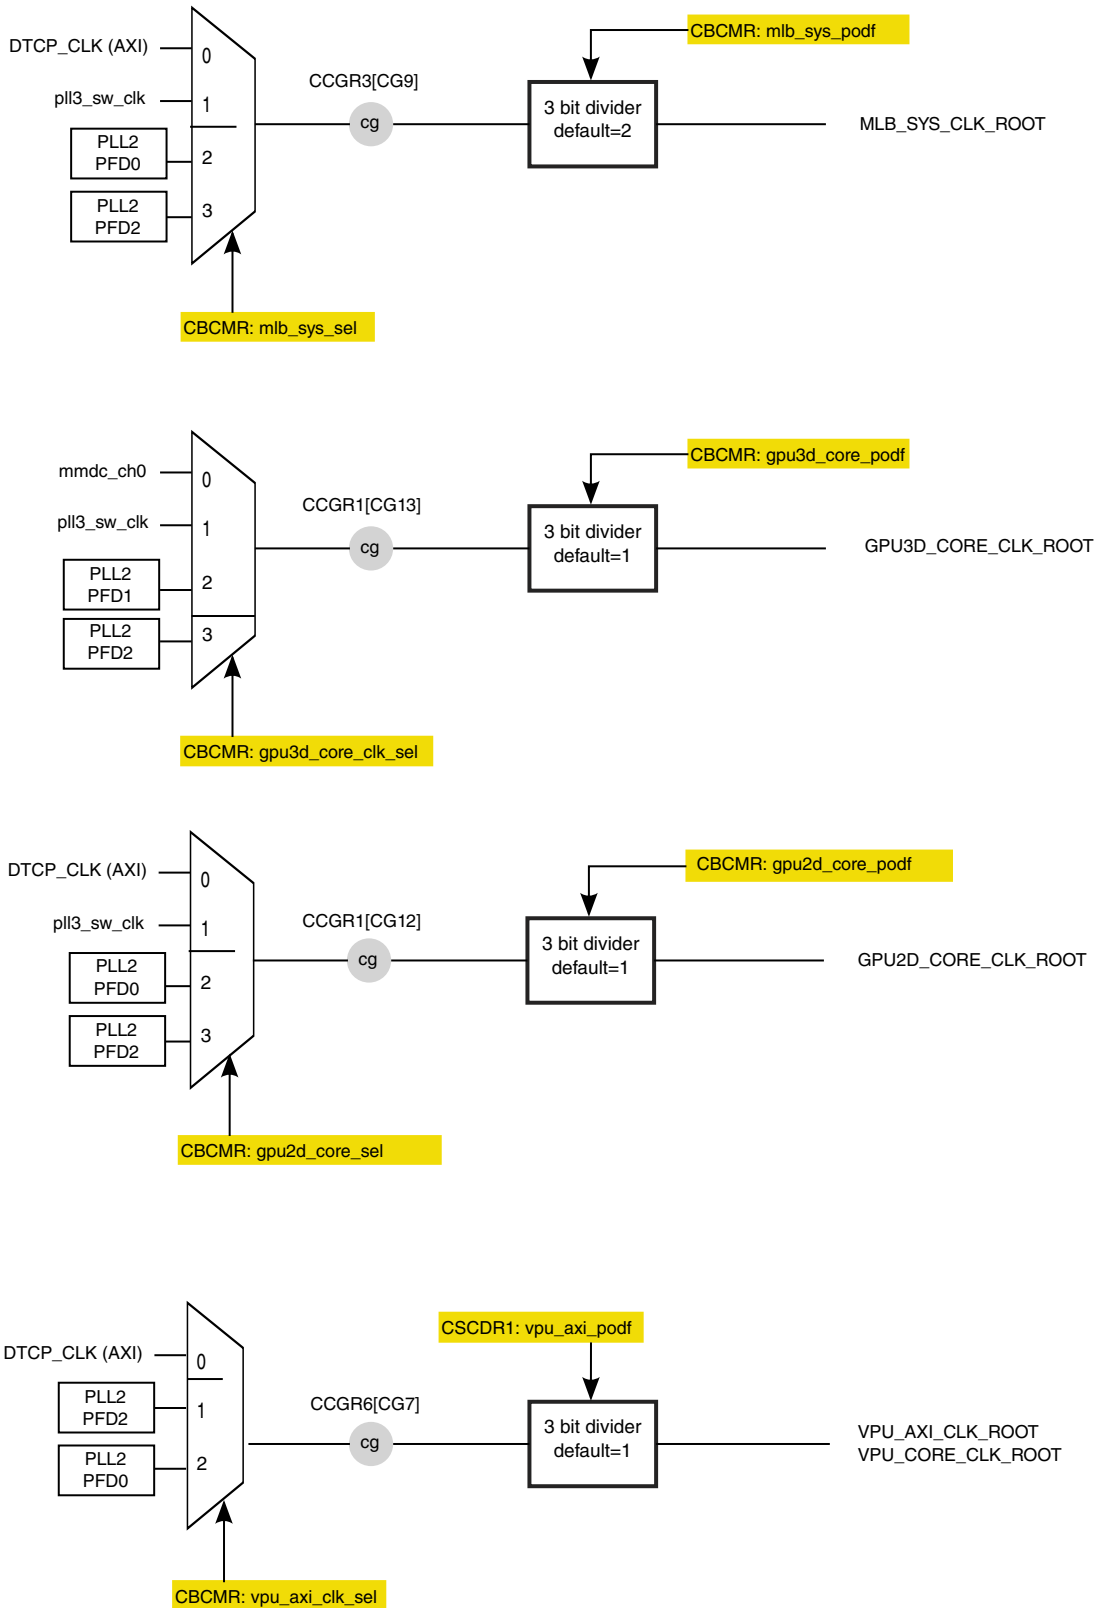

Figure 18-5. BUS clock generation

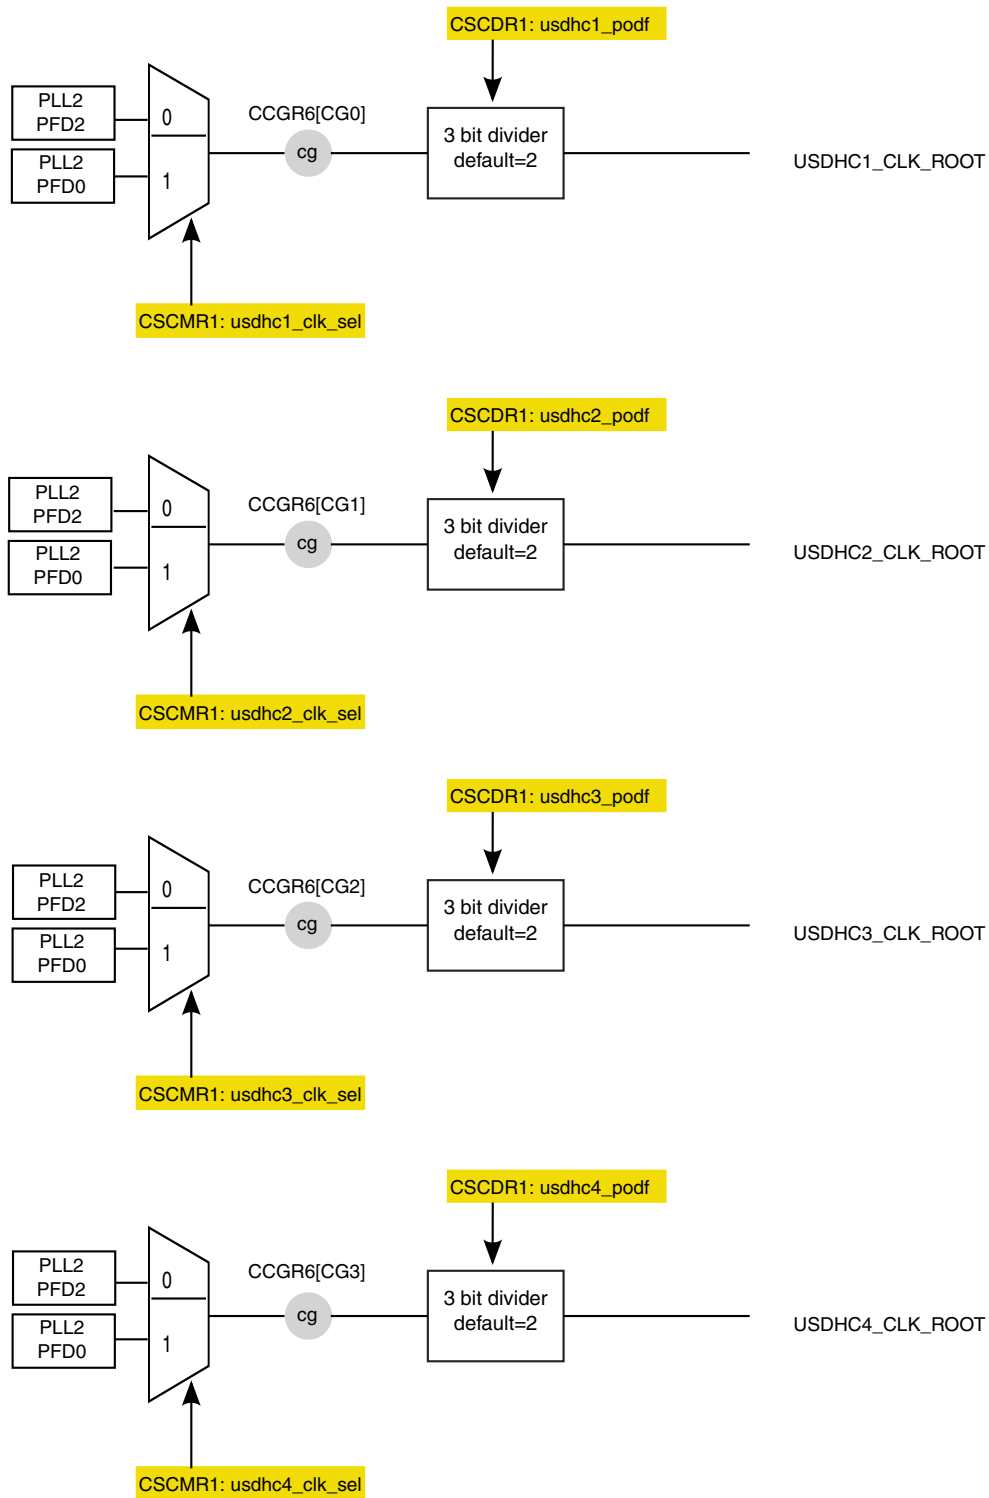

## Functional Description

**Figure 18-6. AXI clocks generation**

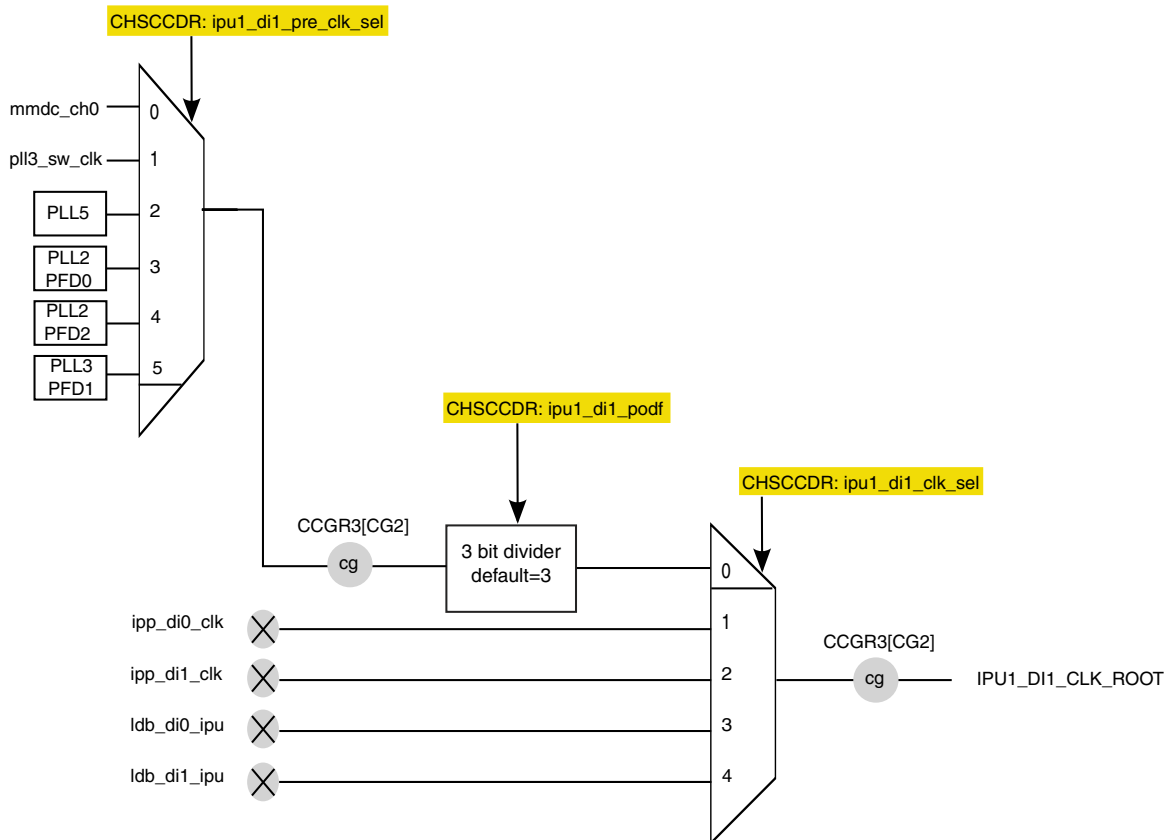

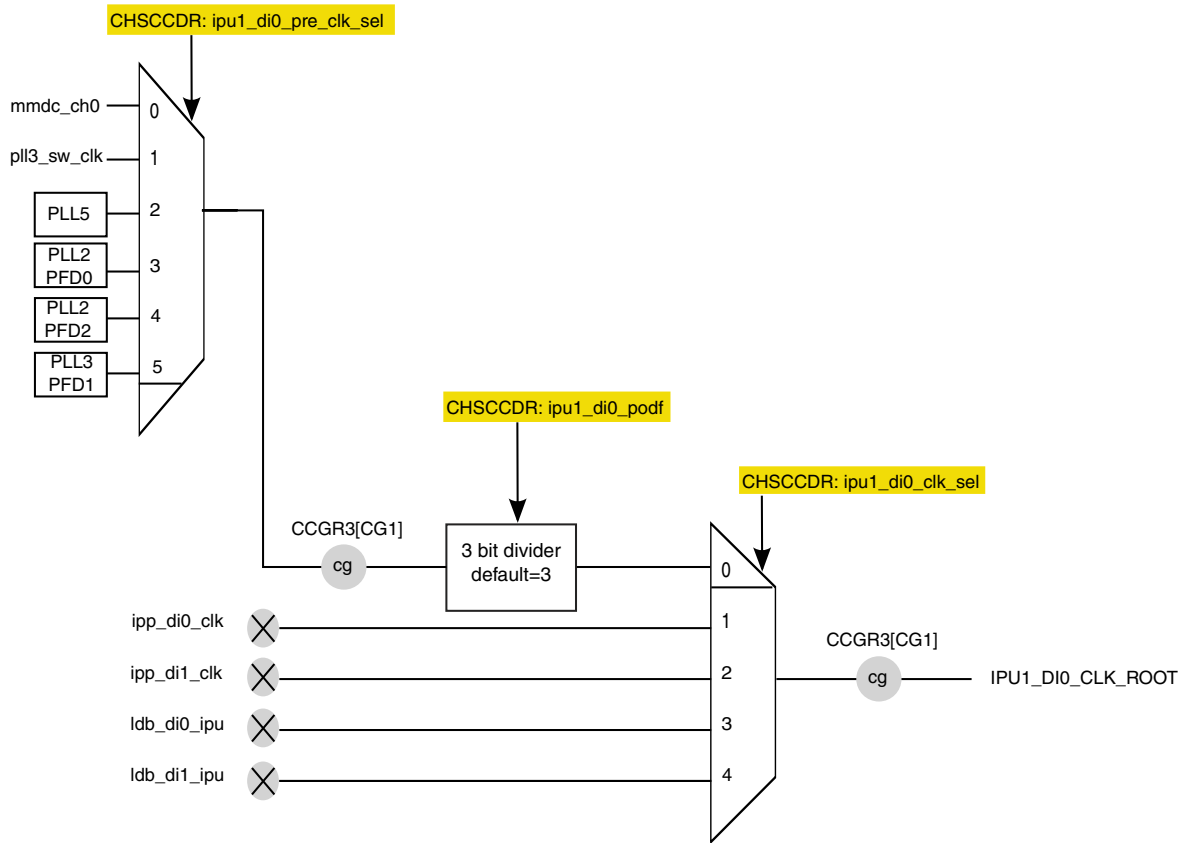

## Functional Description

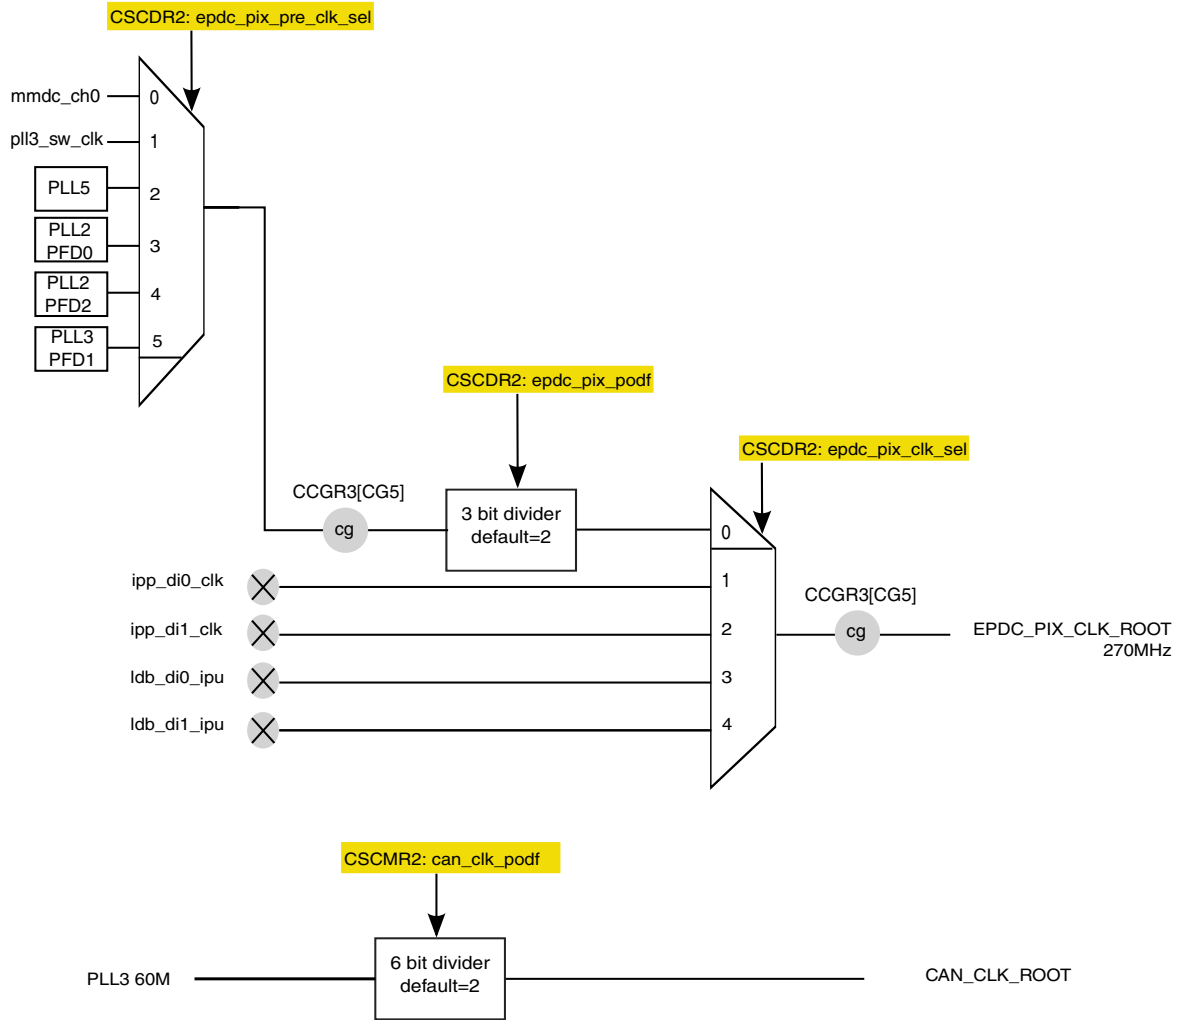

**Figure 18-7. Serial clock generation**

## Functional Description

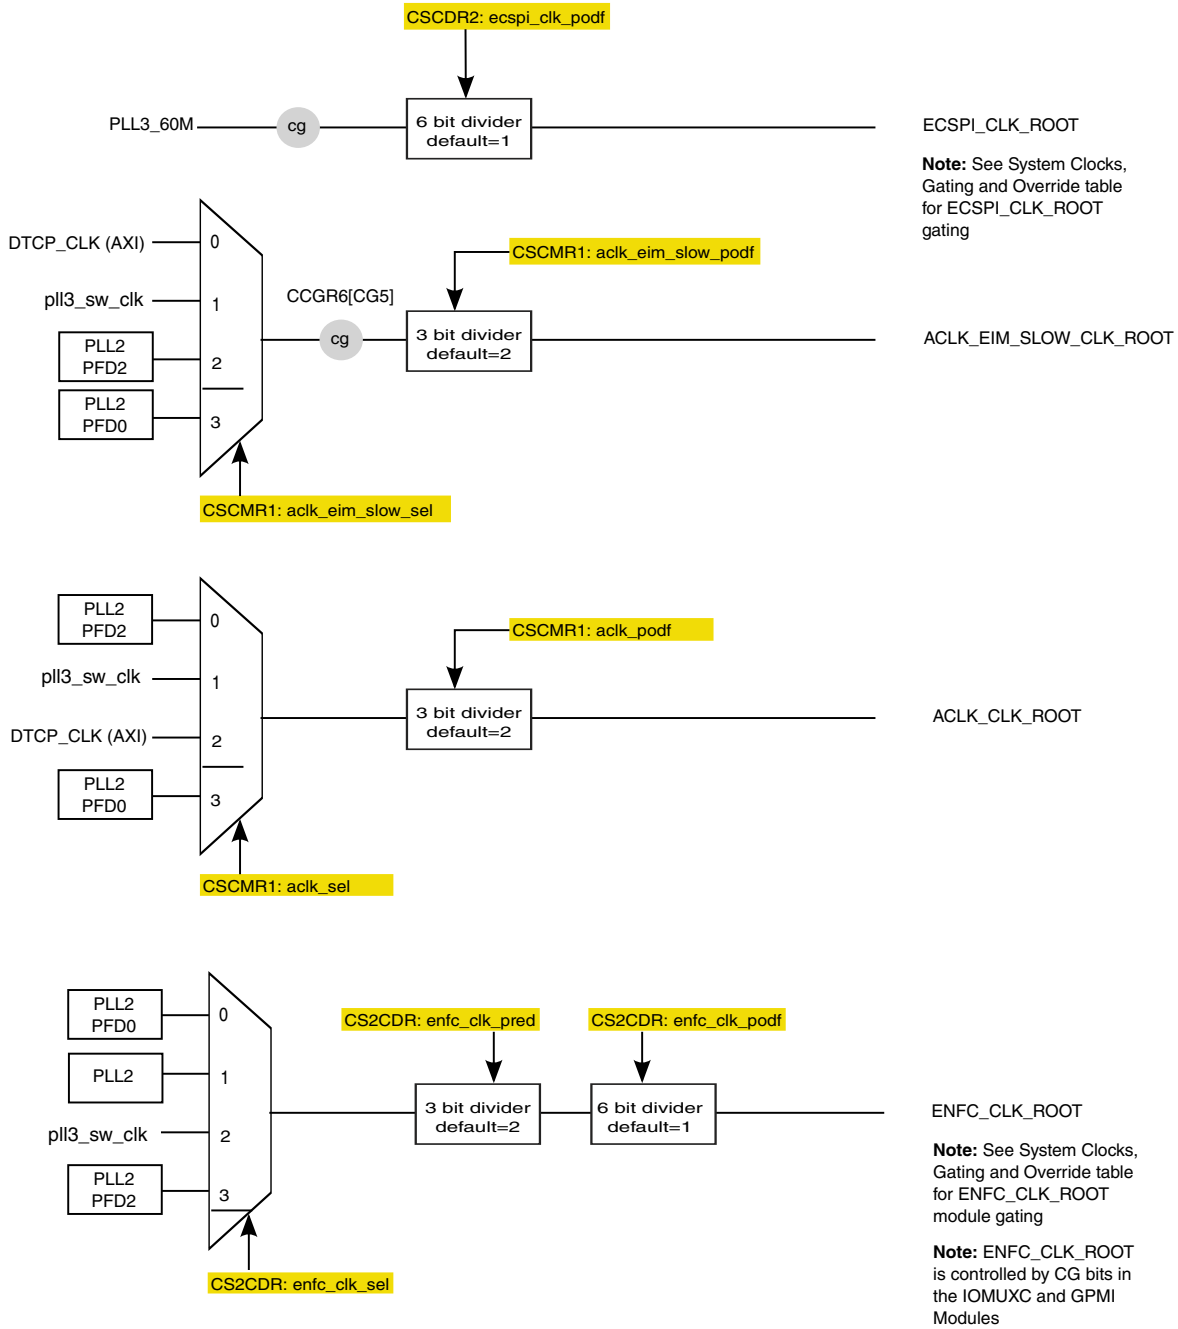

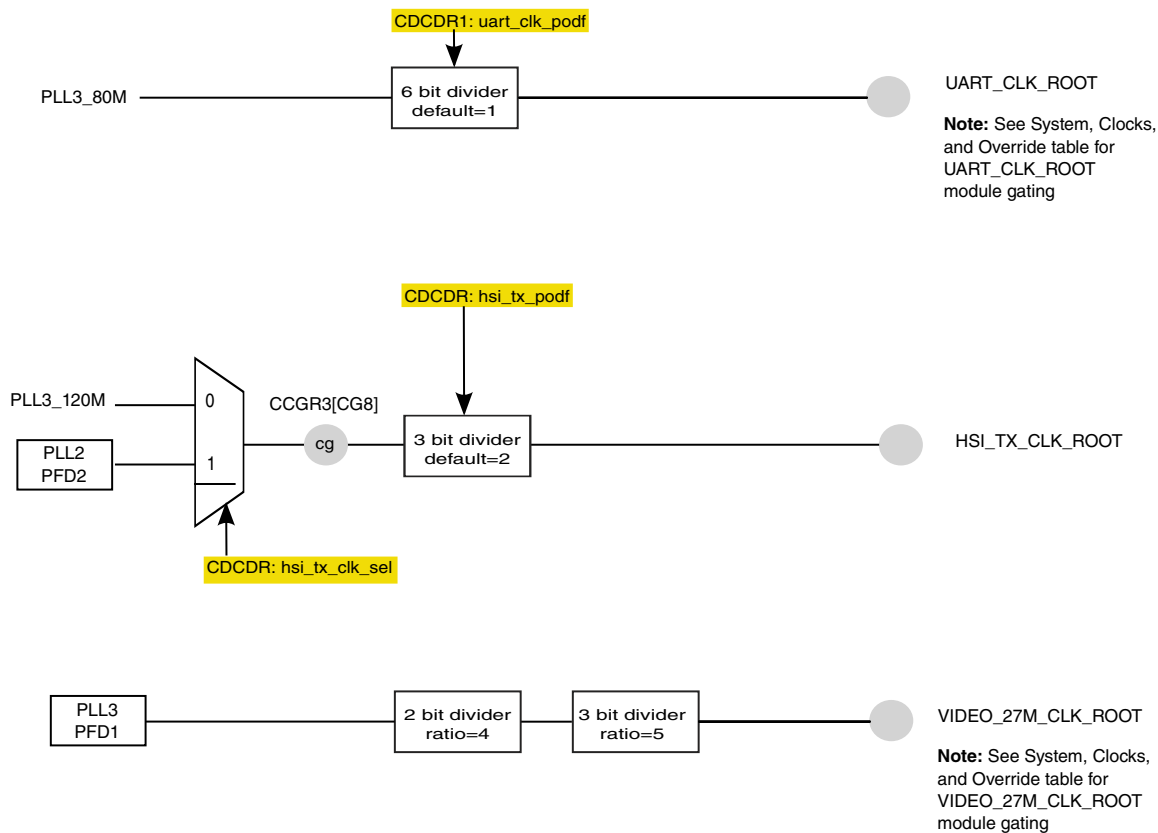

## Functional Description

**Figure 18-8. UART, HSI, Video clock generation (cont)**

**NOTE**

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

**18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).**

The initial values of the following dividers and muxes can be controlled by SJC.

In regular functional mode, the SJC will drive the reset values stated in the CCM register memory map. If SJC is programmed to change those values, then the reset value for those dividers/muxes will be taken from the SJC programability.

Software can update the changed reset value after reset sequence. The control signals and the dividers/muxes are listed below:

- [2:0] init\_mmdc\_ch1\_axi\_podf
- [2:0] init\_periph2\_clk2\_podf
- [1:0] init\_ipg\_podf
- [2:0] init\_ahb\_podf

- [2:0] init\_axi\_podf
- [2:0] init\_mmdc\_ch0\_axi\_podf
- [2:0] init\_periph\_clk2\_podf
- init\_periph\_clk\_sel
- init\_periph2\_clk\_sel

#### 18.5.1.5.6 Divider change handshake

Modifying the following dividers will start the handshake with MMDC CH1 and/or CH0.

- mmdc\_ch0\_axi\_podf
- mmdc\_ch1\_axi\_podf
- periph\_clk\_sel
- periph2\_clk\_sel
- arm\_podf
- axi\_podf
- ahb\_podf

#### 18.5.1.6 Disabling / Enabling PLLs

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

#### 18.5.1.7 Clock Switching Multiplexers

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM utilizes several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. In order for the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

## Functional Description

There are five glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

**Table 18-5. Glitchless Multiplexers**

Glitchless Mux	Mux Select Bit	Handshake Bit
periph_clk_mux	CBCDR[periph_clk_sel]	CDHIPR[periph_clk_sel_busy]
periph2_clk_mux	CBCDR[periph2_clk_sel]	CDHIPR[periph2_clk_sel_busy]
axi_alt_clk_mux	CBCDR[ axi_sel]	
pll3_sw_clk_mux	CCSR[pll3_sw_clk_sel]	
pll1_sw_clk_mux	CCSR[pll1_sw_clk_sel]	

### NOTE

Any change of the `periph_clk_sel` and `periph2_clk_sel` sync mux select will involve handshake with the MMDC. Refer to the CCDCR and CDHIPR registers for the handshake bypass and busy bits.

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in [Figure 18-5](#). In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the `FABRIC_CLK_ROOT` away from the PLL2 or one of its PFDs by programming `CBCMR[PERIPH2_CLK2_SEL]` and `CBCDR[PERIPH2_CLK2_PODF]` to provide an appropriate frequency clock, then glitchlessly switch to it by programming `CBCDR[PERIPH2_CLK_SEL]`.

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The input clocks to the mux are required to be gated before switching the source clock in the CCM clock mux and the output should also be gated. If the input and output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

### 18.5.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

Figure 18-9. Clock split in LPCG

### 18.5.1.8.1 MMDC handshake

CCM will assert the `mmdc_freq_change_req` signal.

MMDC will assert the `mmdc0_freq_change_ack` and `mmdc1_freq_change_ack` signals to acknowledge that the frequency change request has been received and that the frequency can now be changed safely.

CCM will commence the actual change of division ratio of `mmdc0` and/or `mmdc1` dividers or apply mux change on root clocks once both of the non-masked acknowledges are asserted.

#### NOTE

MMDC handshakes can be masked.

## 18.5.2 DVFS support

When performing DVFS, the frequency shift procedure for the ARM core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM\_ANALOG module.

### NOTE

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

### NOTE

CCM\_ANALOG will not control the voltage value in Bypass mode

## 18.5.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

### 18.5.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

### 18.5.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all ARM cores are in WFI, and L2 cache and SCU are idle.

#### 18.5.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. Once CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

### NOTE

Setting MMDC CGR bits to 01 can hang the entire system since the MMDC clock and fabric clock share the same clock root.

Any enabled interrupt assertion will start the exit from WAIT mode.

### 18.5.3.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

### 18.5.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for ARM platform, GPU3D, GPU2D and VPU. External supply voltage can be reduced to decrease leakage.

#### 18.5.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM\_PMIC\_STBY\_REQ asserted, if vstby bit is set

- osc\_en signal is negated
- osc\_pwrdsn is asserted, if sbyos bit is set

Counter will be triggered after CCM\_PMIC\_STBY\_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop\_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP\_GPC until STOP mode is exited.

### 18.5.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC\_STBY\_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If well bias was enabled, deasserted well bias controls.
3. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref\_en\_b signal and deasserting cosc\_pwrdown signal respectively.
4. After the number of cycles of CKILs defined in stby\_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
5. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.
6. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
7. CCM will request GPC to restore ARM power by GPC\_PUP\_REQ. If power was removed from the ARM platform, GPC will notify CCM by asserting signal GPC\_PUP\_ACK that power to ARM is back on, and its safe to exit from STOP mode. Only then will the CCM progress to the next step.
8. Once assertion of notification from src that the resets for the power gated modules has been finished, (src\_power\_gating\_reset\_done is set) negate the low power request signals to all modules and enable all module clocks including ARM clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continued to be gated.)

Once the system is in run mode, negate signals ccm\_ipg\_stop and system\_in\_stop\_mode.

## 18.6 CCM Memory Map/Register Definition

### NOTE

The register reset values for CCM change depending on the boot configuration. See [Clocks at Boot Time](#) for more information.

## 18.6.1 CCM Control Register (CCM\_CCR)

The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 20C\_4000h base + 0h offset = 20C\_4000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0				RBC_EN	REG_BYPASS_COUNT						0		WB_COUNT		
W	0					0						0		0		
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0			COSC_EN	0			OSCNT								
W	0				0			0								
Reset	0	0	0	1	0	1	1	0	1	1	1	1	1	1	1	1

## CCM\_CCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, event if counter is enabled.  1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled
26–21 REG_BYPASS_COUNT	Counter for analog_reg_bypass signal assertion after standby voltage request by PMIC_STBY_REQ. Should be zeroed and reconfigured after exit from low power mode.  REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core.  000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay
20–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 WB_COUNT	Well Bias counter. Delay, defined by this value, counted by CKIL clock will be applied till well bias is enabled at exit from wait or stop low power mode. Counter will be used if wb_core_at_lpm or wb_per_at_lpm bits are set. Should be zeroed and reconfigured after exit from low power mode.  000 no delay 001 1 CKIL clock delay 111 7 CKIL clocks delay
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip oscillator is ready by a interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source.  0 disable on chip oscillator 1 enable on chip oscillator
11–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
OSCNT	Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dpil_ip to use and only then the gate in dpil_ip can be opened.  00000000 count 1 ckil 11111111 count 256 ckil's

## 18.6.2 CCM Control Divider Register (CCM\_CCDCR)

The figure below represents the CCM Control Divider Register (CCDCR), which contains bits that control the loading of the dividers that need handshake with the modules they affect. The table below provides its field descriptions.

Address: 20C\_4000h base + 4h offset = 20C\_4004h

### CCM\_CCDCR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 mmdc_ch0_mask	During divider ratio mmdc_ch0_axi_podf change or sync mux periph_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch0 module.  0 allow handshake with mmdc_ch0 module 1 mask handshake with mmdc_ch0. Request signal will not be generated.
16 mmdc_ch1_mask	During divider ratio mmdc_ch1_axi_podf change or sync mux periph2_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch1 module.  0 allow handshake with mmdc_ch1 module 1 mask handshake with mmdc_ch1. Request signal will not be generated.
Reserved	This read-only field is reserved and always has the value 0.

### 18.6.3 CCM Status Register (CCM\_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 20C\_4000h base + 8h offset = 20C\_4008h

**CCM\_CSR field descriptions**

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 cosc_ready	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting.

*Table continues on the next page...*

## CCM\_CSR field descriptions (continued)

Field	Description
	0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3–1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm 0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

## 18.6.4 CCM Clock Switcher Register (CCM\_CCSR)

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 20C\_4000h base + Ch offset = 20C\_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	pll3_pfd1_dis_mask	Reserved	Reserved	pll3_pfd2_dis_mask	pll2_pfd1_dis_mask	pll2_pfd0_dis_mask	pll2_pfd2_dis_mask	step_sel	0				pll1_sw_clk_sel	Reserved	pll3_sw_clk_sel	
W																
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

## CCM\_CCSR field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 pll3_pfd1_dis_mask	Mask of PLL3 PFD1 auto-disable. 0 - PLL3 PFD1 disable=0 (PFD always on) 1 PLL3 PFD1 disable is managed by associated dividers disable. If all PLL3 PFD1-driven dividers are closed, PFD is disabled.
14 -	This field is reserved. Reserved
13 -	This field is reserved. Reserved
12 pll3_pfd2_dis_mask	Mask of PLL3 PFD2 auto-disable. 0 PLL3 PFD2 disable=0 (PFD always on) 1 PLL3 PFD2 disable is managed by associated dividers disable. If all PLL3 PFD2-driven dividers are closed, PFD is disabled.
11 pll2_pfd1_dis_mask	Mask of PLL2 PFD1 auto-disable. 0 PLL2 PFD1 disable=0 (PFD always on) 1 PLL2 PFD1 disable is managed by associated dividers disable. If all PLL2 PFD1-driven dividers are closed, PFD is disabled.
10 pll2_pfd0_dis_mask	Mask of PLL2 PFD0 auto-disable. 0 PLL2 PFD0 disable=0 (PFD always on) 1 PLL2 PFD0 disable is managed by associated dividers disable. If all PLL2 PFD0-driven dividers are closed, PFD is disabled.
9 pll2_pfd2_dis_mask	Mask of PLL2 PFD2 auto-disable. 0 PLL2 PFD2 disable=0 (PFD always on) 1 PLL2 PFD2 disable is managed by associated dividers disable. If all PLL2 PFD2-driven dividers are closed, PFD is disabled.
8 step_sel	Selects the option to be chosen for the step frequency when shifting ARM frequency. This will control the step_clk.  <b>NOTE:</b> This mux is allowed to be changed only if its output is not used, i.e. ARM uses the output of pll1, and step_clk is not used.  0 derive clock from osc_clk (24M) - source for lp_apm. 1 derive clock from PLL2 PFD2
7–3 Reserved	This read-only field is reserved and always has the value 0.
2 pll1_sw_clk_sel	Selects source to generate pll1_sw_clk. 0 pll1_main_clk 1 step_clk
1 -	This field is reserved. Reserved
0 pll3_sw_clk_sel	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk 1 pll3 bypass clock

## 18.6.5 CCM Arm Clock Root Register (CCM\_CACRR)

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the ARM clock root generation. The table below provides its field descriptions.

Address: 20C\_4000h base + 10h offset = 20C\_4010h

### CCM\_CACRR field descriptions

Field	Description
31–3 Reserved	This read-only field is reserved and always has the value 0.
arm_podf	<p>Divider for ARM clock root.</p> <p><b>NOTE:</b> If arm_freq_shift_divider is set to '1' then any new write to arm_podf will be held until arm_clk_switch_req signal is asserted.</p> <p>000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8</p>

### 18.6.6 CCM Bus Clock Divider Register (CCM\_CBCDR)

The figure below represents the CCM Bus Clock Divider Register (CBCDR). The CBCDR register contains bits to control the clock generation sub module dividers. The table below provides its field descriptions.

Address: 20C\_4000h base + 14h offset = 20C\_4014h

**CCM\_CBCDR field descriptions**

Field	Description
31–30 -	This field is reserved. Reserved
29–27 periph_clk2_podf	Divider for periph2 clock podf. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
26 periph2_clk_sel	Selector for peripheral2 main clock (source of mmdc_ch1_clk_root ). <b>NOTE:</b> Any change of this mux select will involve handshake with the MMDC. Refer to the CCCR and CDHIPR registers for the handshake bypass and busy bits. 0 PLL2 (pll2_main_clk) 1 derive clock from periph2_clk2_clk clock source.

Table continues on the next page...

## CCM\_CBCDR field descriptions (continued)

Field	Description
25 periph_clk_sel	<p>Selector for peripheral main clock (source of MMDC_CH0_CLK_ROOT).</p> <p><b>NOTE:</b> Alternative clock source should be used when PLL is relocked. For PLL relock procedure pls refer to the PLL chapter.</p> <p><b>NOTE:</b> Any change of this sync mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits.</p> <p>0 PLL2 (pll2_main_clk) 1 derive clock from periph_clk2_clk clock source.</p>
24–22 -	This field is reserved. Reserved
21–19 mmdc_ch0_axi_podf	<p>Divider for mmdc_ch0_axi podf.</p> <p>000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8</p>
18–16 axi_podf	<p>Divider for axi podf.</p> <p><b>NOTE:</b> Any change of this divider might involve handshake with EMI and IPU. See CDHIPR register for the handshake busy bits.</p> <p>000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8</p>
15–13 -	This field is reserved. Reserved
12–10 ahb_podf	<p>Divider for AHB PODF.</p> <p><b>NOTE:</b> Any change of this divider might involve handshake with EMI and IPU. See CDHIPR register for the handshake busy bits.</p> <p>000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8</p>

Table continues on the next page...

## CCM\_CBCDR field descriptions (continued)

Field	Description
9–8 ipg_podf	Divider for ipg_podf. <b>NOTE:</b> SDMA module will not support ratio of 1:3 and 1:4 for ahb_clk:ipg_clk. In case SDMA is used, then those ratios should not be used.  00 divide by 1 01 divide by 2 10 divide by 3 11 divide by 4
7 axi_alt_sel	AXI alternative clock select 0 PLL2 PFD2 will be selected as alternative clock for AXI root clock 1 PLL3 PFD1 will be selected as alternative clock for AXI root clock
6 axi_sel	AXI clock source select 0 Periph_clk output will be used as AXI clock root 1 AXI alternative clock will be used as AXI clock root
5–3 mmdc_ch1_axi_podf	Divider for mmdc_ch1_axi_podf. <b>NOTE:</b> This design implementation does not use MMDC_CH1_CLK_ROOT as a clock source to the MMDC. Only MMDC_CH0_CLK_ROOT is used.  000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
periph2_clk2_podf	Divider for periph2_clk2_podf. <b>NOTE:</b> Divider should be updated when output clock is gated.  000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

### 18.6.7 CCM Bus Clock Multiplexer Register (CCM\_CBCMR)

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

**NOTE**

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

The change for arm\_clk\_sel should be done through sdma so that ARM will not use this clock during the change and the clock will be gated in LPCG.

Address: 20C\_4000h base + 18h offset = 20C\_4018h

Field	Description
	010 divide by 3 111 divide by 8
24–22 spdif0_clk_podf	Divider for spdif0 clock podf. <b>NOTE:</b> Divider should be updated when output clock is gated.  000 divide by 1 111 divide by 8
21–20 spdif0_clk_sel	Selector for spdif0 clock multiplexer  00 derive clock from PLL4 divided clock 01 derive clock from PLL3 PFD2 11 derive clock from pll3_sw_clk
19–16 -	This field is reserved. Reserved
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 spdif1_clk_pred	Divider for spdif1 clock pred. <b>NOTE:</b> Divider should be updated when output clock is gated. <b>NOTE:</b> Used for ASRC clock, not related to SPDIF module  000 divide by 1 (do not use with high input frequencies) 001 divide by 2 010 divide by 3 111 divide by 8
11–9 spdif1_clk_podf	Divider for spdif1 clock podf. <b>NOTE:</b> Divider should be updated when output clock is gated. <b>NOTE:</b> Used for ASRC clock, not related to SPDIF module  000 divide by 1 111 divide by 8
8–7 spdif1_clk_sel	Selector for spdif1 clock multiplexer  00 derive clock from PLL4 divided clock 01 derive clock from PLL3 PFD2 11 derive clock from pll3_sw_clk
-	This field is reserved. Reserved

## 18.6.14 CCM HSC Clock Divider Register (CCM\_CHSCCCR)

The figure below represents the CCM HSC Clock Divider Register (CHSCCCR). The CHSCCCR register contains bits to control the ipu di clock generation dividers. The table below provides its field descriptions.

Address: 20C\_4000h base + 34h offset = 20C\_4034h

**CCM\_CHSCCCR field descriptions**

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17–15 ipu1_di1_pre_clk_sel	Selector for ipu1 di1 root clock pre-multiplexer  <b>NOTE:</b> Multiplexor should only be updated when the output clock is gated. Please refer to <a href="#">System Clocks</a> for the respective output clock gating bits.  000 derive clock from mmdc_ch0 clock 001 derive clock from pll3_sw_clk 010 derive clock from pll5 011 derive clock from PLL2 PFD0 100 derive clock from PLL2 PFD2 101 derive clock from PLL3 PFD1 110-111 Reserved
14–12 ipu1_di1_podf	Divider for ipu1_di clock divider.  <b>NOTE:</b> Divider should be updated when output clock is gated.  000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
11–9 ipu1_di1_clk_sel	Selector for ipu1 di1 root clock multiplexer  <b>NOTE:</b> Multiplexor should only be updated when the output clock is gated. Please refer to <a href="#">System Clocks</a> for the respective output clock gating bits.

Table continues on the next page...

## CCM\_CHSCCDR field descriptions (continued)

Field	Description
	000 derive clock from divided pre-muxed ipu1 di1 clock 001 derive clock from ipp_di0_clk 010 derive clock from ipp_di1_clk 011 derive clock from ldb_di0_clk 100 derive clock from ldb_di1_clk 101-111 Reserved
8–6 ipu1_di0_pre_clk_sel	Selector for ipu1 di0 root clock pre-multiplexer <b>NOTE:</b> Multiplexor should only be updated when the output clock is gated. Please refer to <a href="#">System Clocks</a> for the respective output clock gating bits. 000 derive clock from mmdc_ch0 clock 001 derive clock from pll3_sw_clk 010 derive clock from pll5 011 derive clock from PLL2 PFD0 100 derive clock from PLL2 PFD2 101 derive clock from PLL3 PFD1 110-111 Reserved
5–3 ipu1_di0_podf	Divider for ipu1_di0 clock divider. <b>NOTE:</b> Divider should be updated when output clock is gated. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
ipu1_di0_clk_sel	Selector for ipu1 di0 root clock multiplexer <b>NOTE:</b> Multiplexor should only be updated when the output clock is gated. Field	Description
	011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
10–9 ipu1_hsp_clk_sel	Selector for ipu1_hsp clock multiplexer 00 derive clock from mmdc_ch0 clock 01 derive clock from PLL2 PFD2 10 derive clock from pll3_120M 11 derive clock from PLL3 PFD1
-	This field is reserved. Reserved

### 18.6.17 CCM Divider Handshake In-Process Register (CCM\_CDHIPR)

The figure below represents the CCM Divider Handshake In-Process Register (CDHIPR). The CDHIPR register contains read-only bits that indicate that CCM is in the process of updating dividers or muxes that might need handshake with modules.

Address: 20C\_4000h base + 48h offset = 20C\_4048h

**CCM\_CDHIPR field descriptions**

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 arm_podf_busy	<p>Busy indicator for arm_podf.</p> <p>0 divider is not busy and its value represents the actual division.                      1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the arm_podf will be applied.</p>
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 periph_clk_sel_busy	<p>Busy indicator for periph_clk_sel mux control.</p> <p>0 mux is not busy and its value represents the actual division.                      1 mux is busy with handshake process with module. The value read in the periph_clk_sel represents the previous value of select, and after the handshake periph_clk_sel value will be applied.</p>
4 mmdc_ch0_axi_podf_busy	<p>Busy indicator for mmdc_ch0_axi_podf.</p> <p>0 divider is not busy and its value represents the actual division.                      1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the mmdc_ch0_axi_podf will be applied.</p>

Table continues on the next page...

## CCM\_CDHIPR field descriptions (continued)

Field	Description
3 periph2_clk_sel_busy	<p>Busy indicator for periph2_clk_sel mux control.</p> <p>0 mux is not busy and its value represents the actual division.</p> <p>1 mux is busy with handshake process with module. The value read in the periph2_clk_sel represents the previous value of select, and after the handshake periph2_clk_sel value will be applied.</p>
2 mmdc_ch1_podf_busy	<p>Busy indicator for mmdc_ch1_axi_podf.</p> <p>0 divider is not busy and its value represents the actual division.</p> <p>1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the mmdc_ch1_axi_podf will be applied.</p>
1 ahb_podf_busy	<p>Busy indicator for ahb_podf.</p> <p>0 divider is not busy and its value represents the actual division.</p> <p>1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the ahb_podf will be applied.</p>
0 axi_podf_busy	<p>Busy indicator for axi_podf.</p> <p>0 divider is not busy and its value represents the actual division.</p> <p>1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the axi_podf will be applied.</p>

### 18.6.18 CCM Low Power Control Register (CCM\_CLPCR)

The figure below represents the CCM Low Power Control Register (CLPCR). The CLPCR register contains bits to control the low power modes operation. The table below provides its field descriptions.

Address: 20C\_4000h base + 54h offset = 20C\_4054h

**CCM\_CLPCR field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 mask_l2cc_idle	Mask L2CC IDLE for entering low power mode. <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 mask_scu_idle	Mask SCU IDLE for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

Table continues on the next page...

## CCM\_CLPCR field descriptions (continued)

Field	Description
25–24 Reserved	This read-only field is reserved and always has the value 0.
23 mask_core1_wfi	Mask WFI of core1 for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 WFI of core1 is masked 0 WFI of core1 is not masked
22 mask_core0_wfi	Mask WFI of core0 for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 bypass_mmdc_ch1_lpm_hs	Bypass handshake with mmdc_ch1 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. 0 Handshake with mmdc_ch1 on next entrance to low power mode will be performed. 1 Handshake with mmdc_ch1 on next entrance to low power mode will be bypassed.
20 Reserved	This read-only field is reserved and always has the value 0.
19 bypass_mmdc_ch0_lpm_hs	Bypass handshake with mmdc_ch0 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake will also be bypassed, if CGR3 CG10 is set to gate fast mmdc_ch0 clock. 0 Handshake with mmdc_ch0 on next entrance to low power mode will be performed. . 1 Handshake with mmdc_ch0 on next entrance to low power mode will be bypassed.
18 Reserved	This read-only field is reserved and always has the value 0.
17 -	This field is reserved. Reserved
16 wb_per_at_lpm	Enable periphery charge pump for well biasing at low power mode (stop or wait) 0 Periphery charge pump won't be enabled at STOP or WAIT low power modes 1 Periphery charge pump will be enabled at STOP or WAIT low power modes
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 cosc_pwrdown	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed.  The manual closing of onchip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation. 0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'. 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.
10–9 stby_count	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set). <b>NOTE:</b> Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit. 00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles

*Table continues on the next page...*

## CCM\_CLPCR field descriptions (continued)

Field	Description
	01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles
8 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode.  0 Voltage will not be changed to standby voltage after next entrance to STOP mode. (PMIC_STBY_REQ will remain negated - '0') 1 Voltage will be requested to change to standby voltage after next entrance to stop mode. (PMIC_STBY_REQ will be asserted - '1').
7 dis_ref_osc	dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed.  The manual closing of external reference oscillator should be performed only in case the reference oscillator is not the source of any clock generation.  <b>NOTE:</b> When returning from stop mode, the PMIC_STBY_REQ will be deasserted (if it was asserted when entering stop mode). See stby_count bits.  0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'. 1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'
6 SBYOS	Standby clock oscillator bit. This bit defines if cosc_pwrdown, which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if cosc_pwrdown='1' for the on chip oscillator.  0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and cosc_pwrdown will remain de asserted - '0') 1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and cosc_pwrdown will be asserted - '1'). When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after oscnt count, CCM will continue with the exit from the STOP mode process.
5 ARM_clk_dis_on_lpm	Define if ARM clocks (arm_clk, soc_mxclk, soc_pclk, soc_dbg_pclk, vl_wrck) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep ARM clock functioning.  <b>NOTE:</b> Software should not enable ARM power gating in wait mode if this bit is cleared.  0 ARM clock enabled on wait mode. 1 ARM clock disabled on wait mode.
4-3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
LPM	Setting the low power mode that system will enter on next assertion of dsm_request signal.  <b>NOTE:</b> Set CCM_CGPR[INT_MEM_CLK_LPM] and CCM_CGPR[1] bits to 1 when setting CCM_CLPCR[LPM] bits to 01 (WAIT Mode) or 10 (STOP mode) without power gating. CCM_CGPR[INT_MEM_CLK_LPM] and CCM_CGPR[1] bits do not have to be set for STOP mode entry.  00 Remain in run mode 01 Transfer to wait mode

Table continues on the next page...

**CCM\_CLPCR field descriptions (continued)**

Field	Description
10	Transfer to stop mode
11	Reserved

**18.6.19 CCM Interrupt Status Register (CCM\_CISR)**

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. Once an interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

**NOTE**

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

Address: 20C\_4000h base + 58h offset = 20C\_4058h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## CCM Memory Map/Register Definition

### CCM\_CIMR field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 1.
26 arm_podf_loaded	mask interrupt generation due to frequency change of arm_podf 0 don't mask interrupt due to frequency change of arm_podf - interrupt will be created 1 mask interrupt due to frequency change of arm_podf
25–24 Reserved	This read-only field is reserved and always has the value 1.
23 mask_mmdc_ch0_podf_loaded	mask interrupt generation due to update of mask_mmdc_ch0_podf 0 don't mask interrupt due to update of mask_mmdc_ch0_podf - interrupt will be created 1 mask interrupt due to update of mask_mmdc_ch0_podf
22 mask_periph_clk_sel_loaded	mask interrupt generation due to update of periph_clk_sel. 0 don't mask interrupt due to update of periph_clk_sel - interrupt will be created 1 mask interrupt due to update of periph_clk_sel
21 mask_mmdc_ch1_podf_loaded	mask interrupt generation due to update of mask_mmdc_ch1_podf 0 don't mask interrupt due to update of mask_mmdc_ch1_podf - interrupt will be created 1 mask interrupt due to update of mask_mmdc_ch1_podf

Table continues on the next page...

**CCM\_CIMR field descriptions (continued)**

<b>Field</b>	<b>Description</b>
20 mask_ahb_podf_ loaded	mask interrupt generation due to frequency change of ahb_podf 0 don't mask interrupt due to frequency change of ahb_podf - interrupt will be created 1 mask interrupt due to frequency change of ahb_podf
19 mask_periph2_ clk_sel_loaded	mask interrupt generation due to update of periph2_clk_sel. 0 don't mask interrupt due to update of periph2_clk_sel - interrupt will be created 1 mask interrupt due to update of periph2_clk_sel
18 mask_mmdc_ ch0_axi_podf_ loaded	mask interrupt generation due to frequency change of mmdc_ch0_axi_podf 0 don't mask interrupt due to frequency change of mmdc_ch0_axi_podf - interrupt will be created 1 mask interrupt due to frequency change of mmdc_ch0_axi_podf
17 mask_axi_podf_ loaded	mask interrupt generation due to frequency change of axi_podf 0 don't mask interrupt due to frequency change of axi_podf - interrupt will be created 1 mask interrupt due to frequency change of axi_podf
16–7 Reserved	This read-only field is reserved and always has the value 1.
6 mask_cosc_ ready	mask interrupt generation due to on board oscillator ready 0 don't mask interrupt due to on board oscillator ready - interrupt will be created 1 mask interrupt due to on board oscillator ready
5–1 Reserved	This read-only field is reserved and always has the value 1.
0 mask_lrf_pll	mask interrupt generation due to lrf of PLLs 0 don't mask interrupt due to lrf of PLLs - interrupt will be created 1 mask interrupt due to lrf of PLLs

### 18.6.21 CCM Clock Output Source Register (CCM\_CCOSR)

The figure below represents the CCM Clock Output Source Register (CCOSR). The CCOSR register contains bits to control the clocks that will be generated on the output ipp\_do\_clko1 (CCM\_CLKO1) and ipp\_do\_clko2 (CCM\_CLKO2). The table below provides its field descriptions.

Address: 20C\_4000h base + 60h offset = 20C\_4060h

**CCM\_CCOSR field descriptions**

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 CLKO2_EN	Enable of CCM_CLKO2 clock 0 CCM_CLKO2 disabled. 1 CCM_CLKO2 enabled.
23–21 CLKO2_DIV	Setting the divider of CCM_CLKO2 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
20–16 CLKO2_SEL	Selection of the clock to be generated on CCM_CLKO2

Table continues on the next page...

### CCM\_CGPR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 INT_MEM_CLK_LPM	Control for the Deep Sleep signal to the ARM Platform memories with additional control logic based on the ARM WFI signal. Used to keep the ARM Platform memory clocks enabled if an interrupt is pending when entering low power mode.  <b>NOTE:</b> This bit should always be set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry.  0 Disable the clock to the ARM platform memories when entering Low Power Mode 1 Keep the clocks to the ARM platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating)
16 FPL	Fast PLL enable.

Table continues on the next page...

## CCM\_CGPR field descriptions (continued)

Field	Description
	0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.
15–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 efuse_prog_ supply_gate	Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programing 0 fuse programing supply voltage is gated off to the efuse module 1 allow fuse programing.
3 -	This field is reserved. Reserved
2 mmdc_ext_clk_ dis	Disable external clock driver of MMDC during STOP mode 1 disable during stop mode 0 don't disable during stop mode.
1 -	Reserved. Keep default value set to '1' for proper operation.
0 pmic_delay_ scaler	Defines clock division of clock for stby_count (pmic delay counter) 0 clock is not divided 1 clock is divided /8

### 18.6.23 CCM Clock Gating Register 0 (CCM\_CCGR0)

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

The figure below represents the CCM Clock Gating Register 0 (CCM\_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 20C\_4000h base + 68h offset = 20C\_4068h

**18.6.30 CCM Module Enable Override Register (CCM\_CMEOR)**

The following figure represents the CCM Module Enable Override Register (CMEOR). The CMEOR register contains bits to override the clock enable signal from the module. This bit is applicable only for modules whose clock enable signals are used. The following table provides its field descriptions.

Address: 20C\_4000h base + 88h offset = 20C\_4088h

**CCM\_CMEOR field descriptions**

Field	Description
31 Reserved	This read-only field is reserved and always has the value 1.

Table continues on the next page...

## CCM\_CMEOR field descriptions (continued)

Field	Description
30 mod_en_ov_ can1_cpi	Override clock enable signal from CAN1 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
29 Reserved	This read-only field is reserved and always has the value 1.
28 mod_en_ov_ can2_cpi	Override clock enable signal from CAN2 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
27-12 Reserved	This read-only field is reserved and always has the value 1.
11 mod_en_ov_ gpu3d	Override clock enable signal from GPU3D - clock will not be gated based on GPU3D's signal. 0 don't override module enable signal 1 override module enable signal
10 mod_en_ov_ gpu2d	Override clock enable signal from GPU2D - clock will not be gated based on GPU's signal 'gpu2d_busy' . 0 don't override module enable signal 1 override module enable signal
9 mod_en_ov_vpu	Override clock enable signal from VPU- clock will not be gated based on VPU's signal 'vpu_idle' . 0 don't override module enable signal 1 override module enable signal
8 mod_en_ov_dap	Override clock enable signal from DAP- clock will not be gated based on DAP's signal 'dap_dbgen' . 0 don't override module enable signal 1 override module enable signal
7 mod_en_usdhc	Override clock enable signal from USDHC. 0 don't override module enable signal 1 override module enable signal
6 mod_en_ov_epit	Override clock enable signal from EPIT - clock will not be gated based on EPIT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
5 mod_en_ov_gpt	Override clock enable signal from GPT - clock will not be gated based on GPT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
4 mod_en_ov_ vdoa	Override clock enable signal from vdoa - clock will not be gated based on vdoa signal. 0 don't override module enable signal 1 override module enable signal
Reserved	This read-only field is reserved and always has the value 1.

## 18.7 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within { }. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

**CCM\_ANALOG memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20C_8000	Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM)	32	R/W	0001_3042h	<a href="#">18.7.1/885</a>

### 18.7.1 Analog ARM PLL control Register (CCM\_ANALOG\_PLL\_ARMn)

The control register provides control for the system PLL.

Address: 20C\_8000h base + 0h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_ARMn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.

Table continues on the next page...

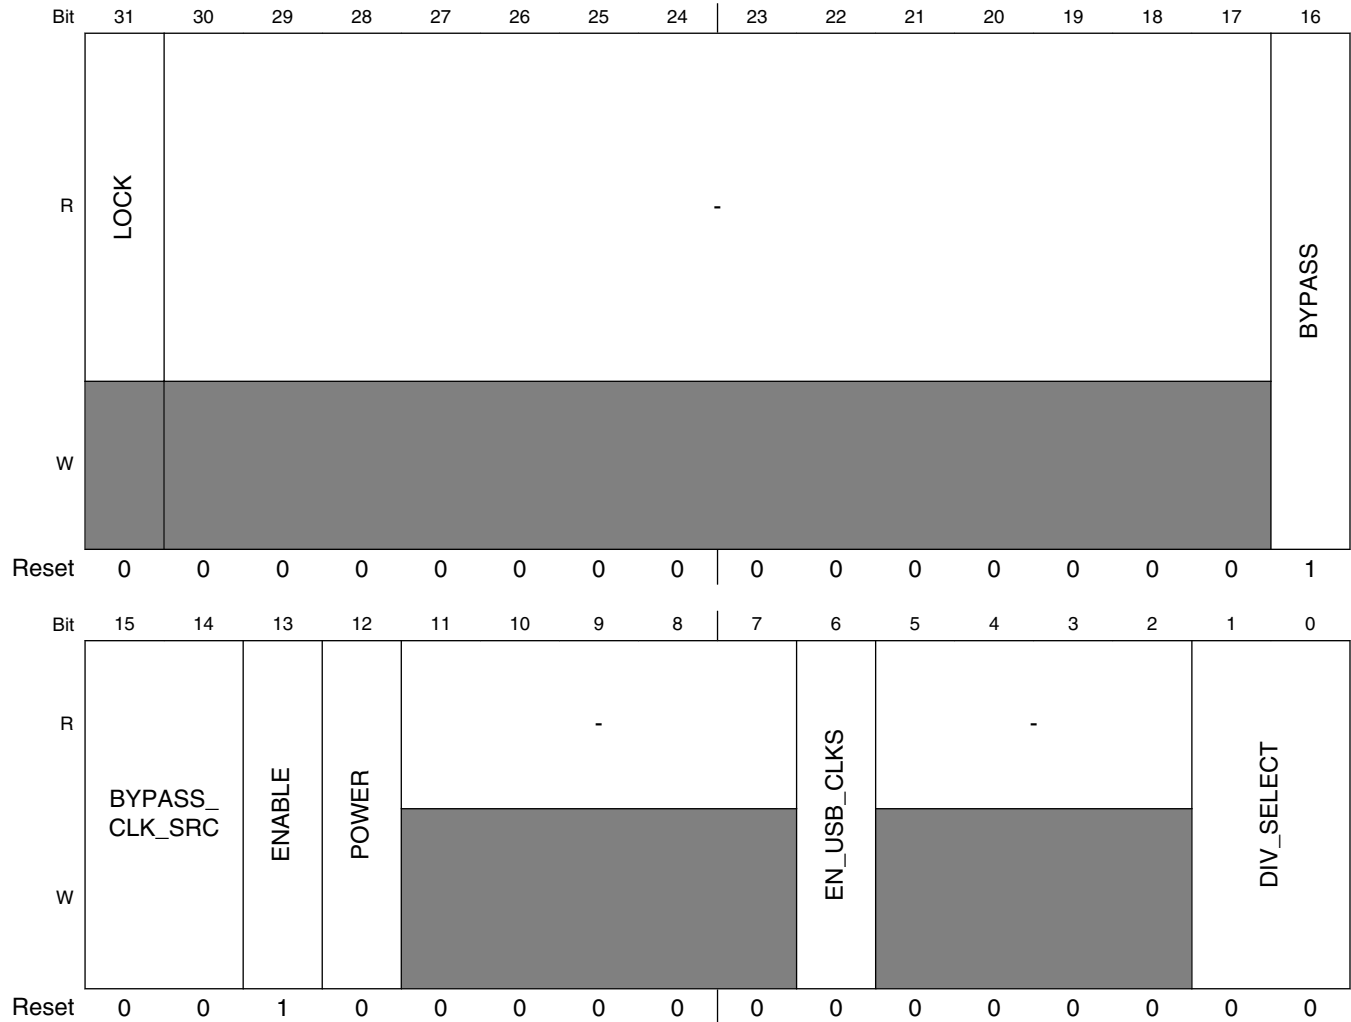

## CCM\_ANALOG\_PLL\_ARMn field descriptions (continued)

Field	Description
30–20 -	Always set to zero (0).
19 PLL_SEL	Reserved
18 LVDS_24MHZ_SEL	Analog Debug Bit
17 LVDS_SEL	Analog Debug Bit
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. <b>NOTE:</b> Changing the Bypass clock source also changes the PLL reference clock source.  0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>CLK2</b> — Select the CLK2_N / CLK2_P as source. 0x3 <b>XOR</b> — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * div\_select / 2.0$ .

## 18.7.2 Analog USB1 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB1n)

The control register provides control for USBPHY0 480MHz PLL.

Address: 20C\_8000h base + 10h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_USB1n field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30-17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...

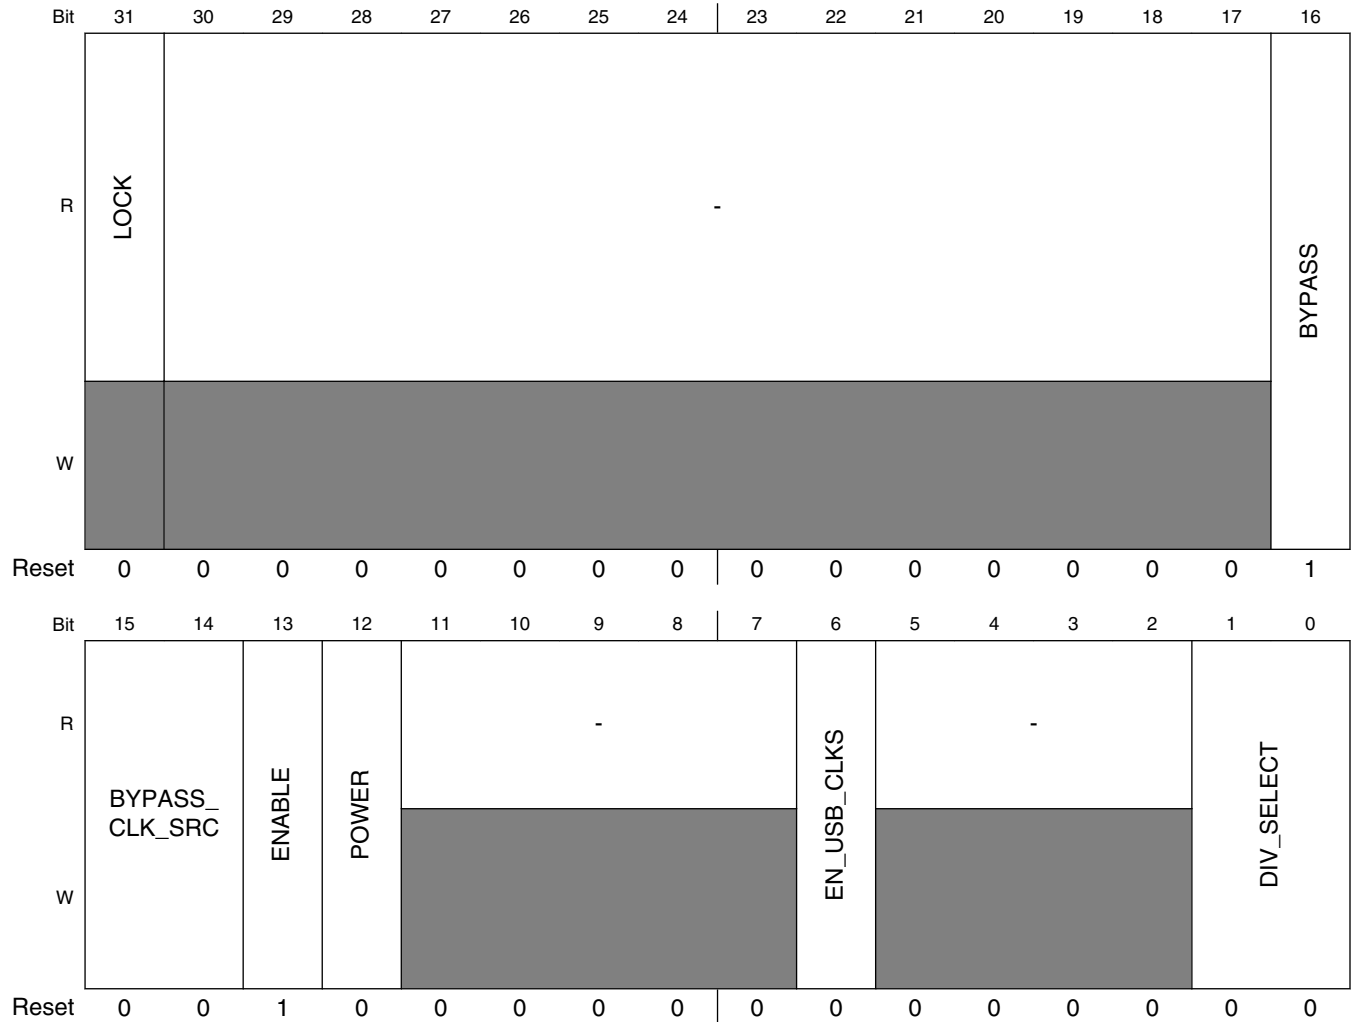

## CCM\_ANALOG\_PLL\_USB1n field descriptions (continued)

Field	Description
15–14 BYPASS_CLK_ SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>CLK2</b> — Select the CLK2_N / CLK2_P as source. 0x3 <b>XOR</b> — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHYn. Additionally, the UTMI clock gate must be deasserted in the USBPHYn to enable USBn operation (clear CLKGATE bit in USBPHYn_CTRL). This bit will be set automatically when USBPHYn remote wakeup event occurs. 0 PLL outputs for USBPHYn off. 1 PLL outputs for USBPHYn on.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

### 18.7.3 Analog USB2 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB2n)

The control register provides control for USBPHY1 480MHz PLL.

Address: 20C\_8000h base + 20h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_USB2n field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30-17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...

## CCM\_ANALOG\_PLL\_USB2n field descriptions (continued)

Field	Description
15–14 BYPASS_CLK_ SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>CLK2</b> — Select the CLK2_N / CLK2_P as source. 0x3 <b>XOR</b> — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL). This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

## 18.7.4 Analog System PLL Control Register (CCM\_ANALOG\_PLL\_SYSn)

The control register provides control for the 528MHz PLL.

Address: 20C\_8000h base + 30h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_SYSn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>CLK2</b> — Select the CLK2_N / CLK2_P as source. 0x3 <b>XOR</b> — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

## 18.7.5 528MHz System PLL Spread Spectrum Register (CCM\_ANALOG\_PLL\_SYS\_SS)

This register contains the 528 PLL spread spectrum controls.

Address: 20C\_8000h base + 40h offset = 20C\_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	STOP															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ENABLE	STEP														
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### CCM\_ANALOG\_PLL\_SYS\_SS field descriptions

Field	Description
31–16 STOP	Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.
15 ENABLE	0 — Spread spectrum modulation disabled 1 — Spread spectrum modulation enabled
STEP	Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.

## 18.7.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_SYS\_NUM)

This register contains the numerator of 528MHz PLL fractional loop divider (signed number).

Absolute value should be less than denominator

Address: 20C\_8000h base + 50h offset = 20C\_8050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	-		A																													
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**CCM\_ANALOG\_PLL\_SYS\_NUM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator (A) of fractional loop divider (signed integer).

**18.7.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_SYS\_DENOM)**

This register contains the Denominator of 528MHz PLL fractional loop divider.

Address: 20C\_8000h base + 60h offset = 20C\_8060h

**CCM\_ANALOG\_PLL\_SYS\_DENOM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator (B) of fractional loop divider (unsigned integer).

## 18.7.8 Analog Audio PLL control Register (CCM\_ANALOG\_PLL\_AUDION)

The control register provides control for the audio PLL.

Address: 20C\_8000h base + 70h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_AUDIO<sub>n</sub> field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>CLK2</b> — Select the CLK2_N / CLK2_P as source. 0x3 <b>XOR</b> — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_AUDIO<sub>n</sub> field descriptions (continued)**

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

**18.7.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_NUM)**

This register contains the numerator (A) of Audio PLL fractional loop divider. (Signed number), absolute value should be less than denominator

Absolute value should be less than denominator

Address: 20C\_8000h base + 80h offset = 20C\_8080h

**CCM\_ANALOG\_PLL\_AUDIO\_NUM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator of fractional loop divider.

### 18.7.10 Denominator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_DENOM)

This register contains the Denominator (B) of Audio PLL fractional loop divider. (unsigned number)

Address: 20C\_8000h base + 90h offset = 20C\_8090h

#### CCM\_ANALOG\_PLL\_AUDIO\_DENOM field descriptions

Field	Description
31-30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

## 18.7.11 Analog Video PLL control Register (CCM\_ANALOG\_PLL\_VIDEOn)

The control register provides control for the Video PLL.

Address: 20C\_8000h base + A0h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_VIDEO<sub>n</sub> field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>CLK2</b> — Select the CLK2_N / CLK2_P as source. 0x3 <b>XOR</b> — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_VIDEO<sub>n</sub> field descriptions (continued)**

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

**18.7.12 Numerator of Video PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_VIDEO\_NUM)**

This register contains the numerator (A) of Video PLL fractional loop divider.(Signed number)

Absolute value should be less than denominator

Address: 20C\_8000h base + B0h offset = 20C\_80B0h

**CCM\_ANALOG\_PLL\_VIDEO\_NUM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator of fractional loop divider(Signed number), absolute value should be less than denominator

### 18.7.13 Denominator of Video PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_VIDEO\_DENOM)

This register contains the Denominator (B) of Video PLL fractional loop divider. (Unsigned number)

Address: 20C\_8000h base + C0h offset = 20C\_80C0h

#### CCM\_ANALOG\_PLL\_VIDEO\_DENOM field descriptions

Field	Description
31-30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

### 18.7.14 MLB PLL Control Register (CCM\_ANALOG\_PLL\_MLBN)

This register defines the control bits for the MLB PLL.

Address: 20C\_8000h base + D0h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_MLBN field descriptions**

Field	Description
31 LOCK	Lock bit 0 PLL is not currently locked 1 PLL is currently locked.

Table continues on the next page...

## CCM\_ANALOG\_PLL\_MLBn field descriptions (continued)

Field	Description
30–29 -	This field is reserved. Reserved.
28–26 MLB_FLT_RES_ CFG	Configure the filter resistor for different divider ratio of MLB PLL.
25–23 RX_CLK_ DELAY_CFG	Configure the phase delay of the MLB PLL RX Clock.
22–20 VDDD_DELAY_ CFG	Configure the phase delay of the MLB PLL by adjusting the delay line in core Vdd poser domain.
19–17 VDDA_DELAY_ CFG	Configure the phase delay of the MLB PLL by adjusting the delay line in Vddio power domain.
16 BYPASS	Bypass the PLL.
15–14 -	This field is reserved. Reserved.
13–12 PHASE_SEL	Analog debut bit.
11 HOLD_RING_ OFF	Analog debug bit.
-	This field is reserved. Reserved.

## 18.7.15 Analog ENET PLL Control Register (CCM\_ANALOG\_PLL\_ENET $n$ )

The control register provides control for the ENET PLL.

Address: 20C\_8000h base + E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK															
W												ENABLE_100M	ENABLE_125M	PFD_OFFSET_EN	Reserved	BYPASS
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_ENETn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–21 -	Always set to zero (0).
20 ENABLE_100M	Enables an offset in the phase frequency detector.
19 ENABLE_125M	Enables an offset in the phase frequency detector.
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>CLK2</b> — Select the CLK2_N / CLK2_P as source. 0x3 <b>XOR</b> — Select the XOR of CLK1_N / CLK1_P and CLK2_N / CLK2_P as source.
13 ENABLE	Enable the ethernet clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_ENET $n$  field descriptions (continued)**

Field	Description
6-2 -	Always set to zero (0).
DIV_SELECT	Controls the frequency of the ethernet reference clock.00 - 25MHz; 01 - 50MHz; 10 - 100MHz (not 50% duty cycle); 11 - 125MHz;

**18.7.16 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_480 $n$ )**

The PFD\_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 20C\_8000h base + F0h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PFD\_480n field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD3\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD2\_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

**CCM\_ANALOG\_PFD\_480n field descriptions (continued)**

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD1\_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \times 18 / \text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12-35.

**18.7.17 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_528n)**

The PFD\_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 20C\_8000h base + 100h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PFD\_528n field descriptions

Field	Description
31-24 -	This field is reserved. Reserved
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \times 18 / \text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12-35.

### 18.7.18 Miscellaneous Register 0 (CCM\_ANALOG\_MISC0n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C\_8000h base + 150h offset + (4d × i), where i=0d to 3d

## CCM\_ANALOG\_MISC0n field descriptions

Field	Description
31–29 -	This field is reserved.
28–26 CLKGATE_ DELAY	<p>This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block.</p> <p><b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p> <p>000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms</p>
25 CLKGATE_CTRL	<p>This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block.</p> <p><b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p> <p>0 <b>ALLOW_AUTO_GATE</b> — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 <b>NO_AUTO_GATE</b> — Prevent the logic from ever gating off the clock.</p>
24–20 -	This field is reserved. Always set to zero.
19–18 WBCP_VPW_ THRESH	<p>This signal alters the voltage that the pwell is charged pumped to.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <p>00 <b>NOMINAL_BIAS</b> — Nominal output pwell bias voltage. 01 <b>PLUS_25MV</b> — Increase pwell output voltage by 25mV. 10 <b>MINUS_25MV</b> — Decrease pwell output pwell voltage by 25mV. 11 <b>MINUS_50MV</b> — Decrease pwell output pwell voltage by 50mV.</p>
17 OSC_XTALOK_ EN	<p>This bit enables the detector that signals when the 24MHz crystal oscillator is stable.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p>
16 OSC_XTALOK	<p>Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p>

Table continues on the next page...

## CCM\_ANALOG\_MISC0n field descriptions (continued)

Field	Description
15–14 OSC_I	<p>This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p> <p>00 <b>NOMINAL</b> — Nominal  01 <b>MINUS_12_5_PERCENT</b> — Decrease current by 12.5%  10 <b>MINUS_25_PERCENT</b> — Decrease current by 25.0%  11 <b>MINUS_37_5_PERCENT</b> — Decrease current by 37.5%</p>
13 discon_high_ snvs	<p>This bit forces the short between VDDHIGH_IN and VSNVS_IN to open when asserted. This is useful in power cases where SNVS_IN &gt; VDDHIGH_IN.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
12 STOP_MODE_ CONFIG	<p>Configure the analog behavior in stop mode.</p> <p>0x0 <b>DEEP</b> — Deep Stop Mode - 0x0 All analog except RTC powered down on Stop mode assertion  0x1 <b>LIGHT</b> — Light Stop Mode - 0x1 All the analog domain except the LDO_1P1, LDO_2P5, and PLL3 is powered down on STOP mode assertion. If required the CCM can be configured not to power down the oscillator (XTALOSC). PLL3 can be disabled with register settings if desired.</p>
11–8 -	<p>This field is reserved. Reserved</p>
7 REFTOP_ VBGUP	<p>Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
6–4 REFTOP_ VBGADJ	<p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <p>000 Nominal VBG  001 VBG+0.78%  010 VBG+1.56%  011 VBG+2.34%  100 VBG-0.78%  101 VBG-1.56%  110 VBG-2.34%  111 VBG-3.12%</p>
3 REFTOP_ SELFBIAOFF	<p>Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.</p> <p><b>NOTE:</b> Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <p>0 Uses coarse bias currents for startup  1 Uses bandgap-based bias currents for best performance.</p>
2–1 -	<p>This field is reserved.</p>

Table continues on the next page...

**CCM\_ANALOG\_MISC0n field descriptions (continued)**

Field	Description
0 REFTOP_PWD	<p>Control bit to power-down the analog bandgap reference circuitry.</p> <p><b>NOTE:</b> A note of caution, the bandgap is necessary for correct operation of most of the LDO, PLL, and other analog functions on the die.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>

### 18.7.19 Miscellaneous Register 1 (CCM\_ANALOG\_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks. The LVDS1 and LVDS2 controls below control the behavior of the anaclk1/1b and anaclk2/2b LVDS IO's.

Address: 20C\_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	IRQ_DIG_BO	IRQ_ANA_BO	IRQ_TEMPSENSE	Reserved

# Chapter 19

## MIPI CSI to IPU Gasket (CSI2IPU)

### 19.1 Overview

The CSI2IPU gasket is a digital core that functions as a gasket interface between the MIPI CSI-2 host controller and the IPU system. This facilitates communication between a MIPI CSI-2 compliant camera sensor and IPU (the image processing unit). The gasket's main functions are to synchronize the CSI-2 input 32-bit data bus with the 16-bit data bus and to separate the four virtual channels.

The following block diagram shows the CSI2IPU gasket's position in the system as part of the CSI to IPU connectivity.

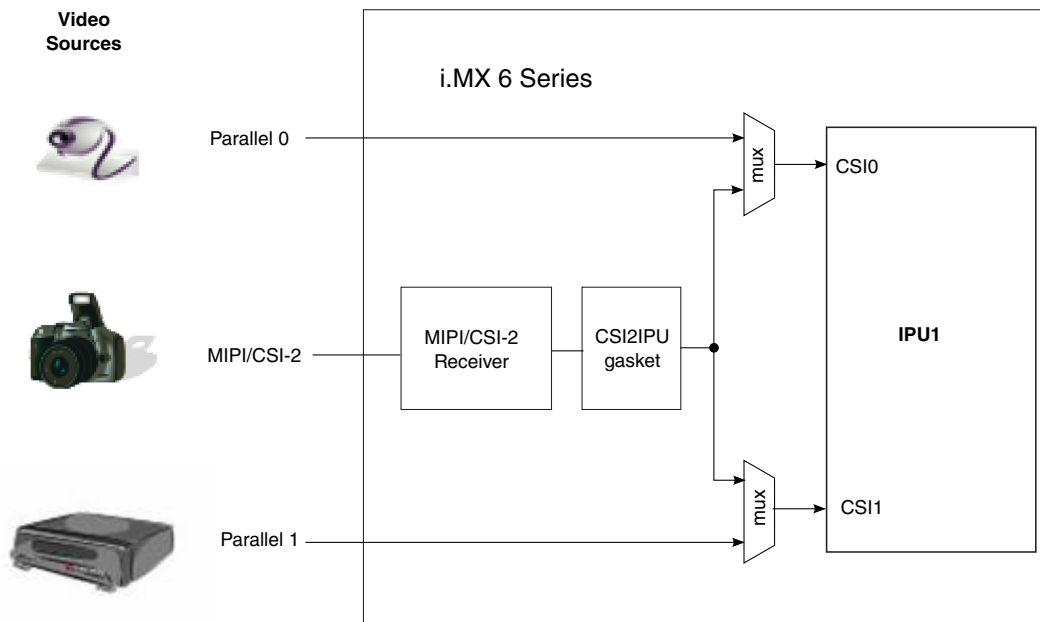

Figure 19-1. CSI2IPU gasket connectivity

## 19.1.1 CSI2IPU feature summary

The CSI2IPU gasket supports:

- Up to 4 virtual channels of MIPI CSI-2 host controller
- All data types of the MIPI Alliance Standard for Camera Serial Interface (CSI)
- Dynamically configurable pixel clock gating or non-gating for the IPU module
- Dynamically configurable RGB444 and YUV422 data format for the IPU module
- A software reset to reset the program during operation

## 19.1.2 CSI2IPU architectural description

The following figure shows the overall architecture of the CSI2IPU gasket.

**Figure 19-2. CSI2IPU gasket architecture**

The main blocks are:

- **FIFO WRITE**—Responsible for receiving the CSI-2 host input signals and integrating them into a `wr_data[46:0]` bus
- **ASYNC FIFO**—Used to synchronize the `wr_data` to the read clock domain. It also generates FIFO full and empty signals.
- **FIFO READ**—Responsible for reading FIFO output and changing the 32-bit data bus to the 16-bit data bus.

- GST OUT—Generates output data according to the format controlled by the register bank.
- REGISTER CONTROL—register bank used to control the GST OUT block.

## 19.2 CSI2IPU signals

The following tables describe the CSI2IPU gasket's input and output signals.

**Table 19-1. Input signals to CSI2IPU**

Signal	Description
clk_data	Clock input for the CSI host controller
header_en	Shows that the header data at the input (signals virtual_channel, data_type, word_count, and ecc) is valid for the packet being transferred. This signal stays HIGH during the complete packet transfer.
virtual_channel[1:0]	Virtual channel identifier value <ul style="list-style-type: none"> <li>• 00—VC0</li> <li>• 01—VC1</li> <li>• 10—VC2</li> <li>• 11—VC3</li> </ul>
data_type[5:0]	<ul style="list-style-type: none"> <li>• 00h–07h—Synchronization short packet data types</li> <li>• 08h–0Fh—Generic short packet data types</li> <li>• 10h–17h—Generic long packet data types</li> <li>• 18h–1Fh—YUV data</li> <li>• 20h–27h—RGB data</li> <li>• 28h–2Fh—RAW data</li> <li>• 30h–37h—User defined byte-based data</li> <li>• 38h–3Fh—Reserved</li> </ul>
word_count[15:0]	16-bit word count information from the packet header
ecc[7:0]	8-bit error correction code for the packet header
data_en	Shows that new payload data is present at the input (signals csi_data and bytes_en). This signal is only asserted when receiving long packets. Note that the signal header_en is also asserted when data_en is asserted.
bytes_en[1:0]	Shows how many bytes are in the csi_data output signal <ul style="list-style-type: none"> <li>• 00 = 1 valid byte in csi_data[7:0]</li> <li>• 01 = 2 valid bytes in csi_data[15:0]</li> <li>• 10 = 3 valid bytes in csi_data[23:0]</li> <li>• 11 = 4 valid bytes in csi_data[31:0]</li> </ul>
vvalid[3:0]	This signal is asserted when a Frame Start is detected and de-asserted when a Frame End is detected. Each virtual channel has one valid signal. <ul style="list-style-type: none"> <li>• vvalid[0]—vvalid for Virtual Channel 0</li> <li>• vvalid[1]—vvalid for Virtual Channel 1</li> <li>• vvalid[2]—vvalid for Virtual Channel 2</li> <li>• vvalid[3]—vvalid for Virtual Channel 3</li> </ul>
hvalid[3:0]	This signal is asserted when a Line Start is detected and de-asserted when a Line End is detected. Line Start and Line End are optional; when they are not available, hvalid has the same behavior as dvalid. Each virtual channel has one valid signal. <ul style="list-style-type: none"> <li>• hvalid[0]—hvalid for Virtual Channel 0</li> </ul>

*Table continues on the next page...*

**Table 19-1. Input signals to CSI2IPU (continued)**

Signal	Description
	<ul style="list-style-type: none"> <li>• hvalid[1]—hvalid for Virtual Channel 1</li> <li>• hvalid[2]—hvalid for Virtual Channel 2</li> <li>• hvalid[3]—hvalid for Virtual Channel 3</li> </ul>
dvalid[3:0]	Used to signal when valid data is available
csi_data_out[31:0]	Payload data
hw_resetrn	System hardware reset
sft_resetrn	System software reset from top module
gst_clk_sel	<ul style="list-style-type: none"> <li>• 0—Gating clock mode</li> <li>• 1—Non-gating clock mode</li> </ul>
gst_rgb444_fm	Rgb444 output format select <ul style="list-style-type: none"> <li>• 0—{4'h0,r4g4b4}</li> <li>• 1—{r4,1'b0,g4,1'b0,b4,1'b0}</li> </ul>
gst_yuv422_8bit_fm	Yuv422 output format select <ul style="list-style-type: none"> <li>• 0—output YUYV</li> <li>• 1—output UYVY</li> </ul>
ccm_pixel_clk	Reading clock from CCM

**Table 19-2. CSI2IPU output signals to IPU**

Signal	Description
csin <sup>1</sup> _data[15:0]	Virtual channel <i>n</i> <sup>1</sup> CSI data
csin <sup>1</sup> _mct_di[7:0]	Virtual channel <i>n</i> <sup>1</sup> {Channel_ID[1:0],Data type[5:0]}
csin <sup>1</sup> _data_en	virtual channel <i>n</i> <sup>1</sup> data enable signal
csin <sup>1</sup> _pix_clk	virtual channel <i>n</i> <sup>1</sup> pixel clock signal clock
csin <sup>1</sup> _vsync	virtual channel <i>n</i> <sup>1</sup> vertical synchronism signal(Frame start)
csin <sup>1</sup> _hsync	virtual channel <i>n</i> <sup>1</sup> horizontal synchronism signal
csin <sup>1</sup> _Byte_en	virtual channel <i>n</i> <sup>1</sup> byte enable <ul style="list-style-type: none"> <li>• 0—[7:0] valid</li> <li>• 1:[15:0] valid</li> </ul>

# Chapter 20

## Display Content Integrity Checker (DCIC)

### 20.1 Overview

The goal of the DCIC is to verify that a safety-critical information sent to a display is not corrupted.

Such a verification is mandatory for warning icons in the instrument cluster of a car, to comply with the ASIL B (Automotive Safety Integrity Level B) specification. It is also required in other safety-sensitive systems.

Using external muxing DCIC can monitor either one of the IPU display port outputs or feedback signals going from IO pads of Parallel display interface. The figure below shows DCIC integration in system with one IPU port.

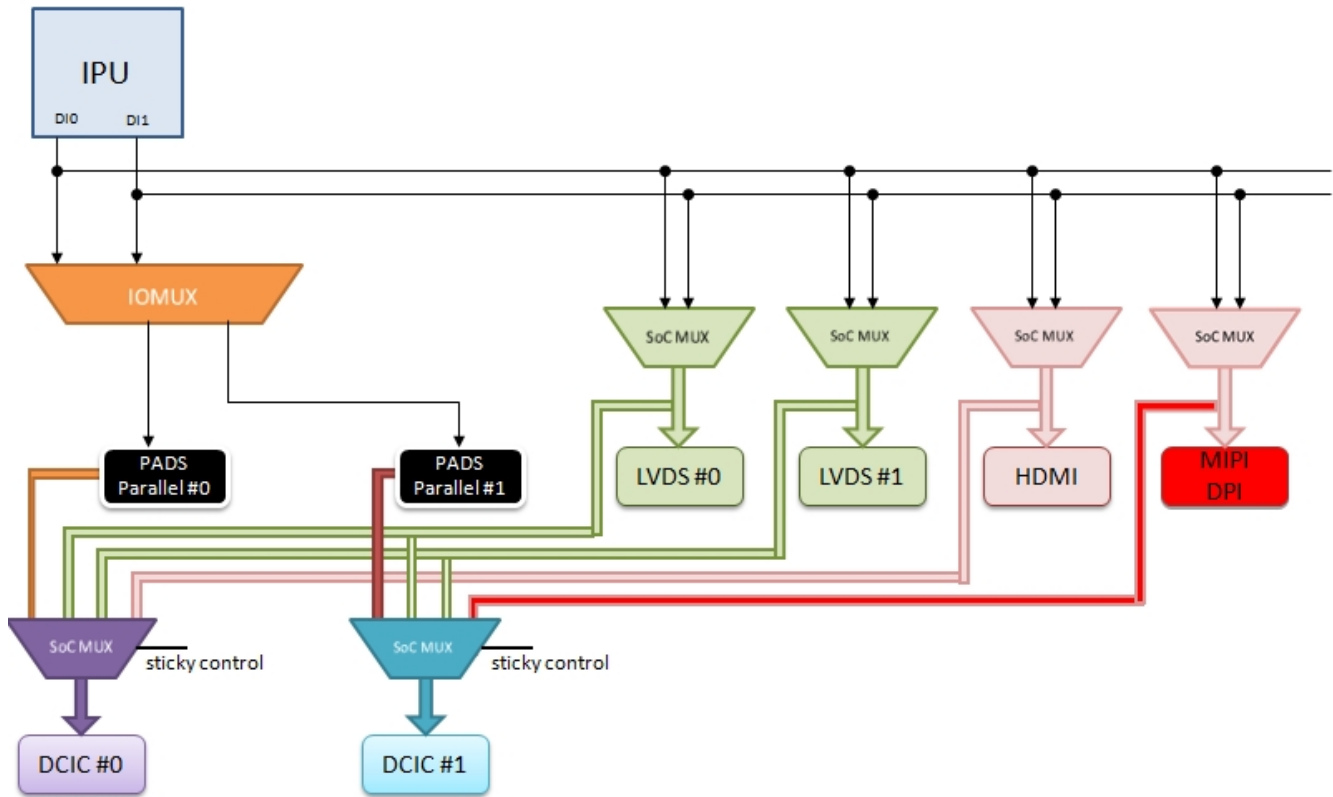

Figure 20-1. DCIC system integration example

### 20.1.1 Block Diagram

The figure below shows DCIC top level block diagram.

Figure 20-2. DCIC Block Diagram

### 20.1.2 Features

- Pixel clock up to 266 MHz
- Configurable polarity of Display Interface control signals
- 24-bit pixel data bus
- Up to 16 rectangular ROIs with a configurable location and size
- Independent CRC32 signature calculation for each ROI
- External controller mismatch indication signal

## 20.2 Functional Description

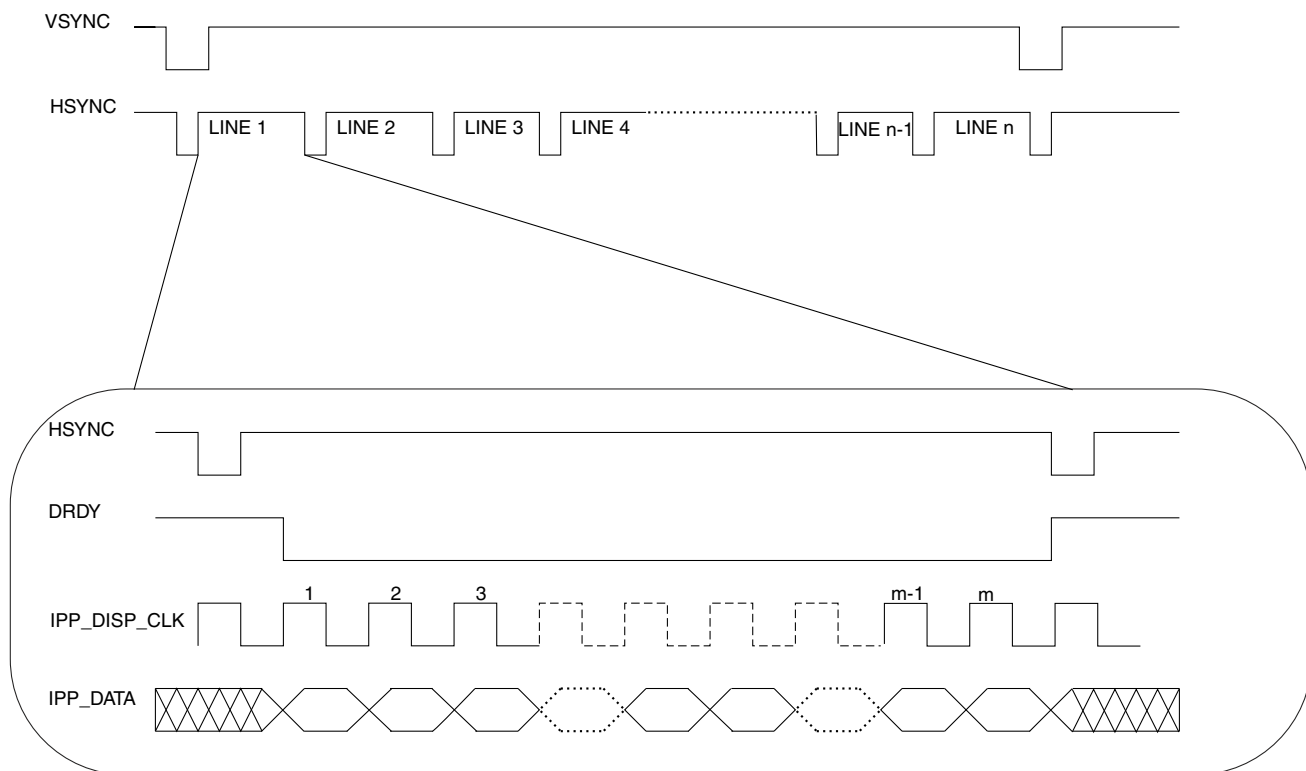

This section provides a complete functional description of the block.

## 20.2.1 Generic synchronous parallel display interface

The figure below depicts the LCD interface timing for a generic active matrix color TFT panel. In this figure signals are shown with negative polarity, but both polarity modes are supported by DCIC through configuration of appropriate bits of DCICCR register.

The sequence of events for active matrix interface timing is:

- IPP\_DISP\_CLK latches data into the panel on its negative edge (when positive polarity is selected). In active mode, IPP\_DISP\_CLK runs continuously.
- HSYNC causes the panel to start a new line.
- VSYNC causes the panel to start a new frame. It always encompasses at least one HSYNC pulse.
- DRDY acts like an output enable signal. This output enables the data to be shifted onto the display. When disabled, the data is invalid and the trace is off.

**Figure 20-3. Interface Timing Diagram for TFT (Active Matrix) Panels**

## 20.2.2 CRC Polynomial

DCIC uses the CRC32 polynomial to calculate the data signature.

Initial value for CRC calculation is 0x00000000.

$$x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

CRC generator uses XOR-ed combination of input data bits and previous result bits.

### 20.2.3 Mode of operation

After DCIC is configured and enabled, providing IPU display interface is already enabled, first VSYNC is being watched. VSYNC assertion zeroizes main position counters and initializes CRC storage registers.

Each HSYNC assertion after first line in frame that holds valid pixel data (non blanking) will signal new line, i.e. increment Y-counter and zeroize X-counter. Each valid data cycle (DATA\_EN asserted) will increment X-counter. Thus X & Y values used to configure the module should be the coordinates on the actual visual part of the screen without blanking intervals. X & Y position counters are constantly compared to ROIs configuration. When current position matches one of the enabled ROIs, it triggers the enablement of CRC generator, which will use the current pixel data and previous pixel CRC result for this ROI. The result of the new calculation stored separately for each ROI. Next VSYNC, apart of signalling new frame start, will cause sampling calculated CRC values into configuration registers domain. These values then will be compared to expected signatures and appropriate status bits / interrupts will be asserted.

### 20.2.4 Interrupts

There are two maskable interrupts:

- Functional - Asserted when match results ready.
- Error - Asserted when there is a signature mismatch.

Both interrupts are generated immediately after completing the signature match check. Software should clean the interrupts by writing "1" to appropriate status bits (FI\_STAT, ROI\_MATCH\_STAT). EI\_STAT bit is a result of OR between all ROI\_MATCH\_STAT bits, hence it will be cleared automatically when these bits are clear.

Interrupt masks can be set/reset only while FREEZE\_MASK bit isn't set. This bit can not be set back to zero.

## 20.2.5 Software reset

Disabling and enabling the module operation (IC\_EN bit, [DCIC Control Register \(DCIC\\_DCICC\)](#)) will reset all the logic apart of configuration registers domain. Status bits of DCICS ([DCIC Status Register \(DCIC\\_DCICS\)](#)) register will also be cleared.

## 20.2.6 Clock domains

Asynchronous FIFO is being used to sample raw display interface signals and transfer them into DCIC fast clock domain (hsp\_clk).

Display interface clock is always slower than DCIC fast clock.

IP registers are driven by the same fast clock and will be synchronized to system IP Bus clock by external IP\_SYNC module.

## 20.2.7 External controller mismatch indication signal

Besides of interrupts to SoC core, DCIC provides an additional mismatch indication for external controller. The signal, if enabled, continuously oscillating at a rate which is an integer division of the main clock (hsp clock).

- When the status bit of the mismatch interrupt is set - i.e. from mismatch detection until the CPU clears the bit: division x16
- Otherwise: division x4

The indication signal is idle while integrity check is disabled.

## 20.2.8 Power saving

Disabling the module by clearing IC\_EN bit will stop all module activities, including sampling of input signals into the FIFO.

## 20.2.9 System Considerations

- The DCIC always assumes a 24-bit pixel. For proper functionality with lower color depth, one must ensure that:
  - When the CPU calculates the reference signature, it applies the same mapping of a pixel to a 24-bit field as that performed by the IPU.

- The display is connected to the appropriate pins.
- The simplest mapping would be
  - Map the pixel to the data bus in the same way as for 24 bpp
  - Set the values at the extra LSBs to zero.
- Parameter updates
  - The reference signature can be freely updated from frame to frame, in coordination with the changing content (since it is used only once per frame, just before the interrupt)
  - Each ROI can be freely and independently enabled/disabled between frames (since the enable bit is double buffered)
  - The size and location of a ROI can be modified while it is disabled.
  - Display interface signals polarity can be changed only when the module is disabled.
- ROI (regions of interest) don't overlap, i.e. each pixel belongs to single ROI at most.
- DCIC operation is intended for monitoring relatively static portions of graphic interface, otherwise it will be complicated software task to keep up with frame synchronization and update expected signature for each frame.
- There should be no processing done at IPU on monitored ROIs, which can't be taken in consideration by software when calculating the expected signature.

## 20.3 DCIC Memory Map/Register Definition

Important: All write accesses have to be full word (32-bit) accesses. No error/abort will be responded in case of different access size, but no data will be written. Similarly, there will be no error response in case of access to undefined memory space.

Read access will return 32-bit data, which may be truncated on system level in case it wasn't full word acces.

**DCIC memory map**

**DCICx\_DCICIC field descriptions (continued)**

Field	Description
15-4 Reserved	This read-only field is reserved and always has the value 0.
3 FREEZE_MASK	Disable change of interrupt masks. "Sticky" bit which can be set once and cleared by reset only. 0 Masks change allowed (default) 1 Masks are frozen
2 Reserved	This read-only field is reserved and always has the value 0.
1 FI_MASK	Functional Interrupt mask. Can be changed only while FREEZE_MASK = 0. 0 Mask disabled - Interrupt assertion enabled 1 Mask enabled - Interrupt assertion disabled (default)
0 EI_MASK	Error Interrupt mask. Can be changed only while FREEZE_MASK = 0. 0 Mask disabled - Interrupt assertion enabled 1 Mask enabled - Interrupt assertion disabled (default)

**20.3.3 DCIC Status Register (DCICx\_DCICS)**

Address: Base address + 8h offset

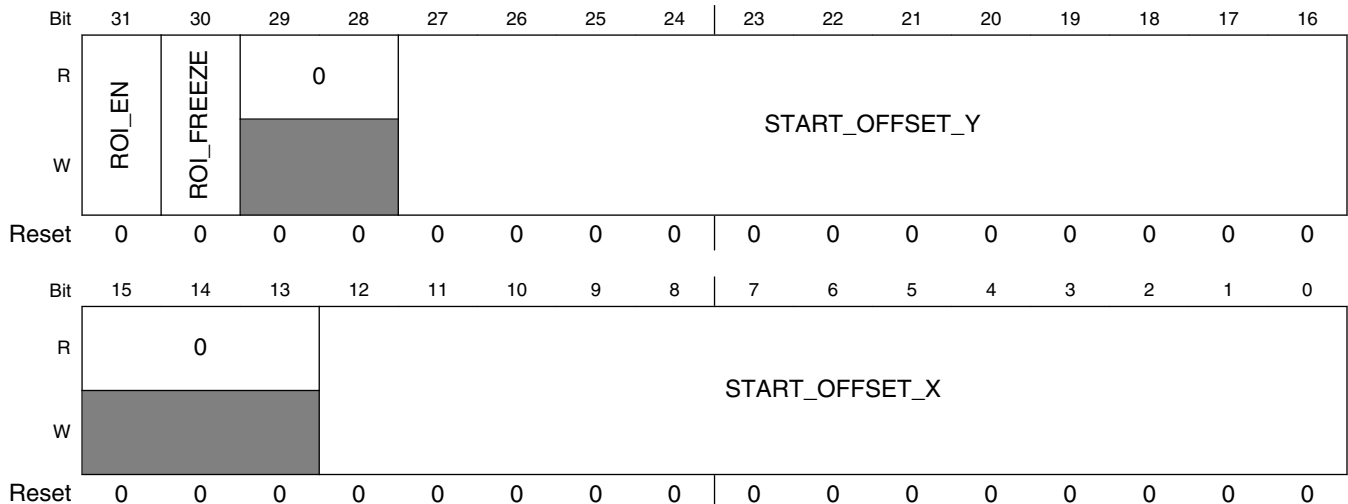

### DCICx\_DCICS field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 FI_STAT	Functional Interrupt status. Write "1" to clear. 0 No pending Interrupt 1 Pending Interrupt
16 EI_STAT	Error Interrupt status. Result of "OR" operation on ROI_MATCH_STAT[15:0] bits. Cleared when these bits are clear. 0 No pending Interrupt 1 Pending Interrupt
ROI_MATCH_STAT	Each set bit of this field indicates there was a mismatch at appropriate ROIs signature during the last frame. Valid only for active ROIs. Write "1" to clear. 0 ROI calculated CRC matches expected signature 1 Mismatch at ROI calculated CRC

### 20.3.4 DCIC ROI Config Register m (DCICx\_DCICRC)

Address: Base address + 10h offset

### DCICx\_DCICRC field descriptions

Field	Description
31 ROI_EN	ROI #m tracking enable 0 Disabled 1 Enabled

Table continues on the next page...

**DCICx\_DCICRC field descriptions (continued)**

Field	Description
30 ROI_FREEZE	When set, the only parameter of ROI #m that can be changed is reference signature. "Sticky" bit - can be set once and cleared by reset only.  0 ROI configuration can be changed 1 ROI configuration is frozen
29–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 START_OFFSET_Y	Row number of ROIs upper-left corner (Y coordinate) Range: 0 to 2 <sup>12</sup> -1
15–13 Reserved	This read-only field is reserved and always has the value 0.
START_OFFSET_X	Column number of ROIs upper-left corner (X coordinate) Range: 0 to 2 <sup>13</sup> -1

**20.3.5 DCIC ROI Size Register m (DCICx\_DCICRS)**

Address: Base address + 14h offset

**DCICx\_DCICRS field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 END_OFFSET_Y	Row number of ROIs lower-right corner (Y coordinate) Range: 1 to 2 <sup>12</sup> -1
15–13 Reserved	This read-only field is reserved and always has the value 0.
END_OFFSET_X	Column number of ROIs lower-right corner (X coordinate) Range: 1 to 2 <sup>13</sup> -1

## 20.3.6 DCIC ROI Reference Signature Register m (DCICx\_DCICRRS)

Address: Base address + 18h offset

### DCICx\_DCICRRS field descriptions

Field	Description
REFERENCE_SIGNATURE	32-bit expected signature (CRC calculation result) for ROI #m

## 20.3.7 DCIC ROI Calculated Signature m (DCICx\_DCICRCS)

Address: Base address + 1Ch offset

### DCICx\_DCICRCS field descriptions

Field	Description
CALCULATED_SIGNATURE	32-bit actual signature (CRC calculation result) for ROI #m during the last frame. Updated automatically at the beginning of a next frame.

---

# Chapter 21

## Enhanced Configurable SPI (ECSPI)

### 21.1 Overview

The Enhanced Configurable Serial Peripheral Interface (ECSPI) is a full-duplex, synchronous, four-wire serial communication block.

The ECSPI contains a 64 x 32 receive buffer (RXFIFO) and a 64 x 32 transmit buffer (TXFIFO). With data FIFOs, the ECSPI allows rapid data communication with fewer software interrupts. The figure below shows a block diagram of the ECSPI.

**Figure 21-1. ECSPi Block Diagram**

### 21.1.1 Features

Key features of the ECSPi include:

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four Chip Select (SS) signals to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 32-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Direct Memory Access (DMA) support
- Max operation frequency up to the reference clock frequency.

## 21.1.2 Modes and Operations

The ECSPI supports the modes described in the indicated sections:

- [Master Mode](#)
- [Slave Mode](#)
- [Low Power Modes](#)

As described in [Operations](#), the ECSPI supports the operations described in the indicated sections:

- [Typical Master Mode](#)
  - [Master Mode with SPI\\_RDY](#)
  - [Master Mode with Wait States](#)
  - [Master Mode with SS\\_CTL\[3:0\] Control](#)
  - [Master Mode with Phase Control](#)
- [Typical Slave Mode](#)

## 21.2 External Signals

The following table describes the external signals of ECSPI:

**Table 21-1. ECSPI1 External Signals**

Signal	Description	Pad	Mode	Direction
ECSPI1_MISO (MISO)	Master data in; slave data out	CSI0_DAT6	ALT2	IO
		DISP0_DAT22	ALT2	
		EIM_D17	ALT1	
		KEY_COL1	ALT0	
ECSPI1_MOSI (MOSI)	Master data out; slave data in	CSI0_DAT5	ALT2	IO
		DISP0_DAT21	ALT2	
		EIM_D18	ALT1	
		KEY_ROW0	ALT0	
ECSPI1_RDY (RDY)	SPI data ready signal	GPIO_19	ALT4	I
ECSPI1_SCLK (SCLK)	SPI clock signal	CSI0_DAT4	ALT2	IO
		DISP0_DAT20	ALT2	
		EIM_D16	ALT1	
		KEY_COL0	ALT0	
ECSPI1_SS0 (SS0)	Chip select signal	CSI0_DAT7	ALT2	IO
		DISP0_DAT23	ALT2	
		EIM_EB2	ALT1	
		KEY_ROW1	ALT0	

*Table continues on the next page...*

ECSPi4_SS2 (SS2)	Chip select signal	EIM_D24	ALT1	IO
ECSPi4_SS3 (SS3)	Chip select signal	EIM_D25	ALT1	IO

Figure 21-2 shows the ECSPi in master mode connected to four external devices in a one-way communication link.

**Figure 21-2. Example Connection Diagram**

## 21.3 Clocks

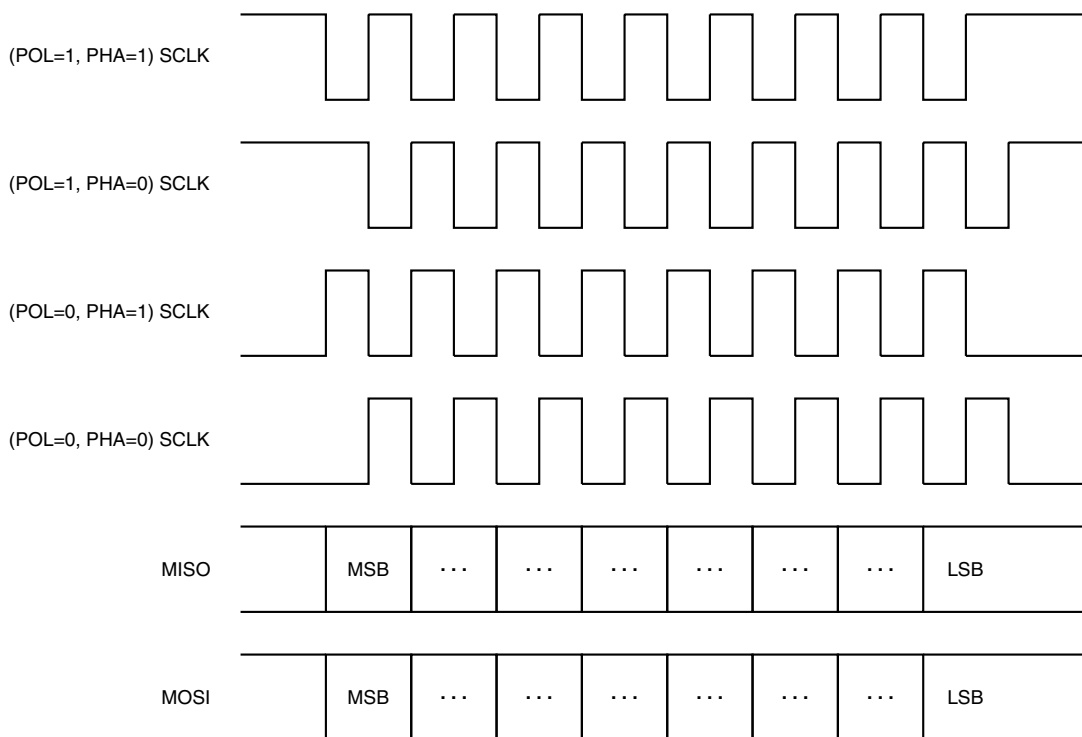

The following table describes the clock sources for eCSPI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 21-5. eCSPI Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_per	ecspi_clk_root	eCSPI module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 21.4 Functional Description

This section provides a complete functional description of the ECSPi. The figure found here shows the relationship of SCLK and data lines while ECSPi has been configured with different POL and PHA settings.

**Figure 21-3. ECSPi SCLK, MISO, and MOSI Relationship**

### 21.4.1 Master Mode

When the ECSPI is configured as a master, it uses a serial link to transfer data between the ECSPI and an external slave device.

One of the Chip Select (SS) signals and the clock signal (SCLK) are used to transfer data between two devices. If the external device is a transmit-only device, the ECSPI master's output port can be ignored and used for other purposes. In order to use the internal TXFIFO and RXFIFO, two auxiliary output signals, Chip Select (SS) and SPI\_RDY, are used for data transfer rate control. Software can also configure the sample period control register to a fixed data transfer rate.

### 21.4.2 Slave Mode

When the ECSPI is configured as a slave, software can configure the ECSPI Control register to match the external SPI master's timing.

In this configuration, Chip Select (SS $\bar$ ) becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

Slave mode only supports the case when SSCTL (SSB\_CTRL[x] bit) is cleared. The accurate burst length should always be specified using the BURST\_LENGTH parameter. SSCTL (SSB\_CTRL[x] bit) set to 1 is not supported in slave mode.

### 21.4.3 Low Power Modes

The ECSPI does not operate under low power mode.

It holds its operation when its clock is gated off in master mode. In slave mode, the ECSPI does not respond when its clock is gated off.

### 21.4.4 Operations

The information found here describes the ECSPI's operations.

### 21.4.4.1 Typical Master Mode

The ECSPI master uses the Chip Select (SS) signal to enable an external SPI device, and uses the SCLK signal to transfer data in and out of the Shift register.

The SPI\_RDY enables fast data communication with fewer software interrupts. By programming the ECSPI\_PERIODREG register accordingly, the ECSPI can be used for a fixed data transfer rate.

When the ECSPI is in Master mode the SS, SCLK, and MOSI are output signals, and the MISO signal is an input.

Figure 21-4. Typical SPI Burst (8-bit Transfer)

In the above figure, the Chip Select (SS) signal enables the selected external SPI device, and the SCLK synchronizes the data transfer. The MOSI and MISO signals change on rising edge of SCLK and the MISO signal is latched on the falling edge of the SCLK. The figure above shows a data of 0xD2 is shifted out, and a data of 0x66 is shifted in.

#### 21.4.4.1.1 Master Mode with SPI\_RDY

By default, the ECSPI does not use the SPI\_RDY signal in master mode (MODE =1).

A SPI burst begins when the following events happen:

- The ECSPI is enabled, TXFIFO has data in it, and ECSPI\_CONREG[XCH] bit or the ECSPI\_CONREG[SMC] bit is set.
- When the SPI Data Ready Control (ECSPI\_CONREG[DRCTL]) bits contains either 01 or 10, the SPI\_RDY signal controls when a SPI burst starts.

A SPI burst is defined as a bus transaction that starts when the slave select is asserted and ends when the slave select is negated. The Chip Select ( $\overline{SS}$ ) signal will remain asserted until all the bits in a SPI burst are shifted out.

If `ECSPI_CONREG[DRCTL]` is set to 01, the SPI burst can be triggered only if a falling edge of the `SPI_RDY` signal has been detected.

The following figure shows the relationship between a SPI burst and the falling edge of `SPI_RDY` signal.

**Figure 21-5. Relationship Between a SPI Burst and `SPI_RDY`: Falling-Edge Triggered**

A SPI burst does not start until the falling edge of the `SPI_RDY` signal is detected. The next SPI burst starts when the next `SPI_RDY` falling edge is detected, after the last burst has finished.

If SPI Data Ready Control (`ECSPI_CONREG[DRCTL]`) is set to 10, the SPI burst can be triggered only if the `SPI_RDY` signal is low.

The following figure shows the relationship between a SPI burst and the `SPI_RDY` signal. The SPI burst does not begin until the `SPI_RDY` signal goes low. The ECSPI will keep transmitting SPI burst if the `SPI_RDY` signal remains low.

**Figure 21-6. Relationship Between a SPI Burst and SPI\_RDY: Low-Level Triggered**

### 21.4.4.1.2 Master Mode with Wait States

Wait states can be inserted between SPI bursts. This provides a way for software to slow down the SPI burst to meet the timing requirements of a slower SPI device.

The following figure shows wait states inserted between SPI bursts.

**Figure 21-7. SPI Bursts with Wait States**

In this case, the number of wait states is controlled by `ECSPI_PERIODREG[SAMPLE PERIOD]` and the wait states' clock source is selected by `ECSPI_PERIODREG[CSRC]`.

### 21.4.4.1.3 Master Mode with SS\_CTL[3:0] Control

The SPI SS Control (`SS_CTL[3:0]`) controls whether the current operation is single burst or multiple bursts.

When the SPI SS Wave Form Select (`SS_CTL[3:0]`) is set, the current operation is multiple bursts transfer. When the SPI SS Wave Form Select (`SS_CTL[3:0]`) bit is cleared, the current operation is single burst transfer. A SPI burst can contains multiple words as defined in the BURST LENGTH field of the ECSPI\_CONREG register.

**Figure 21-8. SPI Burst While `SS_CTL[3:0]` is Clear**

In [Figure 21-8](#), two 8-bit bursts in the TXFIFO have been combined and transmitted in one SPI burst. The maximum length of a single SPI burst is defined in the BURST LENGTH field of the ECSPI\_CONREG control register. ([Figure 21-8](#) corresponds to a BURST LENGTH of 8.) This provides a way for transferring a longer SPI burst by writing data into TXFIFO while the ECSPI is transmitting.

**Figure 21-9. SPI Bursts While `SS_CTL[3:0]` is Set**

In [Figure 21-9](#), two FIFO entries are transmitted, one entry with each SPI burst. The ECSPI will continue to transmit SPI bursts until the TXFIFO is empty. When wait states can be inserted between SPI bursts, the SS will negate between SPI bursts until the wait states finish.

#### 21.4.4.1.4 Master Mode with Phase Control

The Phase Control (`ECSPI_CONREG[PHA]`) bit controls how the transmit data shifts out and the receive data shifts in.

## Functional Description

When the Phase control (ECSPI\_CONREG[PHA]) bit is set, the transmit data will shift out on the rising edge of SCLK, and the receive data is latched on the falling edge of SCLK. The most-significant bit is output on the first rising SCLK edge.

When ECSPI\_CONREG[PHA] is cleared, the transmit data is shifted out on the falling edge of SCLK and the receive data is latched on the rising edge of SCLK. The MSB is output when the host processor loads the transmitted data.

Inverting the SCLK polarity does not impact the edge-triggered operations because they are internal to the serial peripheral interface master. [Figure 21-10](#) shows how SPI burst works with different POL and PHA configuration.

**Figure 21-10. SPI Burst with Different POL and PHA Configurations**

### 21.4.4.2 Typical Slave Mode

When the ECSPI is configured as a slave (Mode = 0), software can configure the ECSPI Control register to match the external SPI master's timing. In this configuration,  $\overline{SS}$  becomes an input signal, and is used to latch data in and out of the internal data Shift registers, as well as to advance the data FIFO.

The SS, SCLK, and MOSI are inputs and MISO is output. Most of the timing diagrams are similar to the diagrams shown previously for the SPI in Master mode (Mode = 1), because the inputs come from a SPI master device.

However, the timing is different when SS is used to advance the data FIFO. When the SS\_CTL[3:0] is set while the ECSPI is configured in Slave mode, the data FIFO will advance on the rising edge of the SS signal. When the polarity is reversed (SSPOL = 1), the data FIFO will advance on the falling edge of the SS signal.

The figure below shows a SPI burst in which the data FIFO is advanced by the rising edge of the SS signal.

**Figure 21-11. Advancing the Data FIFO on the Rising Edge of  $\overline{SS}$**

In the above case, only the most significant 7 bits are loaded to the RXFIFO.

### 21.4.5 Reset

Whenever a device reset occurs, a reset is performed on the ECSPI, resetting all registers to their default values.

Software can reset the block using the CONREG[EN] bit; see [ECSPI](#).

### 21.4.6 Interrupts

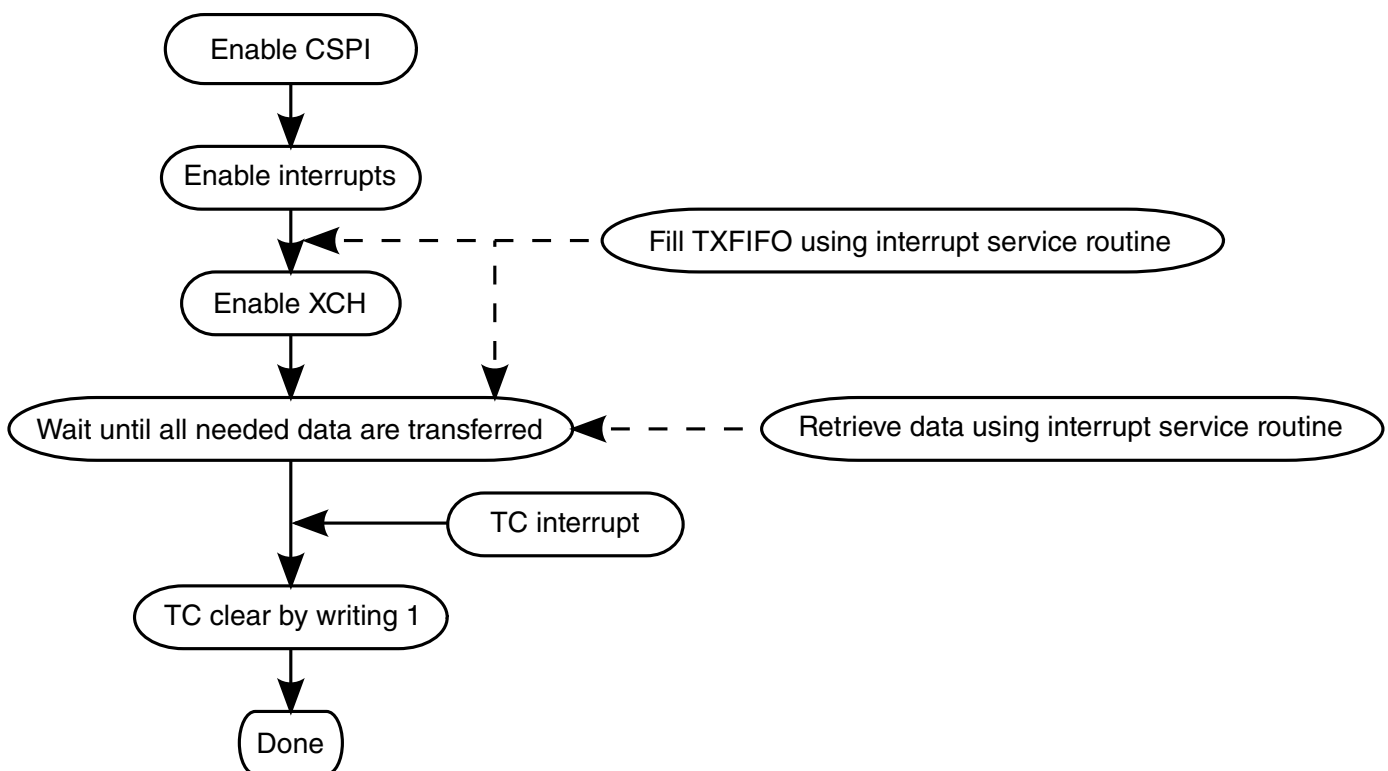

Interrupt control provides a way to manage the ECSPI FIFOs:

## Functional Description

- For transmitting data, software can enable the TXFIFO empty, TXFIFO data request, and TXFIFO full interrupts to maintain the TXFIFO using an interrupt service routine.
- For receiving data, software can enable the RXFIFO ready, RXFIFO data request, and RXFIFO full interrupts to retrieve data from the RXFIFO using an interrupt service routine.

Other interrupt sources can be used to control or debug the SPI bursts:

- The transfer-completed interrupt means that there is no data left in the TXFIFO and that the data in the Shift register has been shifted out.
- The RXFIFO overflow interrupt means that the RXFIFO received more than 64 words and will not accept any other words.

**Figure 21-12. Program Sequence of SPI Burst Using Interrupt Control**

## 21.4.7 DMA

DMA control provides another method to utilize the FIFOs in the ECSPI. By using DMA request and acknowledge signals, larger amounts of data can be transferred, and will reduce interrupts and host processor loading. When the appropriate conditions are matched, the block will send out a DMA request.

The DMA can deal with the following conditions:

- TXFIFO empty
- TXFIFO data request
- RXFIFO data request
- RXFIFO full

The figure below shows a program sequence of SPI bursts using DMA control.

Figure 21-13. Program Sequence of SPI Burst Using DMA

## 21.4.8 Byte Order

The ECSPI does not support byte re-ordering in hardware.

## 21.5 Initialization

This section provides initialization information for ECSPI.

To initialize the block:

1. Clear the EN bit in ECSPI\_CONREG to reset the block.
2. Enable the clocks for ECSPI.
3. Set the EN bit in ECSPI\_CONREG to put ECSPI out of reset.
4. Configure corresponding IOMUX for ECSPI external signals.
5. Configure registers of ECSPI properly according to the specifications of the external SPI device.

## 21.6 Applications

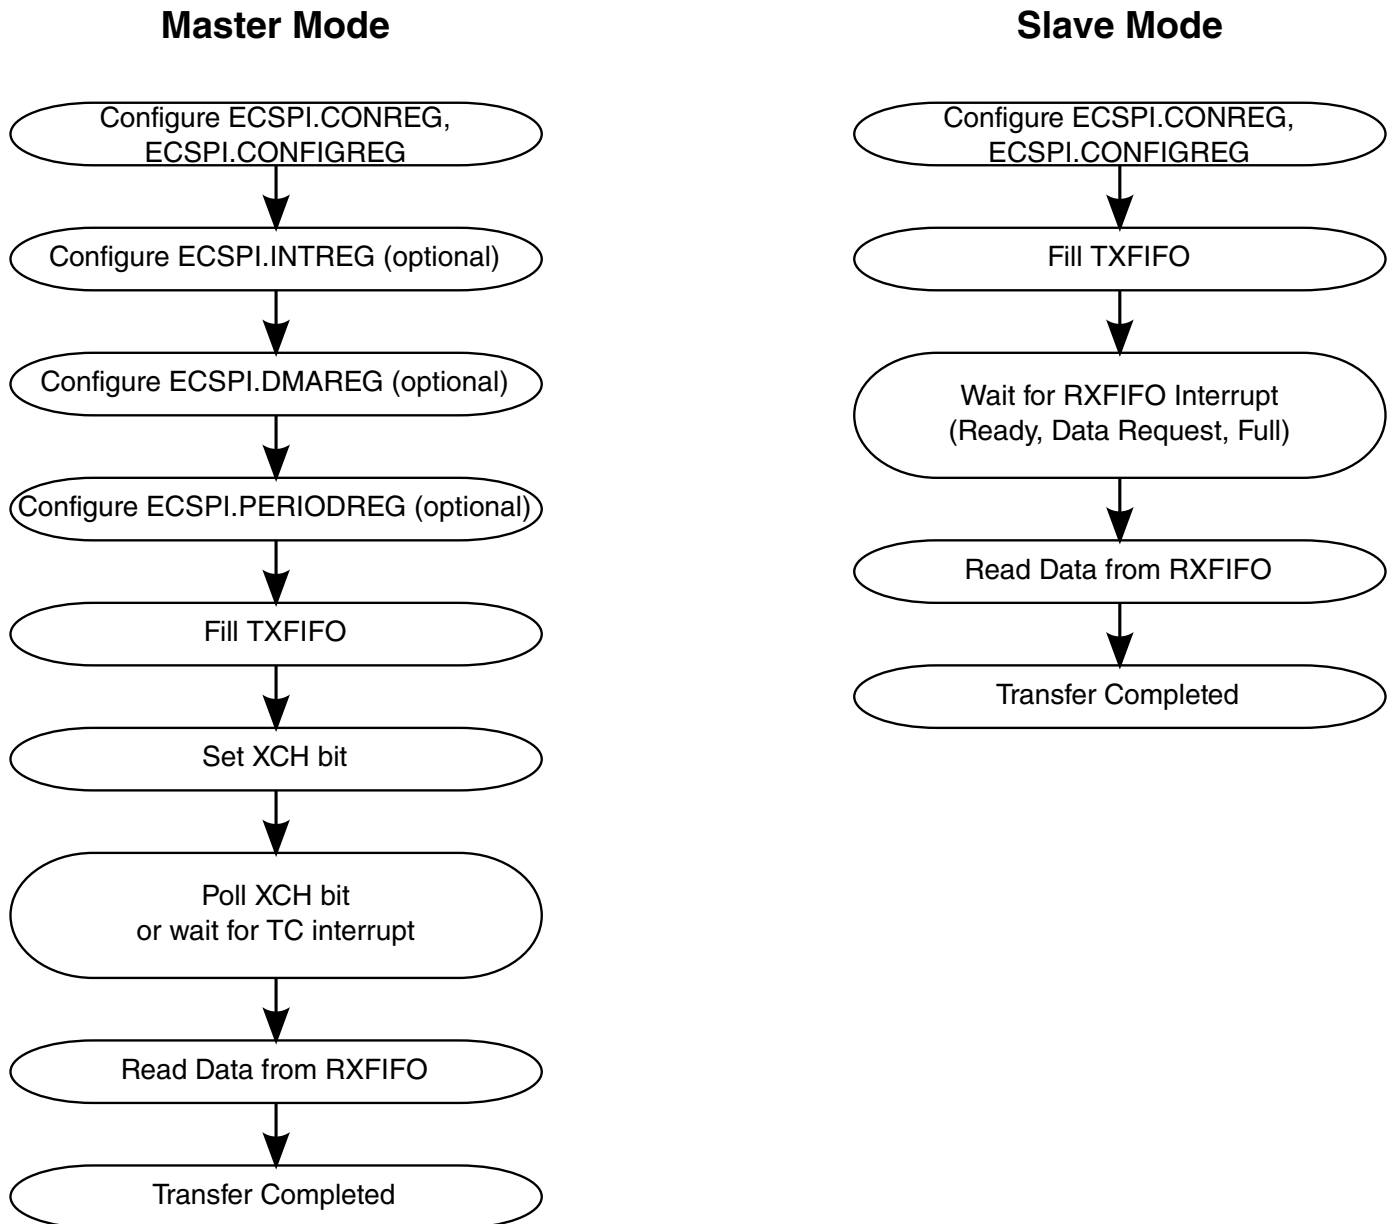

Figure 21-14. Flowchart of the ECSPI Operation

## 21.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

ECSPI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

## 21.7.1 Receive Data Register (ECSPiX\_RXDATA)

The Receive Data register (ECSPI\_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset

### ECSPiX\_RXDATA field descriptions

Field	Description
ECSPI_RXDATA	Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled.

## 21.7.2 Transmit Data Register (ECSPIx\_TXDATA)

The Transmit Data (ECSPI\_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI\_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI\_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

### ECSPIx\_TXDATA field descriptions

Field	Description
ECSPI_TXDATA	Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BIT_COUNT field of the corresponding SPI Control register. If this field contains more bits than the number specified by BIT_COUNT, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled.

## 21.7.3 Control Register (ECSPIx\_CONREG)

The Control Register (ECSPI\_CONREG) allows software to enable the ECSPI , configure its operating modes, specify the divider value, and SPI\_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

## ECSPiX\_CONREG field descriptions

Field	Description
31–20 BURST_LENGTH	<p>Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of <math>2^{12}</math> bits can be transferred in a single SPI burst.</p> <p>In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the <math>n</math> least-significant (<math>n = \text{BURST\_LENGTH} + 1</math>) will be shifted out. The remaining bits will be ignored.</p> <p>In slave mode, only when SS_CTL is cleared, this field will take effect in the transfer.</p> <p>Number of Valid Bits in a SPI burst.</p> <p>0x000 A SPI burst contains the 1 LSB in a word.  0x001 A SPI burst contains the 2 LSB in a word.  0x002 A SPI burst contains the 3 LSB in a word.  ...  0x01F A SPI burst contains all 32 bits in a word.  0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word.  0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word.  ...  0xFFE A SPI burst contains the 31 LSB in first word and <math>2^7 - 1</math> words.  0xFFF A SPI burst contains <math>2^7</math> words.</p>
19–18 CHANNEL_SELECT	<p>SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SS<math>_n</math>) outputs. Only the selected Chip Select (SS<math>_n</math>) signal can be active at a given time; the remaining three signals will be negated.</p> <p>00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted.  01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted.  10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted.  11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.</p>
17–16 DRCTL	<p>SPI Data Ready Control. This field selects the utilization of the <math>\overline{\text{SPI\_RDY}}</math> signal in master mode. ECSPI checks this field before it starts an SPI burst.</p> <p>00 The <math>\overline{\text{SPI\_RDY}}</math> signal is a don't care.  01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered).  10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered).  11 Reserved.</p>
15–12 PRE_DIVIDER	<p>SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divider of the reference clock.</p> <p>0000 Divide by 1.  0001 Divide by 2.  0010 Divide by 3.  ...  1101 Divide by 14.  1110 Divide by 15.  1111 Divide by 16.</p>
11–8 POST_DIVIDER	<p>SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divider of the reference clock using the equation: <math>2^n</math>.</p> <p>0000 Divide by 1.</p>

Table continues on the next page...

**ECSPiX\_CONREG field descriptions (continued)**

Field	Description
	0001 Divide by 2. 0010 Divide by 4. ... 1110 Divide by 2 <sup>14</sup> . 1111 Divide by 2 <sup>15</sup> .
7-4 CHANNEL_ MODE	SPI CHANNEL MODE selects the mode for each SPI channel. CHANNEL MODE[3] is for SPI channel 3. CHANNEL MODE[2] is for SPI channel 2. CHANNEL MODE[1] is for SPI channel 1. CHANNEL MODE[0] is for SPI channel 0. 0 Slave mode. 1 Master mode.
3 SMC	Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to. 0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions. 1 Immediately starts a SPI burst when data is written in TXFIFO.
2 XCH	SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out. 0 Idle. 1 Initiates exchange (write) or busy (read).
1 HT	Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode. Note, HT mode is not supported by this product. 0 Disable HT mode. 1 Enable HT mode.
0 EN	SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPiX_CONREG. The block's internal clocks are gated off whenever the block is disabled. 0 Disable the block. 1 Enable the block.

## 21.7.4 Config Register (ECSPi<sub>x</sub>\_CONFIGREG)

The Config Register (ECSPI\_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ECSPi<sub>x</sub>\_CONFIGREG field descriptions

Field	Description
31–29 -	This field is reserved. Reserved
28–24 HT_LENGTH	HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product. The length in bits of one message is (HT LENGTH + 1).
23–20 SCLK_CTL	SCLK CTL. This field controls the inactive state of SCLK for each SPI channel. SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0.  0 Stay low. 1 Stay high.
19–16 DATA_CTL	DATA CTL. This field controls inactive state of the data line for each SPI channel. DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0.  0 Stay high. 1 Stay low.
15–12 SS_POL	SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal. SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0.

Table continues on the next page...

**ECSPIx\_CONFIGREG field descriptions (continued)**

Field	Description
	0 Active low. 1 Active high.
11–8 SS_CTL	<p>SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL are ignored if the SMC bit is set.</p> <p>SS CTL[3] is for SPI channel 3.                      SS CTL[2] is for SPI channel 2.                      SS CTL[1] is for SPI channel 1.                      SS CTL[0] is for SPI channel 0.</p> <p>In slave mode, this bit controls when the SPI burst is completed.</p> <p>An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.</p> <p>0 In master mode - only one SPI burst will be transmitted.                      1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty.</p> <p>0 In slave mode - an SPI burst is completed when the number of bits received in the shift register is equal to (BURST LENGTH + 1). Only the n least-significant bits (n = BURST LENGTH[4:0] + 1) of the first received word are valid. All bits subsequent to the first received word in RXFIFO are valid.                      1 Reserved</p>
7–4 SCLK_POL	<p>SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See <a href="#">Figure 21-10</a> for more information.</p> <p>SCLK_POL[3] is for SPI channel 3.                      SCLK_POL[2] is for SPI channel 2.                      SCLK_POL[1] is for SPI channel 1.                      SCLK_POL[0] is for SPI channel 0.</p> <p>0 Active high polarity (0 = Idle).                      1 Active low polarity (1 = Idle).</p>
SCLK_PHA	<p>SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See <a href="#">Figure 21-10</a> for more information.</p> <p>SCLK PHA[3] is for SPI channel 3.                      SCLK PHA[2] is for SPI channel 2.                      SCLK PHA[1] is for SPI channel 1.                      SCLK PHA[0] is for SPI channel 0.</p> <p>0 Phase 0 operation.                      1 Phase 1 operation.</p>

## 21.7.5 Interrupt Control Register (ECSPiX\_INTREG)

The Interrupt Control Register (ECSPI\_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### ECSPiX\_INTREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TCEN	Transfer Completed Interrupt enable. This bit enables the Transfer Completed Interrupt. 0 Disable 1 Enable
6 ROEN	RXFIFO Overflow Interrupt enable. This bit enables the RXFIFO Overflow Interrupt. 0 Disable 1 Enable
5 RFEN	RXFIFO Full Interrupt enable. This bit enables the RXFIFO Full Interrupt. 0 Disable 1 Enable
4 RDREN	RXFIFO Data Request Interrupt enable. This bit enables the RXFIFO Data Request Interrupt when the number of data entries in the RXFIFO is greater than RX_THRESHOLD. 0 Disable 1 Enable
3 RREN	RXFIFO Ready Interrupt enable. This bit enables the RXFIFO Ready Interrupt. 0 Disable 1 Enable

Table continues on the next page...

**ECSPIx\_INTREG field descriptions (continued)**

Field	Description
2 TFEN	TXFIFO Full Interrupt enable. This bit enables the TXFIFO Full Interrupt.  0 Disable 1 Enable
1 TDREN	TXFIFO Data Request Interrupt enable. This bit enables the TXFIFO Data Request Interrupt when the number of data entries in the TXFIFO is less than or equal to TX_THRESHOLD.  0 Disable 1 Enable
0 TEEN	TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt.  0 Disable 1 Enable

**21.7.6 DMA Control Register (ECSPIx\_DMAREG)**

The Direct Memory Access Control Register (ECSPI\_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset

## ECSPiX\_DMAREG field descriptions

Field	Description
31 RXTDEN	RXFIFO TAIL DMA Request Enable. This bit enables an internal counter that is increased at each read of the RXFIFO. This counter is cleared automatically when it reaches RX DMA LENGTH. If the number of words remaining in the RXFIFO is greater than or equal to RX DMA LENGTH, a DMA request is generated even if it is less than or equal to RX_THRESHOLD.  0 Disable 1 Enable
30 -	This field is reserved. Reserved
29–24 RX_DMA_LENGTH	RX DMA LENGTH. This field defines the burst length of a DMA operation. Applies only when RXTDEN is set.
23 RXDEN	RXFIFO DMA Request Enable. This bit enables/disables the RXFIFO DMA Request.  0 Disable 1 Enable
22 -	This field is reserved. Reserved
21–16 RX_THRESHOLD	RX THRESHOLD. This field defines the FIFO threshold that triggers a RX DMA/INT request. A RX DMA/INT request is issued when the number of data entries in the RXFIFO is greater than RX_THRESHOLD.
15–8 -	This field is reserved. Reserved
7 TEDEN	TXFIFO Empty DMA Request Enable. This bit enables/disables the TXFIFO Empty DMA Request.  0 Disable 1 Enable
6 -	This field is reserved. Reserved
TX_THRESHOLD	TX THRESHOLD. This field defines the FIFO threshold that triggers a TX DMA/INT request. A TX DMA/INT request is issued when the number of data entries in the TXFIFO is not greater than TX_THRESHOLD.

## 21.7.7 Status Register (ECSPIx\_STATREG)

The ECSPI Status Register (ECSPI\_STATREG) reflects the status of the ECSPI's operating condition. If the ECSPI is disabled, this register reads 0x0000\_0003.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved

### ECSPIx\_STATREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TC	Transfer Completed Status bit. Writing 1 to this bit clears it.  0 Transfer in progress. 1 Transfer completed.
6 RO	RXFIFO Overflow. When set, this bit indicates that RXFIFO has overflowed. Writing 1 to this bit clears it.  0 RXFIFO has no overflow. 1 RXFIFO has overflowed.
5 RF	RXFIFO Full. This bit is set when the RXFIFO is full.  0 Not Full. 1 Full.
4 RDR	RXFIFO Data Request.  0 When RXTDE is set - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is set - Number of data entries in the RXFIFO is greater than RX_THRESHOLD or a DMA TAIL DMA condition exists. 0 When RXTDE is clear - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is clear - Number of data entries in the RXFIFO is greater than RX_THRESHOLD.
3 RR	RXFIFO Ready. This bit is set when one or more words are stored in the RXFIFO.  0 No valid data in RXFIFO. 1 More than 1 word in RXFIFO.
2 TF	TXFIFO Full. This bit is set when if the TXFIFO is full.

Table continues on the next page...

**ECSPi<sub>x</sub>\_STATREG field descriptions (continued)**

Field	Description
	0 TXFIFO is not Full. 1 TXFIFO is Full.
1 TDR	TXFIFO Data Request. 0 Number of valid data slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of valid data slots in TXFIFO is not greater than TX_THRESHOLD.
0 TE	TXFIFO Empty. This bit is set if the TXFIFO is empty. 0 TXFIFO contains one or more words. 1 TXFIFO is empty.

**21.7.8 Sample Period Control Register (ECSPi<sub>x</sub>\_PERIODREG)**

The Sample Period Control Register (ECSPi<sub>x</sub>\_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

The delay counts apply only when the current channel is operating in Master mode (ECSPi<sub>x</sub>\_CONREG[CHANNEL MODE] = 1). ECSPi<sub>x</sub>\_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset

Table continues on the next page...

**ECSPi<sub>x</sub>\_PERIODREG field descriptions (continued)**

Field	Description
21–16 CSD_CTL	Chip Select Delay Control bits. This field defines how many SPI clocks will be inserted between the chip select's active edge and the first SPI clock edge. The range is from 0 to 63.
15 CSRC	Clock Source Control. This bit selects the clock source for the sample period counter.  0 SPI Clock (SCLK) 1 Low-Frequency Reference Clock (32.768 KHz)
SAMPLE_ PERIOD	Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPi <sub>x</sub> _CONREG register.  0x0000 0 wait states inserted 0x0001 1 wait state inserted ... .. 0x7FFE 32766 wait states inserted 0x7FFF 32767 wait states inserted

## 21.7.9 Test Control Register (ECSPIx\_TESTREG)

The Test Control Register (ECSPI\_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPI, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset

### ECSPIx\_TESTREG field descriptions

Field	Description
31 LBC	Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins are not affected, and the input pins are ignored.  0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback.
30–28 -	This field is reserved. Reserved, all bits should be ignored.
27–15 -	This field is reserved. Reserved
14–8 RXCNT	RXFIFO Counter. This field indicates the number of words in the RXFIFO.

Table continues on the next page...

**ECSPIx\_TESTREG field descriptions (continued)**

Field	Description
7 -	This field is reserved. Reserved
TXCNT	TXFIFO Counter. This field indicates the number of words in the TXFIFO.

**21.7.10 Message Data Register (ECSPIx\_MSGDATA)**

The Message Data Register (ECSPI\_MSGDATA) forms the top word of the 16 x 32 MSG Data FIFO. Only word-size accesses are allowed for this register. Reads to this register return zero, and writes to this register store data in the MSG Data FIFO.

Address: Base address + 40h offset

**ECSPi\_MSGDATA field descriptions**

Field	Description
ECSPi_MSGDATA	ECSPi_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO.

---

# Chapter 22

## External Interface Module (EIM)

### 22.1 Overview

The EIM handles the interface to devices external to the chip, including generation of chip selects, clock and control for external peripherals and memory. It provides asynchronous access to devices with SRAM-like interface and synchronous access to devices with NOR-Flash-like or PSRAM-like interface.

## Overview

**Figure 22-1. EIM Diagram**

### 22.1.1 Features

- Four chip selects for external devices
  - Flexible address decoding. Each chip select memory space determined separately, according to VIA port configuration (see [Chip Select Memory Map](#)). Configurable Chip Select 0 base address (by VIA)
  - Individual select signal for each one of the memory space defined. Up to 6 memory spaces may be defined and programmed individually.
  - 26-bit external address bus, max memory size can be 128 MByte (1 Gigabit).
- Selectable Write Protection for each Chip Select
- Support for multiplexed address / data bus operation x16 and x32 port size
- Programmable Data Port Size for each Chip Select (x8, x16 and x32)
- Programmable Wait-State generator for each Chip Select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Support for Asynchronous page mode accesses (x16 and x32 port size)
- Support continuous Burst Clock which can be used as reference clock for FPGA
- Independent synchronous Memory Burst Read Mode support for NOR-Flash and PSRAM memories (x16 and x32 port size)
- Independent synchronous Memory Burst Write Mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Support of NAND-Flash devices with NOR-Flash like interface - MDOC™ (M-Systems), OneNAND™ (Samsung)
- Independent programmable variable/fix Latency support for read and write synchronous (burst) mode
- Support for Big Endian and Little Endian operation modes per access
- ARM AXI slave interface. One ID at a time support.
- External Interrupt support, RDY\_INT signal function as external interrupt
- Boot from external device support according to boot signals, using RDY\_INT signal
  - RDY signal support assertion after reset for MDOC™ (M-Systems) device
  - INT signal support assertion after reset for OneNAND™ (Samsung) device

### 22.1.2 Modes of Operation

The EIM has the following modes of operation:

- Asynchronous Mode
- Asynchronous Page Mode
- Multiplexed Address/Data mode

## Overview

- Burst Clock Mode
- Low Power Modes
- Boot Mode

See details in the [EIM Operational Modes](#).

### 22.1.2.1 Asynchronous Mode

This is a non-burst mode that is used for SRAM access. In this mode, a single data is read/written with each access (asserted address).

All controls' timings are controlled by preset values in Chip Select Configuration Registers.

### 22.1.2.2 Asynchronous Page Read Mode

Setting the APR bit causes the EIM to perform memory burst accesses by emulating page mode operation.

The external address asserts for each piece of data. The initial access timing is according to RWSC field, and the next address assertions timing is according to PAT field. When APR bit is set, RCSN OEN, RADVN and RBEN fields are ignored for burst access to the external device.

The page size can be set via the BL field to 2, 4, 8, 16, or 32 words (the word size is determined by the DSZ field).

### 22.1.2.3 Multiplexed Address/Data Mode

In this mode, multiplexing addresses and data bits on the same pins is supported for synchronous/asynchronous accesses to x8/x16/x32 data width memory devices.

For more information about the pins that drive data/address in 8/16/32 non-muxed mode and 16/32 muxed mode, see the following table.

Table 22-1. EIM multiplexing

Setup	Non Multiplexed Address/Data Mode							Multiplexed Address/ Data mode	
	8 Bit				16 Bit		32 Bit	16 Bit	32 Bit
	MUM = 0, DSZ = 100	MUM = 0, DSZ = 101	MUM = 0, DSZ = 110	MUM = 0, DSZ = 111	MUM = 0, DSZ = 001	MUM = 0, DSZ = 010	MUM = 0, DSZ = 011	MUM = 1, DSZ = 001	MUM = 1, DSZ = 011
A[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]	EIM_DA[15:0]
A[25:16]	EIM_A[25:16]	EIM_A[25:16]	EIM_A[25:16]	EIM_A[25:16]	EIM_A[25:16]	EIM_A[25:16]	EIM_A[25:16]	EIM_A[25:16]	EIM_D[9:0]
D[7:0], EIM_EB0	EIM_D[7:0]	-	-	-	EIM_D[7:0]	-	EIM_D[7:0]	EIM_DA[7:0]	EIM_DA[7:0]

### 22.1.2.4 Burst Clock Mode

The controller has the ability to support burst synchronous operations in various frequencies, depending on the frequency of the input clock supplied by the system (EIM clock).

The EIM clock can be divided by one, two, three or four, and its frequency can be changed according to the requirements. Variable and fix latency are supported for this mode, according to the external device requirements.

- Synchronous read mode. This is a burst mode, which is used for reading from Flash/PSRAM memory devices. In this mode, after address assertion a burst of sequential data can be read. Data exchange is carried out according to BCLK being generated by EIM. An access is delayed according to external WAIT\_B signal assertion (signal from the memory device).
- Synchronous write mode. A burst mode used for accessing external devices, which support synchronous write type of access (PSRAM protocol). In this mode, after address assertion a burst of sequential data can be written to the external device. Access may be delayed according to WAIT\_B signal assertion (signal from the memory device) before first piece of data arrived to the external device.

#### NOTE

Maximum frequency of the EIM main clock is 133Mhz. It may be reduced by the system for special cases of external devices,

which demand a different frequency than integer division of the 133MHz clock.

### 22.1.2.5 Low Power Modes

The input clock is gated by ACT\_CS bits. When all the ACT\_CS are negated (all CS disable) the internal clock is turned off; awready/wready & arready signal are de-asserted and the master can't access the EIM.

### 22.1.2.6 Boot Mode

It is possible to perform a boot operation from external device located on CS0. The configuration of the relevant bits are done with boot mode signals according to the external device parameters (for example, port size and protocol assertion).

See [System Boot](#) for more details.

## 22.2 External Signals

The following table describes the external signals of EIM:

**Table 22-2. EIM External Signals**

Signal	Description	Pad	Mode	Direction
EIM_ACLK_FREERUN	AXI clock signal	EIM_A25	ALT9	I
		EIM_D31	ALT9	
		EIM_EB3	ALT9	
EIM_AD00	LSB multiplexed Address/Data Bus signal	EIM_DA0	ALT0	IO
EIM_AD01	LSB multiplexed Address/Data Bus signal	EIM_DA1	ALT0	IO
EIM_AD02	LSB multiplexed Address/Data Bus signal	EIM_DA2	ALT0	IO
EIM_AD03	LSB multiplexed Address/Data Bus signal	EIM_DA3	ALT0	IO
EIM_AD04	LSB multiplexed Address/Data Bus signal	EIM_DA4	ALT0	IO
EIM_AD05	LSB multiplexed Address/Data Bus signal	EIM_DA5	ALT0	IO
EIM_AD06	LSB multiplexed Address/Data Bus signal	EIM_DA6	ALT0	IO

*Table continues on the next page...*

**Table 22-2. EIM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
EIM_AD07	LSB multiplexed Address/Data Bus signal	EIM_DA7	ALT0	IO
EIM_AD08	LSB multiplexed Address/Data Bus signal	EIM_DA8	ALT0	IO
EIM_AD09	LSB multiplexed Address/Data Bus signal	EIM_DA9	ALT0	IO
EIM_AD10	LSB multiplexed Address/Data Bus signal	EIM_DA10	ALT0	IO
EIM_AD11	LSB multiplexed Address/Data Bus signal	EIM_DA11	ALT0	IO

EIM_DTACK_B	Data Acknowledge, asynchronous access. This input is used as a data acknowledge signal for single asynchronous accesses.	EIM_WAIT	ALT1	I
EIM_EB0	Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.  EIM_EB[0] corresponds to DATA_OUT[7:0]  For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.	EIM_EB0	ALT0	O
EIM_EB1	Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.  EIM_EB[1] corresponds to DATA_OUT[15:8]  For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.	EIM_EB1	ALT0	O

Table continues on the next page...

**Table 22-2. EIM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
EIM_EB2	<p>Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.</p> <p>EIM_EB[2] corresponds to DATA_OUT[23:16]</p> <p>For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.</p>	EIM_EB2	ALT0	O
EIM_EB3	<p>Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only.</p> <p>EIM_EB[3] corresponds to DATA_OUT[31:24].</p> <p>For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.</p>	EIM_EB3	ALT0	O
EIM_LBA	<p>Address Valid. This active-low output signal is asserted during burst mode accesses to cause the external burst capable device to load a new starting burst address. Assertion of LBA indicates that a valid address is present on the address bus. Its behavior is affected by the SWR, SRD, BCD, and BCS fields of the EIM_CSxGCR1 registers, the RADVA and RADVN fields of the EIM_CSxRCR1 registers, and the WADVA and WADVN fields of the EIM_CSxWCR1 registers. In asynchronous mode, LBA length is affected by the RADVA, WADVA, RADVN, and WADVN fields. Minimum length of LBA signal in all modes is one EIM clock cycle.</p>	EIM_LBA	ALT0	O

*Table continues on the next page...*

**Table 22-2. EIM External Signals (continued)**

Signal	Description	Pad	Mode	Direction
EIM_OE	Output Enable. This active-low output signal indicates the bus access is a read and enables external devices to drive the data bus with read data. Its behavior is affected by the OEA and OEN bit fields in the Chip Select Configuration Registers.	EIM_OE	ALT0	O
EIM_RW	Memory Write Enable. This active-low output signal indicates the bus access is a write and enables external devices to sample the data bus. Its behavior is affected by the WEA and WEN bit fields in the Chip Select Configuration Registers.	EIM_RW	ALT0	O
EIM_WAIT	<p>Ready/Busy/Wait signal. This active-low input signal is asserted by external burst capable devices which support fixed or variable latency of data. It is serviced in synchronous mode only (EIM_CSxGCR1[SWR, SRD] =1). WAIT will have a pull up resistor in pad. The signal indicates whether the External device is ready for data transaction or not. Busy cycles (or wait cycles) of the external device can occur at the start of a Burst access or at page boundary crossover.</p> <p><b>NOTE:</b> For burst devices, WAIT output should be configured to change one cycle before data is ready (before delay).</p> <p><b>NOTE:</b> Some External devices may not use this input signal for ready state indication (fix latency without WAIT signal monitoring). For these devices EIM should be configured accordingly (see RFL, WFL, and PSZ field descriptions).</p> <p><b>NOTE:</b> This is same as what is shown in IP_IND_WAIT_B</p>	EIM_WAIT	ALT0	I

## 22.2.1 Other Important Block I/O Signals Internal to the SoC

The following table provides a description of other signals which are internal to the that are important to understand the function of EIM.

Name	I/O	Description
EIM_FB_BCLK	Input	Burst Clock Feedback. This block input is used to sample read data during high transfer speeds. The signal provides feedback from the I/O pad of the BCLK output pin and tends to align more closely with data from the external memory device.
EIM_BOOT	Input	EIM Boot Configuration. These block inputs determine the reset state of DSZ[1:0] and MUM. A more detailed description can be found in <a href="/projects/MAD/iMX6series/fusemap_6sdl/fusemap6sdl_map.xml">/projects/MAD/iMX6series/fusemap_6sdl/fusemap6sdl_map.xml</a> .
ACLK	Input	AXI clock, maximum frequency 133 Mhz
IPG_CLK_S	Input	EIM module IPG clock
RST_B	Input	Active low HW reset
EIM_WARM_RESET	Input	Warm Reset. If this signal is asserted the rst_b will reset only the internal FF and state machine while S/W registers will keep their current state. This signal is active high signal.

## 22.3 Clocks

The following table describes the clock sources for EIM. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 22-4. EIM Clocks**

Clock name	Clock Root	Description
aclk	aclk_eim_slow_clk_root	EIM clock (main)
aclk_slow	aclk_eim_slow_clk_root	EIM clock (slow)
ipg_clk_s	ipg_clk_root	Peripheral access clock
aclk_exsc	aclk_eim_slow_clk_root	EIM clock (external device)

- **ACLK:** EIM clock (main clock, AXI clock) with a Max frequency of 133Mhz. Can be gated externally when there is no active AXI access.
- **ACLK\_SLOW:** EIM all time running ACLK. Used for flip-flops that must be active even when EIM is in low power down mode to provide clock for lpack/lpmd registers, IP registers and IP to AXI sync registers.
- **IPG\_CLK\_S:** IPG clock for IP accesses. IP registers are activated by ACLK\_SLOW clock.
- **ACLK\_EXSC:** Clock created from EIM clock for External device usage. Integer division by 1, 2, 3 and 4 of the clock can be use with BCD bit field configuration, according to external devices demands. EIM clock frequency may be reduced for lower frequency support which cannot be achieved via BCD bit field.

## 22.4 Chip Select Memory Map

Table 22-5. EIM Chip Select Memory Map

Address	Space Size	Use	Access
EIM_NFC_BASE/ACT_CS/ADDRS0 inputs	128MB	CS0 memory region	R/W
ACT_CS/ADDRS1 inputs	128MB	CS1 memory region	R/W
ACT_CS/ADDRS2 inputs	128MB	CS2 memory region	R/W
ACT_CS/ADDRS3 inputs	128MB	CS3 memory region	R/W

## 22.5 Functional Description

This section provides the functional description for the EIM.

### 22.5.1 Continuous BCLK

EIM module can be programmed to provide a continuous BCLK in synchronous mode as the reference clock of PPGA. In this case, an internal DLL(Delay-locked Loop) is used to synchronize the internal clock which is used to sample read data from the I/O pad, with the feedback BCLK from PAD. The DLL compares the phase difference of internal clock to the feedback BCLK and will lock up when the delay of Reference Delay Line equals to the phase difference. After the lock up of Reference Delay Chain , DLL will copy the Master Delay Chain's value to Slave Delay Chain automatically. The Slave Delay Chain is used to delay the internal clock. If continuous BCLK is not selected, DLL should not be enabled.

When using an continuous BCLK in synchronous mode, BCD MUST be set to 0, otherwise will cause malfunction of EIM.

To let EIM work properly under continuous BCLK MODE, the initialization must follow below procedure. The initialize procedure should be done before any access to EIM. If it is not possible to do so, e.g. device booted up from EIM, the initialize flow should be done after performing a reset of EIM.

The recommended initialize flow is as follow

1. Disable EIM clock by clearing bit 4 of EIM\_WIAR Register.
2. Select Continuous BCLK by setting bit 3 of EIM\_WCR Register.
3. Enable DLL by setting bit 0 of EIM\_DCR Register.

4. Enable EIM clock by setting bit 4 of EIM\_WIAR Register.
5. Reset DLL by toggling bit 1 of EIM\_DCR Register(1->0->1).
6. Wait for DLL lock (Both bit 0 and bit 1 of EIM\_DSR Register are asserted).

After initialization, EIM can be programmed to various access timing, but BCD MUST be kept to 0.

DLL Update Interval and initial value can be set by write EIM\_DCR Register in corresponding bit field.

Also DLL provides manual adjustment to delay. An extra offset can be added to internal delay line, which can be used when DLL have some kind of predicable error. OVERRIDE bit field of EIM\_DCR register will override reference DLL locked value and use a direct value for delay.

Note: During initialization, BCLK frequency and duty cycle are not guaranteed.

## 22.5.2 Bus Sizing Configuration

The EIM supports byte, half word and word operands allowing access to x8, x16, x32 ports. It can be address/data multiplexed in x16, x32 ports. The port size is programmable via the DSZ bit field in the corresponding Chip Select Configuration Register. An 8-bit port can reside in each one of the bytes of the data bus. A 16-bit port can reside on the lower 16 bits of the data bus, DATA\_IN/OUT[15:0] or on the higher 16 bits of the data bus, DATA\_IN/OUT[31:16].

In the case of a multi-cycle transfer, the lower two address bits (ADDR[1:0]) are incremented appropriately. The EIM address bus is configured according to DSZ bit field and AUS bits. There is either one bit (for x16 port size) or two bits (for x32 port size) right shift of the address bits (only when AUS=0) and no bit shift when AUS = 1 or DSZ[2] = 1.

The EIM has a data multiplexer which takes the four bytes of the AXI data bus and routes them to their required positions to properly interface to memory.

### NOTE

A word access to or from a x16 port requires two external bus cycles to complete the transfer.

A word access to or from a x8 port requires four external bus cycles to complete the transfer.

## 22.5.2.1 8 BIT PORT SUPPORT

EIM has limited support for mot68000 & intel 386 protocols.

### 22.5.2.1.1 MOTOROLA 68000

EIM has limited support for mot68000 protocol. Only basic read or write asynchronous operations are supported.

The following operations are not supported:

- Read modify write
- Sync access
- All special accesses (ARM platform space, bus arbitration, bus control, bus error & reset operations)
- FC outputs

### 22.5.2.1.2 INTEL 386

EIM has limited support for intel 386 protocol. Only basic read or write async non-pipelined operations are supported.

The following operations are not supported:

- Other bus cycles (interrupt, halt & refresh)
- Bus lock
- M/IO, DC, LBA, NA, REFRESH & BS8 signals

## 22.5.3 EIM Operational Modes

Listed here are the main operational modes for EIM selected by control bit fields settings.

For details, see the bit field descriptions of SWR / SRD / MUM. All modes are supported in with 8-, 16- or 32-bit port configuration, according to DSZ bit field.

**Table 22-6. EIM Operation Modes Field Settings**

Control bit fields			Brief mode description
MUM	SRD	SWR	
0	0	0	Asynchronous write / Asynchronous read for APR=0 / Asynchronous page read for APR=1, none multiplexed
		1	Synchronous write/ Asynchronous read or APR=0 / Asynchronous page read for APR=1,none multiplexed

*Table continues on the next page...*

**Table 22-6. EIM Operation Modes Field Settings (continued)**

Control bit fields			Brief mode description
MUM	SRD	SWR	
	1	0	Asynchronous write/Synchronous read none multiplexed
		1	Synchronous write/read none multiplexed
1	0	0	Asynchronous write/read multiplexed
		1	Synchronous write/ Asynchronous read multiplexed
	1	0	Asynchronous write/Synchronous read multiplexed
		1	Synchronous write/read multiplexed

## 22.5.4 Burst Mode (Synchronous) Memory Operation

This mode is enabled for read or write access. Bit SWR sets the burst mode for write operations at the corresponding chip select and bit SRD sets it for read operation.

When this mode is set, the controller attempts to translate the Master burst accesses to memory burst accesses, being limited by the memory burst length, predefined by BL value, or memory and Master WRAP/INCR boundary crossing non-matching. Only the first address accessed is put by the controller on the external address bus in a memory burst sequence.

EIM may translate from some Master sequential accesses to one or several memory bursts, but not from two Master individual accesses to one memory burst.

For the first access in a memory burst sequence, the EIM asserts  $\overline{ADV}$ , causing the external burst device to latch the starting burst address; then toggle the burst clock (BCLK) for a predefined number of cycles in order to latch the first unit of data. Subsequent accessed data units can then be burst in fewer clock cycles, realizing an overall increase in bus bandwidth.

### NOTE

The BCLK signal toggles only when burst access is executed toward the external device (BCM=1'b0 for normal mode use). It runs with a 50% duty cycle until the end of access is reached. When access is terminated, BCLK stops toggling.

Memory burst accesses are terminated by the EIM whenever it detects the following:

- The specific burst length has executed completely (end of access)
- Write access - missing data in write buffer (Master is delaying the data transfer toward the EIM)

- Next sequential access crosses boundary with unequal condition (wrap/increment, burst length) on the Master and memory
- Current memory burst length reached

### 22.5.5 Burst Clock Divisor (BCD)

In some cases, it may be necessary to slow the external bus in relation to the internal bus to allow accesses to burst devices that have a maximum operating frequency less than the operating frequency of the internal bus.

The internal bus frequency can be divided by one, two, three or four for presentation on the external bus in burst mode operation.

BCLK can only be set to integer divisions of the incoming clock frequency. To get a specific frequency on BCLK, configure the divider to change the incoming EIM clock accordingly.

By programming the BCD bit field to various values, two signals on the external bus are affected;  $\overline{ADV}$  and BCLK. The  $\overline{ADV}$  signal is asserted according to RADVA or WADVA bit fields programming, and is negated according to the formula mentioned in RADVN and WADVN bit fields description. The BCLK signal runs with a 50% duty cycle until the end of access is reached.

If BCM = 1, the BCLK runs at frequency according to GBCD bit field settings on every async memory access, regardless of the SWR and SRD bits configuration. Caution should be exercised when using BCM bit; GBCD bit field should be updated once and should not change when BCLK is toggling. The BCM bit is used mainly for system debug mode. It has no functional use of the EIM in normal mode.

### 22.5.6 Burst Clock Start (BCS)

In an effort to allow greater flexibility in achieving the minimum number of wait states on burst accesses, you can determine when you want the BCLK to start toggling after the start of access. This allows the BCLK to be skewed from point of data capture on the EIM clock by any number of EIM clock cycles.

Care must be exercised when setting BCS bit field in conjunction with the BCD and RWSC/WWSC bit fields. See the external timing diagrams in [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=1](#) and [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=0](#) for examples of how to use the BCS, BCD and RWSC/WWSC bit fields together.

## 22.5.7 Multiplexed Address/Data Mode Support

The control bit MUM allows support memory with multiplexed address/data bus both in asynchronous and in synchronous modes.

Caution should be exercised for using OEA/WEA & ADH bit fields. They should be configured according to the external device requirements, as it determines the time point of end of address phase and start of data phase.

## 22.5.8 Mixed Master/Memory Burst Modes Support

To provide mixed sequential/wrap accesses with different length, EIM interprets burst signal and generate additional  $\overline{ADV}$  signals whenever there appear unequal address or burst boundary crossing condition.

BL bit field is used to notify EIM about current memory burst and wrap condition for properly external address generation. In case of non-matching boundaries in both the memory and Master access, EIM starts a new memory burst access by updating address from Master on address bus and generating  $\overline{ADV}$  signal.

## 22.5.9 AXI (Master) Bus Cycles Support

The EIM uses an ARM AXI slave interface. It has a 32-bit bus and supports one access (one ID) at a time. No out of order or parallel accesses are supported.

The following AXI protocol signals are not supported:

- AWLOCK
- AWCACHE
- ARLOCK
- ARCACHE

ARID bus is sampled when:

- new read access is valid on the read address channel and is reflected on the RID bus output toward the master.

AWID bus is sampled when:

- new write access is valid on the write address channel and is reflected on the WID/BID bus output toward the master.

ARPROT and AWPROT signal are partially used. ARPROT[0] and AWPROT[0] bits are used for normal/privileged access detection. ARPROT[2:1] and AWPROT[2:1] are not used.

When sampling a valid access on both of the address channels, the read access will be performed first while write access is pending. After last data transfer completed, the pending write will be executed.

A new access may be executed one cycle after sampling a valid access on the read or write address channels, assuming there is no current access (back to back) which can cause a recovery or end of access penalty cycles, for write access, also assuming data is in write buffer for fast execution.

### NOTE

- Only 32-bit word size accesses are supported for burst mode accesses.
- Only 8-bit (1 byte), 16-bit (2 byte) and 32-bit (4 byte) word size supported for single access.
- Maximum number of burst length is 16.
- According to AXI protocol, burst access should not cross 4 KB blocks. In case EIM gets an access that crosses the 4 KB, memory address calculation is invalid.

AXI transfers shown in the table below are also supported. These AXI cycles will be translated into the necessary cycles on the memory side. For example, for optimal operation in case ARM cache is configured to 8 beat burst with wrap, a synchronous flash and cellular RAM memory should be configured in 16 word wrap burst mode when using a 16-bit data port, and in 8 word wrap burst mode when using a 32-bit data port. EIM uses BL bit field to support different memory configurations. The controller splits the transaction when needed in some cases. See [Table 22-8](#).

**Table 22-7. AXI Burst Cycles Supported**

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
1	1	INCR	Single transfer
1	2	INCR	Single transfer
1	4	INCR	Single transfer
2	4	WRAP	2-beat wrapping burst
4	4	WRAP	4-beat wrapping burst
8	4	WRAP	8-beat wrapping burst
16	4	WRAP	16-beat wrapping burst
2	4	INCR	2-beat incrementing burst

*Table continues on the next page...*

**Table 22-7. AXI Burst Cycles Supported (continued)**

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
3	4	INCR	3-beat incrementing burst
4	4	INCR	4-beat incrementing burst
5	4	INCR	5-beat incrementing burst
6	4	INCR	6-beat incrementing burst
7	4	INCR	7-beat incrementing burst
8	4	INCR	8-beat incrementing burst
9	4	INCR	9-beat incrementing burst
10	4	INCR	10-beat incrementing burst
11	4	INCR	11-beat incrementing burst
12	4	INCR	12-beat incrementing burst
13	4	INCR	13-beat incrementing burst
14	4	INCR	14-beat incrementing burst
15	4	INCR	15-beat incrementing burst
16	4	INCR	16-beat incrementing burst

**Table 22-8. AXI to Memory Burst Splits Number**

AXI Burst Type	Memory Burst Type Config.	# of accesses to X8 Memory Port size	# of accesses to X16 Memory Port size	# of accesses to X32 Memory Port size
INC16 Aligned Addr.	WRAP4	16	8	4
	Cont.	1	1	1
INC16 Unaligned Addr.	WRAP4	17	9	5
	Cont.	1	1	1

	Cont.	1	1	1
WRAP8 Unaligned Addr.	WRAP16	2 or 3	1	2
	Cont.	2	2	2

### 22.5.10 WAIT\_B Signal, RWSC and WWSC bit fields Usage

Most of the external devices supporting burst mode for write or read accesses provide a signal which indicates data is valid on the memory bus (a.k.a. handshake mode). For this mode, RFL and WFL bits should be cleared and RWSC/ WWSC bit fields indicate when the controller should start sampling this signal from the external device or, in other words, how many BCLK cycles should be masked.

For devices which do not use this signal or have a fixed latency ability, the RFL and WFL bits may be set for internal calculation regarding BCLK cycles penalty until data is valid (memory initial access time). For this mode, RWSC/ WWSC indicates when the data is ready for sampling by the controller (read access) or the external device (write access). There is separation between read and write accesses wait-state control. For read access, RWSC bit field is valid and WWSC bit field is ignored; for write access, WWSC is valid and RWSC is ignored.

### 22.5.11 IPS Register Interface

Access to the registers of the EIM, read or write, is made with IPS protocol signals. The system should avoid changing the registers while master/memory transaction is valid, as this can cause an unknown behavior of the controller.

Register access size is 32-bit as the register size definition, other size of access (byte or half word) is not supported.

### 22.5.12 MRS Set for PSRAM

Memory registers of PSRAM devices can be configured according to external signal, which indicates whether the access is to a memory array or memory register domain.

When the CRE bit is set, the following transactions to the external device will assert the CRE signal. The polarity of this signal is determined by the CREP bit for active low or active high assertion of the signal.

### 22.5.13 EIM Access Termination

EIM is monitoring the corresponding CSx control signal every time variable latency access or dtack access is performed toward the external device.

In variable latency accesses, the Watchdog Timer (WDOG-1) counts BCLK cycles. If it reaches the `wdog_limit` (according to the `WDOG_LIMIT` bit field in the WCR) before the device signals can drive/sample new data, the controller will terminate the access and generate an error response transfer toward the Master.

In `dtack` access, WDOG-1 counts ACLK cycles instead of BCLK and it reaches the `wdog_limit` before the device asserts the `dtack` signal, the controller will terminate the access and generate an error response transfer toward the Master.

WDOG-1 can be disabled by `WDOG_EN` bit in the WCR.

### 22.5.14 Error Conditions

The following conditions cause an error (AXI error or IPS error) response signal:

- AXI errors
  - Access to a disabled chip select - access to a mapped chip select address space where the `CSEN` bit in the corresponding chip select Configuration Register is clear
  - Access to a non mapped address - access to an address that is not mapped to any CS.
  - User access to a supervisor-protected chip select address space (the `SP` bit in the corresponding chip select Configuration Register is set)
  - User access in fixed mode access
  - User performs write access to write protected chip select
  - First write data ID and write address ID do not match. (No data is written to the memory.)
  - First Write Data ID and write address ID match but one or more of the other Write data IDs does not match the First Write data ID (data is written to memory according)
  - Access duration to external device from `CSx` signal assertion is 128/256/512/1024 cycles (access is terminated by the controller) - This error can be disabled by software.
- IPS errors
  - User read or write access to a reserved/non-valid address in the EIM Configuration Register

### 22.5.15 DTACK Mode

In `DTACK` mode, the EIM uses `DTACK` signal as an indication of when to end the access.

DTACK is an asynchronous edge/level sensitive signal. DTACK polarity is configurable by the DAP bit in CsxGCR2 (default value is 0).

In this case, EIM begins the access and after a few cycles (according DAPS field) and waits until DTACK (after synchronization) becomes asserted, then samples the data in read access and completes the current data access (see [Figure 22-15](#), [Figure 22-16](#) & [Figure 22-17](#)).

If more than one data is needed, CS will be negated between access (CSREC field is not zero) and the AXI burst access will be split into single accesses (see [Figure 22-19](#)).

### 22.5.16 RDY\_INT Signal as Interrupt

The EIM has an external interrupt support. When INTEN bit in the WCR is set, signal RDY\_INT is used as interrupt; its status is being reflected by INT bit and output signal.

It is cleared by writing one to the INT bit. When INTEN is cleared, the interrupt is disabled. This interrupt is a level interrupt and its polarity can be configured by the INTPOL bit in the WCR.

### 22.5.17 RDY\_INT Signal as Ready After Reset Indication

This feature is used for boot propose from external devices based on NANDFlash array memory with NORFlash interface.

When ERRST bit is set, RDY\_INT signal is monitored to determine ready after reset of the external device located on CS0.

The monitoring is taking place when CS0 is accessed for the first time. The access will be pending until assertion of the signal is detected. When detection occurs, ERRST bit is self-cleared and pending access is executed to the external device on CS0.

### 22.5.18 EIM\_GRANT / EIM\_BUSY Handshake Description

Prior to executing command to one of the external device (chip select), EIM assert EIM\_BUSY signal (1'b1) and checks the EIM\_GRANT signal status.

If EIM\_GRANT signal is high, it indicates external data bus is not used by other slaves (NAND Flash Controller) and EIM may start to execute the access. If EIM\_GRANT is low, EIM waits until it is set (1'b1) before executing the access.

EIM keeps EIM\_BUSY signal set until it completes the access toward the external device.

Once EIM\_GRANT signal is set, it can not be reset until EIM\_BUSY signal is cleared by EIM.

**NOTE**

In 16-bit Muxed EIM doesn't use the data bus, therefore there is no sharing of the data bus with NFC. EIM doesn't wait for EIM\_GRANT signal from NFC and doesn't assert the EIM\_BUSY signal.

**22.5.19 LPMD / LPACK Handshake Description**

These signals are used for frequency and/or voltage change, and for entering low power mode during normal operation of the EIM. Before any change can take place, the controller and all the relevant external devices should be in idle state, which means no access or data transfer is in process.

LPMD input signal is asserted once EIM detects the assertion of LPMD, all ready signals of the AXI channels are negated, and EIM is not sampling new accesses. It finishes all the ongoing accesses and already pending ones. When EIM is in idle state, the LPACK output signal is asserted. EIM will stay in idle state and the LPACK signal will stay asserted until the LPMD signal is negated.

**22.5.20 Endianness**

Big and Little endianness are supported by the controller according to the following table.

**Table 22-9. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0**

Endian mode	AXI access	AXI address [1:0]	Port size and used bits								
			Word port				Half word port		Byte port		
			[31:24]	[23:16]	[15:8]	[7:0]	External address [0]	[31:24] ([15:8])	[23:16] ([7:0])	External address [1:0]	[31:24] ([23:16]) ([15:8]) ([7:0])
Big	Word	0	0xB3	0xB2	0xB1	0xB0	0	0xB3	0xB2	0	0xB3
										1	0xB2
							1	0xB1	0xB0	2	0xB1
										3	0xB0

Table continues on the next page...

Table 22-9. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0 (continued)

Endian mode	AXI access	AXI address [1:0]	Port size and used bits									
			Word port				Half word port			Byte port		
			[31:24]	[23:16]	[15:8]	[7:0]	External address [0]	[31:24] ([15:8])	[23:16] ([7:0])	External address [1:0]	[31:24] ([23:16]) ([15:8]) ([7:0])

		3	0xB3					0xB3		3	0xB3	

## 22.5.21 Strobe Signal Use

The strobe signal is toggling according to address/data valid condition on the external bus for read and write accesses, and for both synchronous and asynchronous modes.

At any time point when address/data is valid on the external bus, the strobe signal will generate a positive edge, which can be used to sample the external data and control signal.

### NOTE

Strobe signal for read data is active (RL + 1) cycles after data on external bus is valid.

## 22.6 Initialization Information

### 22.6.1 Booting from EIM

EIM is ready to work with CS0 after the hardware reset, but it has been configured for very slow access (for boot purposes), with additional setup and hold time.

Other CSs are disabled by hardware reset. Therefore, all CSs must be properly initialized before use in writing values to the corresponding chip select configuration registers.

DSZ[1:0] and MUM fields are set according to EIM\_BOOT [2:0] block inputs.

## 22.7 Typical Application

Application note uses following functions to illustrate EIM and memory accesses:

- WR16(address, data) is a 16 bit write access
- WR32(address, data) is a 32 bit write access
- RD16(address, data) is a 16 bit read access
- RD32(address, data) is a 32 bit read access
- WR\_I(address, data, delta, counter) is a write data sequence, there  $data(i+1) = data(i) + delta$
- COMMAND\_SEQUENCE
- CHECK\_STATUS

### NOTE

COMMAND\_SEQUENCE and CHECK\_STATUS are described in [AMD Flash Utility](#), [Intel Sibley Flash Utility](#), [MDOC Device Utility](#), [Samsung OneNAND Utility](#), and [Spansion Flash Utility](#).

All addresses are byte addresses. "CS0" is a Chip Select 0 base address. "EIM\_" is a prefix of EIM's registers. 'h' is a prefix of hexadecimal constant. "///" is a comment beginning. csba[cs] is a dimension of CS base addresses. "addr" means an address offset in current CS address space. Examples use CS0 address space, but it may apply to any CS except for boot mode functionality.

Configuration examples were verified with the memory models listed below and may require some adjustments for other family members.

## 22.7.1 Access to Intel Sibley Flash

The following configurations are intended to Sibley family muxed and non-muxed devices.

### 22.7.1.1 Intel Sibley Flash Asynchronous Mode Configuration

- WR32('EIM\_CS0GCR1,'h00210081);
- WR32('EIM\_CS0RCR1,'h0e020000);
- WR32('EIM\_CS0RCR2,'h00000000);
- WR32('EIM\_CS0WCR1,'h0704a040);

### 22.7.1.2 Intel Sibley Flash Synchronous Mode Configuration

Configuration used for 133 MHz synchronous access to flash:

```
// Set memory to synchronous read mode
WR16('CS0+('h5903<<1), 'h0060);
WR16('CS0+('h5903<<1), 'h0003);
WR16('CS0+('h0000<<1), 'h00ff);
// Set EIM configuration to synchronous timing
WR32('EIM_CS0GCR1, 'h50214225);           // 133 MHz
WR32('EIM_CS0RCR1, 'h0c000000);         // 12 cycles on memory
```

Configuration used for 66 MHz synchronous access to muxed flash:

```
// Set memory to synchronous read mode
WR16('CS0+('h3103<<1), 'h0060);
WR16('CS0+('h3103<<1), 'h0003);
WR16('CS0+('h0000<<1), 'h00ff);
-----
// Set EIM configuration to synchronous timing
WR32('EIM_CS0GCR1, 'h5021122d);           // 66 MHz
WR32('EIM_CS0RCR1, 'h07000000);         // 7cycles on memory
```

### 22.7.1.3 Intel Sibley Flash Utility

```
// Single data word programming to addr
WR16('CS0+addr, 'h0060);           // Unlock
WR16('CS0+addr, 'h00d0);
WR16('CS0+addr, 'h0041);
WR16('CS0+addr, data);
WR16('CS0+caddr, 'h0070);           // Read Status command
while('CS0+data[7] == 0)           // Wait / Polling
    RD16('CS0+addr, data);         // Read status
RD16('CS0+addr, data);             // Read status
WR16('CS0+'h0000, 'h00ff);
// Write buffer programming
WR16('CS0+addr, 'h0060);           // Unlock
WR16('CS0+addr, 'h00d0);
data = 0;
```

## Typical Application

```
WR16('CS0+addr, 'h0070);           // Read Status command
while(data[7] == 0)                 // Wait
    RD16('CS0+addr, data);         // Read status
WR16('CS0+'h0000, 'h00ff);
WR16('CS0+addr, 'h00e9);           // Write Buffer command
WR16('CS0+addr, 255);              // Word counter (<256)
for(i=0; i<'h200; i = i + 'h40)
    WR_I('CS0+addr+i, data+((i>2)*'h0010_0001), 'h0010_0001, 16); // Data
WR16('CS0+addr, 'h00d0);           // Write Confirm command
data = 0;
while(data[7] == 0)                 // Wait
    RD16('CS0+addr, data);         // Read status
RD16('CS0+addr, data);             // Read status
WR16('CS0+'h0000, 'h00ff);
```

## 22.7.2 Access to MDOC Device

The following configurations are intended to MDOC H3 device.

### 22.7.2.1 MDOC Device Boot

To boot from the MDOC device the ERRST bit should be configured to 1, so that EIM will hold the first read access to CS0 until the MDOC asserts the RDY signal.

### 22.7.2.2 MDOC Device Asynchronous Mode Configuration

```
// Non-muxed mode
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0e121010);
WR32('EIM_CS0RCR2, 'h00000000);
WR32('EIM_CS0WCR1, 'h12092492);
// Muxed mode
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0e121010);
WR32('EIM_CS0RCR2, 'h00000000);
WR32('EIM_CS0WCR1, 'h12092492);
```

### 22.7.2.3 MDOC Device Utility

```
// Read Manufacturer ID and Device ID
RE16('CS0+'h9400, 'h4833);
RE16('CS0+'h9422, 'hb7cc);
```

## 22.7.3 Access to Micron PSRAM

The following configurations are intended to mt45w4mw16bfb\_706.

### 22.7.3.1 Micron PSRAM Asynchronous Mode Configuration

```
// 16 bit memory
WR32('EIM_CS0GCR1,'h403104b1);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h0b040040);
// 32 bit memory
WR32('EIM_CS0GCR1,'h403304b1);
WR32('EIM_CS0RCR1,'h0f010000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h0f040040);
```

### 22.7.3.2 Micron PSRAM Synchronous Mode Configuration

```
// 16 bit memory
WR32('EIM_CS0GCR1,'h403104b1);
WR32('EIM_CS0WCR1,'h0b040000);
WR16('CS0+('h85947<<1),'h0040); // memory configuration
WR32('EIM_CS0GCR1,'h4021_5487); // fixed latency memory wrap 4
WR32('EIM_CS0RCR1,'h04000000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h04000000);
// 32 bit memory
WR32('EIM_CS0GCR1,'h6003_04f1);
WR32('EIM_CS0WCR1,'h0b04_0000);
WR32('CS0+('h85947<<2),'h0040); // memory configuration
WR32('EIM_CS0GCR1,'h4003_1487); // var latency memory inc. page size 128
WR32('EIM_CS0RCR1,'h04000000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h04000000);
```

## 22.7.4 Access to Samsung OneNAND

Mentioned below are the configurations intended for Samsung OneNAND muxed and non-muxed devices.

### 22.7.4.1 Samsung OneNAND Boot

There are two ways to boot from Samsung OneNAND. In the first way, the ERRST bit is set to 0 and the user has to poll the interrupt status in the OneNAND interrupt register (or set interrupt handler there). In the second way, the ERRST bit is set to 1 and the user should enable the device interrupt output before the first read from CS0 access is issued.

Load sectors 2,3 to DataRAM, page 0 done in the next example:

- WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
- WR16('CS0+('hF100<<1),'h0); // block[8:0] address
- WR16('CS0+('hF107<<1),'h2); // sector[1:0] and page[7:2] addresses
- WR16('CS0+('hF200<<1),'h802); // buffer[11:8] address and counter[1:0]

## Typical Application

- WR16('CS0+('hF101<<1),'h0); // DDP choose
- WR16('CS0+('hF220<<1),'h0); // Set command

### 22.7.4.2 Samsung OneNAND Asynchronous Mode Configuration

```
// Non-muxed memory
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h0c092480);
// Muxed memory
WR32('EIM_CS0GCR1,'h00410089);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h0c092480);
```

### 22.7.4.3 Samsung OneNAND Synchronous Mode Configuration

Set memory and EIM to synchronous read mode is shown in the next example:

```
WR16('CS0+('hF221<<1),'hc0e0); // Synchronous read, 4 clk latency
WR32('EIM_CS0GCR1,'h50412405); // 44 MHz (non-muxed)
WR32('EIM_CS0RCR1,'h05010000);
```

The muxed Samsung OneNAND supports synchronous write, too:

```
// Set memory & EIM to synchronous read and write mode
WR16('CS0+('hF221<<1),'hc0f2); // Sync. read and write, 4 clk latency
WR32('EIM_CS0GCR1,'h5041240f); // 44 MHz
WR32('EIM_CS0RCR1,'h05010000);
WR32('EIM_CS0WCR1,'h05040000);
```

### 22.7.4.4 Samsung OneNAND Utility

The following utility algorithms are used on the Samsung OneNAND:

```
// Unlock Block command
WR16('CS0+('hF100<<1),'h0); // DFS
WR16('CS0+('hF100<<1),'h0); // DBS
WR16('CS0+('hF24c<<1),'h2); // SBA - block number (2)
WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
WR16('CS0+('hF220<<1),'h23); // Unlock command
data = 'h0;
while(!(data &'h0004)) // Polling
    RD32('WIAR, data); // Read status
// Erase block command
WR16('CS0+('hF100<<1),'h2); // DFS and block ([8:0]) address
WR16('CS0+('hF101<<1),'h0); // DBS
WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
WR16('CS0+('hF220<<1),'h94); // Erase command
data = 'h0;
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
// Program page command
WR16('CS0+('hF100<<1),'h2); // DFS and block[8:0] address
WR16('CS0+('hF107<<1),'h0); // sector[1:0] and page[7:2] addresses
```

```

WR16 ('CS0+('hF200<<1), 'h800);           // buffer[11:8] address and counter[1:0]
WR16 ('CS0+('hF241<<1), 'h0);           // Clear interrupt status
WR16 ('CS0+('hF220<<1), 'h80);           // Program command
data = 'h0;
while (!(data &'h0004))                   // Wait
    RD32 ('WIAR, data); // Read status

```

## 22.7.5 Access to Samsung UtRAM

Below mentioned configurations are intended for Samsung UtRAM.

### 22.7.5.1 Samsung UtRAM Asynchronous Mode Configuration

```

WR32 ('EIM_CS0GCR1, 'h400104b1);
WR32 ('EIM_CS0RCR1, 'h0a010000);
WR32 ('EIM_CS0RCR2, 'h00000008);
WR32 ('EIM_CS0WCR1, 'h0b040040);

```

### 22.7.5.2 Samsung UtRAM Synchronous Mode Configuration

```

RD16 ('CS0+('hff_ffff<<1), data);           // command sequence
RD16 ('CS0+('hff_ffff<<1), data);
RD16 ('CS0+('hff_ffff<<1), data);
RD16 ('CS0+('hff_feff<<1), data);
RD16 ('CS0+('h00_82a0<<1), data);           // memory sync. configuration
WR32 ('EIM_CS0GCR1, 'h4021_53b7);           // fixed latency memory wrap 32
WR32 ('EIM_CS0RCR1, 'h0500_0000);
WR32 ('EIM_CS0WCR1, 'h0300_0000);

```

## 22.7.6 Access to Spansion Flash

Below mentioned configurations are intended for Spansion Flash.

### 22.7.6.1 Spansion Flash Asynchronous Mode Configuration

```

WR32 ('EIM_CS0GCR1, 'h00410081);
WR32 ('EIM_CS0RCR1, 'h0a018000);
WR32 ('EIM_CS0RCR2, 'h00000000);
WR32 ('EIM_CS0WCR1, 'h0704a240);
WR16 ('CS0+('hF220<<1), 'h94);           // Erase command
data = 'h0;
while (!(data &'h0004))                   // Wait
    RD32 ('WIAR, data); // Read status
// Program page command
WR16 ('CS0+('hF100<<1), 'h2);           // DFS and block[8:0] address
WR16 ('CS0+('hF107<<1), 'h0);           // sector[1:0] and page[7:2] addresses
WR16 ('CS0+('hF200<<1), 'h800);           // buffer[11:8] address and counter[1:0]
WR16 ('CS0+('hF241<<1), 'h0);           // Clear interrupt status
WR16 ('CS0+('hF220<<1), 'h80);           // Program command
data = 'h0;

```

## Typical Application

```
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
```

### 22.7.6.2 Spansion Flash Synchronous Mode Configuration

```
WR16('CS0+('h0555<<1),'h00aa); // command sequence
WR16('CS0+('h02aa<<1),'h0055);
WR16('CS0+('h0555<<1),'hd0);
WR16('CS0+('h0000<<1),'hle4); // memory sync. configuration
WR32('EIM_CS0GCR1,'h50411325); // 66 MHz
WR32('EIM_CS0RCR1,'h05000000); // 5 cycles on memory
```

### 22.7.6.3 Spansion Flash Utility

```
// Single word programming
COMMAND_SEQUENCE(cs,16,'ha0); // single word programming
WR16('CS0+addr, data);
CHECK_STATUS('CS0+addr,data,16,1,errst);
// Write buffer programming
COMMAND_SEQUENCE(0,16,'h25); // write buffer programming
WR16('CS0+addr,'h001f); // counter-1
WR_I('CS0+addr, data, 'h0010_0001, 16); // data
WR16('CS0+addr,'h0029); // write buffer to flash
CHECK_STATUS('CS0+addr+'h3e,data[31:16]+'h00f0,16,1,errst);
```

There `COMMAND_SEQUENCE` and `CHECK_STATUS` are next functions:

```
task COMMAND_SEQUENCE;
    input [2:0] cs;
    input [7:0] port_size;
    input [31:0] code;
begin
    if(port_size == 16)
        begin
            WR16(csba[cs]+('h0555<<1),'h00aa);
            WR16(csba[cs]+('h02aa<<1),'h0055);
            WR16(csba[cs]+('h0555<<1),code);
        end
    else
        begin
            WR32(csba[cs]+('h0555<<2),'h00aa);
            WR32(csba[cs]+('h02aa<<2),'h0055);
            WR32(csba[cs]+('h0555<<2),code);
        end
end
endtask
task CHECK_STATUS;
    input [31:0] addr;
    input [31:0] edata;
    input [7:0] port_size;
    input [7:0] opcode;
    output [7:0] errst;
    reg [31:0] data;
    reg [31:0] data3;
begin
    errst = 0;
    data = 0;
    data3 = 0;
while(!(data == edata) && !errst) // Wait operation
begin: BR_EN
    RD16(addr, data); // Read status
    if(data[7] != edata[7])
```

```

begin
  if(data[5] == 1)
    begin
      RD16(addr, data3);
      RD16(addr, data);
      if(data[6] != data3[6])
        begin
          $display("CHECK_STATUS: Error timeout on single data program");
          errst = 1;
          disable BR_EN;
        end
      end
    end
  else
    begin
      if(opcode == 2)
        if(data[1] == 1)
          begin
            RD16(addr, data3);
            if(port_size == 32)
              RD32(addr, data);
            else
              RD16(addr, data);
            if(data[1] == 1 && data != edata)
              begin
                $display("CHECK_STATUS: Error on write buffer");
                errst =3;
                disable BR_EN;
              end
            end
          end
        end
      end
    end
  else
    begin
      RD16(addr, data3);
      if(port_size == 32)
        RD32(addr, data);
      else
        begin
          RD16(addr, data);
          edata[31:16] = 16'h0;
        end
      end
      if(data != edata)
        begin
          $display("CHECK_STATUS: Error in data write on single data program");
          errst =2;
          disable BR_EN;
        end
      end
    end
  end
end
endtask

```

## 22.7.7 8 bit support

This section details the pin connections for Intel mode and Motorola mode.

Intel Mode - For intel mode use the following connection:

**Table 22-10. Intel Mode pin connections**

ARM platform Pin	EIM Pin	Notes
ADS#	IPP_DO_ADV_B	WAL = 1,RAL = 1

*Table continues on the next page...*

**Table 22-10. Intel Mode pin connections (continued)**

ARM platform Pin	EIM Pin	Notes
W/R	IPP_DO_BE_B	WBED = 1
WR#	WE#	
RD#	OE#	

Mot. Mode - For intel mode use the following connection:

**Table 22-11. Motorola Mode pin connections**

ARM platform Pin	EIM Pin	Notes
AS#	IPP_DO_CS_B	
R/W#	WE#	
LDS#	BE#	

## 22.8 External Bus Timing Diagrams

The following timing diagrams show the timing of accesses to memory or a peripheral with different timing parameters. All examples done for CS0, but are valid for any others chip select. BE means one from current used BE[3:0].

## 22.8.1 Asynchronous Read Memory Accesses Timing Diagram

## 22.9 EIM Memory Map/Register Definition

The EIM includes 33 user-accessible 32-bit registers. The the EIM Configuration Register (EIM\_WCR) contains control bits that configure the EIM for certain operation modes.

The 160 bits used to control Individual Chip Select are divided into five registers:

- Chip Select n General Configuration Register 1 (EIM\_CSnGCR1)
- Chip Select n General Configuration Register 2 (EIM\_CSnGCR2)
- Chip Select n Read Configuration Register 1 (EIM\_CSnRCR1)
- Chip Select n Read Configuration Register 2 (EIM\_CSnRCR2)
- Chip Select n Write Configuration Register (EIM\_CSnWCR)

In addition there are 3 general registers: EIM\_WCR, EIM\_WIAR & EIM\_EAR.

**NOTE**

- All EIM registers are sampled by IPG\_CLK\_S, therefore IPG\_CLK\_S must be active when accessing through IP bus.
- Read access from all registers (except EIM\_WIAR & EIM\_EAR) will generate one IPG\_XFR\_WAIT cycle.
- Read access from EIM\_WIAR & EIM\_EAR will generate six IPG\_XFR\_WAIT cycles.
- Write access to all registers (except EIM\_EAR) will generate three IPG\_XFR\_WAIT cycles.
- Write access to EIM\_EAR will generate six IPG\_XFR\_WAIT cycles.

**EIM memory map**

### EIM\_CSnGCR1 field descriptions

Field	Description
31–28 PSZ	<p>Page Size. This bit field indicates memory page size in words (word is defined by the DSZ field). PSZ is used when fix latency mode is applied, WFL=1 for sync. write accesses, RFL=1 for sync. Read accesses. When working in fix latency mode WAIT signal from the external device is not being monitored, PSZ is used to determine if page boundary is reached and renewal of access is preformed. This bit field is ignored when sync. Mode is disabled or fix latency mode is not being used for write or read access separately.</p> <p>It can be valid for both access type, read or write, or only for one type, according to configuration. PSZ is cleared by a hardware reset.</p> <p>0000 8 words page size                      0001 16 words page size                      0010 32 words page size                      0011 64 words page size                      0100 128 words page size                      0101 256 words page size                      0110 512 words page size                      0111 1024 (1k) words page size                      1000 2048 (2k) words page size                      1001 - 1111 Reserved</p>
27 WP	<p>Write Protect. This bit prevents writes to the address range defined by the corresponding chip select. WP is cleared by a hardware reset.</p> <p>0 Writes are allowed in the memory range defined by chip.                      1 Writes are prohibited. All attempts to write to an address mapped by this chip select result in a error response and no assertion of the chip select output.</p>
26–24 GBC	<p>Gap Between Chip Selects. This bit field, according to the settings shown below, determines the minimum time between end of access to the current chip select and start of access to different chip select. GBC is cleared by a hardware reset.</p>

Table continues on the next page...

EIM\_CS $n$ GCR1 field descriptions (continued)

Field	Description
	<p>Example settings:</p> <p>000 minimum of 0 EIM clock cycles before next access from different chip select (async. mode only)</p> <p>001 minimum of 1 EIM clock cycles before next access from different chip select</p> <p>010 minimum of 2 EIM clock cycles before next access from different chip select</p> <p>111 minimum of 7 EIM clock cycles before next access from different chip select</p>
23 AUS	<p>Address UnShifted. This bit indicates an unshifted mode for address assertion for the relevant chip select accesses. AUS bit is cleared by hardware reset.</p> <p>0 Address shifted according to port size (DSZ config.)</p> <p>1 Address unshifted</p>
22–20 CSREC	<p>CS Recovery. This bit field, according to the settings shown below, determines the minimum pulse width of CS, OE, and WE control signals before executing a new back to back access to the same chip select. CSREC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0GCR1, CSREC[2:0] is 0b110. For EIM_CS1GCR1 - EIM_CS5GCR, the reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles minimum width of CS, OE and WE signals (read async. mode only)</p> <p>001 1 EIM clock cycles minimum width of CS, OE and WE signals</p> <p>010 2 EIM clock cycles minimum width of CS, OE and WE signals</p> <p>111 7 EIM clock cycles minimum width of CS, OE and WE signals</p>
19 SP	<p>Supervisor Protect. This bit prevents accesses to the address range defined by the corresponding chip select when the access is attempted in the User mode. SP is cleared by a hardware reset.</p> <p>0 User mode accesses are allowed in the memory range defined by chip select.</p> <p>1 User mode accesses are prohibited. All attempts to access an address mapped by this chip select in User mode results in an error response and no assertion of the chip select output.</p>
18–16 DSZ	<p>Data Port Size. This bit field defines the width of an external device's data port as shown below.</p> <p><b>NOTE:</b> Only async. access supported for 8 bit port.</p> <p><b>NOTE:</b> The reset value for EIM_CS0GCR1, DSZ[2] = 0, DSZ[1:0] = EIM_BOOT[1:0]. For EIM_CS1GCR1 - EIM_CS5GCR1, the reset value is 0b001.</p> <p>000 Reserved.</p> <p>001 16 bit port resides on DATA[15:0]</p> <p>010 16 bit port resides on DATA[31:16]</p> <p>011 32 bit port resides on DATA[31:0]</p> <p>100 8 bit port resides on DATA[7:0]</p> <p>101 8 bit port resides on DATA[15:8]</p> <p>110 8 bit port resides on DATA[23:16]</p> <p>111 8 bit port resides on DATA[31:24]</p>
15–14 BCS	<p>Burst Clock Start. When SRD=1 or SWR=1, this bit field determines the number of EIM clock cycles delay from start of access before the first rising edge of BCLK is generated.</p> <p>When BCD=0 value of BCS=0 results in a half clock delay after the start of access. For other values of BCD a one clock delay after the start of access is applied, not an immediate assertion. BCS is cleared by a hardware reset.</p> <p>00 0 EIM clock cycle additional delay</p>

Table continues on the next page...

EIM\_CS $n$ GCR1 field descriptions (continued)

Field	Description
	01 1 EIM clock cycle additional delay 10 2 EIM clock cycle additional delay 11 3 EIM clock cycle additional delay
13–12 BCD	Burst Clock Divisor. This bit field contains the value used to program the burst clock divisor for BCLK generation. It is used to divide the internal EIMbus frequency. BCD is cleared by a hardware reset.  <b>NOTE:</b> For other than the mentioned below frequency such as 104 MHz, EIM clock (input clock) should be adjust accordingly.  00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
11 WC	Write Continuous. The WI bit indicates that write access to the memory are always continuous accesses regardless of the BL field value. WI is cleared by hardware reset.  0 Write access burst length occurs according to BL value. 1 Write access burst length is continuous.
10–8 BL	Burst Length. The BL bit field indicates memory burst length in words (word is defined by the DSZ field) and should be properly initialized for mixed wrap/increment accesses support. Continuous BL value corresponds to continuous burst length setting of the external memory device. For fix memory burst size, type is always wrap. In case not matching wrap boundaries in both the memory (BL field) and Master access on the current address, EIM update address on the external device address bus and regenerates the access.  BL is cleared by a hardware reset.  When APR=1, Page Read Mode is applied, BL determine the number of words within the read page burst. BL is cleared by a hardware reset for EIM_CS0GCR1 - EIM_CS5GCR1.  000 4 words Memory wrap burst length (read page burst size when APR = 1) 001 8 words Memory wrap burst length (read page burst size when APR = 1) 010 16 words Memory wrap burst length (read page burst size when APR = 1) 011 32 words Memory wrap burst length (read page burst size when APR = 1) 100 Continuous burst length (2 words read page burst size when APR = 1) 101 Reserved 110 Reserved 111 Reserved
7 CREP	Configuration Register Enable Polarity. This bit indicates CRE memory pin assertion state, active-low or active-high, while executing a memory register set command to the external device (PSRAM memory type). CREP is set by a hardware reset.  <b>NOTE:</b> Whenever PSRAM is connected the CREP value must be correct also for accesses where CRE is disabled.  For Non-PSRAM memory CREP value should be 1.  0 CRE signal is active low 1 CRE signal is active high
6 CRE	Configuration Register Enable. This bit indicates CRE memory pin state while executing a memory register set command to PSRAM external device. CRE is cleared by a hardware reset.

Table continues on the next page...

EIM\_CS*n*GCR1 field descriptions (continued)

Field	Description
	0 CRE signal use is disable 1 CRE signal use is enable
5 RFL	Read Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start sampling data according to RWSC field, it only valid in synchronous mode. RFL is cleared by a hardware reset.  When RFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device.  0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only)
4 WFL	Write Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start data transfer according to WWSC field, it only valid in synchronous mode. WFL is cleared by a hardware reset.  When WFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device  0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only)
3 MUM	Multiplexed Mode. This bit determines the address/data multiplexed mode for asynchronous and synchronous accesses for 8 bit, 16 bit or 32 bit devices (DSZ config. dependent).  <b>NOTE:</b> The reset value for EIM_CS0GCR1[MUM] = EIM_BOOT[2]. For EIM_CS1GCR1 - EIM_CS5GCR1 the reset value is 0.  0 Multiplexed Mode disable 1 Multiplexed Mode enable
2 SRD	Synchronous Read Data. This bit field determine the read accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SRD is cleared by a hardware reset.  <b>NOTE:</b> Sync. accesses supported only for 16/32 bit port.  0 read accesses are in Asynchronous mode 1 read accesses are in Synchronous mode
1 SWR	Synchronous Write Data. This bit field determine the write accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SWR is cleared by a hardware reset.  <b>NOTE:</b> Sync. accesses supported only for 16/32 bit port.  0 write accesses are in Asynchronous mode 1 write accesses are in Synchronous mode
0 CSEN	CS Enable. This bit controls the operation of the chip select pin. CSEN is set by a hardware reset for CSGCR0 to allow external boot operation. CSEN is cleared by a hardware reset to CSGCR1-CSGCR5.  <b>NOTE:</b> Reset value for EIM_CS0GCR1 for CSEN is 1. For EIM_CS1GCR1-CS1GCR5 reset value is 0.  0 Chip select function is disabled; attempts to access an address mapped by this chip select results in an error respond and no assertion of the chip select output 1 Chip select is enabled, and is asserted when presented with a valid access.

## 22.9.2 Chip Select n General Configuration Register 2 (EIM\_CSnGCR2)

Address: 21B\_8000h base + 4h offset + (24d × i), where i=0d to 3d

### EIM\_CSnGCR2 field descriptions

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12 MUX16_BYP_ GRANT	Muxed 16 bypass grant. This bit when asserted causes EIM to bypass the grant/ack. arbitration with NFC (only for 16 bit muxed mode accesses). 0 EIM waits for grant before driving a 16 bit muxed mode access to the memory. 1 EIM ignores the grant signal and immediately drives a 16 bit muxed mode access to the memory.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9 DAP	Data Acknowledge Polarity. This bit indicates DTACK memory pin assertion state, active-low or active-high, while executing an async access using DTACK signal from the external device. DAP is cleared by a hardware reset. 0 DTACK signal is active high 1 DTACK signal is active low
8 DAE	Data Acknowledge Enable. This bit indicates external device is using DTACK pin as strobe/terminator of an async. access. DTACK signal may be used only in asynchronous single read (APR=0) or write accesses. DTACK poling start point is set by DAPS bit field. polarity of DTACK is set by DAP bit field. DAE is cleared by a hardware reset. 0 DTACK signal use is disable 1 DTACK signal use is enable
7–4 DAPS	Data Acknowledge Poling Start. This bit field determine the starting point of DTACK input signal polling. DAPS is used only in asynchronous single read or write accesses.

Table continues on the next page...

EIM\_CS $n$ GCR2 field descriptions (continued)

Field	Description
	<p><b>NOTE:</b> Since DTACK is an async. signal the start point of DTACK signal polling is at least 3 cycles after the start of access.</p> <p>DAPS is cleared by a hardware reset.</p> <p>Example settings:</p> <p>0000 3 EIM clk cycle between start of access and first <math>\overline{DTACK}</math> check</p> <p>0001 4 EIM clk cycles between start of access and first <math>\overline{DTACK}</math> check</p> <p>0010 5 EIM clk cycles between start of access and first <math>\overline{DTACK}</math> check</p> <p>0111 10 EIM clk cycles between start of access and first <math>\overline{DTACK}</math> check</p> <p>1011 14 EIM clk cycles between start of access and first DTACK check</p> <p>1111 18 EIM clk cycles between start of access and first DTACK check</p>
3–2 Reserved	This read-only field is reserved and always has the value 0.
ADH	<p>Address hold time - This bit field determine the address hold time after ADV negation when mum = 1 (muxed mode).</p> <p>When mum = 0 this bit has no effect. For read accesses the field determines when the pads direction will be switched.</p> <p><b>NOTE:</b> Reset value for EIM_CS0GCR2 for ADH is 0b10. For EIM_CS1GCR2-EIM_CS5GCR2 reset value is 0b00.</p> <p>00 0 cycle after ADV negation</p> <p>01 1 cycle after ADV negation</p> <p>10 2 cycle after ADV negation</p> <p>11 Reserved</p>

### 22.9.3 Chip Select n Read Configuration Register 1 (EIM\_CS $n$ RCR1)

Address: 21B\_8000h base + 8h offset + (24d × i), where i=0d to 3d

EIM\_CS $n$ RCR1 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

EIM\_CS $n$ RRCR1 field descriptions (continued)

Field	Description
29–24 RWSC	<p>Read Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous read access to the external device connected to the chip select.</p> <p>When SRD=1 and RFL=0, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the controller can start sample data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SRD=1 and RFL=1, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SRD=0, RFL bit is ignored, RWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>RWSC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0RRCR1, RWSC[5:0] = 0b011100. For CG1RRCR1 - CS1RRCR5 the reset value is 0b000000.</p> <p>Example settings:</p> <p>000000 Reserved  000001 RWSC value is 1  000010 RWSC value is 2  111101 RWSC value is 61  111110 RWSC value is 62  111111 RWSC value is 63</p>
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 RADVA	<p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous read modes according to the settings shown below. RADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and ADV assertion  001 1 EIM clock cycles between beginning of access and ADV assertion  010 2 EIM clock cycles between beginning of access and ADV assertion  111 7 EIM clock cycles between beginning of access and ADV assertion</p>
19 RAL	Read ADV Low. This bit field determine ADV signal negation time. When RAL=1, RADVN bit field is ignored and ADV signal will stay asserted until end of access. When RAL=0 negation of ADV signal is according to RADVN bit field configuration.
18–16 RADVN	<p>ADV Negation. This bit field determines when ADV signal to memory is negated during read accesses.</p> <p>When SRD=1 (synchronous read mode), ADV negation occurs according to the following formula: (RADVN + RADVA + BCD + BCS + 1) EIM clock cycles from start of access.</p> <p>When asynchronous read mode is applied (SRD=0) and RAL=0 ADV negation occurs according to the following formula: (RADVN + RADVA + 1) EIM clock cycles from start of access. RADVN is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0RRCR1[RADVN] = 0b010. For EIM_CS1RRCR1 - EIM_CS5RRCR1, the reset value is 0b000.</p> <p><b>NOTE:</b> This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time with the end of access user should RAL bit.</p>

Table continues on the next page...

EIM\_CS*n*RRCR1 field descriptions (continued)

Field	Description
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 OEA	<p>OE Assertion. This bit field determines when OE signal are asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. OEA is cleared by a hardware reset.</p> <p>In muxed mode OE assertion occurs (OEA + RADVN + RADVA + ADH + 1) EIM clock cycles from start of access.</p> <p><b>NOTE:</b> The reset value for EIM_CS0RRCR1[OEA] is 0b000 if EIM_BOOT[2] = 0. If EIM_BOOT[2] is 1, the reset value for EIM_CS0RRCR1[OEA] is 0b010. The reset value of this field for EIM_CS1RRCR1 - EIM_CS5RRCR1 is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and OE assertion  001 1 EIM clock cycles between beginning of access and OE assertion  010 2 EIM clock cycles between beginning of access and OE assertion  111 7 EIM clock cycles between beginning of access and OE assertion</p>
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 OEN	<p>OE Negation. This bit field determines when OE signal is negated during read cycles in asynchronous single mode only (SRD=0 &amp; APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. OEN is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and OE negation  001 1 EIM clock cycles between end of access and OE negation  010 2 EIM clock cycles between end of access and OE negation  111 7 EIM clock cycles between end of access and OE negation</p>
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RCSA	<p>Read CS Assertion. This bit field determines when CS signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RCSA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of read access and CS assertion  001 1 EIM clock cycles between beginning of read access and CS assertion  010 2 EIM clock cycles between beginning of read access and CS assertion  111 7 EIM clock cycles between beginning of read access and CS assertion</p>
3 Reserved	This read-only field is reserved and always has the value 0.
RCSN	<p>Read CS Negation. This bit field determines when CS signal is negated during read cycles in asynchronous single mode only (SRD=0 &amp; APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. RCSN is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of read access and CS negation  001 1 EIM clock cycles between end of read access and CS negation  010 2 EIM clock cycles between end of read access and CS negation  111 7 EIM clock cycles between end of read access and CS negation</p>

## 22.9.4 Chip Select n Read Configuration Register 2 (EIM\_CS*n*RCR2)

Address: 21B\_8000h base + Ch offset + (24d × i), where i=0d to 3d

### EIM\_CS*n*RCR2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 APR	Asynchronous Page Read. This bit field determine the asynchronous read mode to the external device. When APR=0, the async. read access is done as single word (where word is defined by the DSZ field). when APR=1, the async. read access executed as page read. page size is according to BL field config., RCSN,RBEN,OEN and RADVN are being ignored.  APR is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1.  <b>NOTE:</b> SRD=0 and MUM=0 must apply when APR=1
14–12 PAT	Page Access Time. This bit field is used in Asynchronous Page Read mode only (APR=1). the initial access is set by RWSC as in regular asynchronous mode. the consecutive address assertions width determine by PAT field according to the settings shown below. when APR=0 this field is ignored.  PAT is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1.  000 Address width is 2 EIM clock cycles 001 Address width is 3 EIM clock cycles 010 Address width is 4 EIM clock cycles 011 Address width is 5 EIM clock cycles 100 Address width is 6 EIM clock cycles 101 Address width is 7 EIM clock cycles 110 Address width is 8 EIM clock cycles 111 Address width is 9 EIM clock cycles
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 RL	Read Latency. This bit field indicates cycle latency when executing a synchronous read operation. The fields holds the feedback clock loop delay in aclk cycle units.  This field is cleared by a hardware reset.  00 Feedback clock loop delay is up to 1 cycle for BCD = 0 or 1.5 cycles for BCD != 0 01 Feedback clock loop delay is up to 2 cycles for BCD = 0 or 2.5 cycles for BCD != 0

Table continues on the next page...

EIM\_CS $n$ R $C$ R2 field descriptions (continued)

Field	Description
	10 Feedback clock loop delay is up to 3 cycles for BCD = 0 or 3.5 cycles for BCD != 0 11 Feedback clock loop delay is up to 4 cycles for BCD = 0 or 4.5 cycles for BCD != 0
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RBEA	Read BE Assertion. This bit field determines when BE signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RBEA is cleared by a hardware reset.  Example settings:  000 0 EIM clock cycles between beginning of read access and BE assertion 001 1 EIM clock cycles between beginning of read access and BE assertion 010 2 EIM clock cycles between beginning of read access and BE assertion 111 7 EIM clock cycles between beginning of read access and BE assertion
3 RBE	Read BE enable. This bit field determines if BE will be asserted during read access.  0 BE are disabled during read access. 1 BE are enable during read access according to value of RBEA & RBEN bit fields.
RBEN	Read BE Negation. This bit field determines when BE signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR=0), according to the settings shown below. This bit field is ignored when SRD=1. RBEN is cleared by a hardware reset.  Example settings:  000 0 EIM clock cycles between end of read access and BE negation 001 1 EIM clock cycles between end of read access and BE negation 010 2 EIM clock cycles between end of read access and BE negation 111 7 EIM clock cycles between end of read access and BE negation

## 22.9.5 Chip Select $n$ Write Configuration Register 1 (EIM\_CS $n$ WCR1)

Address: 21B\_8000h base + 10h offset + (24d  $\times$  i), where i=0d to 3d

EIM\_CS<sub>n</sub>WCR1 field descriptions

Field	Description
31 WAL	Write ADV Low. This bit field determine ADV signal negation time in write accesses. When WAL=1, WADV <sub>N</sub> bit field is ignored and ADV signal will stay asserted until end of access. When WAL=0 negation of ADV signal is according to WADV <sub>N</sub> bit field configuration.
30 WBED	Write Byte Enable Disable. When asserted this bit prevent from IPP_DO_BE_B[x] to be asserted during write accesses. This bit is cleared by hardware reset.
29–24 WWSC	<p>Write Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous write access to the external device connected to the chip select.</p> <p>When SWR=1 and WFL=0, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the memory can sample the first data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SWR=1 and WFL=1, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SWR=0, WFL bit is ignored, WWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>WWSC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0WCR1, WWSC[5:0] = 0b011100. For EIM_CS1WCR1 - EIM_CS5WCR1, the reset value of this field is 0b000000.</p> <p>Example settings:</p> <p>000000 Reserved  000001 WWSC value is 1  000010 WWSC value is 2  000011 WWSC value is 3  111111 WWSC value is 63</p>
23–21 WADVA	<p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous write modes according to the settings shown below. WADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and ADV assertion  001 1 EIM clock cycles between beginning of access and ADV assertion  010 2 EIM clock cycles between beginning of access and ADV assertion  111 7 EIM clock cycles between beginning of access and ADV assertion</p>
20–18 WADV <sub>N</sub>	<p>ADV Negation. This bit field determines when ADV signal to memory is negated during write accesses.</p> <p>When SWR=1 (synchronous write mode), ADV negation occurs according to the following formula: (WADV<sub>N</sub> + WADVA + BCD + BCS + 1) EIM clock cycles.</p> <p>When asynchronous read mode is applied (SWR=0) ADV negation occurs according to the following formula: (WADV<sub>N</sub> + WADVA + 1) EIM clock cycles.</p> <p><b>NOTE:</b> Reset value for EIM_CS0WCR for WADV<sub>N</sub> is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000.</p> <p><b>NOTE:</b> This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time as the end of access, S/W should set the WAL bit.</p>
17–15 WBEA	BE Assertion. This bit field determines when BE signal is asserted during write cycles in async. mode only (SWR=0), according to the settings shown below. BEA is cleared by a hardware reset.

Table continues on the next page...

EIM\_CS $n$ WCR1 field descriptions (continued)

Field	Description
	<p><b>NOTE:</b> Reset value for EIM_CS0WCR for WBEA is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and BE assertion  001 1 EIM clock cycles between beginning of access and BE assertion  010 2 EIM clock cycles between beginning of access and BE assertion  111 7 EIM clock cycles between beginning of access and BE assertion</p>
14–12 WBEN	<p>BE[3:0] Negation. This bit field determines when BE[3:0] bus signal is negated during write cycles in async. mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. BEN is cleared by a hardware reset.</p> <p><b>NOTE:</b> Reset value for EIM_CS0WCR for WBEN is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and WE negation  001 1 EIM clock cycles between end of access and WE negation  010 2 EIM clock cycles between end of access and WE negation  111 7 EIM clock cycles between end of access and WE negation</p>
11–9 WEA	<p>WE Assertion. This bit field determines when WE signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. This bit field is ignored when executing a read access to the external device. WEA is cleared by a hardware reset.</p> <p><b>NOTE:</b> Reset value for EIM_CS0WCR for WEA is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and WE assertion  001 1 EIM clock cycles between beginning of access and WE assertion  010 2 EIM clock cycles between beginning of access and WE assertion  111 7 EIM clock cycles between beginning of access and WE assertion</p>
8–6 WEN	<p>WE Negation. This bit field determines when WE signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WEN is cleared by a hardware reset.</p> <p><b>NOTE:</b> Reset value for EIM_CS0WCR for WEN is 0b010. For EIM_CS1WCR - EIM_CS5WCR reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and WE assertion  001 1 EIM clock cycles between beginning of access and WE assertion  010 2 EIM clock cycles between beginning of access and WE assertion  111 7 EIM clock cycles between beginning of access and WE assertion</p>
5–3 WCSA	<p>Write CS Assertion. This bit field determines when CS signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. this bit field is ignored when executing a read access to the external device. WCSA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of write access and CS assertion</p>

**EIM\_CS<sub>n</sub>WCR1 field descriptions (continued)**

Field	Description
	001 1 EIM clock cycles between beginning of write access and CS assertion 010 2 EIM clock cycles between beginning of write access and CS assertion 111 7 EIMclock cycles between beginning of write access and CS assertion
WCSN	Write CS Negation. This bit field determines when CS signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WCSN is cleared by a hardware reset.  Example settings:  000 0 EIM clock cycles between end of read access and CS negation 001 1 EIM clock cycles between end of read access and CS negation 010 2 EIM clock cycles between end of read access and CS negation 111 7 EIM clock cycles between end of read access and CS negation

**22.9.6 Chip Select n Write Configuration Register 2 (EIM\_CS<sub>n</sub>WCR2)**

Address: 21B\_8000h base + 14h offset + (24d × i), where i=0d to 3d

**EIM\_CS<sub>n</sub>WCR2 field descriptions**

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 WBCDD	Write Burst Clock Divisor Decrement. If this bit is asserted and BCD value is 0 sync. write access will be preformed as if BCD value is 1. When this bit is negated or BCD value is not 0 this bit has no affect.  This bit is cleared by hardware reset.

## 22.9.7 EIM Configuration Register (EIM\_WCR)

Address: 21B\_8000h base + 90h offset = 21B\_8090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W	[Reserved]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Hardware Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0				FRUN_ACLK_EN	WDOG_LIMIT	WDOG_EN	0		INTPOL	INTEN	CONT_BCLK_SEL	GBCD	BCM		
W	[Reserved]							[Reserved]								
Reset	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
Hardware Reset	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

### EIM\_WCR field descriptions

Field	Description
31–12 Reserved	Reserved This read-only field is reserved and always has the value 0.
11 FRUN_ACLK_EN	Free run ACLK enable
10–9 WDOG_LIMIT	Memory Watchdog (WDOG) cycle limit. This bit field determines the number of BCLK cycles (ACLK cycles in dtack mode) before the WDOG counter terminates the access and send an error response to the master.  00 128 BCLK cycles 01 256 BCLK cycles 10 512 BCLK cycles 11 1024 BCLK cycles
8 WDOG_EN	Memory WDOG enable. This bit controls the operation of the wdog counter that terminates the EIM access.  0 Memory WDOG is Disabled 1 Memory WDOG is Enabled

Table continues on the next page...

## EIM\_WCR field descriptions (continued)

Field	Description
7–6 Reserved	This read-only field is reserved and always has the value 0.
5 INTPOL	Interrupt Polarity. This bit field determines the polarity of the external device interrupt. 0 External interrupt polarity is active low 1 External interrupt polarity is active high
4 INTEN	Interrupt Enable. When this bit is set the External signal RDY_INT as active interrupt. When interrupt occurs, INT bit at the WCR will be set and t EIM_EXT_INT signal will be asserted correspondingly. This bit is cleared by a hardware reset. 0 External interrupt Disable 1 External interrupt Enable
3 CONT_BCLK_ SEL	Continuous BCLK select When this bit is set BCLK pin output continuous clock. Otherwise, BCLK will output clock only when nesserary. 0 BCLK When nesserary 1 BCLK Continuous
2–1 GBCD	General Burst Clock Divisor. When BCM bit is set, this bit field contains the value used to program the burst clock divisor for Continuous BCLK generation. The other BCD bit fields for each chip select are ignored. It is used to divide the internal AXI bus frequency. When BCM=0 GBCD bit field has no influence. GBCD is cleared by a hardware reset. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
0 BCM	Burst Clock Mode. This bit selects the burst clock mode of operation. It is used for system debug mode. BCM is cleared by a hardware reset. <b>NOTE:</b> The BCLK frequency in this mode is according to GBCD bit field. <b>NOTE:</b> The BCLK phase is opposite to the EIM clock in this mode if GBCD is 0. <b>NOTE:</b> This bit should be used only in async. accesses. No sync access can be executed if this bit is set. <b>NOTE:</b> When this bit is set bcd field shouldn't be configured to 0. 0 The burst clock runs only when accessing a chip select range with the SWR/SRD bits set. When the burst clock is not running it remains in a logic 0 state. When the burst clock is running it is configured by the BCD and BCS bit fields in the chip select Configuration Register. 1 The burst clock runs whenever ACLK is active (independent of chip select configuration)

## 22.9.8 DLL Control Register (EIM\_DCR)

Address: 21B\_8000h base + 94h offset = 21B\_8094h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	DLL_CTRL_REF_UPDATE_INT				DLL_CTRL_SLV_UPDATE_INT				DLL_CTRL_REF_INITIAL_VAL							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DLL_CTRL_SLV_OVERRIDE_VAL								DLL_CTRL_SLV_OVERRIDE	DLL_CTRL_GATE_UPDATE	DLL_CTRL_SLV_OFFSET		DLL_CTRL_SLV_OFFSET_DEC	DLL_CTRL_SLV_FORCE_UPD	DLL_CTRL_RESET	DLL_CTRL_ENABLE
W											DLL_CTRL_SLV_OFFSET					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EIM\_DCR field descriptions

Field	Description
31–28 DLL_CTRL_REF_UPDATE_INT	Reference DLL Update Interval DLL control loop update interval. The interval cycle is $(2 + \text{REF\_UPDATE\_INT}) * \text{ref\_clock}$ . By default, the DLL control loop shall update every two ref_clock cycles. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–23 DLL_CTRL_SLV_UPDATE_INT	Slave DLL Update Interval If default 0 is used, it means 256 cycles of ref_clock. A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
22–16 DLL_CTRL_REF_INITIAL_VAL	This field is used to select the initial value of reference chain before DLL enabled. It's recommended to set the initial value close to the locked value to accelerate the locking.
15–9 DLL_CTRL_SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 128 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 128.
8 DLL_CTRL_SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

Table continues on the next page...

**EIM\_DCR field descriptions (continued)**

Field	Description
7 DLL_CTRL_ GATE_UPDATE	Set this bit to 1 to force DLL not update from now on. Since when clock exists, glitches might appear during update. This bit is used by software if we met such kind of condition. Set it to 0 to let DLL update automatically
6-4 DLL_CTRL_ SLV_OFFSET	OFFSET value for DLL_CTRL_SLV_SEL
3 DLL_CTRL_ SLV_OFFSET_ DEC	Slave Chain Offset Decrease  Decrease(or increase) the value defined by DLL_CTRL_SLV_OFFSET when calculating DLL_STS_SLV_SEL  0 DLL_STS_SLV_SEL = DLL_STS_REF_SEL + DLL_CTRL_SLV_OFFSET 1 DLL_STS_SLV_SEL = DLL_STS_REF_SEL - DLL_CTRL_SLV_OFFSET
2 DLL_CTRL_ SLV_FORCE_ UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered). Be sure to use it when EIM is idle.
1 DLL_CTRL_ RESET	DLL Reset Bit  Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-lock. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again
0 DLL_CTRL_ ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE_VAL, the DLL does not need to be enabled

**22.9.9 DLL Status Register (EIM\_DSR)**

Address: 21B\_8000h base + 98h offset = 21B\_8098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DLL_STS_REF_SEL								DLL_STS_SLV_SEL						DLL_STS_REF_LOCK	DLL_STS_SLV_LOCK
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## EIM\_DSR field descriptions

Field	Description
31–16 Reserved	Reserved This read-only field is reserved and always has the value 0.
15–9 DLL_STS_REF_SEL	Reference delay line select taps. Be noted this is encoded by 7 bits for 127taps.
8–2 DLL_STS_SLV_SEL	Slave delay line select status. This is the instant value generated from reference chain. Since only when ref_lock is detected can the reference chain get updated, this value should be the right value next be update to the slave line when reference is locked.
1 DLL_STS_REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to feedback BCLK, allowing the slave delay-line to perform programmed clock delays
0 DLL_STS_SLV_LOCK	Slave delay-line lock status. This signifies that a valid delay has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value

## 22.9.10 EIM IP Access Register (EIM\_WIAR)

Address: 21B\_8000h base + 9Ch offset = 21B\_809Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								ACLK_EN	ERRST	INT	IPS_ACK	IPS_REQ			
W	[Shaded]								ACLK_EN	ERRST	INT	IPS_ACK	IPS_REQ			
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

## EIM\_WIAR field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 ACLK_EN	ACLK enable. This bit gates the ACLK for the EIM except from FFs that get ipg_aclk_s. After reset ACLK is enabled. 0 ACLK is disabled 1 ACLK is enabled

Table continues on the next page...

**EIM\_WIAR field descriptions (continued)**

Field	Description
3 ERRST	<p>READY After Reset. This bit controls the initial ready/busy status for external devices on CS0 immediately after hardware reset. This is a sticky bit which is cleared once the RDY_INT signal is asserted by the external device.</p> <p>When ERRST = 1 the first fetch access from EIM to the external device located on CS0 will be pending until RDY_INT signal indicates that the external device is ready, then EIM will execute the access.</p> <p><b>NOTE:</b> Reset value for ERRST is EIM_BOOT[4].</p> <p>0 RDY_INT After Reset Disable 1 RDY_INT After Reset Enable</p>
2 INT	<p>Interrupt. This bit indicates interrupt assertion by an external device according to RDY_INT signal. When polling this bit, INT=0 indicates interrupt not occurred and INT=1 indicates assertion of the external device interrupt. This bit is cleared by a hardware reset.</p>
1 IPS_ACK	<p>IPS ACK. The EIM is ready for ips access. There is no active AXI access and no new AXI access is accepted till this bit is cleared. This bit is cleared by the master after it completes the ips accesses.</p> <p>0 Master cannot access ips. 1 Master can access ips.</p>
0 IPS_REQ	<p>IPS request. The Master requests to access one of the IPS registers. During such access the EIM should not perform any AXI/memory accesses. The EIM finishes the AXI accesses that already starts and asserts the IPS_ACK bit.</p> <p>0 No Master requests ips access 1 Master requests ips access</p>

**22.9.11 Error Address Register (EIM\_EAR)**

Address: 21B\_8000h base + A0h offset = 21B\_80A0h

**EIM\_EAR field descriptions**

Field	Description
Error_ADDR	<p>Error Address. This bit field holds the AXI address of the last access that caused error. This register is read only register.</p>

# Chapter 23

## 10/100/1000-Mbps Ethernet MAC (ENET)

### 23.1 Introduction

The MAC-NET core, in conjunction with a 10/100/1000 MAC, implements layer 3 network acceleration functions. These functions are designed to accelerate the processing of various common networking protocols, such as IP, TCP, UDP, and ICMP, providing wire speed services to client applications.

### 23.2 Overview

The core implements a triple speed 10/100/1000 Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100 Mbit/s Ethernet LANs and full-duplex gigabit Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable 10/100/1000 Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

## 23.2.1 Features

The MAC-NET core includes the following features.

### 23.2.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100 Mbit/s and gigabit operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Supports gigabit full-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via one of the following:
  - a 4-bit Media Independent Interface (MII) operating at 2.5/25 MHz.
  - a 4-bit non-standard MII-Lite (MII without the CRS and COL signals) operating at 2.5/25 MHz.
  - a 2-bit Reduced MII (RMII) operating at 50 MHz.
  - a (double data rate) 4-bit Reduced GMII (RGMII) operating at 125 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
  - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
  - Pause quanta used to form pause frames — dynamically programmable
  - Pause frame generation additionally controllable by user application offering flexible traffic flow control
  - Optional forwarding of received pause frames to the user application
  - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission

- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)
- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management supports two programmable MDIO base addresses, and standard (IEEE 802.3 Clause 22) and extended (Clause 45) MDIO frame formats
- Supports legacy FEC buffer descriptors

### 23.2.1.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers

- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodified/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

### **23.2.1.3 IEEE 1588 features**

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

## 23.2.2 Block diagram

Figure 23-1. Ethernet MAC-NET core block diagram

## 23.3 External Signals

The table found here describes the external signals of ENET.

Table 23-1. ENET External Signals

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET_1588_EVENT0_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the	MII/RMII/RGMII	ENET_TXD1	ALT4	I

**Table 23-1. ENET External Signals (continued)**

Signal	Description	Mode	Pad	Alt Mode	Direction
	When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn.  An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET_COL	Asserted upon detection of a collision and remains asserted while the collision persists. This signal is not defined for full duplex mode.	MII	KEY_ROW1	ALT1	I
ENET_CRS	Carrier sense. When asserted, indicates transmit or receive medium is not idle.  In RMI mode, this signal is present on the RMII_CRS_DV pin.	MII	KEY_COL3	ALT1	I
ENET_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	MII/RMII/ RGMII	ENET_MDC KEY_COL2	ALT1 ALT4	O
ENET_MDIO	Transfers control information between the external PHY and the media-access controller. Data is synchronous to MDC. This signal is an input after reset.	MII/RMII/ RGMII	ENET_MDIO KEY_COL1	ALT1 ALT1	IO
ENET_REF_CLK	In RMI mode, this signal is the reference clock for receive, transmit, and the control interface.	RMI	GPIO_16 RGMII_TX_CTL	ALT2 ALT7	I
ENET_RX_CLK	In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER.	MII	GPIO_18	ALT1	I
ENET_RX_DATA0	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII/RMII	ENET_RXD0	ALT1	I
ENET_RX_DATA1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII/RMII	ENET_RXD1	ALT1	I
ENET_RX_DATA2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII	KEY_COL2	ALT1	I
ENET_RX_DATA3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII	KEY_COL0	ALT1	I

*Table continues on the next page...*

**Table 23-1. ENET External Signals (continued)**

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET_RX_EN	Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal.	MII/RMII	ENET_CRS_DV	ALT1	I
ENET_RX_ER	When asserted with RXDV, indicates the PHY detects an error in the current frame.	MII/RMII	ENET_RX_ER	ALT1	I
ENET_TX_CLK	Input clock, which provides a timing reference for TX_EN, TX_DATA[3:0], and TX_ER.	MII	ENET_REF_CLK	ALT1	I
ENET_TX_DATA0	Serial output Ethernet data. Only valid during TX_EN assertion.	MII/RMII	ENET_TXD0	ALT1	O
ENET_TX_DATA1	Serial output Ethernet data. Only valid during TX_EN assertion.	MII/RMII	ENET_TXD1	ALT1	O
ENET_TX_DATA2	Serial output Ethernet data. Only valid during TX_EN assertion.	MII	KEY_ROW2	ALT1	O
ENET_TX_DATA3	Serial output Ethernet data. Only valid during TX_EN assertion.	MII	KEY_ROW0	ALT1	O
ENET_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame.	MII/RMII	ENET_TX_EN	ALT1	O
ENET_TX_ER	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	MII/RMII	GPIO_19	ALT6	O
RGMII_RD0	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	RGMII_RD0	ALT1	I
RGMII_RD1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	RGMII_RD1	ALT1	I
RGMII_RD2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	RGMII_RD2	ALT1	I
RGMII_RD3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	RGMII_RD3	ALT1	I

*Table continues on the next page...*

**Table 23-1. ENET External Signals (continued)**

Signal	Description	Mode	Pad	Alt Mode	Direction
RGMII_RXC	In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL.	RGMII	RGMII_RXC	ALT1	I
RGMII_RX_CTL	In RGMII mode, contains RX_EN on the rising edge of RGMII_RXC, and a logical derivative of RX_EN and RX_ER (RX_EN XOR RX_ER) on the falling edge of RGMII_RXC.	RGMII	RGMII_RX_CTL	ALT1	I
RGMII_TD0	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII_TD0	ALT1	O
RGMII_TD1	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII_TD1	ALT1	O
RGMII_TD2	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII_TD2	ALT1	O
RGMII_TD3	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII_TD3	ALT1	O
RGMII_TXC	In RGMII mode, provides a timing reference for TX_DATA[3:0] and TX_CTL.	RGMII	RGMII_TXC	ALT1	O
RGMII_TX_CTL	In RGMII mode, contains TX_EN on the rising edge of RGMII_TXC, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of RGMII_TXC.	RGMII	RGMII_TX_CTL	ALT1	O

## 23.4 Clocks

The table found here describes the clock sources for ENET.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 23-2. ENET Clocks**

Clock name	Clock Root	Description
ipg_clk	ahb_clk_root	Module clock
ipg_clk_mac0	ahb_clk_root	MAC peripheral clock
ipg_clk_mac0_s	ipg_clk_root	MAC peripheral access clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_clk_time	ipg_clk_root	Peripheral clock
mac0_rxmem_clk	ahb_clk_root	MAC receive memory clock
mac0_txmem_clk	ahb_clk_root	MAC transmit memory clock

**NOTE**

The ENET module requires ahb\_clk\_root to be 125 MHz or greater.

**23.5 Memory map/register definition**

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read to allow future extension. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

**Table 23-3. Register map summary**

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

**ENET memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
218_8004	Interrupt Event Register (ENET_EIR)	32	w1c	0000_0000h	<a href="#">23.5.1/1074</a>
218_8008	Interrupt Mask Register (ENET_EIMR)	32	R/W	0000_0000h	<a href="#">23.5.2/1077</a>
218_8010	Receive Descriptor Active Register (ENET_RDAR)	32	R/W	0000_0000h	<a href="#">23.5.3/1080</a>
218_8014	Transmit Descriptor Active Register (ENET_TDAR)	32	R/W	0000_0000h	<a href="#">23.5.4/1080</a>
218_8024	Ethernet Control Register (ENET_ECR)	32	R/W	F000_0000h	<a href="#">23.5.5/1082</a>
218_8040	MII Management Frame Register (ENET_MMFR)	32	R/W	0000_0000h	<a href="#">23.5.6/1084</a>
218_8044	MII Speed Control Register (ENET_MSCR)	32	R/W	0000_0000h	<a href="#">23.5.7/1084</a>
218_8064	MIB Control Register (ENET_MIBC)	32	R/W	C000_0000h	<a href="#">23.5.8/1087</a>
218_8084	Receive Control Register (ENET_RCR)	32	R/W	05EE_0001h	<a href="#">23.5.9/1089</a>
218_80C4	Transmit Control Register (ENET_TCR)	32	R/W	0000_0000h	<a href="#">23.5.10/1092</a>
218_80E4	Physical Address Lower Register (ENET_PALR)	32	R/W	0000_0000h	<a href="#">23.5.11/1094</a>
218_80E8	Physical Address Upper Register (ENET_PAUR)	32	R/W	0000_8808h	<a href="#">23.5.12/1094</a>
218_80EC	Opcode/Pause Duration Register (ENET_OPD)	32	R/W	0001_0000h	<a href="#">23.5.13/1095</a>

Table continues on the next page...

## ENET memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
218_8118	Descriptor Individual Upper Address Register (ENET_IAUR)	32	R/W	0000_0000h	23.5.14/ 1095
218_811C	Descriptor Individual Lower Address Register (ENET_IALR)	32	R/W	0000_0000h	23.5.15/ 1096
218_8120	Descriptor Group Upper Address Register (ENET_GAUR)	32	R/W	0000_0000h	23.5.16/ 1096
218_8124	Descriptor Group Lower Address Register (ENET_GALR)	32	R/W	0000_0000h	23.5.17/ 1097
218_8144	Transmit FIFO Watermark Register (ENET_TFWR)	32	R/W	0000_0000h	23.5.18/ 1097
218_8180	Receive Descriptor Ring Start Register (ENET_RDSCR)	32	R/W	0000_0000h	23.5.19/ 1098
218_8184	Transmit Buffer Descriptor Ring Start Register (ENET_TDSR)	32	R/W	0000_0000h	23.5.20/ 1099
218_8188	Maximum Receive Buffer Size Register (ENET_MRBR)	32	R/W	0000_0000h	23.5.21/ 1100
218_8190	Receive FIFO Section Full Threshold (ENET_RSFL)	32	R/W	0000_0000h	23.5.22/ 1101
218_8194	Receive FIFO Section Empty Threshold (ENET_RSEM)	32	R/W	0000_0000h	23.5.23/ 1101
218_8198	Receive FIFO Almost Empty Threshold (ENET_RAEM)	32	R/W	0000_0004h	23.5.24/ 1102
218_819C	Receive FIFO Almost Full Threshold (ENET_RAFL)	32	R/W	0000_0004h	23.5.25/ 1102
218_81A0	Transmit FIFO Section Empty Threshold (ENET_TSEM)	32	R/W	0000_0000h	23.5.26/ 1103
218_81A4	Transmit FIFO Almost Empty Threshold (ENET_TAEM)	32	R/W	0000_0004h	23.5.27/ 1103
218_81A8	Transmit FIFO Almost Full Threshold (ENET_TAFL)	32	R/W	0000_0008h	23.5.28/ 1104
218_81AC	Transmit Inter-Packet Gap (ENET_TIPG)	32	R/W	0000_000Ch	23.5.29/ 1104
218_81B0	Frame Truncation Length (ENET_FTRL)	32	R/W	0000_07FFh	23.5.30/ 1105
218_81C0	Transmit Accelerator Function Configuration (ENET_TACC)	32	R/W	0000_0000h	23.5.31/ 1105
218_81C4	Receive Accelerator Function Configuration (ENET_RACC)	32	R/W	0000_0000h	23.5.32/ 1106
218_8200	Reserved Statistic Register (ENET_RMON_T_DROP)	32	R	0000_0000h	23.5.33/ 1107
218_8204	Tx Packet Count Statistic Register (ENET_RMON_T_PACKETS)	32	R	0000_0000h	23.5.34/ 1108
218_8208	Tx Broadcast Packets Statistic Register (ENET_RMON_T_BC_PKT)	32	R	0000_0000h	23.5.35/ 1108

**23.5.1 Interrupt Event Register (ENET\_EIR)**

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

**NOTE**

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode, ENET\_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

## ENET\_EIR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 BABR	Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.
29 BABT	Babbling Transmit Error Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
28 GRA	Graceful Stop Complete This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop. <b>NOTE:</b> The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
27 TXF	Transmit Frame Interrupt Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
26 TXB	Transmit Buffer Interrupt Indicates a transmit buffer descriptor has been updated.
25 RXF	Receive Frame Interrupt Indicates a frame has been received and the last corresponding buffer descriptor has been updated.
24 RXB	Receive Buffer Interrupt Indicates a receive buffer descriptor is not the last in the frame has been updated.
23 MII	MII Interrupt. Indicates that the MII has completed the data transfer requested.
22 EBERR	Ethernet Bus Error Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.
21 LC	Late Collision Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
20 RL	Collision Retry Limit Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
19 UN	Transmit FIFO Underrun Indicates the transmit FIFO became empty before the complete frame was transmitted. A bad CRC is appended to the frame fragment and the remainder of the frame is discarded.
18 PLR	Payload Receive Error

Table continues on the next page...

**ENET\_EIR field descriptions (continued)**

<b>Field</b>	<b>Description</b>
	Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
17 WAKEUP	Node Wakeup Request Indication  Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.
16 TS_AVAIL	Transmit Timestamp Available  Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
15 TS_TIMER	Timestamp Timer  The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
12 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
11–9 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

## 23.5.2 Interrupt Mask Register (ENET\_EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

Address: 218\_8000h base + 8h offset = 218\_8008h

### 23.5.3 Receive Descriptor Active Register (ENET\_RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: 218\_8000h base + 10h offset = 218\_8010h

ENET\_RDAR field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RDAR	Receive Descriptor Active  Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

### 23.5.4 Transmit Descriptor Active Register (ENET\_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: 218\_8000h base + 14h offset = 218\_8014h

**ENET\_TDAR field descriptions**

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 TDAR	Transmit Descriptor Active  Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

## 23.5.5 Ethernet Control Register (ENET\_ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Address: 218\_8000h base + 24h offset = 218\_8024h

**ENET\_ECR field descriptions**

Field	Description
31–12 Reserved	This field is reserved. This field must be set to F_0000h.
11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 DBSWP	Descriptor Byte Swapping Enable Swaps the byte locations of the buffer descriptors.  0 The buffer descriptor bytes are not swapped to support big-endian devices. 1 The buffer descriptor bytes are swapped to support little-endian devices.
7 STOPEN	STOPEN Signal Control Controls device behavior in doze mode.  In doze mode, if this field is set then all the clocks of the ENET assembly are disabled, except the RMII /MII clock. Doze mode is similar to a conditional stop mode entry for the ENET assembly depending on ECR[STOPEN].  <b>NOTE:</b> If module clocks are gated in this mode, the module can still wake the system after receiving a magic packet in stop mode. MAGICEN must be set prior to entering sleep/stop mode.

Table continues on the next page...

## ENET\_ECR field descriptions (continued)

Field	Description
6 DBGEN	<p>Debug Enable</p> <p>Enables the MAC to enter hardware freeze mode when the device enters debug mode.</p> <p>0 MAC continues operation in debug mode. 1 MAC enters hardware freeze mode when the processor is in debug mode.</p>
5 SPEED	<p>Selects between 10/100 and 1000 Mbps modes of operation.</p> <p>0 10/100 Mbps mode 1 1000 Mbps mode</p>
4 EN1588	<p>EN1588 Enable</p> <p>Enables enhanced functionality of the MAC.</p> <p>0 Legacy FEC buffer descriptors and functions enabled. 1 Enhanced frame time-stamping functions enabled.</p>
3 SLEEP	<p>Sleep Mode Enable</p> <p>0 Normal operating mode. 1 Sleep mode.</p>
2 MAGICEN	<p>Magic Packet Detection Enable</p> <p>Enables/disables magic packet detection.</p> <p><b>NOTE:</b> MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection.</p> <p>0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.</p>
1 ETHEREN	<p>Ethernet Enable</p> <p>Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.</p> <p>Hardware clears this field under the following conditions:</p> <ul style="list-style-type: none"> <li>• RESET is set by software</li> <li>• An error condition causes the EBERR field to set.</li> </ul> <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>• ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only <i>after</i> all other ENET-related registers have been configured.</li> <li>• If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must cleared to 0 due to previous pending interrupts.</li> </ul> <p>0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.</p>
0 RESET	<p>Ethernet MAC Reset</p> <p>When this field is set, it clears the ETHEREN field.</p>

## 23.5.6 MII Management Frame Register (ENET\_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: 218\_8000h base + 40h offset = 218\_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ENET\_MMFR field descriptions

Field	Description
31–30 ST	Start Of Frame Delimiter See <a href="#">Table 23-140</a> (Clause 22) or <a href="#">Table 23-142</a> (Clause 45) for correct value.
29–28 OP	Operation Code See <a href="#">Table 23-140</a> (Clause 22) or <a href="#">Table 23-142</a> (Clause 45) for correct value.
27–23 PA	PHY Address See <a href="#">Table 23-140</a> (Clause 22) or <a href="#">Table 23-142</a> (Clause 45) for correct value.
22–18 RA	Register Address See <a href="#">Table 23-140</a> (Clause 22) or <a href="#">Table 23-142</a> (Clause 45) for correct value.
17–16 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

## 23.5.7 MII Speed Control Register (ENET\_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII\_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII\_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII\_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

If the internal module clock is 25 MHz, programming MII\_SPEED to 0x4 results in an MDC as given in the following equation:

$$25 \text{ MHz} / ((4 + 1) \times 2) = 2.5 \text{ MHz}$$

The following table shows the optimum values for MII\_SPEED as a function of internal module clock frequency.

**Table 23-12. Programming Examples for MSCR**

Internal MAC clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz
66 MHz	0xD	2.36 MHz

Address: 218\_8000h base + 44h offset = 218\_8044h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ENET\_MSCR field descriptions**

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 HOLDTIME	Hold time On MDIO Output  IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased.  000 1 internal module clock cycle 001 2 internal module clock cycles

Table continues on the next page...

## ENET\_MSCR field descriptions (continued)

Field	Description
	010 3 internal module clock cycles 111 8 internal module clock cycles
7 DIS_PRE	Disable Preamble  Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it.  0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame.
6–1 MII_SPEED	MII Speed  Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of:  $1/((\text{MII\_SPEED} + 1) \times 2)$ of the internal module clock frequency
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

### 23.5.8 MIB Control Register (ENET\_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB\_DIS field resets to 1.

Address: 218\_8000h base + 64h offset = 218\_8064h

**ENET\_MIBC field descriptions**

Field	Description
31 MIB_DIS	Disable MIB Logic If this control field is set, 0 MIB logic is enabled. 1 MIB logic is disabled. The MIB logic halts and does not update any MIB counters.

*Table continues on the next page...*

**ENET\_MIBC field descriptions (continued)**

<b>Field</b>	<b>Description</b>
30 MIB_IDLE	MIB Idle  0 The MIB block is updating MIB counters. 1 The MIB block is not currently updating any MIB counters.
29 MIB_CLEAR	MIB Clear  <b>NOTE:</b> This field is not self-clearing. To clear the MIB counters set and then clear this field.  0 See note above. 1 All statistics counters are reset to 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

### 23.5.9 Receive Control Register (ENET\_RCR)

Address: 218\_8000h base + 84h offset = 218\_8084h

**ENET\_RCR field descriptions**

Field	Description
31 GRS	Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped.
30 NLC	Payload Length Check Disable Enables/disables a payload length check. 0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLC] field.
29-16 MAX_FL	Maximum Frame Length

Table continues on the next page...

## ENET\_RCR field descriptions (continued)

Field	Description
	Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
15 CFEN	MAC Control Frame Enable Enables/disables the MAC control frame.  0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
14 CRCFWD	Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. <b>NOTE:</b> If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed.  0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame.
13 PAUFWFWD	Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded.  0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application.
12 PADEN	Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames.  0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames.
11–10 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
9 RMII_10T	Enables 10-Mbps mode of the RMII or RGMII .  0 100 Mbps operation. 1 10 Mbps operation.
8 RMII_MODE	RMII Mode Enable Specifies whether the MAC is configured for MII mode or RMII operation , when ECR[SPEED] is cleared . <b>NOTE:</b> Do not set both RCR[RGMIEN] and RCR[RMII_MODE].  0 MAC configured for MII mode. 1 MAC configured for RMII operation.
7 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
6 RGMII_EN	RGMII Mode Enable  <b>NOTE:</b> Do not set both RCR[RGMIEN] and RCR[RMII_MODE].

Table continues on the next page...

**ENET\_RCR field descriptions (continued)**

<b>Field</b>	<b>Description</b>
	0 MAC configured for non-RGMII operation 1 MAC configured for RGMII operation. If ECR[SPEED] is set, the MAC is in RGMII 1000 Mbps mode. If ECR[SPEED] is cleared, the MAC is in RGMII 10/100 Mbps mode.
5 FCE	<b>Flow Control Enable</b>  If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.
4 BC_REJ	<b>Broadcast Frame Reject</b>  If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.
3 PROM	<b>Promiscuous Mode</b>  All frames are accepted regardless of address matching.  0 Disabled. 1 Enabled.
2 MII_MODE	<b>Media Independent Interface Mode</b>  This field must always be set.  0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.
1 DRT	<b>Disable Receive On Transmit</b>  0 Receive path operates independently of transmit. Used for full-duplex or to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. Normally used for half-duplex mode.
0 LOOP	<b>Internal Loopback</b>  This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0.  0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.

### 23.5.10 Transmit Control Register (ENET\_TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: 218\_8000h base + C4h offset = 218\_80C4h

**ENET\_TCR field descriptions**

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This field is read/write and must be set to 0.
9 CRCFWD	Forward Frame From Application With CRC

*Table continues on the next page...*

**ENET\_TCR field descriptions (continued)**

<b>Field</b>	<b>Description</b>
	<p>0 TxBD[TC] controls whether the frame has a CRC from the application.</p> <p>1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.</p>
8 ADDINS	<p>Set MAC Address On Transmit</p> <p>0 The source MAC address is not modified by the MAC.</p> <p>1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.</p>
7–5 ADDSEL	<p>Source MAC Address Select On Transmit</p> <p>If ADDINS is set, indicates the MAC address that overwrites the source MAC address.</p> <p>000 Node MAC address programmed on PADDR1/2 registers.</p> <p>100 Reserved.</p> <p>101 Reserved.</p> <p>110 Reserved.</p>
4 RFC_PAUSE	<p>Receive Frame Control Pause</p> <p>This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.</p>
3 TFC_PAUSE	<p>Transmit Frame Control Pause</p> <p>Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame.</p> <p>0 No PAUSE frame transmitted.</p> <p>1 The MAC stops transmission of data frames after the current transmission is complete.</p>
2 FDEN	<p>Full-Duplex Enable</p> <p>If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.</p>
1 Reserved	<p>This field is reserved.</p> <p>This write-only field is reserved. It must always be written with the value 0.</p>
0 GTS	<p>Graceful Transmit Stop</p> <p>When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.</p>

### 23.5.11 Physical Address Lower Register (ENET\_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Address: 218\_8000h base + E4h offset = 218\_80E4h

#### ENET\_PALR field descriptions

Field	Description
PADDR1	Pause Address  Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames.

### 23.5.12 Physical Address Upper Register (ENET\_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames.

Address: 218\_8000h base + E8h offset = 218\_80E8h

#### ENET\_PAUR field descriptions

Field	Description
31-16 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
TYPE	Type Field In PAUSE Frames  These fields have a constant value of 0x8808.

### 23.5.13 Opcode/Pause Duration Register (ENET\_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: 218\_8000h base + ECh offset = 218\_80ECh

#### ENET\_OPD field descriptions

Field	Description
31–16 OPCODE	Opcode Field In PAUSE Frames These fields have a constant value of 0x0001.
PAUSE_DUR	Pause Duration Pause duration field used in PAUSE frames.

### 23.5.14 Descriptor Individual Upper Address Register (ENET\_IAUR)

IAUR contains the upper 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the destination address (DA) field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: 218\_8000h base + 118h offset = 218\_8118h

#### ENET\_IAUR field descriptions

Field	Description
IADDR1	Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR1 contains hash index bit 63. Bit 0 of IADDR1 contains hash index bit 32.

### 23.5.15 Descriptor Individual Lower Address Register (ENET\_IALR)

IALR contains the lower 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the DA field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: 218\_8000h base + 11Ch offset = 218\_811Ch

#### ENET\_IALR field descriptions

Field	Description
IADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR2 contains hash index bit 31. Bit 0 of IADDR2 contains hash index bit 0.

### 23.5.16 Descriptor Group Upper Address Register (ENET\_GAUR)

GAUR contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: 218\_8000h base + 120h offset = 218\_8120h

#### ENET\_GAUR field descriptions

Field	Description
GADDR1	Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR1 contains hash index bit 63. Bit 0 of GADDR1 contains hash index bit 32.

### 23.5.17 Descriptor Group Lower Address Register (ENET\_GALR)

GALR contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: 218\_8000h base + 124h offset = 218\_8124h

#### ENET\_GALR field descriptions

Field	Description
GADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

### 23.5.18 Transmit FIFO Watermark Register (ENET\_TFWR)

If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR\_FWD is set to '0', the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR\_FWD to '1'. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

## Memory map/register definition

Address: 218\_8000h base + 144h offset = 218\_8144h

### ENET\_TFWR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 STRFWD	Store And Forward Enable  0 Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 Enabled.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TFWR	Transmit FIFO Write  If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins.  <b>NOTE:</b> If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given.  000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. ... .. 111111 4032 bytes written.

## 23.5.19 Receive Descriptor Ring Start Register (ENET\_RDSR)

RDSR points to the beginning of the circular receive buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, it is recommended to be 128-bit aligned, that is, evenly divisible by 16.

### NOTE

This register must be initialized prior to operation

Address: 218\_8000h base + 180h offset = 218\_8180h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	R_DES_START																
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	R_DES_START															0	
W															0		
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

**ENET\_RDSR field descriptions**

Field	Description
31–3 R_DES_START	Pointer to the beginning of the receive buffer descriptor queue.
2 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

### 23.5.20 Transmit Buffer Descriptor Ring Start Register (ENET\_TDSR)

TDSR provides a pointer to the beginning of the circular transmit buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, it is recommended to be 128-bit aligned, that is, evenly divisible by 16.

**NOTE**

This register must be initialized prior to operation.

Address: 218\_8000h base + 184h offset = 218\_8184h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	X_DES_START																
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	X_DES_START															0	
W															0		
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

**ENET\_TDSR field descriptions**

Field	Description
31–3 X_DES_START	Pointer to the beginning of the transmit buffer descriptor queue.

*Table continues on the next page...*

**ENET\_TDSR field descriptions (continued)**

Field	Description
2 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

**23.5.21 Maximum Receive Buffer Size Register (ENET\_MRBR)**

The MRBR is a user-programmable register that dictates the maximum size of all receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- R\_BUF\_SIZE is concatenated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To allow one maximum size frame per buffer, MRBR must be set to RCR[MAX\_FL] or larger.
- To properly align the buffer, MRBR must be evenly divisible by 16. To ensure this, the lower four bits are set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR greater than or equal to 256 bytes.

**NOTE**

This register must be initialized before operation.

Address: 218\_8000h base + 188h offset = 218\_8188h

**ENET\_MRBR field descriptions**

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–4 R_BUF_SIZE	Receive buffer size in bytes. This value, concatenated with the four least-significant bits of this register (which are always zero), is the effective maximum receive buffer size.
Reserved	This field, which is always zero, is the four least-significant bits of the maximum receive buffer size.  This field is reserved. This read-only field is reserved and always has the value 0.

## 23.5.22 Receive FIFO Section Full Threshold (ENET\_RSFL)

Address: 218\_8000h base + 190h offset = 218\_8190h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																RX_SECTION_FULL															
W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RSFL field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_FULL	Value Of Receive FIFO Section Full Threshold  Value, in 64-bit words, of the receive FIFO section full threshold. Clear this field to enable store and forward on the RX FIFO. When programming a value greater than 0 (cut-through operation), it must be greater than RAEM[RX_ALMOST_EMPTY].  When the FIFO level reaches the value in this field, data is available in the Receive FIFO (cut-through operation).

## 23.5.23 Receive FIFO Section Empty Threshold (ENET\_RSEM)

Address: 218\_8000h base + 194h offset = 218\_8194h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0						0						0						RX_SECTION_EMPTY													
W	0						0						0						0													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RSEM field descriptions

Field	Description
31–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_EMPTY	Value Of The Receive FIFO Section Empty Threshold  Value, in 64-bit words, of the receive FIFO section empty threshold. When the FIFO has reached this level, a pause frame will be issued.  A value of 0 disables automatic pause frame generation.  When the FIFO level goes below the value programmed in this field, an XON pause frame is issued to indicate the FIFO congestion is cleared to the remote Ethernet client.

Table continues on the next page...

**ENET\_RSEM field descriptions (continued)**

Field	Description
	<b>NOTE:</b> The section-empty threshold indications from both FIFOs are OR'ed to cause XOFF pause frame generation.

**23.5.24 Receive FIFO Almost Empty Threshold (ENET\_RAEM)**

Address: 218\_8000h base + 198h offset = 218\_8198h

**ENET\_RAEM field descriptions**

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_ALMOST_EMPTY	Value Of The Receive FIFO Almost Empty Threshold  Value, in 64-bit words, of the receive FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field and the end-of-frame has not been received for the frame yet, the core receive read control stops FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. A minimum value of 4 should be set.

**23.5.25 Receive FIFO Almost Full Threshold (ENET\_RAFL)**

Address: 218\_8000h base + 19Ch offset = 218\_819Ch

**ENET\_RAFL field descriptions**

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_ALMOST_FULL	Value Of The Receive FIFO Almost Full Threshold  Value, in 64-bit words, of the receive FIFO almost full threshold. When the FIFO level comes close to the maximum, so that there is no more space for at least RX_ALMOST_FULL number of words, the MAC stops writing data in the FIFO and truncates the received frame to avoid FIFO overflow. The corresponding error status will be set when the frame is delivered to the application. A minimum value of 4 should be set.

## 23.5.26 Transmit FIFO Section Empty Threshold (ENET\_TSEM)

Address: 218\_8000h base + 1A0h offset = 218\_81A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																TX_SECTION_EMPTY															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_TSEM field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_SECTION_EMPTY	Value Of The Transmit FIFO Section Empty Threshold  Value, in 64-bit words, of the transmit FIFO section empty threshold. See <a href="#">Transmit FIFO</a> for more information.

## 23.5.27 Transmit FIFO Almost Empty Threshold (ENET\_TAEM)

Address: 218\_8000h base + 1A4h offset = 218\_81A4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																TX_ALMOST_EMPTY															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

### ENET\_TAEM field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_EMPTY	Value of Transmit FIFO Almost Empty Threshold  Value, in 64-bit words, of the transmit FIFO almost empty threshold.  When the FIFO level reaches the value programmed in this field, and no end-of-frame is available for the frame, the MAC transmit logic, to avoid FIFO underflow, stops reading the FIFO and transmits a frame with an MII error indication. See <a href="#">Transmit FIFO</a> for more information.  A minimum value of 4 should be set.

## 23.5.28 Transmit FIFO Almost Full Threshold (ENET\_TAFL)

Address: 218\_8000h base + 1A8h offset = 218\_81A8h

### ENET\_TAFL field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_FULL	<p>Value Of The Transmit FIFO Almost Full Threshold</p> <p>Value, in 64-bit words, of the transmit FIFO almost full threshold. A minimum value of six is required . A recommended value of at least 8 should be set allowing a latency of two clock cycles to the application. If more latency is required the value can be increased as necessary (latency = TAFL - 5).</p> <p>When the FIFO level comes close to the maximum, so that there is no more space for at least TX_ALMOST_FULL number of words, the pin ff_tx_rdy is deasserted. If the application does not react on this signal, the FIFO write control logic, to avoid FIFO overflow, truncates the current frame and sets the error status. As a result, the frame will be transmitted with an GMII/MII error indication. See <a href="#">Transmit FIFO</a> for more information.</p> <p><b>NOTE:</b> A FIFO overflow is a fatal error and requires a global reset on the transmit datapath or at least deassertion of ETHEREN.</p>

## 23.5.29 Transmit Inter-Packet Gap (ENET\_TIPG)

Address: 218\_8000h base + 1ACh offset = 218\_81ACh

### ENET\_TIPG field descriptions

Field	Description
31–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
IPG	<p>Transmit Inter-Packet Gap</p> <p>Indicates the IPG, in bytes, between transmitted frames. Valid values range from 8 to 26. If the written value is less than 8 or greater than 26, the internal (effective) IPG is 12.</p> <p><b>NOTE:</b> The IPG value read will be the value that was written, even if it is out of range.</p>

### 23.5.30 Frame Truncation Length (ENET\_FTRL)

Address: 218\_8000h base + 1B0h offset = 218\_81B0h

#### ENET\_FTRL field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TRUNC_FL	<p>Frame Truncation Length</p> <p>Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL].</p> <p><b>NOTE:</b> Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.</p>

### 23.5.31 Transmit Accelerator Function Configuration (ENET\_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

Address: 218\_8000h base + 1C0h offset = 218\_81C0h

### ENET\_TACC field descriptions

Field	Description
31–5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 PROCHK	Enables insertion of protocol checksum. 0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified.
3 IPCHK	Enables insertion of IP header checksum. 0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified.
2–1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 SHIFT16	TX FIFO Shift-16 0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header.

## 23.5.32 Receive Accelerator Function Configuration (ENET\_RACC)

Address: 218\_8000h base + 1C4h offset = 218\_81C4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	[Reserved]															
W	0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	[Reserved]								SHIFT16	LINEDIS	[Reserved]			PRODIS	IPDIS	PADREM
W	0								SHIFT16	LINEDIS	0			PRODIS	IPDIS	PADREM
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RACC field descriptions

Field	Description
31–8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

Table continues on the next page...

## ENET\_RACC field descriptions (continued)

Field	Description
7 SHIFT16	<p>RX FIFO Shift-16</p> <p>When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary.</p> <p><b>NOTE:</b> This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received.</p> <p>0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.</p>
6 LINEDIS	<p>Enable Discard Of Frames With MAC Layer Errors</p> <p>0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.</p>
5–3 Reserved	<p>This field is reserved. This write-only field is reserved. It must always be written with the value 0.</p>
2 PRODIS	<p>Enable Discard Of Frames With Wrong Protocol Checksum</p> <p>0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).</p>
1 IPDIS	<p>Enable Discard Of Frames With Wrong IPv4 Header Checksum</p> <p>0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).</p>
0 PADREM	<p>Enable Padding Removal For Short IP Frames</p> <p>0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame.</p>

## 23.5.33 Reserved Statistic Register (ENET\_RMON\_T\_DROP)

Address: 218\_8000h base + 200h offset = 218\_8200h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved																															
W	Reserved																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ENET\_RMON\_T\_DROP field descriptions

Field	Description
Reserved	<p>This read-only field always has the value 0.</p> <p>This field is reserved.</p>

### 23.5.34 Tx Packet Count Statistic Register (ENET\_RMON\_T\_PACKETS)

Address: 218\_8000h base + 204h offset = 218\_8204h

#### ENET\_RMON\_T\_PACKETS field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Packet count Transmit packet count

### 23.5.35 Tx Broadcast Packets Statistic Register (ENET\_RMON\_T\_BC\_PKT)

RMON Tx Broadcast Packets

Address: 218\_8000h base + 208h offset = 218\_8208h

#### ENET\_RMON\_T\_BC\_PKT field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Broadcast packets

### 23.5.36 Tx Multicast Packets Statistic Register (ENET\_RMON\_T\_MC\_PKT)

Address: 218\_8000h base + 20Ch offset = 218\_820Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### ENET\_IEEE\_T\_MCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with multiple collisions

### 23.5.55 Frames Transmitted after Deferral Delay Statistic Register (ENET\_IEEE\_T\_DEF)

Address: 218\_8000h base + 258h offset = 218\_8258h

#### ENET\_IEEE\_T\_DEF field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with deferral delay

### 23.5.56 Frames Transmitted with Late Collision Statistic Register (ENET\_IEEE\_T\_LCOL)

Address: 218\_8000h base + 25Ch offset = 218\_825Ch

#### ENET\_IEEE\_T\_LCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with late collision

## 23.5.57 Frames Transmitted with Excessive Collisions Statistic Register (ENET\_IEEE\_T\_EXCOL)

Address: 218\_8000h base + 260h offset = 218\_8260h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ENET\_IEEE\_T\_EXCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with excessive collisions

## 23.5.58 Frames Transmitted with Tx FIFO Underrun Statistic Register (ENET\_IEEE\_T\_MACERR)

Address: 218\_8000h base + 264h offset = 218\_8264h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						
R	0																COUNT																					
W	[Shaded]																																					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_IEEE\_T\_MACERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with transmit FIFO underrun

### 23.5.59 Frames Transmitted with Carrier Sense Error Statistic Register (ENET\_IEEE\_T\_CSERR)

Address: 218\_8000h base + 268h offset = 218\_8268h

#### ENET\_IEEE\_T\_CSERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with carrier sense error

### 23.5.60 ENET\_IEEE\_T\_SQE

Address: 218\_8000h base + 26Ch offset = 218\_826Ch

#### ENET\_IEEE\_T\_SQE field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with SQE error  <b>NOTE:</b> Counter not implemented (always reads zero) as no SQE information is available.

## 23.5.61 Flow Control Pause Frames Transmitted Statistic Register (ENET\_IEEE\_T\_FDXFC)

Address: 218\_8000h base + 270h offset = 218\_8270h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0										
R	0																COUNT																									
W	[Shaded]																																									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_IEEE\_T\_FDXFC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames transmitted

## 23.5.62 Octet Count for Frames Transmitted w/o Error Statistic Register (ENET\_IEEE\_T\_OCTETS\_OK)

Address: 218\_8000h base + 274h offset = 218\_8274h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0										
R	COUNT																																									
W	[Shaded]																																									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_IEEE\_T\_OCTETS\_OK field descriptions

Field	Description
COUNT	Octet count for frames transmitted without error  <b>NOTE</b> Counts total octets (includes header and FCS fields).

### 23.5.63 Rx Packet Count Statistic Register (ENET\_RMON\_R\_PACKETS)

Address: 218\_8000h base + 284h offset = 218\_8284h

#### ENET\_RMON\_R\_PACKETS field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of packets received

### 23.5.64 Rx Broadcast Packets Statistic Register (ENET\_RMON\_R\_BC\_PKT)

Address: 218\_8000h base + 288h offset = 218\_8288h

#### ENET\_RMON\_R\_BC\_PKT field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive broadcast packets

## 23.5.65 Rx Multicast Packets Statistic Register (ENET\_RMON\_R\_MC\_PKT)

Address: 218\_8000h base + 28Ch offset = 218\_828Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	0																COUNT																	
W	[Shaded]																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

### ENET\_RMON\_R\_MC\_PKT field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive multicast packets

## 23.5.66 Rx Packets with CRC/Align Error Statistic Register (ENET\_RMON\_R\_CRC\_ALIGN)

Address: 218\_8000h base + 290h offset = 218\_8290h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	0																COUNT																	
W	[Shaded]																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

### ENET\_RMON\_R\_CRC\_ALIGN field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets with CRC or align error

### 23.5.67 Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENET\_RMON\_R\_UNDERSIZE)

Address: 218\_8000h base + 294h offset = 218\_8294h

#### ENET\_RMON\_R\_UNDERSIZE field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets with less than 64 bytes and good CRC

### 23.5.68 Rx Packets Greater Than MAX\_FL and Good CRC Statistic Register (ENET\_RMON\_R\_OVERSIZE)

Address: 218\_8000h base + 298h offset = 218\_8298h

#### ENET\_RMON\_R\_OVERSIZE field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets greater than MAX_FL and good CRC

## 23.5.69 Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET\_RMON\_R\_FRAG)

Address: 218\_8000h base + 29Ch offset = 218\_829Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	0																COUNT																
W	[Shaded]																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RMON\_R\_FRAG field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets with less than 64 bytes and bad CRC

## 23.5.70 Rx Packets Greater Than MAX\_FL Bytes and Bad CRC Statistic Register (ENET\_RMON\_R\_JAB)

Address: 218\_8000h base + 2A0h offset = 218\_82A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**ENET\_RMON\_R\_RESVD\_0 field descriptions**

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

**23.5.72 Rx 64-Byte Packets Statistic Register (ENET\_RMON\_R\_P64)**

Address: 218\_8000h base + 2A8h offset = 218\_82A8h

**ENET\_RMON\_R\_P64 field descriptions**

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of 64-byte receive packets

**23.5.73 Rx 65- to 127-Byte Packets Statistic Register (ENET\_RMON\_R\_P65TO127)**

Address: 218\_8000h base + 2ACh offset = 218\_82ACh

**ENET\_RMON\_R\_P65TO127 field descriptions**

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of 65- to 127-byte receive packets

## 23.5.74 Rx 128- to 255-Byte Packets Statistic Register (ENET\_RMON\_R\_P128TO255)

Address: 218\_8000h base + 2B0h offset = 218\_82B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RMON\_R\_P128TO255 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of 128- to 255-byte receive packets

## 23.5.75 Rx 256- to 511-Byte Packets Statistic Register (ENET\_RMON\_R\_P256TO511)

Address: 218\_8000h base + 2B4h offset = 218\_82B4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RMON\_R\_P256TO511 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of 256- to 511-byte receive packets

### 23.5.76 Rx 512- to 1023-Byte Packets Statistic Register (ENET\_RMON\_R\_P512TO1023)

Address: 218\_8000h base + 2B8h offset = 218\_82B8h

#### ENET\_RMON\_R\_P512TO1023 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of 512- to 1023-byte receive packets

### 23.5.77 Rx 1024- to 2047-Byte Packets Statistic Register (ENET\_RMON\_R\_P1024TO2047)

Address: 218\_8000h base + 2BCh offset = 218\_82BCh

#### ENET\_RMON\_R\_P1024TO2047 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of 1024- to 2047-byte receive packets

## 23.5.78 Rx Packets Greater than 2048 Bytes Statistic Register (ENET\_RMON\_R\_P\_GTE2048)

Address: 218\_8000h base + 2C0h offset = 218\_82C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	0																COUNT																	
W	[Shaded]																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

### ENET\_RMON\_R\_P\_GTE2048 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of greater-than-2048-byte receive packets

## 23.5.79 Rx Octets Statistic Register (ENET\_RMON\_R\_OCTETS)

Address: 218\_8000h base + 2C4h offset = 218\_82C4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	COUNT																																	
W	[Shaded]																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

### ENET\_RMON\_R\_OCTETS field descriptions

Field	Description
COUNT	Number of receive octets

### 23.5.80 Frames not Counted Correctly Statistic Register (ENET\_IEEE\_R\_DROP)

Counter increments if a frame with invalid or missing SFD character is detected and has been dropped. None of the other counters increments if this counter increments.

Address: 218\_8000h base + 2C8h offset = 218\_82C8h

#### ENET\_IEEE\_R\_DROP field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Frame count

### 23.5.81 Frames Received OK Statistic Register (ENET\_IEEE\_R\_FRAME\_OK)

Address: 218\_8000h base + 2CCCh offset = 218\_82CCh

#### ENET\_IEEE\_R\_FRAME\_OK field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received OK

## 23.5.82 Frames Received with CRC Error Statistic Register (ENET\_IEEE\_R\_CRC)

Address: 218\_8000h base + 2D0h offset = 218\_82D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_IEEE\_R\_CRC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received with CRC error

## 23.5.83 Frames Received with Alignment Error Statistic Register (ENET\_IEEE\_R\_ALIGN)

Address: 218\_8000h base + 2D4h offset = 218\_82D4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_IEEE\_R\_ALIGN field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received with alignment error

### 23.5.84 Receive FIFO Overflow Count Statistic Register (ENET\_IEEE\_R\_MACERR)

Address: 218\_8000h base + 2D8h offset = 218\_82D8h

#### ENET\_IEEE\_R\_MACERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Receive FIFO overflow count

### 23.5.85 Flow Control Pause Frames Received Statistic Register (ENET\_IEEE\_R\_FDXFC)

Address: 218\_8000h base + 2DCh offset = 218\_82DCh

#### ENET\_IEEE\_R\_FDXFC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames received

## 23.5.86 Octet Count for Frames Received without Error Statistic Register (ENET\_IEEE\_R\_OCTETS\_OK)

Address: 218\_8000h base + 2E0h offset = 218\_82E0h

### ENET\_IEEE\_R\_OCTETS\_OK field descriptions

Field	Description
COUNT	Number of octets for frames received without error  <b>NOTE:</b> Counts total octets (includes header and FCS fields). Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).

## 23.5.87 Adjustable Timer Control Register (ENET\_ATCR)

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required.

Address: 218\_8000h base + 400h offset = 218\_8400h

## ENET\_ATCR field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 SLAVE	Enable Timer Slave Mode  0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.
12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11 CAPTURE	Capture Timer Value  This field automatically clears to 0 after the command completes.  <b>NOTE:</b> To ensure that the correct time value is read from the ATVR register, a minimum amount of time must elapse from issuing this command to reading the ATVR register. This minimum time is defined by the greater of either six register clock cycles or six 1588/timestamp clock cycles.  0 No effect. 1 The current time is captured and can be read from the ATVR register.
10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9 RESTART	Reset Timer  Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes.  <b>NOTE:</b> The Reset Timer command requires at least 6 clock cycles of either the register clock or the 1588/timestamp clock, whichever is greater, to complete.
8 Reserved	This field is reserved.
7 PINPER	Enables event signal output assertion on period event.  <b>NOTE:</b> Not all devices contain the event signal output. See the chip configuration details.  0 Disable. 1 Enable.
6 Reserved	This field is reserved.
5 Reserved	This field is reserved.  <b>NOTE:</b> This field must be written always with one.
4 PEREN	Enable Periodical Event  0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit.  <b>NOTE:</b> Not all devices contain the event signal output. See the chip configuration details.

Table continues on the next page...

## ENET\_ATCR field descriptions (continued)

Field	Description
3 OFFRST	Reset Timer On Offset Event 0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.
2 OFFEN	Enable One-Shot Offset Event 0 Disable. 1 The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field.
1 Reserved	This field is reserved.
0 EN	Enable Timer 0 The timer stops at the current value. 1 The timer starts incrementing.

## 23.5.88 Timer Value Register (ENET\_ATVR)

Address: 218\_8000h base + 404h offset = 218\_8404h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ENET\_ATVR field descriptions

Field	Description
ATIME	A write sets the timer. A read returns the last captured value. To read the current value, issue a capture command (i.e., set ATCR[CAPTURE]) prior to reading this register.

## 23.5.89 Timer Offset Register (ENET\_ATOFF)

Address: 218\_8000h base + 408h offset = 218\_8408h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_ATOFF field descriptions

Field	Description
OFFSET	Offset value for one-shot event generation. When the timer reaches the value, an event can be generated to reset the counter. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds.

## 23.5.90 Timer Period Register (ENET\_ATPER)

Address: 218\_8000h base + 40Ch offset = 218\_840Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	1	1	1	0	1	1	1	0	0	1	1	0	1	0	1	1	0	0	1	0	1	0	0	0	0	0	0	0	0	

### ENET\_ATPER field descriptions

Field	Description
PERIOD	Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10 <sup>9</sup> ) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock ts_clk, hence implementing a true 1 second counter.

## 23.5.91 Timer Correction Register (ENET\_ATCOR)

Address: 218\_8000h base + 410h offset = 218\_8410h

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_ATCOR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COR	Correction Counter Wrap-Around Value  Defines after how many timer clock cycles (ts_clk) the correction counter should be reset and trigger a correction increment on the timer. The amount of correction is defined in ATINC[INC_CORR]. A value of 0 disables the correction counter and no corrections occur.  <b>NOTE:</b> This value is given in clock cycles, not in nanoseconds as all other values.

### 23.5.92 Time-Stamping Clock Period Register (ENET\_ATINC)

Address: 218\_8000h base + 414h offset = 218\_8414h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

#### ENET\_ATINC field descriptions

Field	Description
31–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–8 INC_CORR	Correction Increment Value  This value is added every time the correction timer expires (every clock cycle given in ATCOR). A value less than INC slows down the timer. A value greater than INC speeds up the timer.
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
INC	Clock Period Of The Timestamping Clock (ts_clk) In Nanoseconds  The timer increments by this amount each clock cycle. For example, set to 10 for 100 MHz, 8 for 125 MHz, 5 for 200 MHz.  <b>NOTE:</b> For highest precision, use a value that is an integer fraction of the period set in ATPER.

### 23.5.93 Timestamp of Last Transmitted Frame (ENET\_ATSTMP)

Address: 218\_8000h base + 418h offset = 218\_8418h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### ENET\_TCSRn field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 TF	Timer Flag  Sets when input capture or output compare occurs. This flag is double buffered between the module clock and 1588 clock domains. When this field is 1, it can be cleared to 0 by writing 1 to it.  0 Input Capture or Output Compare has not occurred. 1 Input Capture or Output Compare has occurred.
6 TIE	Timer Interrupt Enable  0 Interrupt is disabled 1 Interrupt is enabled
5–2 TMODE	Timer Mode  Updating the Timer Mode field takes a few cycles to register because it is synchronized to the 1588 clock. The version of Timer Mode returned on a read is from the 1588 clock domain. When changing Timer Mode, always disable the channel and read this register to verify the channel is disabled first.  0000 Timer Channel is disabled. 0001 Timer Channel is configured for Input Capture on rising edge. 0010 Timer Channel is configured for Input Capture on falling edge. 0011 Timer Channel is configured for Input Capture on both edges. 0100 Timer Channel is configured for Output Compare - software only. 0101 Timer Channel is configured for Output Compare - toggle output on compare. 0110 Timer Channel is configured for Output Compare - clear output on compare. 0111 Timer Channel is configured for Output Compare - set output on compare. 1000 Reserved 1010 Timer Channel is configured for Output Compare - clear output on compare, set output on overflow. 10X1 Timer Channel is configured for Output Compare - set output on compare, clear output on overflow. 110X Reserved

Table continues on the next page...

### ENET\_TCSRn field descriptions (continued)

Field	Description
	1110 Timer Channel is configured for Output Compare - pulse output low on compare for one 1588-clock cycle. 1111 Timer Channel is configured for Output Compare - pulse output high on compare for one 1588-clock cycle.
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
0 TDRE	Timer DMA Request Enable 0 DMA request is disabled 1 DMA request is enabled

## 23.5.96 Timer Compare Capture Register (ENET\_TCCRn)

Address: 218\_8000h base + 60Ch offset + (8d × i), where i=0d to 3d

### ENET\_TCCRn field descriptions

Field	Description
TCC	<p>Timer Capture Compare</p> <p>This register is double buffered between the module clock and 1588 clock domains.</p> <p>When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag.</p> <p>The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow.</p> <p>When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.</p>

## 23.6 Functional description

This section provides a complete functional description of the MAC-NET core.

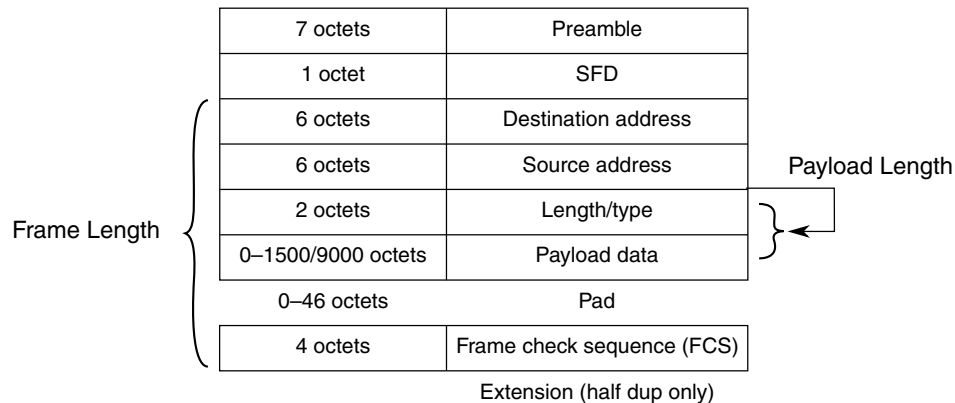

### 23.6.1 Ethernet MAC frame formats

The IEEE 802.3 standard defines the Ethernet frame format as follows:

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)
- Extension field is defined only for Gigabit Ethernet half-duplex implementations and is not supported by the MAC core

**Figure 23-106. MAC frame format overview**

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

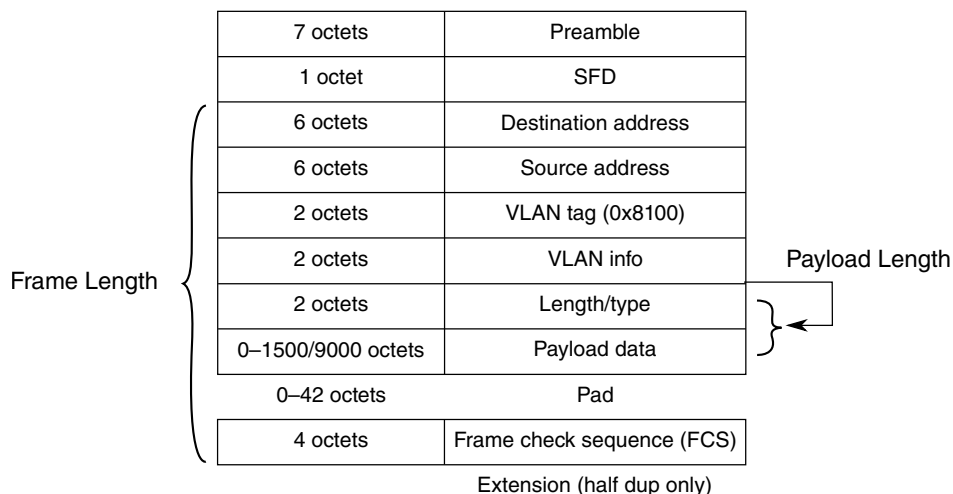

Figure 23-107. VLAN-tagged MAC frame format overview

Table 23-110. MAC frame definition

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. <ul style="list-style-type: none"> <li>• If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame.</li> <li>• If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.</li> </ul>
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in <a href="#">MAC address check</a> .

**Note**

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

**23.6.1.1 Pause Frames**

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

**Table 23-111. Pause Frame Format (Values in Hex)**

1	2	3	4	5	6	7	8	9	10	11	12	13	14
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01
Preamble							SFD	Multicast Destination Address					
15	16	17	18	19	20	21	22	23	24	25	26	27–68	
00	00	00	00	00	00	88	08	00	01	hi	lo	00	
Source Address						Type		Opcode		P1	P2	pad (42)	
69	70	71	72										
26	6B	AE	0A										
CRC-32													

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see [Full-duplex flow control operation](#) for details).

### 23.6.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions as described in [Magic packet detection](#).

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

### 23.6.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

### 23.6.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

**Table 23-112. Ethernet type value examples**

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

### 23.6.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

**Table 23-113. IPv4 header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Version				IHL				TOS				Length																			
Fragment ID								Flags				Fragment offset																			
TTL				Protocol				Header checksum																							
Source address																															
Destination address																															
Options																															

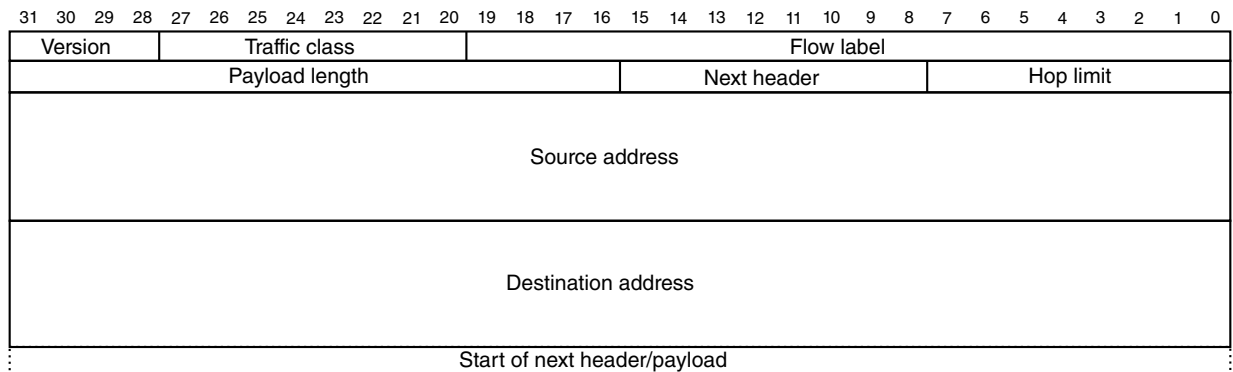

**Table 23-114. IPv4 header fields**

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

### 23.6.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly. The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

The first byte sent/received is the leftmost byte of the first word (in other words, version/traffic class fields).

**Figure 23-108. IPv6 header format**

**Table 23-115. IPv6 header fields**

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

### 23.6.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

**Table 23-116. ICMP header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Type				Code				Checksum																							
ICMP message data																															

**Table 23-117. IP header fields**

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type
Checksum	16-bit one's complement checksum over the complete ICMP datagram

### 23.6.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

**Table 23-118. UDP header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source port												Destination port																			
Length												Checksum																			

**Table 23-119. UDP header fields**

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

### 23.6.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

**Table 23-120. TCP header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source port												Destination port																			
Sequence number																															
Acknowledgement number																															
Offset				Reserved				Flags				Window																			
Checksum																Urgent pointer															
Options																															

**Table 23-121. TCP header fields**

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5

*Table continues on the next page...*

**Table 23-121. TCP header fields (continued)**

Field name	Description
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

### 23.6.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

#### 23.6.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

##### 23.6.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

[Table 23-122](#) shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

**Table 23-122. UDP/IP multicast domains**

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

**Table 23-123. UDP port numbers**

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

### 23.6.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

**Table 23-124. PTPv2 multicast domains**

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

### 23.6.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

#### 23.6.3.2.1 PTPv1 header

**Table 23-125. Common PTPv1 message header**

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	2	versionPTP = 0x0001							
2	2	versionNetwork							
4	16	subdomain							
20	1	messageType							
21	1	sourceCommunicationTechnology							
22	6	sourceUuid							
28	2	sourcePortId							
30	2	sequenceId							

*Table continues on the next page...*

**Table 23-125. Common PTPv1 message header (continued)**

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
32	1	control							
33	1	0x00							
34	2	flags							
36	4	reserved							

The type of message is encoded in the messageType and control fields as shown in [Table 23-126](#) :

**Table 23-126. PTPv1 message type identification**

messageType	control	Message Name	Message
0x01	0x0	SYNC	Event message
0x01	0x1	DELAY_REQ	Event message
0x02	0x2	FOLLOW_UP	General message
0x02	0x3	DELAY_RESP	General message
0x02	0x4	MANAGEMENT	General message
other	other	—	Reserved

The field sequenceId is used to non-ambiguously identify a message.

### 23.6.3.2.2 PTPv2 header

**Table 23-127. Common PTPv2 message header**

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	1	transportSpecific				messageId			
1	1	reserved				versionPTP = 0x2			
2	2	messageLength							
4	1	domainNumber							
5	1	reserved							
6	2	flags							
8	8	correctionField							
16	4	reserved							
20	10	sourcePortIdentity							
30	2	sequenceId							
32	1	control							
33	1	logMeanMessageInterval							

The type of message is encoded in the field messageId as follows:

**Table 23-128. PTPv2 message type identification**

messageId	Message name	Message
0x0	SYNC	Event message
0x1	DELAY_REQ	Event message
0x2	PATH_DELAY_REQ	Event message
0x3	PATH_DELAY_RESP	Event message
0x4–0x7	—	Reserved
0x8	FOLLOW_UP	General message
0x9	DELAY_RESP	General message
0xa	PATH_DELAY_FOLLOW_UP	General message
0xb	ANNOUNCE	General message
0xc	SIGNALING	General message
0xd	MANAGEMENT	General message

The PTPv2 flags field contains further details on the type of message, especially if one-step or two-step implementations are used. The one- or two-step implementation is controlled by the TWO\_STEP bit in the first octet of the flags field as shown below. Reserved bits are cleared.

**Table 23-129. PTPv2 message flags field definitions**

Bit	Name	Description
0	ALTERNATE_MASTER	See IEEE 1588 Clause 17.4
1	TWO_STEP	1 Two-step clock 0 One-step clock
2	UNICAST	1 Transport layer address uses a unicast destination address 0 Multicast is used
3	—	Reserved
4	—	Reserved
5	Profile specific	
6	Profile specific	
7	—	Reserved

## 23.6.4 MAC receive

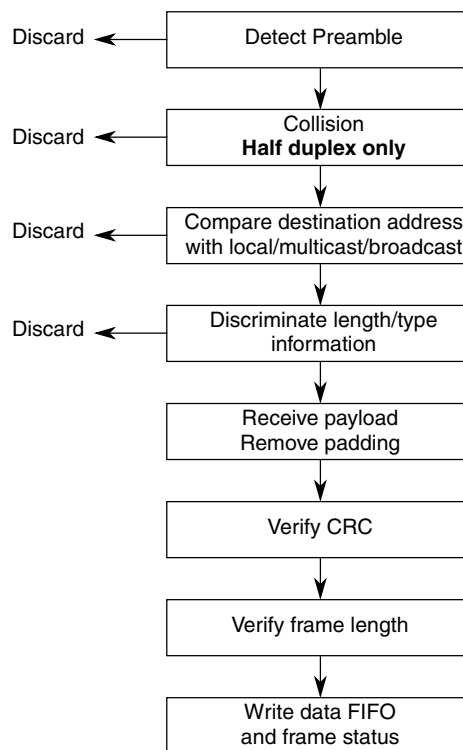

The MAC receive engine performs the following tasks:

- Check frame framing

## Functional description

- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

**Figure 23-109. MAC receive flow**

### 23.6.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

### 23.6.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100 Mbps operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

### 23.6.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

#### 23.6.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled ( $\text{RCR}[\text{PROM}] = 1$ ) no address checking is performed and all unicast frames are accepted.

#### 23.6.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in  $\text{ENET}_n\_GAUR/GALR$  (group address hash match) or  $\text{ENET}_n\_IAUR/IALR$  (individual address hash match).

## Functional description

- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET $n$ \_GAUR (msb = 1) or ENET $n$ \_GALR (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

If Promiscuous mode is enabled (ENET $n$ \_RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET $n$ \_GAUR/GALR and ENET $n$ \_IAUR/IALR settings.

### 23.6.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC\_REJ is cleared or ENET $n$ \_RCR[PROM] is set. If PROM is cleared when ENET $n$ \_RCR[BC\_REJ] is set, all broadcast frames are rejected.

**Table 23-130. Broadcast address reject programming**

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

### 23.6.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC\_REJ is set
- A unicast is received that does not match either:
  - Node address (PALR[PADDR1] and PAUR[PADDR2])
  - Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])
- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

### 23.6.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

### 23.6.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX\_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET<sub>n</sub>\_FTRL[TRUNC\_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

### 23.6.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxB[NO]) indicates that the current frame is VLAN tagged.

### 23.6.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET $n$ \_RCR[FCE] is cleared and are forwarded to the client interface when ENET $n$ \_RCR[PAUFWD] is set.

### 23.6.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET $n$ \_RCR[CRCFWD] is cleared and ENET $n$ \_RCR[PADEN] is set.

When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the  $x^{31}$  term as right-most bit of the first octet. The CRC bits are thus received in the following order:  $x^{31}, x^{30}, \dots, x^1, x^0$ .

If a CRC error is detected, the frame is marked invalid and RxB[CR] is set.

### 23.6.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of `ENET $n$ _RCR[PADEEN]`.

#### Note

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

### 23.6.5 MAC transmit

Frame transmission starts when the transmit FIFO holds enough data.

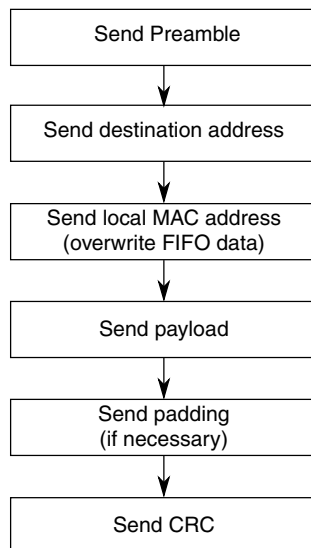

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if `ENET $n$ _TCR[TFC_PAUSE]` is set with `ENET $n$ _OPD[PAUSE_DUR]` set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if `TFC_PAUSE` is set with `PAUSE_DUR` cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required
- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

## Functional description

- Collision detection
- Frame retransmit after back-off timer expires

**Figure 23-110. Frame transmit overview**

### 23.6.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC ( $\text{TxBD}[\text{TC}] = 1$ ), the user application is responsible for providing frames with a minimum length of 64 octets.

### 23.6.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields ( $\text{ENET}_n\text{TCR}[\text{ADDINS}] = 1$ )
- Transparently forwarded to the Ethernet line ( $\text{ENET}_n\text{TCR}[\text{ADDINS}] = 0$ )

### 23.6.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

The 32 bits of the CRC value are placed in the FCS field so that the  $x^{31}$  term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order:  $x^{31}$ ,  $x^{30}$ , ...,  $x^1$ ,  $x^0$ .

### 23.6.5.4 Inter-packet gap (IPG)

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in  $ENETn\_TIPG$ ) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS/GMII\_CRS de-assertion.

### 23.6.5.5 Collision detection and handling — half-duplex operation only

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

## Functional description

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

**Figure 23-111. Packet re-transmit overview**

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the  $n^{\text{th}}$  re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- $k = \min(n, N)$ ; where  $n$  is the number of retransmissions and  $N = 10$

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by  $N = 10$  as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET $n$ \_EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

**warning**

Ethernet PHYs that support the SQE Test, or "heartbeat," feature must disable this feature. When this feature is enabled, the PHY asserts the collision signal after a frame is transmitted to indicate to the ENET that the PHY's collision logic is working. This may cause data corruption in the next frame from the ENET. This corrupted frame contains up to 21 zero bytes which start somewhere within the MAC destination address field. The ENET, however, will still generate a good FCS (CRC-32) but with corrupted data.

**23.6.6 Full-duplex flow control operation**

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

**23.6.6.1 Remote device congestion**

When the MAC transmit control gets a valid pause quanta from the receive path and if `ENETn_RCR[FCE]` is set, the MAC transmit logic:

- Completes the transfer of the current frame.
- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets `ENETn_TCR[RFC_PAUSE]`.

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets `RFC_PAUSE` to zero.

If `ENETn_RCR[FCE]` cleared, the MAC ignores received pause frames.

Optionally and independent of ENETn\_RCR[FCE], pause frames are forwarded to the client interface if PAUFWD is set.

### 23.6.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENETn\_TCR[TFC\_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC\_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENETn\_OPD[PAUSE\_DUR].

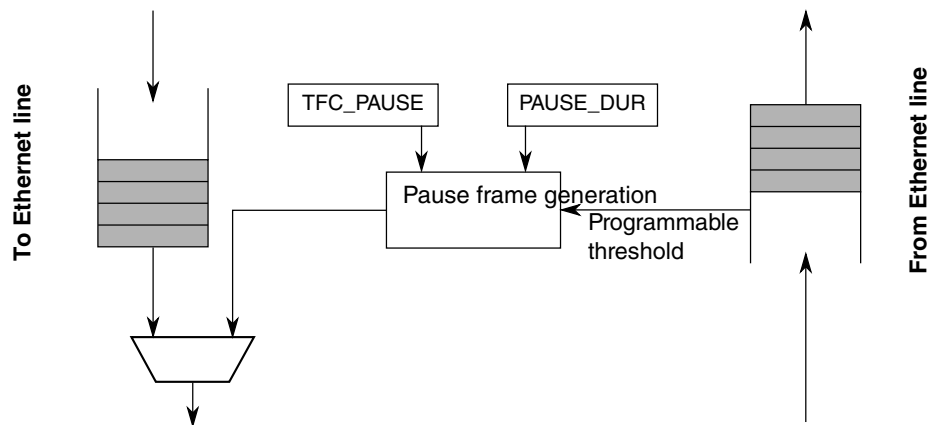

Figure 23-112. Pause frame generation overview

#### Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO,

the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

### 23.6.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

#### 23.6.7.1 Sleep mode

To put the MAC in Sleep mode, set ENET $n$ \_ECR[SLEEP]. At the same time ENET $n$ \_ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, when the processor is in Stop mode, Sleep mode is entered, without affecting the ENET $n$ \_ECR register bits.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

#### 23.6.7.2 Magic packet detection

The core is designed to detect magic packets (see [Magic packets](#)) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

### 23.6.7.3 Wakeup

When a magic packet is detected, indicated by ENET $n$ \_EIR[WAKEUP], ENET $n$ \_ECR[SLEEP] should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks ENET $n$ \_ECR[MAGICEN], disabling magic packet detection.

### 23.6.8 IP accelerator functions

The following sections describe the IP accelerator functions.

#### 23.6.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

**Table 23-131. IPv4 pseudo-header for checksum calculation**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source address																															
Destination address																															
Zero				Protocol								TCP/UDP length																			

**Table 23-132. IPv6 pseudo-header for checksum calculation**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source address																															
Destination address																															
TCP/UDP length																															
Zero																Next header															

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

### 23.6.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

### 23.6.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET $_n$ \_TACC and ENET $_n$ \_RACC registers.

When enabled, the valid frame data is arranged as shown in [Table 23-133](#).

**Table 23-133. 64-bit interface data structure with SHIFT16 enabled**

63	56	55	48	47	40	39	32	31	24	23	16	15	8	7	0
----	----	----	----	----	----	----	----	----	----	----	----	----	---	---	---

*Table continues on the next page...*

**Table 23-133. 64-bit interface data structure with SHIFT16 enabled (continued)**

Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6
...							

### 23.6.8.3.1 Receive processing

When `ENETn_RACC[SHIFT16]` is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

#### Note

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

### 23.6.8.3.2 Transmit processing

When `ENETn_TACC[SHIFT16]` is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

### 23.6.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (`ENETn_RSFL` cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
  - The frame has an invalid payload length
  - Frame length is greater than `MAX_FL`
  - Frame received with a CRC-32 error
  - Frame truncated due to receive FIFO overflow
  - Frame is corrupted as PHY signaled an error (`RX_ERR` asserted during reception)

- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENET $n$ \_RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

### 23.6.8.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBDFRAG) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBDPayload checksum].

#### Note

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

### 23.6.8.6 IPv6 support

The following sections describe the IPv6 support.

### 23.6.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see [32-bit Ethernet payload alignment](#)).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

### 23.6.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

## 23.6.9 Resets and stop controls

The following sections describe the resets and stop controls.

### 23.6.9.1 Hardware reset

To reset the Ethernet module, set ENET $n$ \_ECR[RESET].

### 23.6.9.2 Soft reset

When ENET $n$ \_ECR[ETHER\_EN] is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting GMII/TXER to the PHY.
- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

### 23.6.9.3 Hardware freeze

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII/GMII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

### 23.6.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER\_EN is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

### 23.6.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET $n$ \_TCR[GTS] is set by software.
- ENET $n$ \_TCR[TFC\_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see [Sleep mode](#)).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

### 23.6.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see [Magic packet detection](#)). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII/GMII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set
- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
  - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
  - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

### Note

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

#### 23.6.9.4.3 Graceful stop interrupt (GRA)

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC\_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

## 23.6.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set `ENETn_ECR[EN1588]` to enable 1588 support.

Figure 23-113. IEEE 1588 functions overview

### 23.6.10.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to  $(1 \times 10^9) - 1$ . The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

#### 23.6.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

**Figure 23-114. Adjustable timer implementation detail**

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in  $ENETn\_ATINC$ . The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in  $ENETn\_ATPER$ , defines the modulo when the counter wraps. In a typical implementation, the period is set to  $1 \times 10^9$  so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value  $(Current + Inc - (1 \times 10^9))$ , assuming the period is set to  $1 \times 10^9$ .

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in  $ENETn\_ATCOR$ , it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in  $ENETn\_ATINC$ . To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode ( $ENETn\_ATCR[SLAVE] = 1$ ), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules

within the system must operate from a single timer. When slave mode is enabled, you still must set `ENETn_ATINC[INC]` to the value of the master, since it is used for internal comparisons.

### **23.6.10.2 Transmit timestamping**

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set `TxBD[TS]` together with the frame.

If `TxBD[TS]` is set, the MAC records the timestamp for the frame in `ENETn_ATSTMP`. `ENETn_EIR[TS_AVAIL]` is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting `TxBD[TS]` when it transmits the frame for which a timestamp is needed, and then waits for `ENETn_EIR[TS_AVAIL]` to determine when the timestamp is available. The timestamp is then read from `ENETn_ATSTMP`. This is done for all event frames. Other frames do not use `TxBD[TS]` and, therefore, do not interfere with the timestamp capture.

### **23.6.10.3 Receive timestamping**

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on `RxBD[1588 timestamp]`. This is done for all received frames.

### **23.6.10.4 Time synchronization**

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to  $(1 \times 10^9) - 1$ . In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at  $1 \times 10^9$ .

### 23.6.10.5 Input Capture and Output Compare

The Input Capture Output Compare block can be used to provide precise hardware timing for input and output events.

#### 23.6.10.5.1 Input capture

The  $TCCR_n$  capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the  $1588\_TMR_n$  signals. An event will cause the corresponding  $TCSR_n[TF]$  timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the  $TCSR_n[TIE]$  field, an interrupt can be generated.

#### 23.6.10.5.2 Output compare

The  $TCCR_n$  compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the  $TCCR_n$  register, the corresponding flag,  $TCSR_n[TF]$ , is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by  $TCSR_n[TIE]$ , will be generated. The corresponding  $1588\_TMR_n$  output signal will be asserted according to  $TCSR_n[TMODE]$ .

#### 23.6.10.5.3 DMA requests

A DMA request can be enabled by setting  $TCSR_n[TDRE]$ . The corresponding DMA request is generated when the  $TCSR_n[TF]$  timer flag is set. When the DMA has completed, the corresponding  $TCSR_n[TF]$  flag is cleared.

### 23.6.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

## Functional description

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 512 words.

### 23.6.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

**Table 23-134. Receive FIFO thresholds definition**

Register	Description
ENET $n$ _RSFL [RX_SECTION_F ULL]	<p>When the FIFO level reaches the ENET<math>n</math>_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENET<math>n</math>_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again.</p> <p>If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted.</p> <p>To enable store and forward on the receive path, clear ENET<math>n</math>_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO.</p> <p>When programming a non-zero value to ENET<math>n</math>_RSFL (cut-through operation) it should be greater than ENET<math>n</math>_RAEM.</p>
ENET $n$ _RAEM [RX_ALMOST_E MPTY]	<p>When the FIFO level reaches the ENET<math>n</math>_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application).</p> <p>It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO.</p> <p>Set ENET<math>n</math>_RAEM to a minimum of six.</p>
ENET $n$ _RAFL [RX_ALMOST_F ULL]	<p>When the FIFO level approaches the maximum and there is no more space remaining for at least ENET<math>n</math>_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow.</p> <p>The corresponding error status is set when the frame is delivered to the application.</p> <p>Set ENET<math>n</math>_RAFL to a minimum of 4.</p>
ENET $n$ _RSEM [RX_SECTION_E MPTY]	<p>When the FIFO level reaches the ENET<math>n</math>_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client.</p> <p>When the FIFO level goes below the value programmed in ENET<math>n</math>_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client.</p> <p>Clearing ENET<math>n</math>_RSEM disables any pause frame generation.</p>

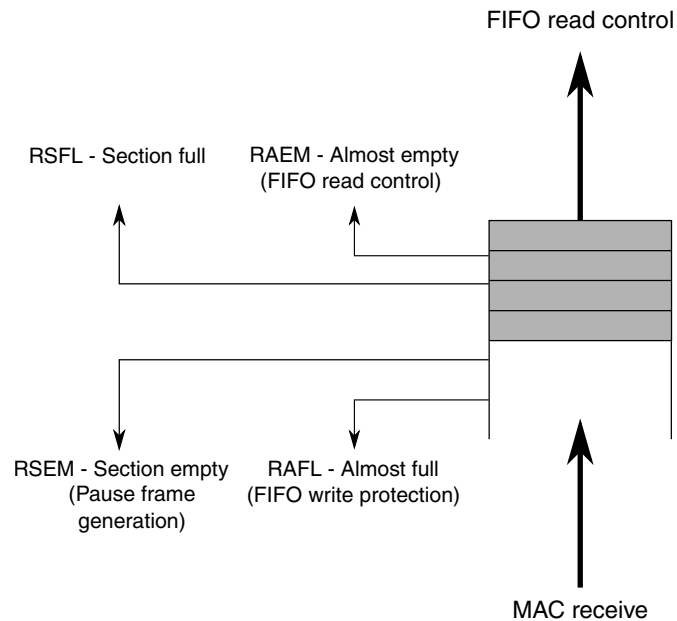

Figure 23-115. Receive FIFO overview

### 23.6.11.2 Transmit FIFO

Four programmable thresholds are available which control the core operation as described below.

Table 23-135. Transmit FIFO thresholds definition

Register	Description
ENET $n$ _TAEM [TX_ALMOST _EMPTY]	When the FIFO level reaches the ENET $n$ _TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication.  Set ENET $n$ _TAEM to a minimum of 4.
ENET $n$ _TAFL [TX_ALMOST _FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENET $n$ _TAFL number of words, the MAC deasserts its control signal to the application.  If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an GMII/MII error indication.  Set ENET $n$ _TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENET $n$ _TSEM [TX_SECTION _EMPTY]	When the FIFO level reaches the ENET $n$ _TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC.  When ENET $n$ _TSEM is 0, the signal is never deasserted.
ENET $n$ _TFWR	When the FIFO level reaches the ENET $n$ _TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

**Table 23-135. Transmit FIFO thresholds definition**

Register	Description
	<p>If a complete frame has a size smaller than the ENET<sub>n</sub>_TFWR threshold, the MAC also transmits the frame to the line.</p> <p>To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.</p>

**Figure 23-116. Transmit FIFO overview**

### 23.6.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENET<sub>n</sub>\_RCR register fields found here.

The core implements external and internal loopback options, which are controlled by the following ENET<sub>n</sub>\_RCR register fields:

**Table 23-136. Loopback options**

Register field	Description
LOOP	<p>Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces.</p> <p>In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s)</p>

**Figure 23-117. Loopback options**

### 23.6.13 Legacy buffer descriptors

To support the Ethernet controller on previous Freescale devices, legacy FEC buffer descriptors are available. To enable legacy support, clear `ENETn_ECR[1588EN]`.

#### NOTE

- The legacy buffer descriptor tables show the byte order for chips. `DBSWP` must be set to after reset to enable mode.

#### 23.6.13.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. contains the descriptions for each field.

#### 23.6.13.2 Legacy transmit buffer descriptor

The following table shows the legacy FEC transmit buffer descriptor. contains the descriptions for each field.

### 23.6.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set `ENETn_ECR[1588EN]`.

**NOTE**

The enhanced buffer descriptor tables show the byte order for chips. **DBSWP** must be set to after reset to enable mode.

**23.6.14.1 Enhanced receive buffer descriptor**

The following table shows the enhanced uDMA receive buffer descriptor. contains the descriptions for each field.

**23.6.14.2 Enhanced transmit buffer descriptor****23.6.15 Client FIFO application interface**

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

**23.6.15.1 Data structure description**

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

**Table 23-137. FIFO interface data structure**

	63	56 55	48 47	40 39	32 31	24 23	16 15	8 7	0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	
...	...								

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address

- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

### Note

On transmit, if `ENETn_TCR[ADDINS]` is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the `ENETn_PAUR` and `ENETn_PALR` registers.

**Table 23-138. FIFO interface frame format**

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

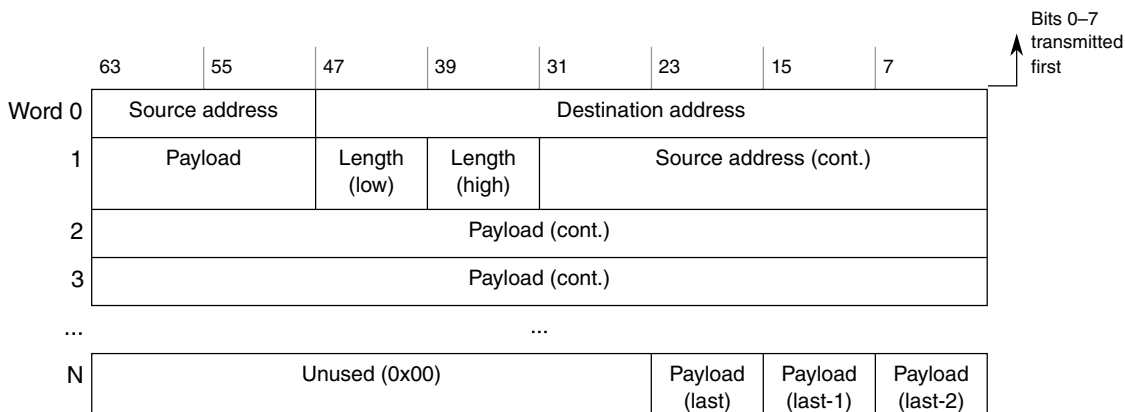

**Table 23-139. FIFO interface VLAN frame format**

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

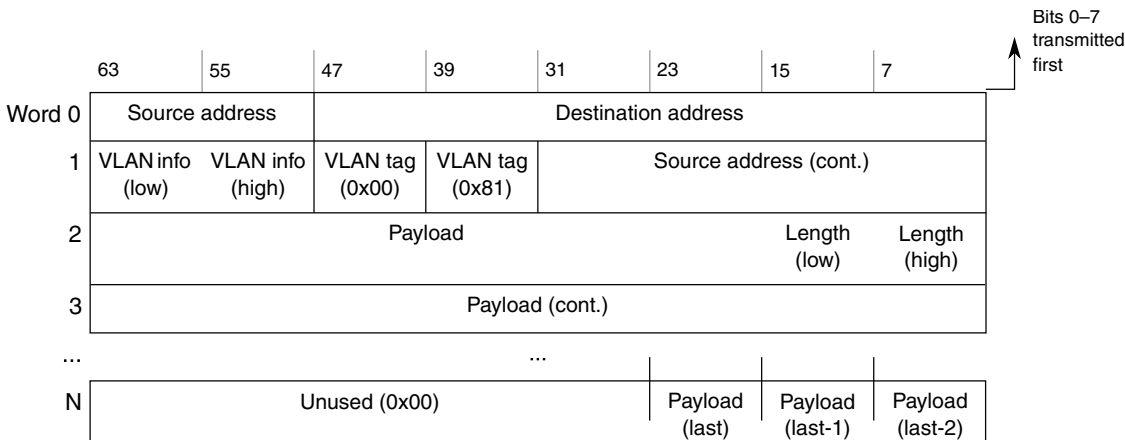

**Note**

The standard defines that the LSB of the MAC address is sent/received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

**23.6.15.2 Data structure examples**

**Figure 23-118. Normal Ethernet frame 64-bit mapping example**

**Figure 23-119. VLAN-tagged frame 64-bit mapping example**

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

**23.6.15.3 Frame status**

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

See [Enhanced buffer descriptors](#) for details.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxBD[ME] is also set with the last data of the frame.

## 23.6.16 FIFO protection

The following sections describe the FIFO protection mechanisms.

### 23.6.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII\_TXER) (1 in [Figure 23-120](#)) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII\_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

## Functional description

Figure 23-120. Transmit FIFO underflow protection

### 23.6.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurrence.

#### Note

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET $n$ \_ECR[ETHER\_EN], to clear the FIFOs and prepare for normal operation again.

### 23.6.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

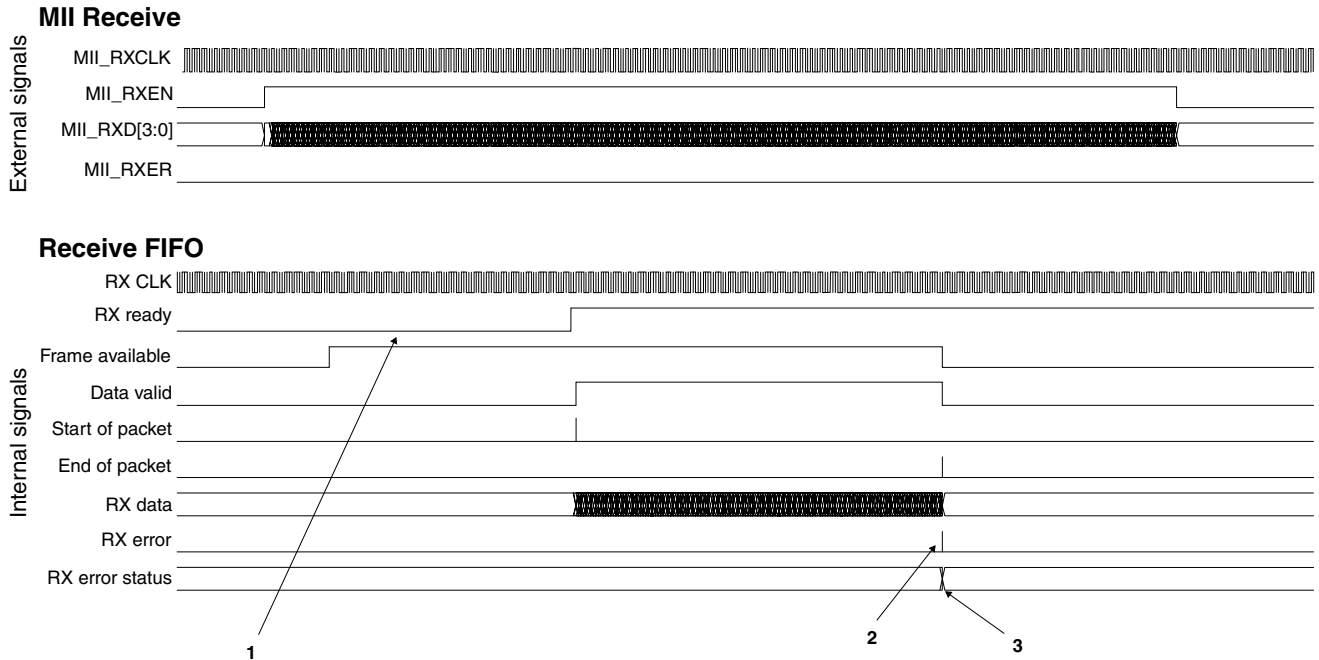

Figure 23-121. Receive FIFO overflow protection

### 23.6.17 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

#### 23.6.17.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

## Functional description

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

**Table 23-140. MDIO clause 22 frame structure**

ST	OP	PHYADR	REGADR	TA	DATA
----	----	--------	--------	----	------

**Table 23-141. MDIO frame field descriptions**

Field	Description
ST (2 bits)	Start indication field, programmed with ENET $n$ _MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENET $n$ _MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENET $n$ _MMFR[PA]. Up to 32 devices can be addressed.
REGADR (5 bits)	Five-bit register address, programmed with ENET $n$ _MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENET $n$ _MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data (16 bits)	Data, set by ENET $n$ _MMFR[DATA]. Written to or read from the PHY

### 23.6.17.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

**Table 23-142. MDIO clause 45 frame structure**

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA
----	----	-------	-------	----	-----------

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

**Table 23-143. MDIO clause 45 frame field descriptions**

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENET $n$ _MMFR[OP]. See <a href="#">Table 23-144</a> for more information. 00 Address write 01 Write operation 10 Read inc. operation 11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENET $n$ _MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
ADDR/DATA	16-bit address (for address write) or data, set by ENET $n$ _MMFR[DATA], written to or read from the PHY.

**Table 23-144. MDIO Clause 45 Transactions**

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

### 23.6.17.3 MDIO clock generation

The MDC clock is generated from the internal bus clock divided by the value programmed in ENET<sub>n</sub>\_MSCR[MII\_SPEED].

### 23.6.17.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET<sub>n</sub>\_MMFR) according to the description provided in MII Management Frame Register (ENET<sub>n</sub>\_MMFR).

To check when the programmed access completes, read the ENET<sub>n</sub>\_EIR[MII] field.

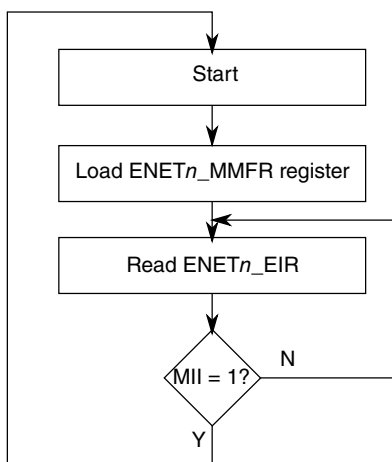

Figure 23-122. MDIO access overview

### 23.6.18 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)
- RMII 10/100 using interface converters/gaskets
- RGMII 10/100/1000 by way of interface converters/gaskets

The following table shows how to configure ENET registers to select each interface.

Mode	ECR[SLEEP]	RCR[RMII_10T]	RCR[RMII_MODE]	RCR[RGMIIE_EN]
MII - 10 Mbit/s	0	—	0	0
MII - 100 Mbit/s	0	—	0	0
RMII - 10 Mbit/s	0	1	1	0

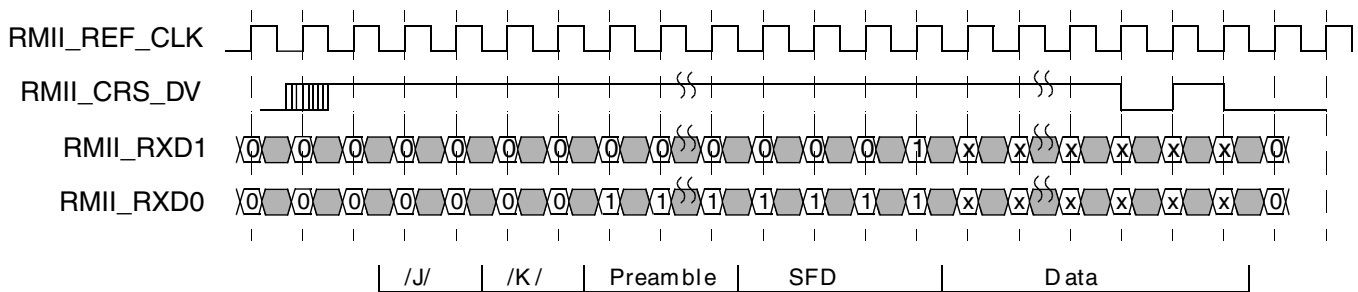

Table continues on the next page...

Mode	ECR[SLEEP]	RCR[RMII_10T]	RCR[RMII_MODE]	RCR[RGMII_EN]
RMII - 100 Mbit/s	0	0	1	0
RGMII - 10 Mbit/s	0	1	0	1
RGMII - 100 Mbit/s	0	0	0	1
RGMII - 1000 Mbit/s	1	—	0	1

### 23.6.18.1 RMII interface

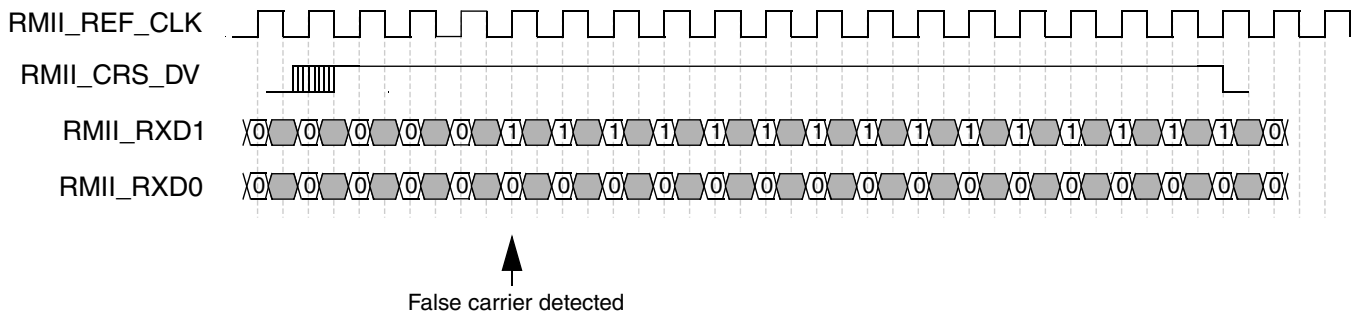

In RMII receive mode, for normal reception following assertion of CRS\_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

**Figure 23-123. RMII receive operation**

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

**Figure 23-124. RMII receive operation with false carrier**

In RMII transmit mode, TXD[1:0] provides valid data for each REF\_CLK period while TXEN is asserted.

Figure 23-125. RMII transmit operation

### 23.6.18.2 RGMII interface

In RGMII modes, the data and control information is multiplexed by taking advantage of both edges of the reference clocks.

The data signals contain the lower four data bits on the rising edge and the upper four bits on the falling edge. The control signals are multiplexed into a single clock cycle using the same technique.

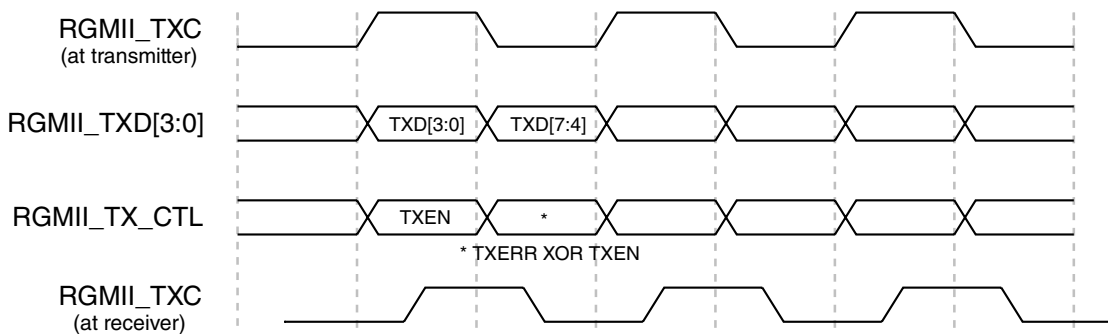

Figure 23-126. RGMII transmit operation

Figure 23-127. RGMII receive operation

### 23.6.18.3 MII Interface — transmit

On transmit, all data transfers are synchronous to MII\_TXCLK rising edge. The MII data enable signal MII\_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII\_TXD[3:0] bus.

Between frames, MII\_TXEN remains deasserted.

**Figure 23-128. MII transmit operation**

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII\_TXER error signal for one clock cycle at any time during the packet transfer.

**Figure 23-129. MII transmit operation — errored frame**

### 23.6.18.3.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII\_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

(See [Collision detection in half-duplex mode](#) for details)

Figure 23-130. MII transmit operation — transmission with collision

### 23.6.18.4 MII interface — receive

On receive, all signals are sampled on the MII\_RXCLK rising edge. The MII data enable signal, MII\_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII\_RXD[3:0] bus.

Between frames, MII\_RXDV remains deasserted.

Figure 23-131. MII receive operation

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII\_RXER, for at least one clock cycle at any time during the packet transfer.

**Figure 23-132. MII receive operation — errored frame**

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxBD[ME] set.

# Chapter 24

## Electrophoretic Display Controller (EPDC)

### 24.1 Overview

This chapter describes the architecture of the EPDC. It provides a detailed description of the block for digital design and software driver development.

The EPDC is a feature-rich, low power and high performance direct drive active matrix EPD controller. It is specifically designed to drive E•INK™ EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution, while reaching much higher levels of performance at lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the PXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

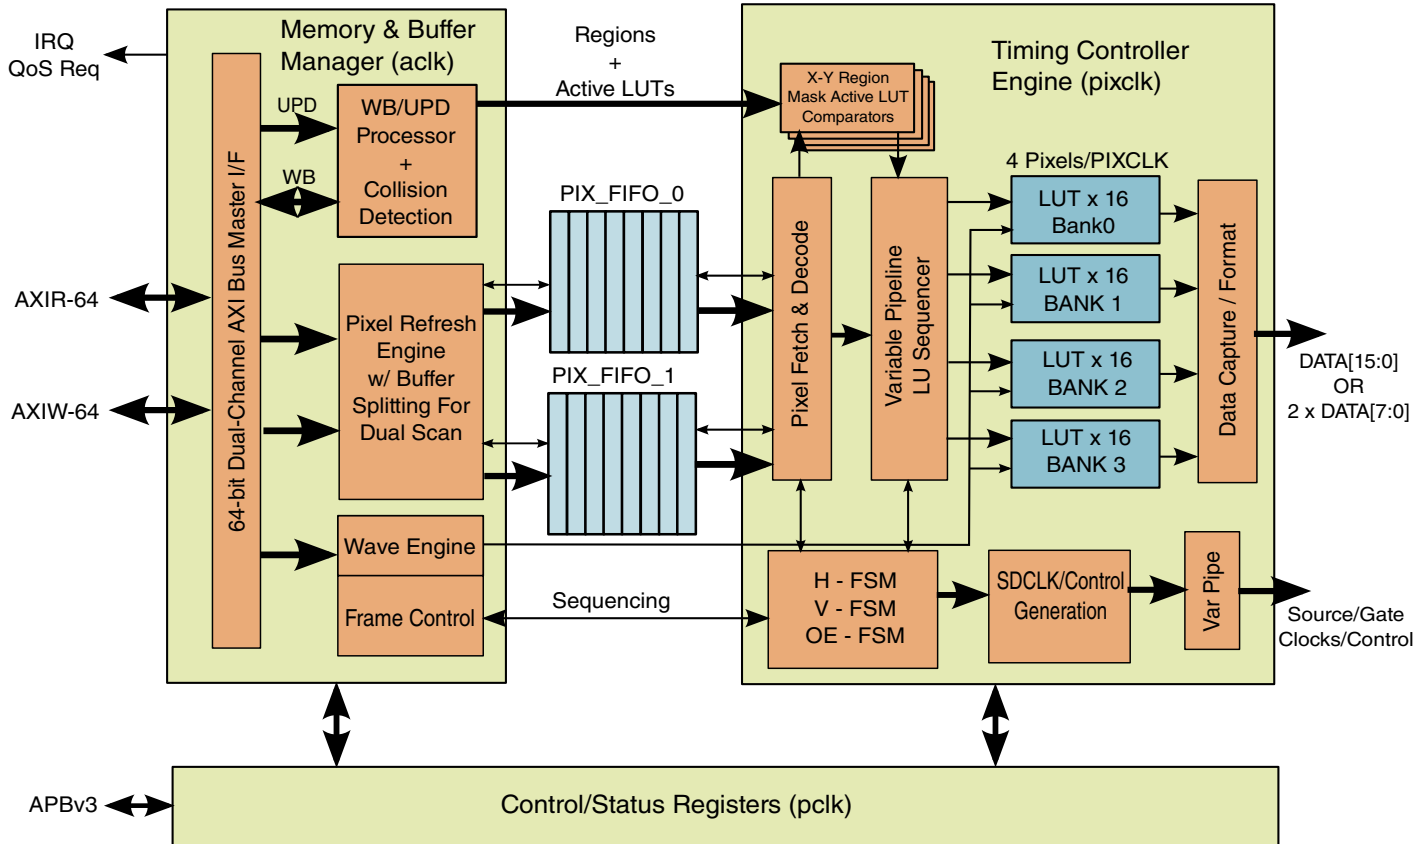

- TFT resolutions up to 4096 x 4096 pixels with 20 Hz refresh (programmable up to 8191 x 8191)
- TFT resolutions up to 1650 x 2332 pixels at 106 Hz refresh
- Industry standard bus interfaces (AMBA AXI and APB)
- Up to 5-bit pixel representation for up to 32 greyscale levels
- Up to 64 concurrent updates with partial update support, except for 32(5-bit) grey level panel for which only 16 concurrent updates can be used
- Automatic collision handling when used in conjunction with the i.MX device driver
- Dual-scan TFT drive mode to support ultra high resolution/refresh rate displays
- Flexible direct drive TFT interface supporting next generation source driver, gate driver and panel architectures, including LVDS, DDR and multi-level source drivers
- Unified generic configurable timing mode (Pigeon Mode) available on most panel timing control signals
- High performance pixel pipeline architecture to guarantee refresh performance at high pixel rates without the need for high internal clocking

## Overview

- Ability to process multiple updates asynchronously to refresh/update operations with ability to intercept each frame scan will multiple update requests
- Performance tuning capabilities which can interface with SoC level memory arbitration mechanisms further guaranteeing frame refresh operation
- Decoupled clocking architecture allowing for independent and asynchronous clock sources for memory bus, peripheral bus and pixel clock domains
- Full and partial update mode support
- Support for up to 256 waveform modes, also support optimal waveform auto-selection based on grey level of the pixels being updated
- Low power mode operation via architectural clock gating
- Update buffer analysis functions to get information like collision rectangle, grey level

### 24.1.1 EPDC Block Diagram

The top-level view of the EPDC is shown in the following figure.

**Figure 24-1. EPDC Top-Level Block Diagram**

The EPD function can be separated into two major asynchronous processes. The first is the front end portion which is responsible for processing display updates. The second is the function of driving waveforms to the TFT panel in order to update the screen contents (the refresh operation). The EPDC is comprised of two major submodules (MBM and TCE) which mirror the architectural split in the EPD algorithm. These submodules communicate through a number of control/sequencing signals and data (through the pixel FIFOs and LUT memories):

- **Memory and Buffer Manager (MBM):** This submodule is responsible for all memory-related operations and LUT life cycle control, which involves the frame count management for all updates. This module is clocked by both *acclk* and *pixclk*. It also encapsulates the APB register interface which is clocked by *acclk* too.
- **Timing Control Engine (TCE):** This submodule is responsible for performing TFT scan frame refreshes. It is clocked by *pixclk*. It also houses the LUT memory system.

## 24.2 External Signals

The following table describes the external signals of EPDC:

**Table 24-1. EPDC External Signals**

Signal	Description	Pad	Mode	Direction

## 24.3 Programming Model

From an application perspective, the EPDC HW/SW solution aims to abstract much of the details of driving an EPD display from the user space.

This is achieved through a blend of HW features and the kernel-level SW driver implementation of the EPD frame buffer. The scope of this chapter mostly pertains to EPDC HW but in order to correctly define the context of the programming model, certain assumptions about the driver architecture (including use of the eXPX IP) are described below.

## 24.3.1 Assumptions

The scope of the EPDC does not include certain functions performed by the driver and application layer.

These features are as follows:

- Maintenance of update and collision lists. This includes, but is not limited to, responsibility for managing update order. Updates are processed in the order they are received by the EPDC. Actual start times of multiple updates can occur on the same frame scan. All pixels contained within an update will always begin on the same frame scan.
- Border control. This function is assumed to be performed by a GPIO functionality.
- EPD Panel Power Management. It is assumed that the driver and application layers will control the panel PMIC functions including relevant interfaces such as I<sup>2</sup>C and 4-wire power sequencing signals.
- Reading and decompression of the waveform file. This is assumed to be unpacked, reformatted and written to system memory into a form that is easily accessed by the EPDC.
- Waveform mode selection. The EPDC provides a mechanism through its histogram analysis feature (which can be run as part of any frame/region processing operations) to allow the SW driver to characterize the region/buffer in terms of gray-map content. For example, EPDC can determine if the update region (considering only those pixels undergoing a transition) contains only 2, 4, 8 or 16 gray levels, HW can automatically select waveform mode according to a programmed LUT holding mapping between grey level and waveform mode. SW driver can also manually choose the appropriate waveform update mode (e.g., when doing an update to repair ghosting artifacts).

## 24.3.2 Register Space (Write/Set/Clear/Toggle)

The EPDC registers utilize four word address locations per 32-bit register.

For control registers (especially interrupts), this provides for a unique address for the following operations:

- Write (0x0). The base address of the register allows full writes to the 32-bit register.
- Set (0x4). This address allows a set operation on the register or its fields; writing a 1 to a register bit/field with the set address will set that bit. Writing a 0 to the set address has no effect.
- Clear (0x8). This address allows a clear operation on the register or its fields; writing a 1 to a register bit/field with the clear address will clear that bit or field.

**NOTE**

Interrupt status bits (such as those contained in EPDC\_IRQ) must be cleared with the clear address only. Writing to the EPDC\_IRQ register with a 0 will not clear the interrupt status/source. Writing a 0 to the clear address has no effect.

- Toggle (0xc). This address allows a toggle operation on the register or its fields; writing a 1 to a register bit/field with the toggle address will invert the state of that bit/field. This address is especially useful because it provides the ability to perform a read-modify-write operation with a single write operation. Writing a 0 to the toggle address has no effect.

**24.3.3 Interrupts****24.3.3.1 Interrupt Sources**

The EPDC contains 72 ( 64 of LUT completes IRQs and 8 of common IRQs ) unique interrupt sources. Each interrupt source has an interrupt status bit captured in EPDC\_IRQ /EPDC\_IRQ1/EPDC\_IRQ2 .

When an interrupt event occurs, the appropriate bit within the EPDC\_IRQ\* register is set by the EPDC. Each of the bits in EPDC\_IRQ is first AND'ed with its enable bit (in EPDC\_IRQ\_MASK\*), and then the masked bits are logically OR'ed together to generate the final output.

**24.3.3.2 Enabling/Masking Interrupts**

Each of the EPDC interrupt sources can be individually enabled through the bits in the EPDC\_IRQ\_MASK\* register.

Even if an interrupt source is masked out (IRQ\_EN bit set to 0), its status will still be available in the EPDC\_IRQ\* register. The difference is that it does not result in the interrupt line being asserted.

**24.3.3.3 Handling/Clearing Interrupts**

When the software driver is entered as a result of an EPDC interrupt it should read the EPDC\_IRQ\* interrupt status register.

Because multiple interrupts may have fired, in the case of a collision for example, both WB\_CMPLT\_IRQ and LUT\_COL\_IRQ fields of EPDC\_IRQ will be set. Once the interrupt has been handled, the driver should clear the interrupt source by writing to the CLEAR address (see [Register Space \(Write/Set/Clear/Toggle\)](#) for details).

When collision has occurred and the LUT\_COL\_IRQ bit is set, SW will handle the collision and clear LUT\_COL\_IRQ. Please note HW will also clear the entire EPDC\_STATUS\_COL\* register at the same time on LUT\_COL\_IRQ clearing by SW.

## 24.3.4 Controller Setup

Before screen update operations can be performed, the EPDC should be configured appropriately.

These rudimentary setup operations include:

- Waveform data must be present in memory (in a format that is consistent with the method in which the EPDC accesses it). Because the format of the waveform data is supplier proprietary information, it is not discussed in this chapter.
- Configuring the panel architecture parameters (source and gate-driver configuration)
- Configuring line and frame timing parameters
- Initializing the working buffer and panel

### 24.3.4.1 Memory Requirements

EPDC requires continuous access to the unpacked waveform data, the update region buffer, and its working buffer.

These are all expected to reside in system memory (typically external DRAM). As such, each has particular requirements:

- The Working Buffer (WB), which is pointed to by EPDC\_WB\_ADDR, must have EPDC\_RES[HORIZONTAL] x EPDC\_RES[VERTICAL] x 2 bytes allocated. This buffer is used by the EPDC to process updates and perform TFT refresh operations.
  - EPDC\_RES[HORIZONTAL] mod 4 must equal to 0 for memory allocation calculations because the EPDC constructs each line of the working buffer at a 64-bit boundary.
- The Update Buffer, which is pointed to by EPDC\_UPD\_ADDR (and can be redefined with a different address for each update), must have the following allocation in memory:
  - a. when stride feature not enabled

- EPDC\_UPD\_SIZE[HEIGHT] x EPDC\_UPD\_SIZE[WIDTH] bytes
- Note that EPDC\_UPD\_SIZE[WIDTH] mod 8 must equal to 0 for memory allocation purposes. This means that for the address size allocation, the WIDTH field must be rounded up to the nearest number so that it can be divided by 8. This is because the EPDC reads each line of the update buffer at a 64-bit boundary (it should be noted that this is consistent with the ePXP IP output). The actual value programmed for the update can be at the pixel granularity.
- The waveform data set size is a function of mode count, number of temperature tables and number of frames required for each temperature-compensated mode.

In summary, the memory requirements are as follows (in bytes):

- $WB\text{-roundup4}(EPDC\_RES[HORIZONTAL]) \times EPDC\_RES[VERTICAL] \times 2$

### 24.3.4.2 Panel Architecture Configuration

The EPDC is designed to directly drive EPD panels which typically expose the source and gate driver IC interfaces (these are often abstracted in traditional displays such as TFT-LCD).

The source and gate driver ICs are responsible for driving the TFT matrix. There are variations in both the panel architectures and the underlying source and gate driver IC functionality.

All the key configuration parameters are defined in the EPDC\_RES, EPDC\_FORMAT, EPDC\_TCE\_CTRL, EPDC\_TCE\_SDCFG and EPDC\_TCE\_GDCFG registers as follows.

- EPDC\_RES:
  - HORIZONTAL: The panel horizontal resolution (in pixels). The horizontal resolution must be an integer multiple of the source driver PIXELS\_PER\_SDCLK value. It also must be an integer multiple of the PIXELS\_PER\_CE value.
  - VERTICAL: The panel vertical resolution (in pixels). This can be any integer value.
- EPDC\_FORMAT:
  - DEFAULT\_TFT\_PIXEL: This field should almost always be left at 0x00. This register field is used as the value for the TFT pixel during a frame scan when a pixel is not being updated. This condition is commonplace especially when using partial updates or updates which do not encompass the entire screen resolution. This value must always correspond to the state the source driver should see when

no voltage change is needed. Incorrectly setting this value will damage the EPD material.

- **TFT\_PIXEL\_FORMAT:** This enumerated field defines the width of the TFT pixel. The TFT pixel is defined as the per-pixel voltage control value. The most common pixel format is 2B (2 bits per pixel). Panels which support source driver voltage modulation (multi-level voltage control) should use the 4B format. For source drivers that support 7 levels, the 4B format can be used and the unused DATA output pins should be left floating at the board level connection (specifically DATA3, 7, 11, 15). The 2BV and 4BV are variations which require the waveform data to supply a 2-bit VCOM value for each pixel.
- **EPDC\_TCE\_CTRL:**
  - **SDDO\_WIDTH:** This selects 8- or 16-bit DATA operation using enumerations 8-bit and 16-bit. This field is used to describe useful data for panels that support LVDS. DATA[15:8] would be used to drive differential data. In these modes, SDDO\_WIDTH would be set to 8-bit.
  - **VCOM\_MODE, VCOM\_VAL:** This VCOM\_MODE bit allows the EPDC to either use the VCOM value supplied in the waveform or a software programmable value defined in the VCOM\_VAL field, for panels which support VCOM modulation.
  - **DDR\_MODE:** This mode-bit should be set for panels which expect source-driver data to be available on both edges of the SDCLK. This is common place for panels that support differential signaling, but the feature is not limited to LVDS panels. For example, the EPDC supports DDR modes which make full use of DATA[15:0]. In these modes, DDR\_MODE = 1 and LVDS\_MODE = 0.
  - **LVDS\_MODE:** This mode always requires DDR\_MODE to be set. When this mode bit is set, differential signaling is enabled such that DATA[15:8] always drives the inverse of the pixel data which is presented on DATA[7:0]. Because LVDS source-drivers use 2 pins per data-bit, they are typically configured to work in DDR mode. Differential signaling is also supported on the SDCE pins (as an option selected by LVDS\_MODE\_CE). In this mode SDCE[9:5] are used to drive the inverse differential signals for SDCE[4:0].
  - **LVDS\_MODE\_CE:** When LVDS\_MODE is set, this bit can also be set to allow SDCE[9:5] to act as differential pairs for each SDCE[4:0].
  - **DUAL\_SCAN:** Setting this field enables the dual scan function. When this field is set, all other parameters (except resolution) should be programmed in reference to each half of the panel. Because DUAL\_SCAN modes require 2x the pixel-generation capability, there are limitations to the available TFT modes supported in this configuration (see [Table 24-2](#) for details).
  - **SCAN\_DIR0, SCAN\_DIR1:** These fields determine the vertical scan direction of the panel.

- **SCAN\_DIR0**: Determines the vertical scan direction of the panel when `DUAL_SCAN = 0`. When `DUAL_SCAN = 1`, it determines the vertical scan direction of the top-half of the panel (0 means scan down and 1 means scan up).
- **SCAN\_DIR1** only has meaning when `DUAL_SCAN = 1`. It defines the vertical scan direction of the bottom half of the panel.
- **PIXELS\_PER\_SDCLK**: This is a key configuration and timing parameter. Each source driver latches a number of TFT pixels per shift clock period (SDCLK). This register defines how many pixels are driven per SDCLK period. When `DDR_MODE = 1`, pixels are driven on both edges of the clock, so this value must be adjusted accordingly. See [Table 24-2](#) for the required values per mode.
- **EPDC\_TCE\_SDCFG**:
  - **SDCLK\_HOLD**: Holds the SDCLK low during the `LINE_BEGIN` time. The purpose of this field is to allow the user to set a `LINE_BEGIN` time which is not an integer multiple of SDCLKs (for fine tuning the line-time).
  - **SDSHR**: Defines the value of the SDSHR output signal which determines the source driver output order mapping.
  - **NUM\_CE**: Defines the total number of source driver chip-enables (must be 1-10). This number doesn't always correspond to the number of source drivers in the panel. Many panels require only a single chip-enable signal which is active during the entire line data time. This signal is often called SPH (Horizontal Start Pulse) in such cases.
  - **PIXELS\_PER\_CE**: This register defines the span of each chip-enable expressed in pixels. For panels that utilize a single global CE, this value should be set to the horizontal resolution of the panel.
  - **SDDO\_REFORMAT**: This enumerated field allows for TFT-pixel level reordering within `DATA`. For most panels it is recommended to set `SDDO_REFORMAT` to the `REVERSE_PIXELS` enumeration.
  - **SDDO\_INVERT**: When this field is set, the values on `DATA` are inverted relative to the values extracted from the waveform LUT operations.
- **EPDC\_TCE\_GDCFG**:
  - **GDRL**: Defines the value of the GDRL output signal which determines the gate driver pulse shift direction.
  - **GDOE\_MODE**: This field selects between two possible methods for driving the GDOE signal. When `GDOE_MODE = 0`, the GDOE output is always driven during the frame scan time, except during `FRAME_SYNC` when it is driven low. When `GDOE_MODE = 1`, the GDOE signal mimics the GDCLK signal but is only active during the frame-data time (FD). For most panels the recommended setting is 0.
  - **GDSP\_MODE**: This field selects between two possible methods for driving the GDSP signal. When `GDSP_MODE = 0`, the GDSP signal is driven on the first

line clock time of the FRAME\_BEGIN time. The signal is driven for one GDCLK period (same as line time), and can be shifted using the GDSP\_OFFSET control. When GDSP\_MODE = 1, GDSP is active during the entire FRAME\_SYNC time, and GDSP\_OFFSET has not effect in this mode.

### 24.3.4.3 TFT Panel Timing Configuration

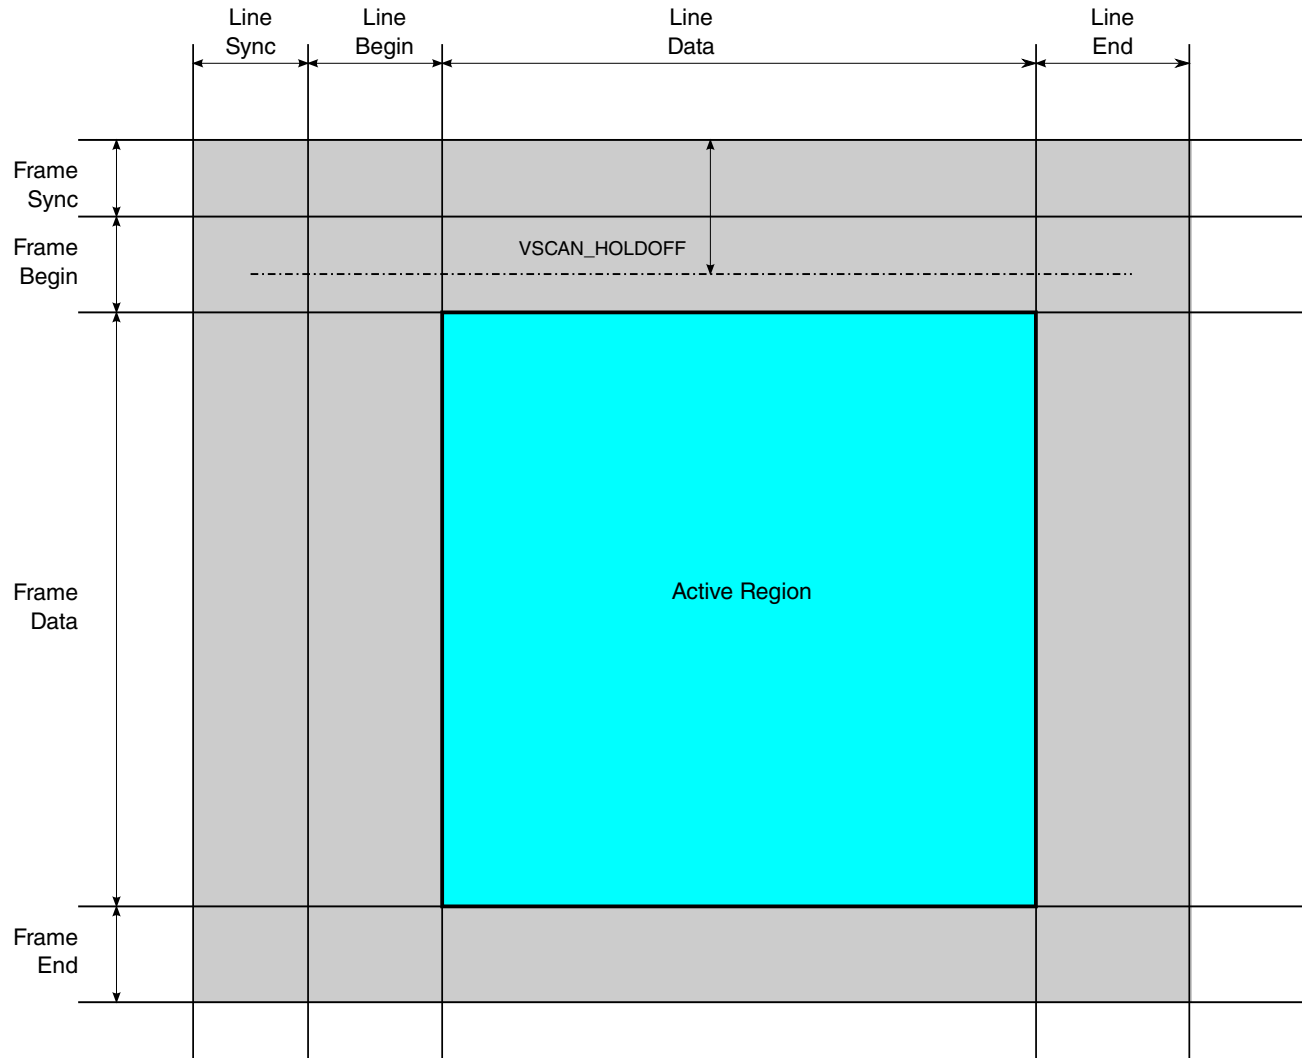

The EPDC provides a simple primary set of registers to define TFT line and frame (refresh) timing.

In addition to these, there are also low-level timing and polarity registers to provide additional flexibility in dealing with future TFT architectures.

The following figure shows how the horizontal and vertical timing is defined in terms of the various timing parameters. When configuring the TFT timing, the following goals should be met:

- Arrive at a refresh rate that matches the waveform requirement (for example, 50 Hz for 50 Hz waveform). The refresh rate is defined as the time between each frame sync event and can be expressed as a multiple of the line timing and the total number of vertical lines.
- Meet the various timing requirements of the gate and source driver clock and control signals (the blanking period provide an infrastructure for controlling these).
- Stay below the maximum source-driver clock (usually referred to as CL) frequency.
- Arrive at a source driver clock frequency which in turn defines the exact pixclk frequency. In most cases, E-INK™ provides the expected SDCLK frequency.
- Meet the line-timing (LT) requirements of the E-INK panels and their associated waveforms.

For proper waveform performance, it is critical to match the refresh frequency to that required by the waveform and associated panel. Deviation from this frequency results in short term inaccuracy of color and in the long term, complete loss of coherency between the EPDC's internal representation of color and the physical representation on the screen.

**Figure 24-2. Frame Timing**

The following equations define the timing of the panel scan frame (where LT = line-timing and FT = frame-timing):

$$LT = TPIXCLK (LS + LB + (HRES \times \left( \frac{\text{Ratio}}{\text{PIXELSPERSDCLK}} \right) + LE)$$

$$FT = LT \times (FS + FB + VRES + LE)$$

Ratio is defined between the internal PIXCLK and the external source driver clock SDCLK. The ratio is automatically determined by the EPDC according to [Table 24-2](#). A simple method to determine the ratio is as follows:

- When `DDR_MODE = 1`, `RATIO = 4`
- When `DDR_MODE = 0`
  - If `PIXELS_PER_SDCLK = 8`, `RATIO = 4`
  - Else, `RATIO = 2`

Typically it is recommended to seed these equations with an estimated (or provided) SDCLK frequency and adjust the various timings until the desired refresh rate is attained.

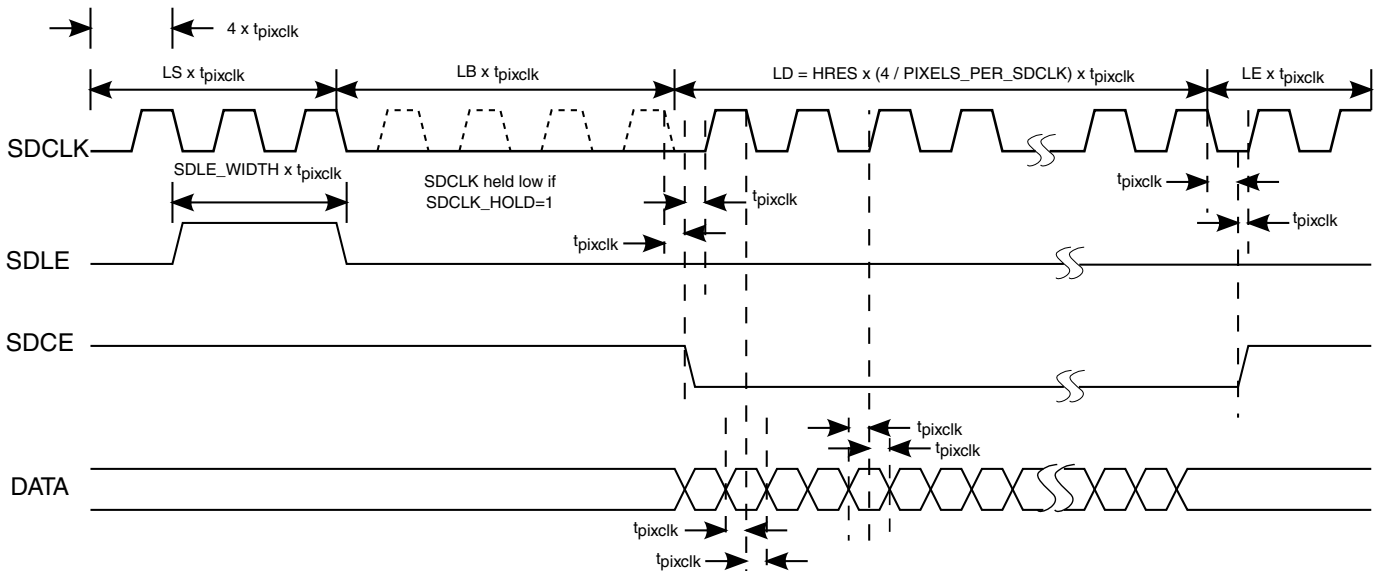

The following figure shows line timing for cases, where `DDR_MODE = 0` (those cases where data is only sampled by the source driver on the rising edge of SDCLK).

Depending on the mode (see [Table 24-2](#)), the ratio is a function of TFT pixel width and `PIXELS_PER_SDCLK`, so the timings are shown generically. For the purposes of this diagram, `RATIO` can either be 2 or 4.

**Figure 24-3. Line Timing (`DDR_MODE = 0`)**

As per [Table 24-2](#), when `DDR_MODE=1` (for example, for source drivers that require data to be driven on each edge of SDCLK), the `RATIO` is always set to 4. The timing for such cases is shown in the figure below.

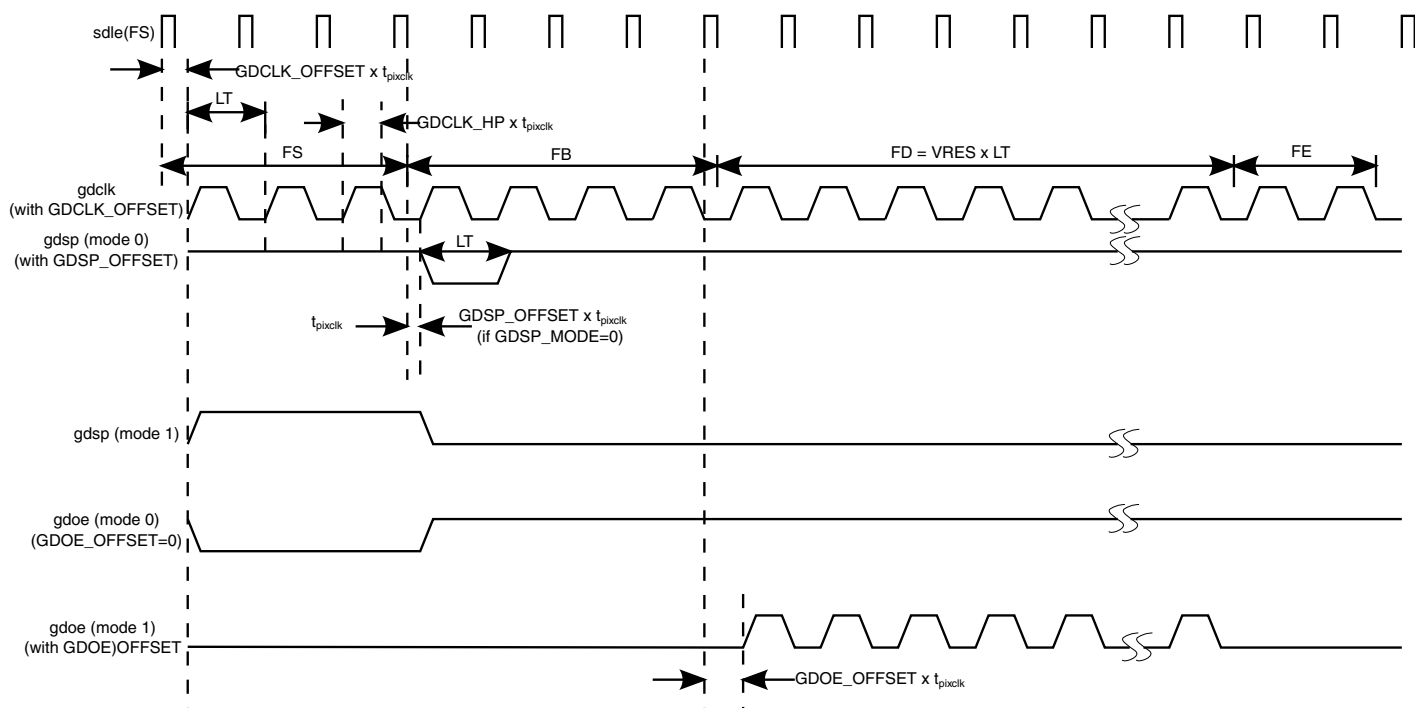

**Figure 24-4. Line Timing (DDR\_MODE = 1) - RATIO = 4**

Vertical timing or frame timing (FT) is always expressed in terms of line timing (LT). This is shown in the following figure, followed by a detailed view of the GDCLK timing (which has programmable duty cycle to allow programming of gate-on/gate-off time) in [Figure 24-6](#). The following important points should be noted in regard to gate driver timing:

- All gate driver timing signals are independently referenced to the LINE\_SYNC leading edge (this includes GDCLK\_OFFSET, GDSP\_OFFSET, and GDOE\_OFFSET).
- GDSP\_OFFSET is only supported for GDSP\_MODE = 1
- For GDOE\_MODE = 1, if GDOE is expected to be delayed relative to GDCLK, the GDOE\_OFFSET value should be set at a value appropriately greater than GDCLK\_OFFSET.
- All offset settings are programmed in terms of PIXCLK cycles.
- By default, if all offset values are set to 0, the gate driver signals are always one PIXCLK cycle delayed from the LINE\_SYNC leading edge.
- The LINE\_SYNC leading edge doesn't depend on the LINE\_SYNC\_WIDTH value. In cases where LINE\_SYNC\_WIDTH is set to some value that is less than LINE\_SYNC, a virtual leading edge which determines the line start time still exists.

## Programming Model

**Figure 24-5. Frame Timing (Vertical)**

**Figure 24-6. GDCLK Duty Cycle**

An example calculation based on the 800 x 600 E-INK 6" panel with 50 Hz waveforms is shown be:

- $PIXELS\_PER\_SDCLK = 4$
- Ratio = 2 (2 bpp, 8-bit single-ended, SDR per [Table 24-2](#))
- $t_{PIXCLK} = 17.64 \text{ MHz}$  (assuming available chip clock frequency)
- $LS = 20 \times t_{PIXCLK}$
- $LB = 8 \times t_{PIXCLK}$
- $LD = 800 \times (2/4) \times t_{PIXCLK} = 400 \times t_{PIXCLK}$
- $LE = 142 \times t_{PIXCLK}$
- $LT = (20 + 8 + 400 + 142) \times t_{PIXCLK} = 32.31293 \text{ uS}$

`LINE_SYNC_WIDTH` does not affect line timing. It should be set to the same value as `LINE_SYNC`, unless `LB` and `LE` are short and it is used to shorten the width of `SDLE` whilst still maintaining the same line-timing.

It is important to meet the target line time of the panel which was 32.312  $\mu$ S. Then the frame-rate can be calculated and given the vertical timings:

- $FS = 4 \times LT$
- $FB = 4 \times LT$
- $FD = 600 \times LT$
- $FE = 10 \times LT$
- $FT = (4 + 4 + 600 + 10) \times LT = 50.07665 \text{ Hz}$

In addition to this, E-INK panels require a particular duty cycle for the GDCLK signal which is specified as gate-on-time and gate-off-time. The sum of gate-off and gate-on should equal LT and the value of gate-on can be programmed through HW\_EPDC\_TCE\_TIMING2[GDCLK\_HP], or GDCLK High-Pulse time.

#### 24.3.4.4 Source Driver and Pixel Clock Configuration

The EPDC supports a number of source driver architectures. Each architecture forces a particular shift clock pixel rate.

In addition to this, the selection of the architecture requires a particular clock ratio between the internal pixel clock (pixclk) and external shift clock EPDC\_SDCLK. The table below outlines the various configurations and clock ratios. It also lists the relevant register settings for this configuration.

**Table 24-2. Interface Modes**

High-Level Mode		HW_EPDC_CTRL [DUAL_SCAN]	EPDC_DATA pins used	HW_EPDC_FORM_AT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
Single Scan	2bpp, 8-bit single-ended, SDR	0	[7:0]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
	2bpp, 16-bit single-ended, SDR	0	[15:0]	2B[V]	EIGHT	0	0	16BIT	SDCLK x 4
	2bpp, 8-bit, DDR (LVDS option)	0	[7:0],[15:8]	2B[V]	EIGHT	110	1	8BIT	SDCLK x 4

*Table continues on the next page...*

**Table 24-2. Interface Modes (continued)**

High-Level Mode		HW_EPDC_CTRL [DUAL_SCAN]	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
	4bpp, 8-bit single-ended, SDR	0	[7:0]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
	4bpp, 16-bit, single-ended SDR	0	[15:0]	4B[V]	FOUR	0	0	16BIT	SDCLK x 2
	4bpp, 8-bit, DDR (LVDS option)	0	[7:0],[15:8]	4B[V]	FOUR	110	1	8BIT	SDCLK x 4
	4bpp, 16-bit, single-ended, DDR	0	[15:0]	4B[V]	EIGHT	0	1	16BIT	SDCLK x 4
Dual Scan	2bpp, 8-bit single-ended, SDR	1	[7:0],[15:8]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
	2bpp, 8-bit, DDR	1	[7:0],[15:8]	2B[V]	EIGHT	0	1	8BIT	SDCLK x 4
	4bpp, 8-bit single-ended, SDR	1	[7:0],[15:8]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
	4bpp, 8-bit, DDR	1	[7:0],[15:8]	4B[V]	FOUR	0	1	8BIT	SDCLK x 4

### 24.3.4.5 Initializing the Display

Because of the nature of the EPD technology, a typical scenario would involve the EPDC's working buffer (WB) being maintained in system memory. In such power states (where memory is maintained), it is not required to initialize the display (even if the EPD panel had been powered off for example).

In low-power modes where system memory is not maintained, there are two possible methods to initialize the display.

The first method includes initialization from an unknown state and the second mode simply requires software to load the last state of the WB into memory and configure the EPDC to point to it.

#### 24.3.4.5.1 Reset/Clocks and Buffer Preparation

In cases in which the user wants to initialize the screen to a new known state, the following sequence should be followed. Assume that all relevant display power supplies are active.

First, the user must complete a soft reset sequence which includes enabling the main EPDC block-level clock gate. This sequence is described in the example code below. Setting SFTRST enables the CLKGATE. In order to correctly cycle reset values through pipeline registers, the CLKGATE bit stays asserted for some finite amount of time before it sets. After this time, it is safe to clear both the SFTRST and CLKGATE. The example below shows a typical use of these registers.

```
EPDC_CTRL_SET(BM_EPDC_CTRL_SFTRST);
while (!EPDC_CTRL.B.CLKGATE);
EPDC_CTRL_CLR(BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE);
while (EPDC_CTRL_RD() & (BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE));
```

Before any display update is performed, the waveform address and working buffer (WB) pointers must be set (both must be aligned to a 64-bit double long word address):

- EPDC\_WVADDR: Must point to the base address of the waveform data (managed by the i.MX driver)
- EPDC\_WB\_ADDR: An area of memory must be assigned for the EPDC's working buffer (WB). Once assigned, this memory space should be reserved purely for the use of the EPDC. The requirements for the memory allocation are described in [Memory Requirements](#).

After this, the various panel configuration parameters must be set including resolutions, source and gate driver formats, TFT and buffer pixel formats.

#### 24.3.4.5.2 Performing an Initialization Display Update

Once all the panel timing and format parameters are defined, a command sequence must be sent to the EPDC with the properties found here.

- Update size must be full screen resolution
- HW\_EPDC\_UPD\_CTRL[UPDATE\_MODE] must be set to FULL
- HW\_EPDC\_UPD\_CTRL[WAVEFORM\_MODE] must be set to the INIT waveform (typically 0x00)

- HW\_EPDC\_UPD\_CTRL[USE\_FIXED] must be set
- HW\_EPDC\_UPD\_FIXED[FIXNP\_EN], FIXCP\_EN must be set to 1, and FIXNP and FIXCP must be set to 0xFF

The use of HW\_EPDC\_UPD\_FIXED allows the EPDC working buffer to be primed to a state that matches the result of the initialization waveform.

If the application loads the previous WB of the EPDC, these steps are not necessary.

### 24.3.5 Dual-Scan Configuration

The EPDC supports ultra-high resolution/refresh rate EPD panels.

At certain resolutions/refresh rates, there exist electrical limitations of the TFT devices and TFT driver ICs such as source drivers. In order to support driving such displays, the EPDC supports the dual-scan driver method.

The specific method involves driving a TFT configuration where there are two sets of source drivers. All source driver control signals are expected to be shared across all source drivers (except the SDCE signals unless a unified CE is presented by the panel).

In this mode, EPDC\_DATA[7:0] is reserved to drive the upper half of the display and EPDC\_DATA[15:8] is reserved to drive the lower half of the panel. The update and working buffers do not have to be aware of the dual-scan operation because the MBM knows how to access the WB for refresh operations based on the settings of the EPDC\_TCE\_CTRL[SCAN\_DIR\_0,1]. The EPDC supports four scan configurations for dual-scan which are shown in the following figures. Each figure shows an example configuration (that is to say, the EPDC is not limited to the support of only 2 source drivers per side).

The dual-scan drive method allows the SDCLK frequency to be halved relative to a single-scan method for the same resolution and refresh rate. In addition to this, each TFT is only charged in half frequency (for any given SDCLK cycle, twice as many pixels are being driven per frame scan).

Because all 16 DATA signals must be utilized for dual-scan, there is no support for the LVDS\_MODE. The supported source-driver modes for dual scan are shown in [Table 24-2](#). For the 2bpp DDR mode, the EPDC is capable of generating a total of 16 pixels per SDCLK cycle.

Figure 24-7. Dual-Scan Method (Scan = 00)

Figure 24-8. Dual-Scan Method (Scan = 01)

Figure 24-9. Dual-Scan Method (Scan = 10)

Figure 24-10. Dual-Scan Method (Scan = 11)

### 24.3.6 Update Buffer Analysis Functions

EPDC can perform several analyses on the update buffer.

The information collected during processing will be reported to the register after update buffer processing is complete.

- **Collision Rectangle Detection**

For a collided update buffer, this function will report a minimal rectangle that can cover all collided pixels.

When a collision occurs, it's possible that not all, but only part of that update buffer generate a collision, so only the pixels inside a minimal collision rectangle need to be re-submitted.

Details of minimal collision rectangle reported in UPD\_COL\_CORD/  
UPD\_COL\_SIZE.

- **Grey Level Detection (histogram)**

This function reports the minimal grey level that covers all pixels and which must be updated. This histogram differs from that of PXP; here we ignore those pixels which need no update, while the PXP histogram is calculated on the whole update buffer. The histogram feature is capable of reporting a histogram for 1, 2, 4, 8, or 16 grey levels. The valid grey levels value should be programmed into the HIST(1/2/4/8/16)\_PARAM registers before using this functionality.

- **Dry-Run Mode**

Dry-Run mode allows the user to run an update for the purpose of obtaining information without performing any real action. This mode is enabled by setting UPD\_CTRL[DRY\_RUN] = 1 when writing UPD\_CTRL register .

In this mode, Update Buffer will be read and checked against the current Working Buffer. As with a normal update, an interrupt will be generated when the Working Buffer processing completes.

Several pieces of information about the update can then be acquired from the EPDC registers: whether a collision occurred, the minimal collision area, and histogram data.. However, the result (Next Pixel, LUT info) will not be written back into the Working Buffer for further panel scan operation, nor will the LUT waveform be loaded.

The LUT resource specified by UPD\_CTRL[LUT\_SEL] is not used here; the user can start this dry-run update when no LUTs are available.

### 24.3.7 Waveform Mode Selection (AUTOWV)

This function is provided to support waveform selection based on the grey level (histogram) information collected during the update buffer processing stage.

Then AUTOWV LUT is provided to hold a mapping between the grey level of NP(pixel value from update buffer) and optimal waveform mode. This LUT mapping should be programmed before using this function by writing into the AUTOWV\_LUT register with AUTOWV\_LUT[ADDR]="grey level", AUTOWV\_LUT[DATA]="waveform mode" for each possible grey level reported by the EPDC histogram.

After AUTOWV\_LUT is programmed, AUTOWV mode can be enabled by setting UPD\_CTRL[AUTOWV]=1. When enabling AUTOWV, the waveform mode written into UPD\_CTRL[WAVEFORM\_MODE] will be ignored and the loading waveform will initially be put on hold.

After the Update Buffer processing completes, EPDC reports the minimal grey level, retrieves the mapped waveform mode from AUTOWV LUT, and writes it back into UPD\_CTRL[WAVEFORM\_MODE].

If the user also sets UPD\_CTRL[DRY\_RUN], EPDC will be finished at this point.

Otherwise, EPDC continues with the following, depending upon the UPD\_CTRL[AUTOWV\_PAUSE] setting:

1. UPD\_CTRL[AUTOWV\_PAUSE] = 0, AUTO MODE)

EPDC will begin waveform loading immediately without any software interaction

2. UPD\_CTRL[AUTOWV\_PAUSE] = 1, MANUAL MODE)

EPDC waits for software to decide whether the selected waveform is ok, then if necessary software can use some other criteria to select a waveform mode. After software selects the waveform mode, it writes again into UPD\_CTRL with final waveform mode, and waveform loading then panel scan will start.

### 24.3.8 Panel Interface Generator (Pigeon Mode)

There are seventeen panel interface signal outputs (DATA/SDCLK not included), each of them with dedicated timing purpose as default. This is called "Legacy Mode".

Pigeon Mode is a timing mode which can be independently enabled on any of the seventeen timing signals, with a unified flexible configuration. Signals within pigeon mode can be programmed into any supported signals, and are interchangeable.

The following are the legacy timing signals which support pigeon mode:

- PIGEON[00] - SDCE0
- PIGEON[01] - SDCE1
- PIGEON[02] - SDCE2
- PIGEON[03] - SDCE3
- PIGEON[04] - SDCE4
- PIGEON[05] - SDCE5
- PIGEON[06] - SDCE6
- PIGEON[07] - SDCE7
- PIGEON[08] - SDCE8
- PIGEON[09] - SDCE9
- PIGEON[10] - SDOE
- PIGEON[11] - SDL3
- PIGEON[12] - SDOEZ
- PIGEON[13] - SDOED
- PIGEON[14] - GDSP
- PIGEON[15] - GDOE
- PIGEON[16] - GDCLK

### Working Theory

Each pigeon signal has one local counter with a configurable start point and incremental condition. It will be compared to configuration register value for signal assertion/de-assertion control, plus delta offset for data alignment and other options like polarity/logic operation. A detailed running scenario is as follows:

1. Start local counter on the MASK rising edge (reference point/start point)
2. Increment on event selected through INC\_SEL
3. Count and match SET\_CNT: assert signal, reset counter  
( SET\_CNT==0 means assert immediately on MASK's rising edge )
4. Count and match CLR\_CNT: de-assert signal, stop counter  
(CLR\_CNT==0 means de-assert on MASK's falling edge)

### NOTE

When local counter is running, further changes to MASK are not cared unless CLR\_CNT==0

MASK - start point for local counter

Created using any combination of below options (ANDed)

1. STATE\_MASK = (FS|FB|FD|FE) AND (LS|LB|LD|LE)

8 bits to select in which vertical/horizontal state your counter starts ticking. This is the most common use-case because timing signals generally relate to scan states.

For example, for a line timing signal start on Line Begin phase during Frame Begin/ Frame Data lines, use the configuration below:

**Table 24-3. STATE\_MASK combinations**

STATE_MASK	LS	LB =1	LD	LE
FS				
FB =1		X		
FD =1		X		
FE				

2. MASK\_CNT/MASK\_CNT\_SEL(global counter)

Sometimes a more accurate reference point is required, such as "line 20 in a frame", or "line 12 in Frame Begin state" or "pixel 23 in LD phase". For such use-cases, several Global Counters shared by all pigeons are provided. Global counter type (line counter/frame counter/state counter, etc.) is selected using MASK\_CNT\_SEL, when global counter matches the MASK\_CNT value. The pigeon local counter will start ticking.

3. Use another pigeon signal as mask (SIG\_LOGIC=MASK)

For some tightly coupled signals it is possible to use one as a reference to generate another.

INC\_SEL- select local counter tick event

1. pclk - pixel clk
2. line - line start pulse
3. frame - frame start pulse
4. another - another pigeon signal

OFFSET- offset on pclk basis

Some signals need to come out slightly earlier or later than programmed. For example, the CE type signal usually aligns with the Line Data phase, but some panels need it as one cycle pulse before Line Data. The user can set `OFFSET` to a negative value to achieve this.

Global Counters (selectable through `MASK_CNT_SEL`)

- `HCNT / VCNT`
  - normal pclk counter / line counter
- `HSTATE_CNT / VSTATE_CNT`
  - similar to above, but reset when state changes
- `HSTATE_CYCLE / VSTATE_CYCLE`

(see figure below for definition of `CYCLE/PERIOD/CNT`)

Some panels have multiple Gate Drivers/Source Drivers, so Frame Data / Line Data state may be further split to match each driver, and signals such as `CE[n]` are only valid during part `n` of Line Data. For such signals, use `HW_EPDC_PIGEON_CTRL.*_PERIOD` to specify `PERIOD` where `CNT` is reset and `CYCLE` is included. Then the user can select `CYCLE` as `MASK_CNT` to generate mask for `CE[n]`.

- `FRAME_CNT / FRAME_CYCLE` (only for frame-crossing signals)

frame cycle counter doesn't have a reset condition; use `HW_EPDC_PIGEON_CTRL1.FRAME_CNT_CYCLES` to reset it.

## Programming Model

**Figure 24-11. Definition of CNT, CYCLE, PERIOD**

The following are register settings for the figure above:

- `HW_EPDC_PIGEON_CTRL0.LD_PERIOD=2`
- `MASK_CNT_SEL = 1 // HSTATE_CYCLE`
- `MASK_CNT = 1 // CE[1]`
- `MASK_CNT = 2 // CE[2]`

### 24.3.9 Display Update Programming

The EPDC is designed to communicate with the kernel driver through the interrupts and status registers.

The driver entry is always assumed to occur as a result of an interrupt.

#### 24.3.9.1 Initiating a Display Update

The typical flow for performing a display update involves the following:

- `EPDC_STATUS[WB_BUSY]` must be 0. The EPDC cannot process new updates if it is currently processing an update.
- `EPDC_STATUS[LUTS_BUSY]` must be 0. The EPDC cannot accept new updates if all LUT resources are currently active.

Assuming both conditions above are met, an update request is programmed in the following manner (it is important to note that the last step must be writing to EPDC\_UPD\_CTRL which initiates the display update).

The following steps can be performed before WB\_BUSY and LUTS\_BUSY are clear:

- At this time it is assumed that the correct temperature is selected and written to EPDC\_TEMP.
- EPDC\_UPD\_ADDR must be set to the 8-bit buffer for the update. This buffer must be aligned to a 64-bit word address. In addition, each line address must begin at a 64-bit word address. Both criteria can be met by utilizing the PXP pixel processing engine which always aligns lines at a 64-bit raster (see [Memory Requirements](#) for details).
- EPDC\_UPD\_CORD defines the insertion co-ordinate into the panel resolution.
- EPDC\_UPD\_SIZE defines the dimension of the update (pixels).
- EPDC\_UPD\_FIXED is used for panel initialization or rectangular fill operations.

Writing the EPDC\_UPD\_CTRL register initiates a display update:

- USE\_FIXED-This field is set when EPDC\_UPD\_FIXED is used.
- LUT\_SEL-The driver should read EPDC\_STATUS\_NEXLUT[NEXT\_LUT] (qualified by NEXT\_LUT\_VALID) to select an available LUT to assign this update.
- WAVEFORM\_MODE selects the E-INK waveform mode (for example, INIT, DU, GC16 and so on). The number corresponds to the waveform number in the waveform specification document.
- UPDATE\_MODE selects one of two enumerated updated modes.
  - FULL-In this mode, all pixels defined in the update rectangle have the waveform applied.
  - PARTIAL-In this mode, the EPDC shall only apply the waveform to pixels which are changing, otherwise the EPDC\_FORMAT[DEFAULT\_TFT\_PIXEL] is applied to the pixels which are not changing.

### 24.3.9.2 Update Processing and Collisions

After the update is initiated (by writing EPDC\_UPD\_CTRL), the EPDC performs update-buffer processing. This involves processing this update region into its working buffer (WB).

During this time, the EPDC also performs collision detection. At the end of the WB processing, the EPDC asserts the WB\_CMPLT\_IRQ interrupt. If a collision is detected, the LUT\_COL\_IRQ interrupt status bit will also be asserted.

The EPDC performs image updates to the EPD by applying waveforms to individual pixels. Waveforms are applied to groups of pixels (ranging from a single pixel to the entire display). Each individual update request is bound to a rectangle. Each pixel within this rectangle has a waveform applied to it using the waveform and update mode specified in EPDC\_UPD\_CTRL. After this process is initiated, a waveform takes an amount of time to complete which is usually determined by the specifications of the waveform mode. For proper display operation and optimum performance, a waveform must not be interrupted once it has begun.

A collision is defined simply as the interruption of the application of waveform to a pixel or group of pixels. As such, it must be avoided. Because the waveforms take a finite amount of time to complete, the EPDC provides a mechanism to automatically manage collisions, which allows the application to perform multiple updates resulting in a richer user experience without having to be cognizant of the panel and waveform characteristics.

Depending on the update mode (FULL or PARTIAL) a collision is defined as follows:

- For a full-update mode, a collision is defined as the temporal and spatial union of rectangles pertaining to active unique update requests. An active update is one which is still in the process of being updated (that is, a waveform is being applied).
- For a partial-update mode, a collision is defined as the temporal, spatial and differential union of pixels pertaining to unique update requests which are active. The difference between a full-updated and a partial-updated collision is that in the latter case, the collision state occurs only if the next-pixel states differ between the updates. Thus, two partial-update rectangles may intersect, but if all of the pixels in the intersecting update regions are being updated to the same gray-state, the original update and associated LUT/waveform are not disturbed and the intersection does not constitute a collision.
- It should be noted that collisions may be a one-to-many effect. In the case of partial updates, there may be a spatial and temporal union of rectangles with no differential pixel-level union. A subsequent update however might form such a pixel-level differential union to all active updates. Since each update pertains to an active LUT, these many collided updates are referred to as victim LUTs. The update/LUT that caused the collision is referred to as the aggressor LUT.

An example of a partial-update mode collision is shown in the following figure. Each update encompasses the outer rectangle which meets the criteria of the spatial union. The red areas show the pixels which are currently transitioning to gray (from update 1) but need to transition to white (in update 2). These pixels meet the criteria of the differential union and lastly in the temporal domain, the period of time where LUT0 and LUT1 overlap is the temporal union. The pixels that did not change (grey and green areas in the LUT assignment box) are not part of the collision area. In the case of the gray

overlapping pixels, LUT0 can continue to update. In the case of the white pixels (which were previously inactive) a new LUT (if available) can be assigned and forms the green region. Note that a subsequent update could potentially collide with the green pixels in update 2.

**Figure 24-12. Partial Update Collision Handling**

### NOTE

For FULL update modes, a collision occurs at any intersection of active rectangles/LUTs because in FULL update mode, all pixels within the update rectangle have the waveform applied (even if pixel values are not changing).

It can be seen that when collision is detected (during the WB update process), the EPDC will "block" the collided pixels being updated, and any pixels which are not collided will be assigned to the requested LUT process. When a collision occurs, the EPDC will raise the LUT\_COL\_IRQ interrupt status bit (this will always happen in conjunction with WB\_CMPLT\_IRQ).

Because the driver is always entered via an interrupt, when the EPDC interrupt fires, driver should not only check for WB\_CMPLT\_IRQ but also for the LUT\_COL\_IRQ status bit within the EPDC\_IRQ register. If LUT\_COL\_IRQ is set, this means that a

collision has occurred. If this is the case the driver should check the value of the EPDC\_STATUS\_COL register. This register contains one bit for each LUT that has been collided with, that is, it holds the vector of the victim LUTs as a result of the last update LUT. Since the driver knows the value of the LUT of the last update, it can store this update LUT value along with this associated victim LUT vector in a collision list.

Because the EPDC can drive up to 16 concurrent updates (which can be overlapping when using PARTIAL mode updates), a unique interrupt status bit is provided per LUT so that when an update completes (physically completes the waveform), the SW driver can know which LUT completed. In addition to the LUT completion interrupts (which are mapped into the EPDC\_IRQ[LUTn\_CMPLT\_IRQ] interrupt status bits), the current state of each LUT can also be read from the EPDC\_STATUS\_LUTS status register.

The driver can use the LUT status interrupts in conjunction with EPDC\_STATUS\_LUTS to perform regular checks on the completion of victim LUTs against the vectors stored for each colliding LUT in the collision list. The driver may also choose to serialize updates such that it might wait until all victim LUTs have completed before re-issuing the colliding update.

The figure below shows a more extended sequence of a collision. In this case there are a series of updates coming from the application layer. They are A, B, C and D. Updates A, B, and C are set without any collision. When update D is requested a collision is detected. Using the interrupt status collision registers, the SW-driver stores D in a collision-list. For that list entry it also store B which is the victim LUT. It uses this information to check when a LUT completes to see if the victim LUTs for any update in the collision list have completed. If they have completed (through a LUT completion interrupt), the SW-driver then sends this update (D in this case) again to the EPDC. It should be noted that from the application perspective it appears that all updates A, B, C and D have been accepted, that is, the collision handling is completely hidden from user-space. Using the collision detection and LUT status interrupts, the application (in conjunction with the driver) could also choose to completely serialize the requests (such that between the first and second D update, no other update is accepted).

**Figure 24-13. Collision Sequence**

### 24.3.9.3 Multiple Update Flow

In most applications, such as e-book readers, besides full-screen page turns, user interfaces require multiple updates to be performed.

Examples of this include cursors, pen input, drop-down menus (with highlighting) and other movable graphical objects. Each update takes such a limited amount of time to complete (up to 1 second depending on the waveform mode) that it would be too prohibitive to only process updates serially.

As described in [Initiating a Display Update](#), there are two conditions that must be met before the SW driver can issue a new update request:

- The Working buffer (WB) update process must be complete.
- There must be an available LUT.

Assuming a free LUT is available, the EPDC is designed to have the capability to start new updates at each TFT frame scan (even being able to commence multiple updates within a frame scan blanking period). The general flow for sequential updates (concurrent or serialized) is shown in the following figure.

**Figure 24-14. Driver Update Flow**

This flow assumes that the driver is entered via interrupts. The two busy states are shown to illustrate the conditions under which the driver will not issue new updates. In general, the driver should be throttled by the WB\_CMPLT\_IRQ interrupt. Because the EPDC can support up to 64 concurrent updates, it is possible to re-enter the update-request (show as Update\_Req() in the figure above) any-time that the WB is not busy (even though LUTs are active and the display is being updated). It is possible that when there are 63 LUTs currently active and a new update is sent, there will be a WB\_CMPLT\_IRQ interrupt issued, but the driver at that time would be in a busy state (because LUTS\_BUSY is signaled). The driver will be re-entered on the next LUTn\_CMPLT\_IRQ interrupt during which time it can issue a new update (since WB\_BUSY and LUTS\_BUSY status bits are low).

The update-processing process (which is controlled by the MBM module) is asynchronous to the actual TFT refresh operations (which carry out the physical screen updates), so there is no particular relationship between the WB\_BUSY status and the state of the screen update. In contrast, the LUTn\_CMPLT\_IRQ interrupt status and EPDC\_STATUS\_LUTS provide the status of the physical waveform update. This means that when LUTn\_CMPLT\_IRQ interrupt fires, it means that the last physical TFT frame scan just completed for that update/LUT.

The EPDC implements proprietary methods to efficiently process the WB such that the WB processing time (the time from the SW driver writing EPDC\_UPD\_CTRL to EPDC\_IRQ[WB\_CMPLT\_IRQ] fires), is dependent on the size of the update rectangle. This allows smaller updates to be processed faster. In most EPD applications, this is ideal because it's typically smaller sprites that require the fastest performance. In addition, the EPDC implements methods to allow store pending updates and activate them on the next available frame-scan. For example, if the TFT scanning is currently in the active region and during this time a series of small update requests are sent, the EPDC can begin all of those updates on the next available blanking period.

The figure below shows an example of two larger update requests, one to LUT4 and one to LUT5. These update requests are shown in the context of active LUTs and thus active frame scan times. The time when both WB\_BUSY and LUT\_BUSY is high are defined as "blocking" because no new updates can be accepted. It should also be noted that new updates are physically commenced by the EPDC on blanking periods. From a SW programming model perspective, the EPDC\_STATUS\_LUTS[LUTn\_STATUS] is activated immediately upon the update request being written to the EPDC. The physical frame-scanning for this particular update does not being commenced until the next available frame scan.

It should be noted that updates and WB processing can actually occur during the blanking period (or can begin in the active scan time and continue into the blanking period). For this reason, the EPDC provides some tuning controls via EPDC\_TCE\_CTRL[VSCAN\_HOLDOFF] such that more time can be given to finish processing update request and less time "locking down" the set of LUTs that will be activated for the upcoming active scan. The EPDC will start to pre-fill its refresh pixel FIFOs after the VSCAN\_HOLDOFF period. Its possible to tune this value to allow the minimum time for the pixel FIFO pre-fill operation (making sure that refresh under-runs do not occur). If a pixel-FIFO under-run occurs, EPDC\_IRQ[TCE\_UNDERRUN\_IRQ] will fire.

Figure 24-15. Temporal Flow of Update Processing

### 24.3.10 Architectural Clock Gating (Low Power Mode)

As with most modern IP, the EPDC contains low-level hardware controlled automatic clock gating throughout the design.

These clock gating elements typically gate clocks locally for individual or groups of sequential elements (flip flops) when these registers are not currently active.

This tier of clock gating is useful for reducing power during active operation of the EPDC.

Most e-paper applications utilizing EPDs involve the processor and display controller to be a low-power inactive state in most of the time. This is because EPDs only require refresh operations when the display content is being updated. As such, in between update operations, the EPDC provides a module level clock-gating feature that can be controlled by the SW driver as part of a higher-level power management solution.

The EPDC module can have all its clocks completely gated-off by the setting of EPDC\_CTRL[CLKGATE]. There are a couple of considerations that the SW driver must adhere to before placing the EPDC into this low power state:

- All active LUTs (updates) must complete
- Any TFT operations must be complete (including any final blanking operations)

In order to maximize display update frequency (the ability accept new updates during each frame scan), the LUT completion interrupts fire on the end of the last frame's active scan period for that update. This means that the TCE still must complete the final FRAME\_END blanking time to guarantee coherency of its state machines with the panel state (receiving the final LUT completion IRQ is not enough to determine that the EPDC can have all of its clocks shut down). Based on this, the EPDC provides the necessary interrupt and status bits to allow the driver to correctly perform the clock-gating operation by using the following method:

- Once the final EPDC\_IRQ[LUTn\_CMPLT\_IRQ] is reached, the driver should enable the TCE\_IDLE interrupt mask bit via EPDC\_IRQ\_MASK[TCE\_IDLE\_IRQ\_EN], unmask other interrupts and return.
- Once the final blanking time of the last LUT (FRAME\_END time) is completed and the TCE reaches its idle state, the EPDC will assert the EPDC\_IRQ[TCE\_IDLE\_IRQ] interrupt which will cause the driver to re-enter. At this point, the SW knows that the EPDC is in a completely idle state and can perform a set on EPDC\_CTRL[CLKGATE].

Alternative implementations of the driver could simply involve polling for the EPDC\_IRQ[TCE\_IDLE\_IRQ] interrupt status bit (which operates regardless of the interrupt being masked or not) before setting the clock gate (this prevents two iterations of interrupt based driver-entry, but requires a wait loop in the interrupt handler which might be undesirable).

It should be noted that the time interval between the last LUTs LUTn\_CMPLT\_IRQ time and TCE\_IDLE\_IRQ interrupt is equal to the FRAME\_END time.

When the application is ready to send more updates, the driver can immediately re-enable the EPDC by un-gating the module-level clock by clearing the EPDC\_CTRL[CLKGATE] field. This un-gating of the clock is instant and the driver is free to immediately send update requests.

### 24.3.11 Performance Tuning and Considerations

The EPDC is designed to meet the performance requirements of the most demanding e-paper applications. These performance targets must be met in the context of highly integrated SoCs.

In such a context, system memory is typically shared across multiple masters including the ARM platform. Because of this, there is no guarantee of latency from system memory. EPDC provides a number of mechanisms to deal with this as well as some ability to tune various parameters allowing the user to trade-off between update processing performance and refresh functionality.

#### 24.3.11.1 Memory and Bus Bandwidth Requirements

The EPDC MBM module contains up to 6 internal AXI requesting functions (5 read and 1 write). These are arbitrated internally before being sent to the SoC memory system.

The EPDC interfaces to the SoC bus system via a dual-channel 64-bit AXI bus master port. The following table shows the various internal requesters and their properties. Note that there are two round-robin (RR) loops. Because there is only one write source, and the EPDC supports dual-channel AXI, there is no arbitration on the WB write operations.

**Table 24-4. EPDC Bus Requestor Profiles**

Operation	Priority	Burst Length (x8 Bytes)	Maximum Outstanding Transactions	FIFO size
Waveform LUT read	0	8	2	16x68
WB pixel read FIFO0 (refresh)	RR 1	8 or 16	8	256x64
WB pixel read FIFO1 (refresh)	RR 1	8 or 16	8	256x64
WB read for update processing	RR 2	8	2	16x64
WB write for update processing	N/A	8	2	16x64
UPD read for update processing	RR 2	8	2	16x64

As described in [Memory Requirements](#), it can be seen that all lines in a buffer are padded to the nearest 8 byte boundary. This is important to be noted for the bandwidth calculations. The maximum bandwidth scenario involves processing a full-screen update

while performing refresh operations, but refresh operations always have the highest priority. Based on this, the memory bandwidth required by the EPDC is a function of the refresh pixel rate which in turn is a function of resolution, frame-rate and blanking/active time.

The refresh bandwidth can be calculated as follows:

Active Time = Active time of the frame-scan time as a fraction (for example, 0.8)

Frame Rate = TFT frame refresh rate (Hz) (for example, 106 Hz)

Bandwidth (MB/s) =  $\text{roundup}_4(\text{EPDC\_RES}[\text{HORIZONTAL}]) \times \text{EPDC\_RES}[\text{VERTICAL}] \times \text{Frame Rate} \times (1/\text{Active Time}) \times 2 \times (1/1024^2)$

For example, a panel with resolution 2048 x 1536 with 106 Hz refresh and estimated 80% active time, 20% blanking time, the refresh bandwidth is:

$\text{BW (MB/S)} = 2048 \times 1536 \times 106 \times (1/0.8) \times 2 \times (1/1024^2) = 795 \text{ MB/s}$

(Note that  $2048 \bmod 4 = 0$ .)

The WB requires 2 bytes per pixel.

Remaining bandwidth is used for other operations. Because update processing operations are not real-time (they do not necessarily have to occur at the refresh frame-rate), the time required to perform the update can be calculated as a function of the available bandwidth (actual bandwidth minus refresh bandwidth) and the update size.

### 24.3.11.2 Pixel Latency FIFOs

The EPDC contains two working buffer latency FIFOs which are used to load working buffer pixel data which is used by the TCE to perform the panel refresh operations.

These FIFOs are sized at 1024 pixels each in order to provide significant system memory latency tolerance. One pixel FIFO is dedicated for the main screen and the second is in dual-scan cases for the second half of the screen.

Under no circumstance should the EPDC pixel FIFOs reach an under-run condition. The EPDC provides an interrupt status bit to flag such a condition (TCE\_UNDERRUN\_IRQ). During development, this interrupt must be enabled. The pixel values stored in the FIFOs are used by the TCE to perform look-up operations (from the LUTs) to generate TFT voltage control pixels. If an under-run occurs, the result will be unknown data being used as the source for the look-ups, which can damage the panel.

### 24.3.11.3 Basic Watermarking Control

The EPDC provides a basic pixel pre-fetching control mechanism that is applied to the beginning of a new update (from an idle state). This control is provided by EPDC\_FIFOCTRL[FIFO\_INIT\_LEVEL].

The control allows the value to be set between 0-255, with a reset value of 128. Because the internal width of the FIFO holds 4-pixels per entry, the actual number of pixels is  $(\text{FIFO\_INIT\_LEVEL}+1) \times 4$ .

The EPDC uses this value to pre-fill the pixel latency FIFO(s) to this level before the TCE commences the refresh operations which drive the update to the panel. This control has no effect on the FIFO(s) when the EPDC is performing sequential frame-scans.

It must be noted that this value must be set less than  $(\text{EPDC\_RES}[\text{VERTICAL}] \times \text{EPDC\_RE}[\text{HORIZONTAL}]) / 4$ .

### 24.3.11.4 Update/Refresh Tuning (VSCAN\_HOLD OFF)

During active frame-scan time, the EPDC provides the ability to process and display new update requests, because all pixels in the WB pertaining to a particular update are bound to a single LUT.

Until all pixels pertaining to that update have been processed in the WB, its LUT cannot be activated. As shown in [Figure 24-15](#), the blanking period provides time to pre-load the pixel FIFOs and for completing WB processing updates and loading the associated frame of waveform data into LUT memories.

The EPDC\_TCE\_CTRL[VSCAN\_HOLD OFF] control field allows control over the vertical blanking period allotment for working buffer processing and pre-loading of the pixel FIFO. The time window defined by VSCAN\_HOLD OFF is allotted for working-buffer processing and LUT loading (of newly processed updates). The remainder of the time is allotted for pre-filling the pixel FIFO.

Note that aggressive use of VSCAN\_HOLD OFF can result in pixel FIFO under-run as the FIFO pre-fill time is compromised.

### 24.3.11.5 System-Level Arbitration Control

As previously mentioned, the TCE refresh operation is time critical.

Because the EPDC is designed to be integrated into a multimaster SoC, system memory is shared between multiple requesters in the system.

The EPDC provides a dynamic Quality of Service (QoS) priority elevation mechanism that can be leveraged at the SoC level.

The EPDC\_FIFOCTRL registers can be used to drive the `epdc_panic` output signal during times when the EPDC requests require priority elevation. As long as `epdc_panic` is asserted, transaction requests from the EPDC will have their priority elevated at the SoC-level bus arbitration control points.

The registers and associated functionality are as follows:

- EPDC\_FIFOCTRL[ENABLE\_PRIORITY] must be set to enable `epdc_panic` functionality.
- EPDC\_FIFOCTRL[FIFO\_L\_LEVEL] determines FIFO threshold which causes `epdc_panic` to assert when crossed.
- EPDC\_FIFOCTRL[FIFO\_H\_LEVEL] once `epdc_panic` has been asserted due to the pixel FIFO(s) crossing FIFO\_L\_LEVEL, this value, which must be set higher than FIFO\_L\_LEVEL, determines the point at which `epdc_panic` will de-assert as the FIFO(s) fills.

Note that the delta between FIFO\_H\_LEVEL and FIFO\_L\_LEVEL is intended as a de-bounce mechanism. The purpose is to avoid a constant panic situation, which would cause thrashing of the `epdc_panic` signal.

Figure 24-16. FIFO Priority Elevation

## 24.4 EPDC Memory Map/Register Definition

### EPDC Register Format Summary

#### EPDC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20F_4000	EPDC Control Register (EPDC_CTRL)	32	R/W	C000_0000h	<a href="#">24.4.1/1245</a>
20F_4004	EPDC Control Register (EPDC_CTRL_SET)	32	R/W	C000_0000h	<a href="#">24.4.1/1245</a>
20F_4008	EPDC Control Register (EPDC_CTRL_CLR)	32	R/W	C000_0000h	<a href="#">24.4.1/1245</a>
20F_400C	EPDC Control Register (EPDC_CTRL_TOG)	32	R/W	C000_0000h	<a href="#">24.4.1/1245</a>

## 24.4.1 EPDC Control Register (EPDC\_CTRLn)

EPDC Main control register

This register controls various high-level functions of the EPDC

### EXAMPLE

```

/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
    ;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
    ;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);

```

Address: 20F\_4000h base + 0h offset + (4d × i), where i=0d to 3d

## EPDC Memory Map/Register Definition

### EPDC\_CTRLn field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal EPDC operation. Set this bit to one (default) to disable clocking with the EPDC and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the EPDC block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29–9 RSVD1	Reserved.
8 SRAM_POWERDOWN	Enable Power-down of embedded SRAM memories
7–6 UPD_DATA_SWIZZLE	Specifies how to swap the bytes for the UPD data before the WB construction. Please note this swizzle operate right after data fetch from bus, no matter it's aligned access or not. Supported configurations: 0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x1 <b>ALL_BYTES_SWAP</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
5–4 LUT_DATA_SWIZZLE	Specifies how to swap the bytes for the LUT data before store to LUTRAM. Supported configurations: 0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x1 <b>ALL_BYTES_SWAP</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
3–1 RSVD0	Reserved.
0 BURST_LEN_8	0- EPDC display fifo logic will issue AXI bursts of length 16. When set to 1, the block will issue bursts of length 8.

## 24.4.2 EPDC Waveform Address Pointer (EPDC\_WVADDR)

### EPDC Waveform Address Pointer

**EXAMPLE**

```

/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);

```

Address: 20F\_4000h base + 20h offset = 20F\_4020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_WVADDR field descriptions**

Field	Description
ADDR	Start address of waveform tables. This address needs to be aligned to a 64-bit word boundary.

**24.4.3 EPDC Working Buffer Address (EPDC\_WB\_ADDR)****EPDC Working Buffer Address**

Address: 20F\_4000h base + 30h offset = 20F\_4030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_WB\_ADDR field descriptions**

Field	Description
ADDR	Address for EPDC working buffer. This address must be a aligned to a 64-bit double-word boundary.

### 24.4.4 EPDC Screen Resolution (EPDC\_RES)

EPDC Screen Resolution. This register defines the horizontal and vertical resolution of the target display panel

Address: 20F\_4000h base + 40h offset = 20F\_4040h

EPDC\_RES field descriptions

Field	Description
31–29 RSVD1	Reserved.
28–16 VERTICAL	Vertical Resolution (in pixels)
15–13 RSVD0	Reserved.
HORIZONTAL	Horizontal Resolution (in pixels)

### 24.4.5 EPDC Format Control Register (EPDC\_FORMATn)

EPDC Pixel format control register. Defines formats for buffer and TFT pixels.

This register controls various functions throughout the digital portion of the chip.

**EXAMPLE**

```

/* EPDC_FORMAT - 2bit TFT and 4bit Buf pixel format */
reg_val = EPDC_FORMAT_TFT_PIXEL_FORMAT_2BIT
          | EPDC_FORMAT_BUF_PIXEL_FORMAT_P4N
          | ((0x0 << EPDC_FORMAT_DEFAULT_TFT_PIXEL_OFFSET) &
            EPDC_FORMAT_DEFAULT_TFT_PIXEL_MASK);
__raw_writel(reg_val, EPDC_FORMAT);
    
```

Address: 20F\_4000h base + 50h offset + (4d × i), where i=0d to 3d

**EPDC\_FORMATn field descriptions**

Field	Description
31–25 RSVD2	Reserved.
24 BUF_PIXEL_SCALE	Selects method of conversion from 8-bit input 0x0 <b>TRUNCATE</b> — Use Truncate method (LSB) 0x1 <b>ROUND</b> — Use rounding method (with saturation)
23–16 DEFAULT_TFT_PIXEL	Default TFT pixel value. This value is used as the source-driver voltage value (TFT-pixel) for either partial-updates where a pixel has not changed or for any part of the screen which is not being updated during active frame scans.
15–11 RSVD1	Reserved.
10–8 BUF_PIXEL_FORMAT	EPDC Input Buffer Pixel format. All update buffers are expected to have 8-bit grayscale pixels. This register defines which MSB's of those pixels are used. It must be noted that this format must match the waveform (e.g. P4N is not compatible with 3-bit waveforms)  0x2 <b>P2N</b> — 2-bit pixel 0x3 <b>P3N</b> — 3-bit pixel 0x4 <b>P4N</b> — 4-bit pixel 0x5 <b>P5N</b> — 5-bit pixel

Table continues on the next page...

**EPDC\_FORMAT $n$  field descriptions (continued)**

Field	Description
7-2 RSVD0	Reserved.
TFT_PIXEL_FORMAT	<p>EPDC TFT Pixel Format. This defines how many bits of the DATA bus are required per pixel. This field must be consistent with the waveform and panel architecture.</p> <p>0x0 <b>2B</b> — 2-bit                      0x1 <b>2BV</b> — 2-bit and VCOM                      0x2 <b>4B</b> — 4-bit                      0x3 <b>4BV</b> — 4-bit and VCOM</p>

**24.4.6 EPDC FIFO control register (EPDC\_FIFOCTRL $n$ )**

Allows for programmability of pixel FIFO watermarks used in conjunction with system arbitration hardware

This register houses FIFO control bits

**EXAMPLE**

```

/* EPDC_FIFOCTRL (disabled) */
reg_val =
    ((100 << EPDC_FIFOCTRL_FIFO_INIT_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_INIT_LEVEL_MASK)
    | ((200 << EPDC_FIFOCTRL_FIFO_H_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_H_LEVEL_MASK)
    | ((100 << EPDC_FIFOCTRL_FIFO_L_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_L_LEVEL_MASK);
__raw_writel(reg_val, EPDC_FIFOCTRL);
    
```

Address: 20F\_4000h base + A0h offset + (4d × i), where i=0d to 3d

### EPDC\_FIFOCTRL $n$ field descriptions

Field	Description
31 ENABLE_ PRIORITY	Enable watermark-based priority elevation mechanism. 1=Enabled, 0=Disabled. (Only applies to FIFO_H_LEVEL and FIFO_L_LEVEL)
30–24 RSVD1	Reserved.
23–16 FIFO_INIT_ LEVEL	This register sets the watermark for the pixel-fifo.
15–8 FIFO_H_LEVEL	Upper level value of FIFO watermark. Must be greater than FIFO_L_LEVEL. When the pixel FIFO reaches this level or above, the priority elevation request is negated
FIFO_L_LEVEL	Lower level value of FIFO watermark. When the pixel FIFO reaches this level or below, the priority elevation request is asserted.

## 24.4.7 EPDC Update Region Address (EPDC\_UPD\_ADDR)

### EPDC Update Region Address

The address alignment depends on whether the update region stride register (EPDC\_UPD\_STRIDE) is set or not.

If EPDC\_UPD\_STRIDE is zero, the update region address must start and end on the 8-byte aligned addresses.

If EPDC\_UPD\_STRIDE is non-zero, the update region address can start and/or end on any byte addressing. But aligned address still recommended to get best bus performance.

### EXAMPLE1

```
/* no update stride case */
u32 stride = 0;
u32 addr = 0x100; /* 8-byte aligned */
```

## EPDC Memory Map/Register Definition

```
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

### EXAMPLE2

```
/* update stride = 345 */
u32 stride = 345;
u32 addr = 0x123; /* 8-byte unaligned is OK */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

Address: 20F\_4000h base + 100h offset = 20F\_4100h

### EPDC\_UPD\_ADDR field descriptions

Field	Description
ADDR	Address for incoming region update. This address points to update region which will be processed into the working buffer.

## 24.4.8 EPDC Update Region Stride (EPDC\_UPD\_STRIDE)

### EPDC Update Region Stride

When UPD\_STRIDE==0 (stride feature disabled), UPD buffer line must start from 64-bit boundary and end on 64-bit boundary(padding if not). When UPD\_STRIDE!=0 (stride feature enabled), UPD buffer line can start or end on any byte address, UPD\_WIDTH should be set to real line bytes count as normal, while UPD\_STRIDE set to byte distance between two lines' start.

### EXAMPLE

see details on stride feature introduction

Address: 20F\_4000h base + 110h offset = 20F\_4110h

### EPDC\_UPD\_STRIDE field descriptions

Field	Description
STRIDE	line stride for incoming region update

## 24.4.9 EPDC Update Command Co-ordinate (EPDC\_UPD\_CORD)

### EPDC Update Command Co-ordinate

This register is used for setting up the coordinate of a new update region.

Address: 20F\_4000h base + 120h offset = 20F\_4120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1			YCORD												RSVD0			XCORD													
W	[Shaded]															[Shaded]																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_UPD\_CORD field descriptions

Field	Description
31–29 RSVD1	Reserved.
28–16 YCORD	Y co-ordinate for incoming region update
15–13 RSVD0	Reserved.
XCORD	X co-ordinate for incoming region update

## 24.4.10 EPDC Update Command Size (EPDC\_UPD\_SIZE)

### EPDC Update Command Size

This register sets up the size of an update region.

Address: 20F\_4000h base + 140h offset = 20F\_4140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1			HEIGHT												RSVD0			WIDTH													
W	[Shaded]															[Shaded]																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_UPD\_SIZE field descriptions

Field	Description
31–29 RSVD1	Reserved.
28–16 HEIGHT	Height (in pixels)

*Table continues on the next page...*

EPDC\_UPD\_SIZE field descriptions (continued)

Field	Description
15-13 RSVD0	Reserved.
WIDTH	Width (in pixels)

### 24.4.11 EPDC Update Command Control (EPDC\_UPD\_CTRLn)

EPDC Update Command Control. Writing to this registers triggers and update request operation.

Update control register

**EXAMPLE**

```
HW_DIGCTL_CTRL_CLR(BM_DIGCTL_CTRL_USB_CLKGATE); // enable USB clock
```

Address: 20F\_4000h base + 160h offset + (4d × i), where i=0d to 3d

## EPDC\_UPD\_CTRLn field descriptions

Field	Description
31 USE_FIXED	Use fixed pixel values (requires programming of HW_EPDC_UPD_FIXED)
30–22 RSVD1	Reserved.
21–16 LUT_SEL	LUT select 0-63
15–8 WAVEFORM_ MODE	Waveform Mode 0-255
7–4 RSVD0	Reserved.
3 AUTOWV_ PAUSE	0x0 <b>AUTO</b> — epdc will analyze update buffer, report histogram, then update waveform mode using the programmed mode mapping in AUTOWV_LUT and start LUT loading 0x1 <b>MANUAL</b> — epdc will analyze update buffer, report histogram, then pause and waiting software to write again with selected waveform mode to start lut loading
2 AUTOWV	enable automatical waveform mode selection
1 DRY_RUN	Enable Dry Run mode(set to 1). WB won't be updated in this mode, and lut_sel will be ignored, so actually you don't need to wait for LUT available to use this feature
0 UPDATE_MODE	Update Mode 0x0 <b>PARTIAL</b> — Partial Update : only process changed pixels in region 0x1 <b>FULL</b> — Full Update : process all pixels in region

### 24.4.12 EPDC Update Fixed Pixel Control (EPDC\_UPD\_FIXEDn)

EPDC Update Control register for fixed-pixel updates (enabled via HW\_EPDC\_UPD\_CTRL[USE\_FIXED])

Update control register for fixed-pixel update values

#### EXAMPLE

TBD.

## EPDC Memory Map/Register Definition

Address: 20F\_4000h base + 180h offset + (4d × i), where i=0d to 3d

### EPDC\_UPD\_FIXEDn field descriptions

Field	Description
31 FIXNP_EN	If set to 1, current updated region has the NP value defined by FIXNP
30 FIXCP_EN	If set to 1, current updated region has the CP value defined by FIXCP
29–16 RSVD0	Reserved.
15–8 FIXNP	NP value if fixenp_en is set to 1. Data in Y8 format.
FIXCP	CP value if fixecp_en is set to 1. Data in Y8 format.

## 24.4.13 EPDC Temperature Register (EPDC\_TEMP)

### EPDC Temperature Compensation Register

Address: 20F\_4000h base + 1A0h offset = 20F\_41A0h

### EPDC\_TEMP field descriptions

Field	Description
TEMPERATURE	Temperature Value. This value is simply an index (not a temperature value). The index is used by the EPDC to access the correct temperature compensated waveform.

### 24.4.14 Waveform Mode Lookup Table Control Register. (EPDC\_AUTOWV\_LUT)

This register is used to access the waveform mode lookup table.

DATA -> AUTOWV\_LUT[ADDR] : Writing this reg with 'ADDR' and 'DATA' info will get 'DATA' written to AUTOWV\_LUT mem indexed with 'ADDR'

Address: 20F\_4000h base + 1C0h offset = 20F\_41C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD1								DATA								RSVD0								ADDR							
W	[Shaded]								[Shaded]								[Shaded]								[Shaded]							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_AUTOWV\_LUT field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
23–16 DATA	DATA
15–8 RSVD0	Reserved, always set to zero.
ADDR	ADDR

### 24.4.15 EPDC Timing Control Engine Control Register (EPDC\_TCE\_CTRL<sub>n</sub>)

TCE general control register

This register houses Horizontal scan timing. Note that line data length is derived from HW\_EPDC\_RES.

## EPDC Memory Map/Register Definition

Address: 20F\_4000h base + 200h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1								VSCAN_HOLDOFF							
W	[Reserved]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0				VCOM_VAL		VCOM_MODE	DDR_MODE	LVDS_MODE_CE	LVDS_MODE	SCAN_DIR_1	SCAN_DIR_0	DUAL_SCAN	SDDO_WIDTH	PIXELS_PER_SDCLK	
W	[Reserved]															
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

### EPDC\_TCE\_CTRLn field descriptions

Field	Description
31–25 RSVD1	Reserved.
24–16 VSCAN_HOLDOFF	This period (expressed in vertical lines), sets the portion of the vertical blanking available for new LUTs to be activated. The remainder of the blanking period is reserved for pre-filling the TCE pixel FIFOs. Increasing this value allows for multiple smaller updates to be intercepted by the current frame scan. This number should not exceed FRAME_END+FRAME_SYNC+FRAME_BEGIN. Increasing this value can improve the ability for any given update to intercept the next available frame-scan. Excessive values can result in TCE FIFO under-runs.
15–12 RSVD0	Reserved.
11–10 VCOM_VAL	When VCOM_MODE = MANUAL, this value is used to manually set the VCOM value for the VCOM[1:0] pins
9 VCOM_MODE	This field determines the method used to drive the VCOM signal. 0x0 <b>MANUAL</b> — VCOM Value is set manually using VCOM_VAL field 0x1 <b>AUTO</b> — VCOM Value is used from waveform
8 DDR_MODE	If set, DATA data is driven on both positive and negative edges of SDCLK. Note that this mode is not supported when SDDO_BUS_FORMAT=16BIT and LVDS is not used. This must always be set when LVDS_MODE is set.

Table continues on the next page...

## EPDC\_TCE\_CTRLn field descriptions (continued)

Field	Description
7 LVDS_MODE_CE	If set (together with LVDS_MODE=1), SDCE[9:5] shall be driven as the differential inverse of SDCE[4:0]. In this mode the EPDC only supports 5 CE lines.
6 LVDS_MODE	If set, the upper 8-bit of the DATA bus are used for LVDS differential signalling. Note that this can only be used when SDDO_BUS_FORMAT is set to 16BIT, i.e. LVDS signaling is not supported with an 8-bit DATA interface. Note that for LVDS_MODE, DDR_MODE must also be set.
5 SCAN_DIR_1	Determines scan direction for each half of the TFT panel 0x1 <b>UP</b> — Scan this region from bottom to top 0x0 <b>DOWN</b> — Scan this region from top to bottom
4 SCAN_DIR_0	Determines scan direction for each half of the TFT panel 0x1 <b>UP</b> — Scan this region from bottom to top 0x0 <b>DOWN</b> — Scan this region from top to bottom
3 DUAL_SCAN	Enables dual scan-mode. Note in this mode, SDDO_BUS_FORMAT=16BIT must be selected. and PIXELS_PER_CLK applies to each 8-bit segment of the DATA bus.
2 SDDO_WIDTH	Selects either 8 or 16 bit DATA bus format 0x0 <b>8BIT</b> — Connect to 8-bit source driver 0x1 <b>16BIT</b> — Connct to 16-bit source driver
PIXELS_PER_SDCLK	Number of TFT pixels per SDCLK period. Note that this value forms the division of the PIXLK to generate the SDCLK such that $SDCLK = PIXCLK / PIXELS\_PER\_SDCLK$ . For dual-scan mode (DUAL_SCAN=1), this applies to 8-bit half of the 16-bit DATA. It should be noted that when DDR_MODE is enabled, both edges of the clock have to be accounted for in this value, so for example with an 8-bit DATA, 2-bit TFT pixel, this field should be set to EIGHT (four pixels on the pos-edge and 4-pixels on the neg-edge) 0x0 <b>RESERVED</b> — Reserved 0x1 <b>TWO</b> — Two TFT-pixels per SDCLK 0x2 <b>FOUR</b> — Four TFT-pixels per SDCLK 0x3 <b>EIGHT</b> — Eight TFT-pixels per SDCLK

### 24.4.16 EPDC Timing Control Engine Source-Driver Config Register (EPDC\_TCE\_SDCFGn)

Source-driver configuration register

This register houses source-driver configuration.

## EPDC Memory Map/Register Definition

Address: 20F\_4000h base + 220h offset + (4d × i), where i=0d to 3d

Reset 0 0 0 0 0 0 0 0 0 | 0 0 0 0 0 0 0 0

Reset 0 0 0 0 0 0 0 0 0 | 0 0 0 0 0 0 0 0

### EPDC\_TCE\_SDCFGn field descriptions

Field	Description
31–22 RSVD0	Reserved.
21 SDCLK_HOLD	Setting this bit to 1 holds the SDCLK low during LINE_BEGIN
20 SDSHR	Value for source-driver shift direction output port
19–16 NUM_CE	Number of source driver IC chip-enables. Must be 1-10
15–14 SDDO_REFORMAT	This register defines the various re-formatting options to enable more flexibility in the source-driver interface:  0x0 <b>STANDARD</b> — No change. 0x1 <b>FLIP_PIXELS</b> — Reverses the order of the pixels on DATA. This register setting is sensitive to the TFT pixel width (TFT_PIXEL_FORMAT), e.g. for TFT_PIXEL_FORMAT=2B on an 8-bit bus P3,P2,P1,P0 becomes P0,P1,P2,P3, whereas with TFT_PIXEL_FORMAT=4B, on an 8-bit bus, P1,P0 becomes P0,P1
13 SDDO_INVERT	Setting this bit to 1 reverses the polarity of each DATA bit so 0xAAAA in 16-bit mode for example becomes 0x5555. This setting can be made in addition to the SDDO_REFORMAT register setting.
PIXELS_PER_CE	Number of pixels (outputs) per source-driver IC. Please note that HW_EPDC_RES[HORIZONTAL] must be an integer multiple of PINS_PER_CE.

## 24.4.17 EPDC Timing Control Engine Gate-Driver Config Register (EPDC\_TCE\_GDCFGn)

Source-driver configuration register

This register houses gate-driver configuration.

Address: 20F\_4000h base + 240h offset + (4d × i), where i=0d to 3d

**EPDC\_TCE\_GDCFGn field descriptions**

Field	Description
31–16 PERIOD_VSCAN	when vscan state is splitted, this reg defines the counter period
15–5 RSVD1	Reserved.
4 GDRL	Value for gate-driver right/left shift output port
3–2 RSVD0	Reserved.
1 GDOE_MODE	Selects method for driving GDOE signal. When set to 0, GDOE is driven at all times during the frame-scan except FRAME_SYNC. When set to 1, GDOE is driven as a delayed version of GDCLK delayed by HW_EPDC_TCE_TIMING3[GDOE_OFFSET].

*Table continues on the next page...*

**EPDC\_TCE\_GDCFGn field descriptions (continued)**

Field	Description
0 GDSP_MODE	Selects method for driving GDSP pulse. When set to 0, GDSP is always fixed to have a pulse width of one line-time. When set to 1, GDSP has a pulse-width determined by the FRAME_SYNC setting. Note that GDSP_MODE=1 is not compatible with the GDSP_OFFSET function

**24.4.18 EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC\_TCE\_HSCAN1n)**

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS\_PER\_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from HW\_EPDC\_RES.

Address: 20F\_4000h base + 260h offset + (4d × i), where i=0d to 3d

**EPDC\_TCE\_HSCAN1n field descriptions**

Field	Description
31–28 RSVD1	Reserved.
27–16 LINE_SYNC_WIDTH	Number of PIXCLK cycles for the SDLE active time. Note that this value cannot be larger than LINE_SYNC and must be greater than 0. Typically it is recommended to set this value to be the same as LINE_SYNC
15–12 RSVD0	Reserved.
LINE_SYNC	Number of PIXCLK cycles for line sync duration. Note that this value encompasses the LINE_SYNC_WIDTH duration. This value must be programmed to a multiple of SDCLK cycles

**24.4.19 EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC\_TCE\_HSCAN2n)**

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS\_PER\_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from HW\_EPDC\_RES.

Address: 20F\_4000h base + 280h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	RSVD1				LINE_END												RSVD0				LINE_BEGIN												
W	[Shaded]				[Shaded]												[Shaded]				[Shaded]												
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_TCE\_HSCAN2n field descriptions

Field	Description
31–28 RSVD1	Reserved.
27–16 LINE_END	Number of PIXCLK cycles for line end duration. This defines the duration from the de-assertion of SDCE and assertion of the next SDLE.
15–12 RSVD0	Reserved.
LINE_BEGIN	Number of PIXCLK cycles for line begin duration. This defines the interval between de-assertion of SDLE and assertion of the SDCE signals. This value must be programmed to a multiple of SDCLK cycles

## 24.4.20 EPDC Timing Control Engine Vertical Timing Register (EPDC\_TCE\_VSCANn)

Vertical scan timing registers

This register houses vertical scan timing. Note that frame data length is derived from HW\_EPDC\_RES.

Address: 20F\_4000h base + 2A0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	RSVD0								FRAME_END								FRAME_BEGIN								FRAME_SYNC								
W	[Shaded]								[Shaded]								[Shaded]								[Shaded]								
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_TCE\_VSCANn field descriptions

Field	Description
31–24 RSVD0	Reserved.
23–16 FRAME_END	Number of lines for frame end duration.
15–8 FRAME_BEGIN	Number of lines for frame begin duration.
FRAME_SYNC	Number of lines for frame sync duration.

### 24.4.21 EPDC Timing Control Engine OE timing control Register (EPDC\_TCE\_OEn)

This register contain delay programming values for the SDOEZ and SDOED source driver control signals

This register contain delay programming values for the SDOZ and SDOE source driver control signals

Address: 20F\_4000h base + 2C0h offset + (4d × i), where i=0d to 3d

#### EPDC\_TCE\_OEn field descriptions

Field	Description
31–24 SDOED_WIDTH	Number of PIXCLK cycles from SDOED high to SDOED falling (Must be greater than 0)
23–16 SDOED_DLY	Number of PIXCLK cycles from SDOEZ low to SDOED rising (Must be greater than 0)
15–8 SDOEZ_WIDTH	Number of PIXCLK cycles from SDOEZ high to SDOEZ falling (Must be greater than 0)
SDOEZ_DLY	Number of PIXCLK cycles from SDLE falling edge to SDOEZ rising (Must be greater than 0)

### 24.4.22 EPDC Timing Control Engine Driver Polarity Register (EPDC\_TCE\_POLARITY)

This registers allows for programming the polarity of source/gate driver control signals

This register houses FIFO control bits

Address: 20F\_4000h base + 2E0h offset = 20F\_42E0h

**EPDC\_TCE\_POLARITY field descriptions**

Field	Description
31–5 RSVD0	Reserved.
4 GDSP_POL	0 = Active Low, 1 = Active High. Applies to the GDSP output
3 GDOE_POL	0 = Active Low, 1 = Active High. Applies to the GDOE output
2 SDOE_POL	0 = Active Low, 1 = Active High. Applies to the SDOE. Does not apply to SDOEZ and SDOED outputs
1 SDLE_POL	0 = Active Low, 1 = Active High. Applies to the SDLE output
0 SDCE_POL	0 = Active Low, 1 = Active High. Applies to all 10 SDCE outputs

### 24.4.23 EPDC Timing Control Engine Timing Register 1 (EPDC\_TCE\_TIMING1n)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

## EPDC Memory Map/Register Definition

Address: 20F\_4000h base + 300h offset + (4d × i), where i=0d to 3d

### EPDC\_TCE\_TIMING1n field descriptions

Field	Description
31–6 RSVD1	Reserved.
5–4 SDLE_SHIFT	This register can be used to implement additional timing setup/hold adjustment of source driver signals by adjusting the SDCLK up to 3 PIXCLK cycles  0x0 <b>NONE</b> — No shift of SDLE 0x1 <b>ONE</b> — Shift SDLE 1 pixclk cycle 0x2 <b>TWO</b> — Shift SDLE 2 pixclk cycles 0x3 <b>THREE</b> — Shift SDLE 3 pixclk cycles
3 SDCLK_INVERT	Invert phase of SDCLK
2 RSVD0	Reserved.
SDCLK_SHIFT	This register can be used to implement additional timing setup/hold adjustment of source driver signals by adjusting the SDCLK up to 4 cycles

Table continues on the next page...

EPDC\_TCE\_TIMING1*n* field descriptions (continued)

Field	Description
0x0	<b>NONE</b> — No shift of SDCLK
0x1	<b>ONE</b> — Shift SDCLK 1 pixclk cycle
0x2	<b>TWO</b> — Shift SDCLK 2 pixclk cycles
0x3	<b>THREE</b> — Shift SDCLK 3 pixclk cycles

### 24.4.24 EPDC Timing Control Engine Timing Register 2 (EPDC\_TCE\_TIMING2*n*)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 20F\_4000h base + 310h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	GDCLK_HP																GDSP_OFFSET															
W	GDCLK_HP																GDSP_OFFSET

EPDC\_TCE\_TIMING2*n* field descriptions

Field	Description
31–16 GDCLK_HP	This register controls the GDCLK high-pulse width. It is expressed by N PIXCLKs where N=1 to 65535. Note that GDCLK will always have a period equal to the line-clock timing. A value of 0 is not supported. It is recommended that this value be set to at least a half line-clock time. For panels which use GDCLK to drive GDOE, this high-pulse width should be set to cover the majority of the line timing
GDSP_OFFSET	This register allows the user to shift the GDSP pulse by N PIXCLKs where N=1 to 65535. Note that GDSP will always have a pulse width equivalent to the line-clock timing. A value of 0 is not supported.

### 24.4.25 EPDC Timing Control Engine Timing Register 3 (EPDC\_TCE\_TIMING3*n*)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 20F\_4000h base + 320h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	GDOE_OFFSET																GDCLK_OFFSET															
W	GDOE_OFFSET																GDCLK_OFFSET															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

**EPDC\_TCE\_TIMING3n field descriptions**

Field	Description
31–16 GDOE_OFFSET	When using GDOE_MODE=1, this register sets the delay from GDCLK to the GDOE in terms of N PIXCLK cycles
GDCLK_OFFSET	This register allows the user to shift the GDCLK from the line time by N PIXCLK cycles.

**24.4.26 EPDC Pigeon Mode Control Register 0 (EPDC\_PIGEON\_CTRL0n)**

This register contains global counter settings for Pigeon Mode

This register houses general purpose timing adjustment registers

Address: 20F\_4000h base + 380h offset + (4d × i), where i=0d to 3d

**EPDC\_PIGEON\_CTRL0n field descriptions**

Field	Description
31–28 RSVD1	Reserved.
27–16 LD_PERIOD	period of pclk counter during LD phase
15–12 RSVD0	Reserved.
FD_PERIOD	period of line counter during FD phase

**24.4.27 EPDC Pigeon Mode Control Register 1 (EPDC\_PIGEON\_CTRL1n)**

This register contains global counter setting for pigeon mode

This register houses general purpose timing adjustment registers

Address: 20F\_4000h base + 390h offset + (4d × i), where i=0d to 3d

### EPDC\_PIGEON\_CTRL1*n* field descriptions

Field	Description
31–28 RSVD1	Reserved.
27–16 FRAME_CNT_ CYCLES	max cycles of frame counter
15–12 RSVD0	Reserved.
FRAME_CNT_ PERIOD	period of frame counter

### 24.4.28 EPDC IRQ Mask Register for LUT 0~31 (EPDC\_IRQ\_MASK1*n*)

Controls masking EPDC LUT complete interrupts

This register controls LUT0~31 IRQ masks for EPDC interrupts

Address: 20F\_4000h base + 3C0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### EPDC\_IRQ\_MASK1*n* field descriptions

Field	Description
LUTN_CMPLT_ IRQ_EN	LUT0~31 Complete Interrupt Enable

### 24.4.29 EPDC IRQ Mask Register for LUT 32~63 (EPDC\_IRQ\_MASK2*n*)

Controls masking EPDC LUT complete interrupts

This register controls LUT0~31 IRQ masks for EPDC interrupts

Address: 20F\_4000h base + 3D0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_IRQ\_MASK2n field descriptions**

Field	Description
LUTN_CMPLT_IRQ_EN	LUT32~64 Complete Interrupt Enable

**24.4.30 EPDC Interrupt Register for LUT 0~31 (EPDC\_IRQ1n)**

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corresponding physical update is competed on the screen. Each interrupt has a corresponding mask register in HW\_EPDC\_IRQ\_MASK

This register houses the interrupt bits for the LUT Completions

Address: 20F\_4000h base + 3E0h offset + (4d × i), where i=0d to 3d

**EPDC\_IRQ1n field descriptions**

Field	Description
LUTN_CMPLT_IRQ	LUT 0~31 Complete Interrupt

**24.4.31 EPDC Interrupt Register for LUT 32~63 (EPDC\_IRQ2n)**

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corresponding physical update is competed on the screen. Each interrupt has a corresponding mask register in HW\_EPDC\_IRQ\_MASK

This register houses the interrupt bits for the LUT Completions

Address: 20F\_4000h base + 3F0h offset + (4d × i), where i=0d to 3d

**EPDC\_IRQ2n field descriptions**

Field	Description
LUTN_CMPLT_IRQ	LUT 32~64 Complete Interrupt

### 24.4.32 EPDC IRQ Mask Register (EPDC\_IRQ\_MASKn)

Controls masking for all EPDC interrupts

This register controls IRQ masks for all EPDC interrupts

Address: 20F\_4000h base + 400h offset + (4d × i), where i=0d to 3d

**EPDC\_IRQ\_MASKn field descriptions**

Field	Description
31–24 RSVD1	Reserved.
23 PWR_IRQ_EN	Enable power interrupt
22 UPD_DONE_IRQ_EN	Enable UPD complete interrupt

Table continues on the next page...

**EPDC\_IRQ\_MASK<sub>n</sub> field descriptions (continued)**

Field	Description
21 TCE_IDLE_IRQ_EN	Enable TCE Idle interrupt detection.
20 BUS_ERROR_IRQ_EN	Enable AXI BUS ERROR interrupt detection.
19 FRAME_END_IRQ_EN	If this bit is set, EPDC will assert the current frame end interrupt. This irq is only available during updating period.
18 TCE_UNDERRUN_IRQ_EN	Enable pixel FIFO under-run condition detection.
17 COL_IRQ_EN	Enable collision detection interrupts for all LUTs
16 WB_CMPLT_IRQ_EN	Enable WB complete interrupt
RSVD0	Reserved.

**24.4.33 EPDC Interrupt Register (EPDC\_IRQ<sub>n</sub>)**

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corresponding physical update is completed on the screen. Each interrupt has a corresponding mask register in HW\_EPDC\_IRQ\_MASK

This register houses the interrupt bits for the LUT Completions

Address: 20F\_4000h base + 420h offset + (4d × i), where i=0d to 3d

**EPDC\_IRQn field descriptions**

Field	Description
31–24 RSVD1	Reserved.
23 PWR_IRQ	Power Interrupt
22 UPD_DONE_IRQ	Working buffer process complete Interrupt
21 TCE_IDLE_IRQ	Interrupt to indicate that the TCE has completed TFT frame scans and is in an idle state.
20 BUS_ERROR_IRQ	Interrupt to indicate AXI BUS error occurs.
19 FRAME_END_IRQ	Interrupt to indicate EPDC has completed the current frame and is in the vertical blanking period.
18 TCE_UNDERRUN_IRQ	Interrupt to indicate that a pixel FIFO under-run has occurred.
17 LUT_COL_IRQ	Collision detection interrupt. Check HW_EPDC_STATUS_COL.
16 WB_CMPLT_IRQ	Working buffer process complete Interrupt
RSVD0	Reserved.

### 24.4.34 EPDC Status Register - LUTs (EPDC\_STATUS\_LUTS1n)

#### EPDC Status Register - LUTS 0~31

Address: 20F\_4000h base + 440h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUS\_LUTS1n field descriptions**

Field	Description
LUTN_STS	LUT 0~31 Status : 1=ACTIVE, 0=IDLE

### 24.4.35 EPDC Status Register - LUTs (EPDC\_STATUS\_LUTS2n)

#### EPDC Status Register - LUTS 0~31

Address: 20F\_4000h base + 450h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUS\_LUTS2n field descriptions**

Field	Description
LUTN_STS	LUT 32~63 Status : 1=ACTIVE, 0=IDLE

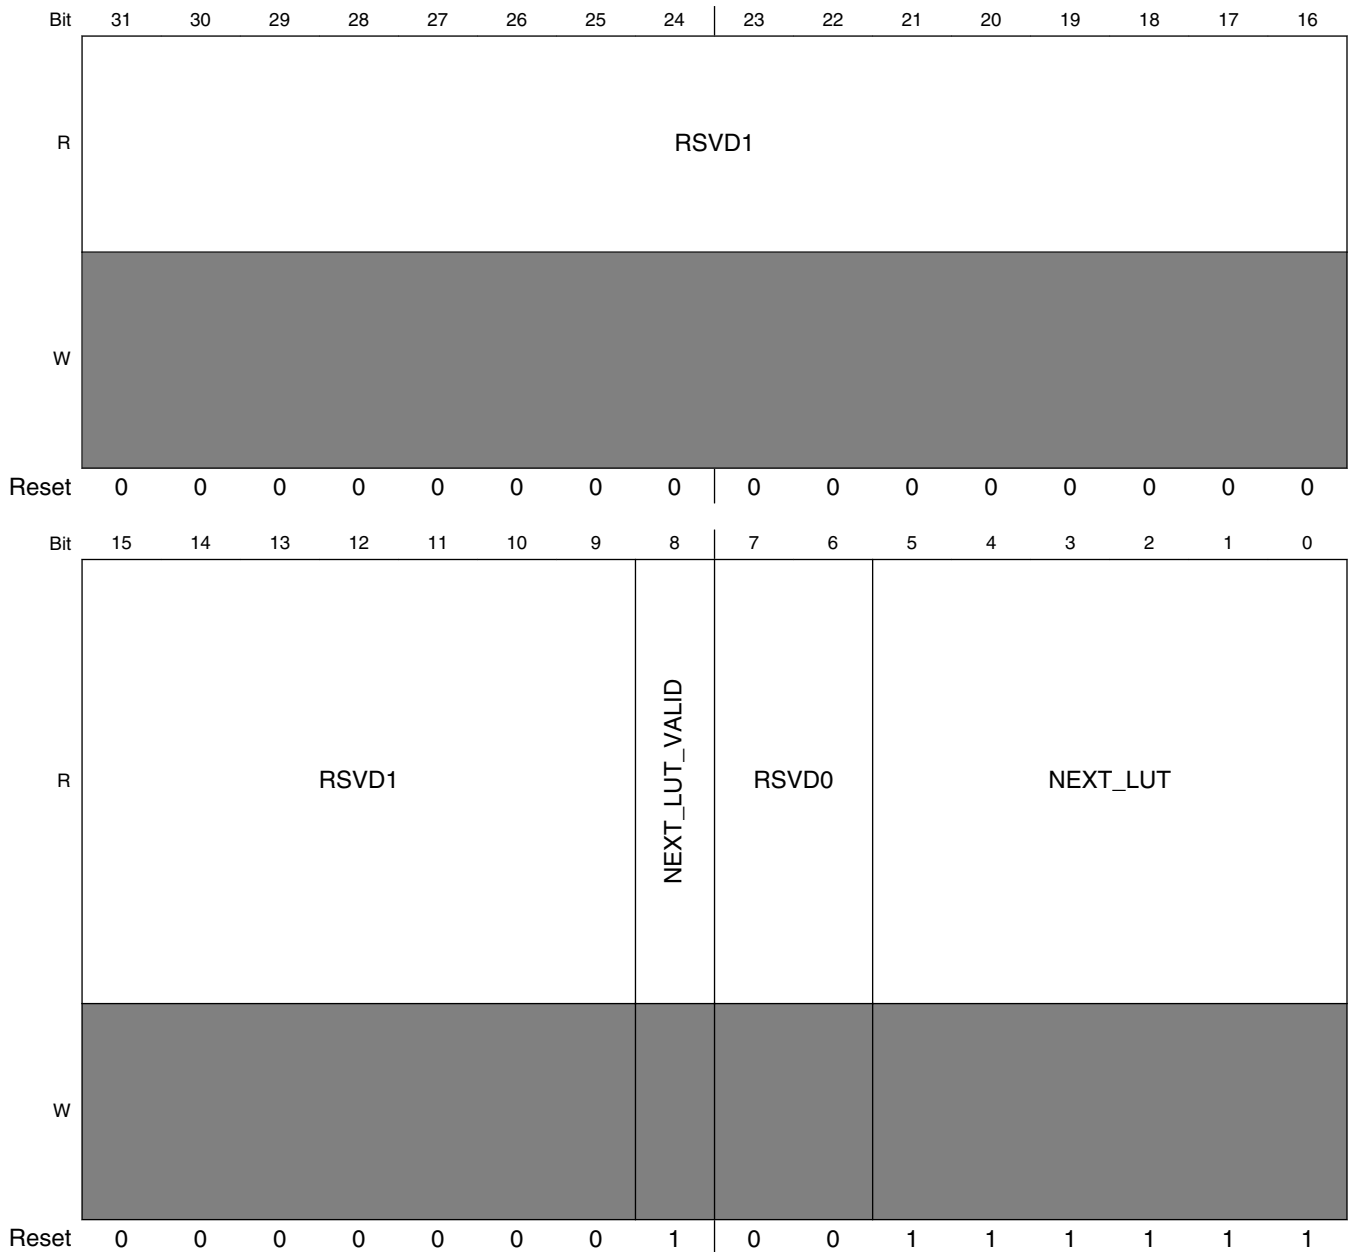

### 24.4.36 EPDC Status Register - Next Available LUT (EPDC\_STATUS\_NEXTLUT)

Holds value of next available LUT. Can be used for fast LUT assignment. This value can be read and then used in an update command as part of the HW\_EPDC\_UPD\_CTRL register write

The DIGCTL Status Register provides a read-only view to various input conditions and internal states.

Address: 20F\_4000h base + 460h offset = 20F\_4460h

**EPDC\_STATUS\_NEXTLUT field descriptions**

Field	Description
31–9 RSVD1	Reserved.
8 NEXT_LUT_VALID	This bitfield can be used to check against a LUTs full condition

Table continues on the next page...

**EPDC\_STATUS\_NEXTLUT field descriptions (continued)**

Field	Description
7-6 RSVD0	Reserved.
NEXT_LUT	Next available LUT value

**24.4.37 EPDC LUT Collision Status (EPDC\_STATUS\_COL1n)**

EPDC LUT Collision Status Register and works in conjunction with HW\_EPDC\_IRQ[LUT\_COL\_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in HW\_EPDC\_IRQ\_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit HW\_EPDC\_IRQ[LUT\_COL\_IRQ] clears this register

This register houses the status bits for the LUT Collisions

Address: 20F\_4000h base + 480h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUS\_COL1n field descriptions**

Field	Description
LUTN_COL_STS	LUTn Collision Status

**24.4.38 EPDC LUT Collision Status (EPDC\_STATUS\_COL2n)**

EPDC LUT Collision Status Register and works in conjunction with HW\_EPDC\_IRQ[LUT\_COL\_IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in HW\_EPDC\_IRQ\_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit HW\_EPDC\_IRQ[LUT\_COL\_IRQ] clears this register

This register houses the status bits for the LUT Collisions

Address: 20F\_4000h base + 490h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUS\_COL2n field descriptions**

Field	Description
LUTN_COL_STS	LUTn Collision Status

**24.4.39 EPDC General Status Register (EPDC\_STATUSn)**

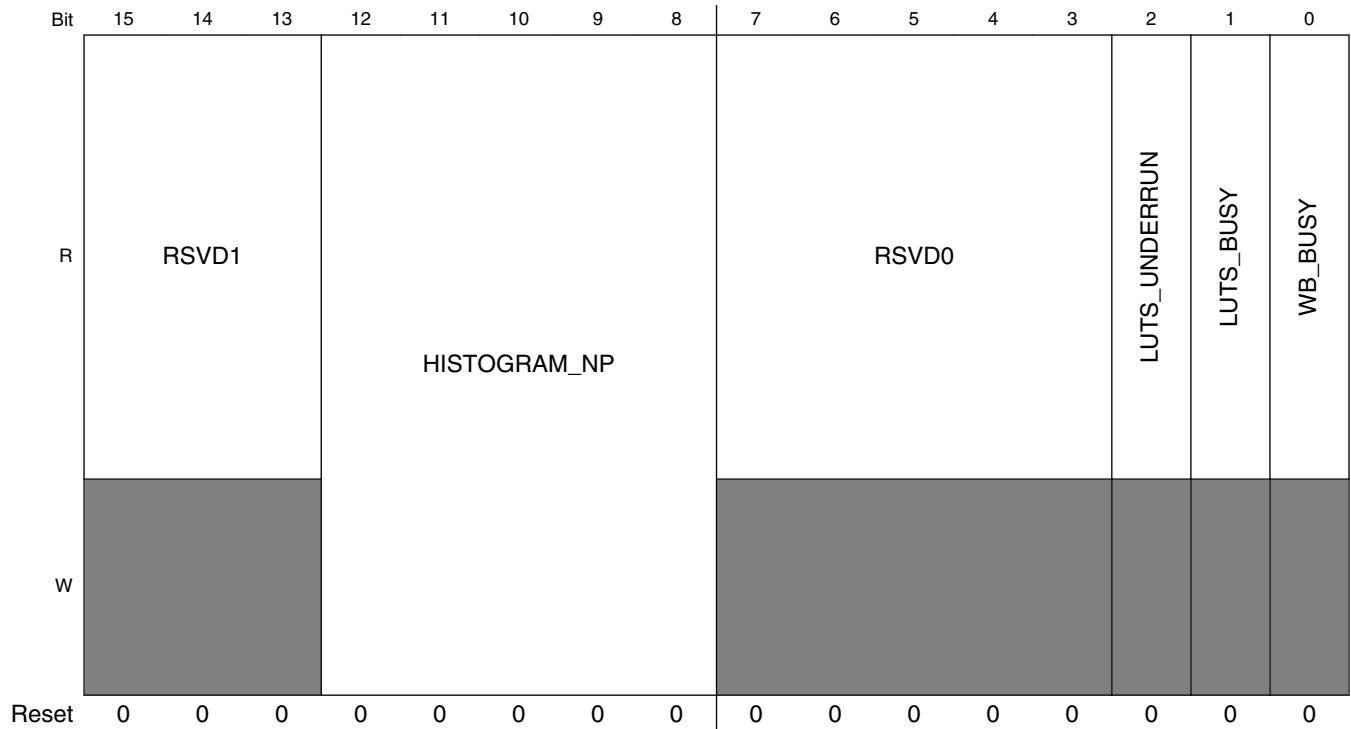

Register to house non LUT specific status bits

This register houses general status bits

Address: 20F\_4000h base + 4A0h offset + (4d × i), where i=0d to 3d

**EPDC Memory Map/Register Definition**

**EPDC\_STATUSn field descriptions**

Field	Description
31–21 RSVD2	Reserved.
20–16 HISTOGRAM_CP	Indicates which histogram matched the existing bitmap(CP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color ) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white ) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
15–13 RSVD1	Reserved.
12–8 HISTOGRAM_NP	Indicates which histogram matched the processed bitmap(NP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color ) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white ) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
7–3 RSVD0	Reserved.
2 LUTS_UNDERRUN	Provides a summary status of LUT fill. 1= not enough time for active luts read during blanking period before vscan_holdoff. 0=complete all active luts fill during blanking period before VSCAN_HOLD OFF.

*Table continues on the next page...*

**EPDC\_STATUS<sub>n</sub> field descriptions (continued)**

Field	Description
1 LUTS_BUSY	Provides a summary status of LUTs. 1= All LUTs are busy, 0= LUTs are available
0 WB_BUSY	Working buffer process is busy cannot accept new update requests. When WB_BUSY is 1, software should wait for the WB_CMPLT_IRQ interrupt. When this interrupt occurs WB_BUSY is cleared immediately. This is a real-time status of the process.

**24.4.40 EPDC Collision Region Co-ordinate (EPDC\_UPD\_COL\_CORD)**

EPDC Collision Region Co-ordinate, cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 20F\_4000h base + 4C0h offset = 20F\_44C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	RSVD1			YCORD												RSVD0			XCORD														
W	0																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_UPD\_COL\_CORD field descriptions**

Field	Description
31–29 RSVD1	Reserved.
28–16 YCORD	Y co-ordinate for collision region of the latest completed update
15–13 RSVD0	Reserved.
XCORD	X co-ordinate for collision region of the latest completed update

**24.4.41 EPDC Collision Region Size (EPDC\_UPD\_COL\_SIZE)**

EPDC Collision Region Size of the latest completed update cleared when new update issued

This register only valid after WB completion and collision happens.

## EPDC Memory Map/Register Definition

Address: 20F\_4000h base + 4E0h offset = 20F\_44E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EPDC\_UPD\_COL\_SIZE field descriptions

Field	Description
31–29 RSVD1	Reserved.
28–16 HEIGHT	Height (in pixels)
15–13 RSVD0	Reserved.
WIDTH	Width (in pixels)

## 24.4.42 1-level Histogram Parameter Register. (EPDC\_HIST1\_PARAM)

This register specifies the valid values for a 1-level(single color) histogram. If all pixels in a bitmap is only one color, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 600h offset = 20F\_4600h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
R	RSVD																											VALUE0									
W	[Shaded]																																				
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0					

### EPDC\_HIST1\_PARAM field descriptions

Field	Description
31–5 RSVD	Reserved, always set to zero.
VALUE0	value for 1-level histogram

### 24.4.43 2-level Histogram Parameter Register. (EPDC\_HIST2\_PARAM)

This register specifies the valid values for a 2-level histogram. If all pixels in a bitmap match these two values, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 610h offset = 20F\_4610h

**EPDC\_HIST2\_PARAM field descriptions**

Field	Description
31–16 RSVD	Reserved, always set to zero.
15–13 RSVD1	Reserved, always set to zero.
12–8 VALUE1	White value for 2-level histogram
7–5 RSVD0	Reserved, always set to zero.
VALUE0	Black value for 2-level histogram

### 24.4.44 4-level Histogram Parameter Register. (EPDC\_HIST4\_PARAM)

This register specifies the valid values for a 4-level histogram. If all pixels in a bitmap match these two values, STATUS[1] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 620h offset = 20F\_4620h

**EPDC\_HIST4\_PARAM field descriptions**

Field	Description
31–29 RSVD3	Reserved, always set to zero.
28–24 VALUE3	GRAY3 (White) value for 4-level histogram
23–21 RSVD2	Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 4-level histogram
15–13 RSVD1	Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 4-level histogram
7–5 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 4-level histogram

**24.4.45 8-level Histogram Parameter 0 Register. (EPDC\_HIST8\_PARAM0)**

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match these two values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 630h offset = 20F\_4630h

**EPDC\_HIST8\_PARAM0 field descriptions**

Field	Description
31–29 RSVD3	Reserved, always set to zero.
28–24 VALUE3	GRAY3 value for 8-level histogram
23–21 RSVD2	Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 8-level histogram

Table continues on the next page...

**EPDC\_HIST8\_PARAM0 field descriptions (continued)**

Field	Description
15–13 RSVD1	Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 8-level histogram
7–5 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 8-level histogram

**24.4.46 8-level Histogram Parameter 1 Register.  
(EPDC\_HIST8\_PARAM1)**

This register specifies four of the valid values for an 8-level histogram. If all pixels in a bitmap match these two values, STATUS[2] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 640h offset = 20F\_4640h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_HIST8\_PARAM1 field descriptions**

Field	Description
31–29 RSVD7	Reserved, always set to zero.
28–24 VALUE7	GRAY7 (White) value for 8-level histogram
23–21 RSVD6	Reserved, always set to zero.
20–16 VALUE6	GRAY6 value for 8-level histogram
15–13 RSVD5	Reserved, always set to zero.
12–8 VALUE5	GRAY5 value for 8-level histogram
7–5 RSVD4	Reserved, always set to zero.
VALUE4	GRAY4 value for 8-level histogram

### 24.4.47 16-level Histogram Parameter 0 Register. (EPDC\_HIST16\_PARAM0)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 650h offset = 20F\_4650h

EPDC\_HIST16\_PARAM0 field descriptions

Field	Description
31–29 RSVD3	Reserved, always set to zero.
28–24 VALUE3	GRAY3 value for 16-level histogram
23–21 RSVD2	Reserved, always set to zero.
20–16 VALUE2	GRAY2 value for 16-level histogram
15–13 RSVD1	Reserved, always set to zero.
12–8 VALUE1	GRAY1 value for 16-level histogram
7–5 RSVD0	Reserved, always set to zero.
VALUE0	GRAY0 (Black) value for 16-level histogram

### 24.4.48 16-level Histogram Parameter Register. (EPDC\_HIST16\_PARAM1)

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 660h offset = 20F\_4660h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_HIST16\_PARAM1 field descriptions**

Field	Description
31–29 RSVD7	Reserved, always set to zero.
28–24 VALUE7	GRAY7 value for 16-level histogram
23–21 RSVD6	Reserved, always set to zero.
20–16 VALUE6	GRAY6 value for 16-level histogram
15–13 RSVD5	Reserved, always set to zero.
12–8 VALUE5	GRAY5 value for 16-level histogram
7–5 RSVD4	Reserved, always set to zero.
VALUE4	GRAY4 value for 16-level histogram

**24.4.49 16-level Histogram Parameter Register.  
(EPDC\_HIST16\_PARAM2)**

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 670h offset = 20F\_4670h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_HIST16\_PARAM2 field descriptions**

Field	Description
31–29 RSVD11	Reserved, always set to zero.

*Table continues on the next page...*

**EPDC\_HIST16\_PARAM2 field descriptions (continued)**

Field	Description
28–24 VALUE11	GRAY11 value for 16-level histogram
23–21 RSVD10	Reserved, always set to zero.
20–16 VALUE10	GRAY10 value for 16-level histogram
15–13 RSVD9	Reserved, always set to zero.
12–8 VALUE9	GRAY9 value for 16-level histogram
7–5 RSVD8	Reserved, always set to zero.
VALUE8	GRAY8 value for 16-level histogram

**24.4.50 16-level Histogram Parameter Register. (EPDC\_HIST16\_PARAM3)**

This register specifies four of the valid values for a 16-level histogram. If all pixels in a bitmap match these two values, STATUS[3] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

Address: 20F\_4000h base + 680h offset = 20F\_4680h

**EPDC\_HIST16\_PARAM3 field descriptions**

Field	Description
31–29 RSVD15	Reserved, always set to zero.
28–24 VALUE15	GRAY15 (White) value for 16-level histogram
23–21 RSVD14	Reserved, always set to zero.
20–16 VALUE14	GRAY14 value for 16-level histogram
15–13 RSVD13	Reserved, always set to zero.

Table continues on the next page...

## EPDC\_HIST16\_PARAM3 field descriptions (continued)

Field	Description
12–8 VALUE13	GRAY13 value for 16-level histogram
7–5 RSVD12	Reserved, always set to zero.
VALUE12	GRAY12 value for 16-level histogram

### 24.4.51 EPDC General Purpose I/O Debug register (EPDC\_GPION)

GPIO register to control BDR[1:0], EPDC\_PWR\_CTRL[3:0] and EPDC\_PWR\_COM output signals

Houses software control signal registers

Address: 20F\_4000h base + 700h offset + (4d × i), where i=0d to 3d

**EPDC\_GPIOn field descriptions**

Field	Description
31–9 RSVD0	Reserved.
8 PWRSTAT	reflect ipp_epdc_pwrstat input
7 PWRWAKE	Controls ipp_epdc_pwrwake output
6 PWRCOM	Controls ipp_epdc_pwrcom output
5–2 PWRCTRL	Controls ipp_epdc_pwrctrl[3:0] output
BDR	Controls ipp_epdc_bdr[1:0] output

**24.4.52 EPDC Version Register (EPDC\_VERSION)**

This register reflects the version number for the EPDC.

**EXAMPLE**

No Example.

Address: 20F\_4000h base + 7F0h offset = 20F\_47F0h

**EPDC\_VERSION field descriptions**

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

**24.4.53 Panel Interface Signal Generator Register 0\_0 (EPDC\_PIGEON\_0\_0)**

parameters for timing signal generation

Address: 20F\_4000h base + 800h offset = 20F\_4800h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0

**EPDC\_PIGEON\_0\_0 field descriptions**

Field	Description
31–24 STATE_MASK	state_mask = (FSIFBIFDIFE) and (LSILBILDILE) , select any combination of scan states as reference point for local counter to start ticking  0x80 <b>FS</b> — FRAME SYNC 0x40 <b>FB</b> — FRAME BEGIN 0x20 <b>FD</b> — FRAME DATA 0x10 <b>FE</b> — FRAME END 0x8 <b>LS</b> — LINE SYNC 0x4 <b>LB</b> — LINE BEGIN 0x2 <b>LD</b> — LINE DATA 0x1 <b>LE</b> — LINE END
23–12 MASK_CNT	When the global counter selected through MASK_CNT_SEL matches value in this reg, pigeon local counter start ticking. 0=disable
11–8 MASK_CNT_SEL	select global counters as mask condition, use together with MASK_CNT  0x0 <b>HSTATE_CNT</b> — pclk counter within one hscan state 0x1 <b>HSTATE_CYCLE</b> — pclk cycle within one hscan state 0x2 <b>VSTATE_CNT</b> — line counter within one vscan state 0x3 <b>VSTATE_CYCLE</b> — line cycle within one vscan state 0x4 <b>FRAME_CNT</b> — frame counter 0x5 <b>FRAME_CYCLE</b> — frame cycle 0x6 <b>HCNT</b> — horizontal counter (pclk counter within one line ) 0x7 <b>VCNT</b> — vertical counter (line counter within one frame)
7–4 OFFSET	offset on pclk unit. 0=align with data, positive value means delay, minus value mean ahead. Supported range depends on panel mode
3–2 INC_SEL	event to increment local counter  0x0 <b>PCLK</b> — pclk 0x1 <b>LINE</b> — line start pulse 0x2 <b>FRAME</b> — frame start pulse 0x3 <b>SIG_ANOTHER</b> — use another signal as tick event
1 POL	polarity of signal output  0x0 <b>ACTIVE_HIGH</b> — normal signal (active high) 0x1 <b>ACTIVE_LOW</b> — inverted signal (active low)
0 EN	enable pigeon mode on this signal

### 24.4.54 Panel Interface Signal Generator Register 0\_1 (EPDC\_PIGEON\_0\_1)

parameters for timing signal generation

Address: 20F\_4000h base + 810h offset = 20F\_4810h

#### EPDC\_PIGEON\_0\_1 field descriptions

Field	Description
31–16 CLR_CNT	deassert signal output when counter match this value  0x0 <b>CLEAR_USING_MASK</b> — keep active until mask off
SET_CNT	assert signal output when counter match this value  0x0 <b>START_ACTIVE</b> — start as active

### 24.4.55 Panel Interface Signal Generator Register 0\_1 (EPDC\_PIGEON\_0\_2)

parameters for timing signal generation

Address: 20F\_4000h base + 820h offset = 20F\_4820h

#### EPDC\_PIGEON\_0\_2 field descriptions

Field	Description
31–9 -	This field is reserved. Reserved.
8–4 SIG_ANOTHER	select another signal for logic operation or as mask or counter tick event
SIG_LOGIC	logic operation with another signal sigout : final output signal of this generator mask : final mask of this generator this_sig : intermediate signal of this generator before logic operation

Table continues on the next page...

## EPDC\_PIGEON\_0\_2 field descriptions (continued)

Field	Description
	other_masks : intermediate mask result of this generator before logic operation sig_another : signal selected other generators
0x0	<b>DIS</b> — no logic operation
0x1	<b>AND</b> — sigout = sig_another AND this_sig
0x2	<b>OR</b> — sigout = sig_another OR this_sig
0x3	<b>MASK</b> — mask = sig_another AND other_masks

## 24.4.56 Panel Interface Signal Generator Register 1\_0 (EPDC\_PIGEON\_1\_0)

parameters for timing signal generation

Address: 20F\_4000h base + 840h offset = 20F\_4840h
